TO OUR READERS.

When Charles Knight was told of an intended journal, he advised that it should contain "things new and old;" and one of his concluding observations was, "If you find it is useful, that will be almost as pleasing as its being profitable." Experience has confirmed to us the truth of that veteran publisher's utterances. We have sought successfully for the best of things new and old, and no pleasanter narrative has reached us than that which told of a farm labourer, whose library, besides his bible, prayer and hymn books, comprised no more than two of our old volumes. His garden was always mentioned by the village parson as a model, and that parson glowed with pleasure as he told how the labourer acknowledged that his flower beds were from Donald Beaton's teachings, his roof Vine was prolific from Robert Fish's, and his kitchen garden productive from James Barnes's. Those teachings were in the two old volumes of our Journal; but in that cottage our newer name was not admitted, for, as its tenant said, "I calls it 'The Cottage Gardener'—the name comes more home." Gladdened are we by such testimony to our usefulness, but further gladdened are we by the knowledge that we are useful to the amateur and the gardener; for them, for all who delight in home surroundings, we obtain the best of "things new and old"—we say emphatically "the best," because they are rendered to us by those known to be well skilled.

We have no new thing to say in conclusion, for it is an old thing for us to have to thank our helpmates and our readers for enabling us still to say that we rejoice in being

THE EDITORS.

INDEX.

Aberdeen Poultry Show, 44
Acacia affinis hardy, 53
Acacias in conservatory, 216
Acanthus culture, 3
Acarus gallinæ, 504
Accrington Poultry Show, 338
Achimenes, select, 128
Aconite, culture of Winter, 93
Acres of orchards, &c., 153
Adelaide Botanic Garden, 147
Adenandra uniflora and culture, 387
Adiantums, Farleyense not thriving, 243; potting, 81
Adonis-flowers, our border, 52
Æthionema coridifolium, 491
Ageratums, sowing, 111
Ajugas, reptans, 148; hardy, and culture, 121
Albert, Prince Consort, a gardener, 241
Alexandra Park Horticultural Show, 393
Alisma plantago and culture, 452
Alloa Poultry Show, 88
Aloe perfoliata, 2 7
Alsophila Leichardtiana, 495
Alternanthera culture, 81
American, blight, 170, dressing, 170; Aloe, flowering, 478, rapid growth, 390
Amsterdam International Show, 221

From observations taken near London during forty-three years, the average day temperature of the week is 41.73°; and its night temperature 29.77°.

PAST AND FUTURE.

I SIT down for the eleventh time to write the opening article of the volume of "our Journal," beginning with a new year. I might well be staggered at the thought. I might remember the case of Dickens, who after a few years ceased to write Christmas books, at least with anything Christmas-like in them; but I am comforted when I recollect the case of a gentleman who, at an agricultural gathering, made for twenty years the same speech, which was always well received, though addressed for the most part to the same audience. Now I have an advantage over that good man, for, although I have the same subject, I have a different audience—at least, a greater one each new year; for I know the circulation of this Journal is every year extending, and that this has been the case during even the just past year, in spite of its many and special opponents; and although the new little crafts—very little ones indeed some of them—start alongside, yet the old ship, christened by me long ago "our Journal," sails on bravely with more canvas and a bigger crew, and more interested in her welfare, and delighting in her welfare, than ever.

I have this year entitled my New Year's piece "Past and Future;" and at the beginning of a year I hardly know which we think of most, the past or the future, but I rather think the former. The wish of "A merry Christmas" uttered on a Christmas morning by laughing girls at a gladsome family gathering is realised, and just expresses the present feeling. Christmas is but a day or a tide, and its happiness is assured if the very day be happy. In its case the present only is thought of; but it is different in regard to the New Year's wish, "A Happy New Year." Of that there is a doubt, for it extends over 365 days. But apart from its uncertainty, I think at the opening of a year we think fully as much, or more, of the past year than of the coming one. We, delighters in the subjects dilated on in "our Journal," have even in this respect an advantage over many, for we are sure that our gardens and our fancies will give as much pleasure to us this year as in past years. We shall welcome the Snowdrop and the golden Crocus with as much delight as ever; we shall watch the spring flowers, aye, and the spring chickens (not, oh! epicure, on the table, but in the poultry-yard I mean) as gladly as in former years. Here we see the happiness that a taste gives, and a taste for Nature's productions is more certain of giving abiding pleasure than that of any art. The picture may tire, the landscape never.

Says a modern writer, "Few men who have distinguished themselves have been without a collection, or at least a taste. John Selden formed a library. The Duke of Wellington loved music. One of the greatest living statesmen is a judge of china. The first financier in Europe collects enamels. The busy man finds his greatest relaxation in such pursuits. Without being frivolous they afford relief from serious cares. Walpole and Richelieu formed galleries as refuges from affairs of state. It may be a question how far education neglects this subject. The early development of a turn for collecting is perhaps worth more consideration from those who bring up children than has yet been given to it. Monograms and postage stamps may in this way be among the civilising agents of our time."

Upon this subject of early developing a taste, a lady of position (known only to me through "our Journal" writes to me, "I began poultry-keeping for my elder boy and his brother, and have succeeded in giving to both a strong love for the pursuit." Thus so natural is the love of living things that the turn can be given if but early opportunity be afforded. The mother that gives a child a garden, the father that permits a Bantam or two in the stable-yard, or a few Pigeons over the stable, gives the turn by allowing the opportunity of its commencement, and so a life-long source of happiness is created.

As to collections, of the making of which the author above quoted speaks, there are other collections than pictures or china, or monograms. There are collections of Orchids, glorious to behold; there is the northern mechanics' collection of Auriculas, the lady's collection of Ferns. What a source of pleasure I have known these to be to the delicate or home-keeping! Then there are collections of choice poultry, and collections of fancy Pigeons. Oh, the pleasures all these afford, and the pleasure they have afforded to many of my readers in the past year, and are sure to afford similar pleasure in future years! Goëthe said, "You may know a man's character by what he laughs at." I would rather say, You may know it by what he privately delights in. The greatest have always delighted most in Nature. The great Bacon says, "A flower garden is the greatest recreation of the mind;" and he found his greatest relief, after being busied with high thoughts and projecting great works, was to be found in a quiet saunter by himself amid green foliage, and the unobtrusive humming of bees, and the sweet perfume of the flowers. A greater even than Bacon, the myriad-minded Shakespeare, turns his back on London to spend the rest of his life amid the gardens, and the meadows, the lanes of quiet, almost sleepy, Stratford-on-Avon, again to eye with delight

> "The pale Primrose,
> The freckled Cowslip, Burnet, and sweet Cloves.
> Daffodils,
> They come before the swallow dares, and take
> The winds of March with beauty; Violets dim,
> But sweeter than the lids of Juno's eyes
> Or Cytherea's breath; bold Oxlips, and
> The Crown Imperial."

All of which he sang in such grand verse while living in London, but remembering them in his country home in Warwickshire, to which he escaped as soon as ever he could, again to have his garden where doubtless he had, in his own words, in late summer the fairest flowers

> "Of the season, Carnations and streaked Gillyflowers,
> Hot Lavender, Minta, Savory, Marjoram:
> The Marigold that goes to bed with the sun,
> And with him rises weeping."

And if the greatest loved their gardens, so down the scale do the tired citizen, the busy country doctor, the tied-at-home tradesman (yet making home happy with flowers and pets), the mother with her group of little ones around her, and, too, those "unappropriated blessings" single ladies, in former years so jeered at by shallow-brained men, but now highly esteemed by all the good.

It is pleasant to see, after the long reign of small bedding plants, that a taste for the old border plants has revived—happily before they have all died-out of knowledge; and such papers as Mr. J. Wright's on Wallflowers and Stocks cannot fail to help on this revival. All knowledge is power, and more, all proper knowledge—*i.e.*, knowledge of good, brings pleasure; so that the man who first turns our attention to what is beautiful in Nature, or re-directs further attention to some half-forgotten flower, is doing good.

> "Sweet is the lore which Nature brings:
> Our meddling intellect
> Mis-shapes the beauteous forms of things—
> We murder to dissect.
>
> "Enough of science and of art:
> Close up these barren leaves;
> Come forth, and bring with you a heart
> That watches and receives."

I have often thought of the above beautiful lines during the past summer, which, beginning in April, at least to us in the west, was prolonged far, very far, into the autumn, as even late in November I counted above a hundred blooms of the Lamarque Rose on the south front of my house, perfect in form and equally as beautiful in foliage to those which July showed. It has been a rare season, this past one, for enjoying the foliage of trees, from the first green bud to the last golden leaves, as they stood and would stand week after week untouched by frost. So, too, has the past year, as far as I could judge, been favourable to flowers—a fine out-of-door summer, when week after week I have lived and read and even written out in the open air, listening to the soft summer breeze gently stirring among the leaves of the park trees as they stood knee-deep in the grass, and I felt the power of Tennyson's expression, "There is no joy but calm." Such of the past season.

And will not the future year be as joy-giving? I trust so. No doubt the pleasure derived from our gardens will be as ever a perennial one. This is well expressed in a small poem of Goëthe's, which, though our little children learn it, has the mark of a great genius—

> "Through the forest idly, as my steps I bent,
> With a free and happy heart, singing as I went;
> Cowering in the shade, I a floweret did espy,
> Bright as any star in heaven, sweet as any eye.
> Down to pluck it stooping, thus to me it said—
> 'Wherefore pluck me only to wither and to fade?'
> Up with its roots I dug it; I bore it as it grew,
> And in my garden-plot at home I planted it anew,
> All in a still and shady place beside my home so dear;
> And now it thanks me for my pains, and blossoms every year."

Here in little we have the gain of a garden—the wild flower placed there, and always to be seen, and in its season to meet us with its bright flowers. There is cheerfulness in a garden. How opposite this to the picture drawn by Goldsmith of the deserted garden, the garden gone back to a wilderness—

> "Near yonder copse, where once the garden smiled,
> And still where many a garden flower grows wild."

I love to see the wild reclaimed; but the once-civilised, as here described, to become again wild is sad indeed.

In that department of "our Journal" in which I personally take a small share with my pen, I may congratulate all exhibitors of poultry and Pigeons in the advance made by their fancy, evidenced by shows so attracting public attention that reports appear in the daily London papers of many shows, and which reports show some slight knowledge of the subject; which was not the case formerly, for no notice was taken of shows save in comic journals by way of ridicule, and the general writer knew not the difference of one variety from another. It is so no longer. These fancies have become general, and knowledge of them has become general too.

Novelists reflect very accurately the feelings and tastes of the generation in which they live. Fielding, by far the greatest writer of fiction in the last century (would that he had been a pure as well as a great writer), describes in one of the opening chapters of "Tom Jones," Prior Park House near Bath, the residence of Ralph Allen, who, under the *nom de plume* of Squire Allworthy, figures as an almost perfect English gentleman in its pages, yet mentions nothing about Allen's feathered pets; but we learn from Wood, the architect of Prior Park, that Allen instructed him to provide good accommodation for all his live stock, from his horses down, or rather up, to his Pigeons. "Within this superstructure," says Wood, after describing its architectural details, "the Pigeons are magnificently housed, and their particular cells are made with wrought freestone; so that if a beautiful habitation is really an allurement to this species of birds as some pretend, Mr. Allen's Pigeons will in all probability never desert their present place of abode. The tamer poultry," it is added, "are not less beautifully housed than the Pigeons." Of all this the novelist takes no notice whatever, although he accurately describes the house and park. Allen's Pigeons were also, evidently, only common birds kept for pies, not fancy Pigeons.

Now to show how the fancy has increased, we notice in modern days the lady who writes under the name of George Elliot, and is the greatest novelist living, makes a lady of rank say in "Middlemarch," one of her most recent works, "Take a pair of Tumblers for them. Little beauties! You must come and see them. You have no Tumblers among your Pigeons." And the good dame, a humble person, makes answer, "Well, madam, Fitchett shall go and see them after work. He's very hot on new sorts." The Pigeons meant were no doubt high-class Tumblers. Here the novelist exactly reflects the age, for turn to the catalogue of our Crystal Palace Show, you will find exhibitors of every rank from dukes and lords and ladies downwards.

I would wish in regard to poultry that utility should be more kept in view and more honoured in our schedules. Fancy is ruining some breeds of dogs; for instance, the fox terrier, who is actually not unfrequently no terrier at all, but a bastard-bred beagle. The judges demanding length of nose, and they have got it, but the earth-going terrier is gone, being no more a terrier than our show Dragoon is a Dragoon. The latter matters less, because a fancy Pigeon is not a bird of utility, though Pigeons should always be shown under their correct names, and a Horseman be called a Horseman. I hope, too, we shall not americanise our Game fowls by calling them "Games." Let our cousins do as they will across the water, let us keep to English names.

Lastly, I say, and say fully assured of its truth, that not only the subjects of our pages will give their admirers as much pleasure in the future year as the past, but this Journal will be in the future year, as in each past year, advancing in interest, position, and influence. It will go on as always calmly, steadily, and successfully, having

> "No fears to beat away, no strife to heal;
> The past unsighed for, and the future sure."

—Wiltshire Rector.

A NEW TYPE OF PELARGONIUM.

All horticulturists engaged with the cultivation of Pelargoniums, all amateurs of this beautiful genus, and especially those who are occupied in hybridising, know the hybrids of P. hederæfolium and zonale obtained in England by Wills and Peter Grieve by artificial fecundation. They know also that these hybrids seem to corroborate the theory of certain botanists, seeing that those that we know, and particularly Willsii, Willsii rosea, Emperor, and Dolly Varden are sterile; and that which is much more to be regretted is that they are superior to P. peltatum and lateripes by their great vigour and abundant blooming.

The horticultural world will therefore learn with pleasure that a plant of this strain, which produces an abundance of seed, has been found in the environs of Nice. According to a communication I have received it has been found in a bed planted with Pelargonium hederæfolium, having lilac white flowers, and P. zonale with red, white, rose, and buff. So far as I can judge by the branches and flowers which I have received it is a good hybrid between the two species, but tending by its habit more to hederæfolium than zonale, as it is decumbent. Nevertheless, the foliage is more in the way of zonale than that of the hybrids obtained in England: the flowers are red brilliant, and fifteen to twenty in a truss. The zonale has therefore exercised great influence in the fecundation.

Which is the plant which has produced the seed whence this remarkable and curious plant has come? We do not know, and perhaps never shall know.

This interesting plant is in the hands of M. Ch. Huber, florist, of Nice, who has propagated and will send it out next March under the name (an erroneous one I think) of Geranium pseudo-zonale; but the name matters little.

This is a plant that ought to attract the attention of all

those who are occupied with hybridisation, for who knows what may arise from this *species?* (No offence to certain botanists.) By judicious crossing a new section in the numerous family of Geraniaceæ may be created.

All amateurs know that with the old peltatums and lateripes the charming edgings round shrubberies, the hanging baskets of rooms, and the pillars of conservatories are decorated. I therefore advise all amateurs to make early application to M. Charles Huber, as the number he has propagated cannot be large.—Jean Sisley, *Lyons.*

SELECTION OF FRUITS AND VEGETABLES.

"What shall I do to be for ever known,
And make the ages yet to come my own?"

I will write an article on the selection of fruits and vegetables.

FRUITS.

Peaches.—I will begin with *old sorts:* Early York, Grosse Mignonne, Royal George, Violette Hâtive, Noblesse, Bellegarde, Frogmore Golden, Barrington. *New sorts:* Early Louise, Early Victoria, Early Alfred, Dr. Hogg, Early Ascot, Nectarine Peach, Princess of Wales, Lord Palmerston and Lady Palmerston. The next are under glass, late and very good—Albatross and Golden Eagle. The Early Ascot was raised by Mr. Standish, and all the other new ones were raised by Mr. Rivers.

Nectarines.—*Old sorts:* Downton, Elruge, Violette Hâtive. *New sorts:* Lord Napier, Rivers's Orange, Pine Apple, Rivers's White, Emmerton's White, commonly called the New White. I cannot leave these two classes of fruit without saying how much we owe to Mr. Rivers for prolonging the season.

Pears.—Beurré Bachelier, Beurré Clairgeau, Beurré d'Amanlis, Beurré Superfin (the best), Beurré Hardy, Beurré Diel, Williams's Bon Chrêtien, Conseiller de la Cour, Doyenné du Comice, Duchesse d'Angoulême, Louise Bonne, Gratioli, Josephine de Malines (one of the best), Marie Louise (ditto), Marie Louise d'Uccle, Thompson's. On trial, not yet proven—Souvenir du Congrès, Olivier de Serres, Pitmaston Duchess, General Todtleben, Madame Bonnefond, and Beurré de l'Assomption. Except Marie Louise they are all on the Quince stock.

Apples.—*Dessert:* Cox's Orange Pippin, Ribston Pippin (the two best), Kerry Pippin, Court of Wick, Blenheim Orange, King of the Pippins, Golden Pippin, Lord Burghley, Caraway Pippin (delicious), Boston Russet. *Culinary:* White Lion, Hawthornden, Blenheim Orange.

Cherries.—They are all on the Mahaleb stock. Early Lyons, Napoleon Bigarreau, Governor Wood, Empress Eugénie, Bedford Prolific, May Duke, Large Late Black Bigarreau. I have the Early Purple Guigne, but it requires glass.

Plums.—*Dessert:* De Montfort, Violette de Galopin, Green Gage, Transparent Gage. *Culinary:* Mitchelson's, Dove Bank, Belle de Septembre, Diamond.

Apricots.—Royal, Peach Apricot, St. Ambroise.

Figs.—White Marseilles, Brown Turkey, Early Violet. The first is the best. I have been obliged to give up Apricots and Figs, my gardens being too cold and exposed for them.

Grapes.—For a cold vinery.—Black Hamburgh, and the following delicious Frontignans—Early Smyrna, Primavis, Chasselas Musqué de Sillery, Early Golden, Early Auvergne, Early Silver.

Strawberries.—Black Prince, Duke of Edinburgh (Dr. Roden), handsome, well coloured, and fine flavour; Sir Joseph Paxton, Rivers's Eliza, Dr. Hogg, Mr. Radclyffe, Napoleon III. (Gloëde), not sufficiently known; Cockscomb, Wonderful, Galande, Red Alpine, Royal Hautbois.

Currants.—*Black:* Black Naples, Ogden's Black. *Red and White:* The old Red and White Dutch.

Raspberries.—Fillbasket, Red Antwerp, Fastolf.

Gooseberries.—Walnut Green, the best flavoured of all; Whitesmith, admirable; Red Warrington, a good finisher. For culinary purposes, Ironmonger.

I have many culinary Pears here, but I know only the names of two, and they are good—Catillac and Uvedale's St. Germain. Of this latter sort Mr. Bréhaut exhibited in London six Pears weighing 19 lbs. 14 ozs. One of them weighed 4 lbs. 4 ozs.

I do but little in vegetables.

Potatoes.—Royal Ashleaf, Veitch's Ashleaf, Yorkshire Hero, Lapstone, Taylor's Yorkshire Hybrid, and Bountiful (Fenn), a red kidney, rich and excellent. It is a good cropper, and it is the best-flavoured novelty that I have tasted for some years. *Potatoes for poor people.*—Early Rose, Gryffe Castle, and Red-skinned Flourball.

Cabbages.—Green's Early, Enfield Market.

Peas.—Ringleader, Veitch's Perfection, King of the Marrows.

Beetroot.—Henderson's Pine Apple.

Lettuces.—All the Year Round, or Sutton's Tom Thumb.

Celery.—Ivery's Pink Nonsuch, Veitch's Silver, and Sandringham.

Onions.—White Spanish.

Carrots.—The Long Horn.

Parsnips.—The Hollow-crowned.

Turnips.—Early Stone, not yet beaten.

The reader will not be disappointed if he selects out of the above lists.—W. F. Radclyffe, *Okeford Fitzpaine, Dorset.*

OUR BORDER FLOWERS—ACANTHUS.

Among our beautiful border flowers there is a family that appears to be quite neglected (or shall I say unknown?) to many of the cultivators of the present day. The family I allude to is the Acanthus. We have not many species; we have only five enumerated as hardy herbaceous, and I am not aware that we have a native of this family. Spain and Portugal are the places chiefly they inhabit.

They are plants of easy cultivation, and, when once established, last for a long time. They should have plenty of room. When crowded together they have no chance of developing themselves. I find them succeed best as single plants.

They require liberal treatment; a compost of good sound loam and leaf mould mixed with siftings of old lime rubble; a border broken up to the depth of 2 or 3 feet well incorporated with the above compost, and efficient drainage. They must be supplied with water when required, and they may have liquid manure water now and again when they are making their growth, for they are gross feeders. A sunny situation is desirable for their well doing.

When fully developed their beautiful holly-green spinous foliage renders them very attractive.

They may be increased by division, but that sometimes injures the plants, for, wounded by the operation, they sometimes rot off. I find the easiest way to increase them is by seed. The seed may be sown during the summer, the plants pricked out when large enough, and in the autumn or following spring they may be planted where they are to remain. When planted they should be made firm in their new situation. I prefer potting the young plants and plunging them in a cold pit or reserve ground, and planting as above. They are late-summer and autumn-blooming plants, from 2 to 3 feet high. They require staking to prevent the wind from twisting them about.

Acanthus mollis is, I believe, the commonest of the genus. A. spinosus is very desirable too, and the whole family are interesting. They are effective for centres of large beds, but more especially for shrubbery borders, and are all worthy of the cultivator's attention.

I have not seen them suffer from insects as some of our border plants do. The seeds may be obtained from most of our large seedsmen. We are told by some authors that the leaf of Acanthus mollis suggested the idea of Corinthian architecture; if so, it gave birth to the most beautiful.—Veritas.

MONT D'OR RUNNER BEAN.

The Bean referred to by Mr. Beater is, I presume, the Mont d'Or Butter Bean, which I have grown for the last twenty years. It is quite true what Mr. Beater says—when cooked it is only "a dirty yellowish green, neither yellow enough to look like marmalade, nor green enough to please the eye," but I have yet to learn that all our vegetables must necessarily be green, and that pleasure to the eye is preferable to pleasure to the palate. I can testify to the excellent flavour of the Butter Bean after many years' experience; and what is of much importance is, that unlike Dwarf French Beans and Scarlet Runners, it matters not how old the Butter Bean may be, it can be eaten pods and all, without stringiness and without parchment lining, the latter of which it does not possess.—P. B.

Mr. William Paul's Show of Roses in Pots, Pictorial Trees, Geraniums, &c., will this year be held in the Royal Botanic

Society's Gardens, Regent's Park, from the 3rd to the 10th May inclusive.

LILIES.

I PRETEND to not one atom of scientific knowledge on this beautiful tribe of plants. I could not allocate any new species to its true position in either the Isolirion or Eulirion group, but I do pretend to a great love for the whole family. From my very earliest floral days I have delighted in them, and it rejoices me now that they are once more coming to the front. Collectors are adding to our lists, or re-introducing species that have either gone out of cultivation or become scarce; and although exhibitors have not brought them forward liberally (and they are not easy plants to send any distance), yet we may rest assured that if the taste for their culture progresses, and some of our metropolitan growers take them in hand, we shall see them in greater numbers than we have hitherto done.

Amongst those who are busily engaged in adding to our stores are Mr. Bull of Chelsea, and The New Bulb and Seed Company (late Tentschel & Co.) of Colchester, while Lily sales at Stevens's are a regular feature of the season. In these sales Auratum still holds the prominent place, and is undoubtedly the most popular of the tribe, although personally I do not give it that position. Amongst the Lilies which have been lately introduced by the Colchester firm it may be well to mention Lilium dalmaticum, belonging to the Martagon group, a large quantity of it having been collected by Herr Max Leitchlin of Carlsruhe, and forwarded to them. It is of an intense deep purplish colour, and until the present time has been comparatively rare in our gardens; and L. neilgherricum, a fine plant of the longiflorum type, and gathered near Ootacamund, in the Neilgherries, at an elevation of about 8000 feet. It is, undoubtedly, for the form of its flowers, one of the very finest species of this widely distributed genus, and is well deserving of the notice of all lovers of the tribe. It was exhibited, I believe, some twelve years ago by the Messrs. Veitch, but has not been seen since. Mr. Bull has also a very scarce Lily from Santa Rosa Island (Bloomerianum oscellatum), of which I know nothing, but hope to make its acquaintance this season.

Lilium Humboldtii is a grand species. I was greatly charmed with a fine plant of it I had last year. There is something peculiar in the shade of orange yellow, it is very clear, and the claret-coloured spots add greatly to its beauty; it varies very much in the markings. Already we have maculatum and punctatum, and doubtless other varieties will be found. It is a robust-growing form, and bears from fifteen to twenty blooms. I dare not, in the presence of such a grower of Lilies as my friend Mr. Wilson, say anything of culture, in which he is a master, and I only give these few observations, as they are indications of the favour into which the tribe is coming.—D., *Deal.*

REMOVING THE OUTER BARK OF VINES.

I CAN endorse the opinion of your correspondent, Mr. J. Wright, respecting the peeling of Vines. I do not approve of the practice.

In my younger days, by the order of others, I have spent weeks in peeling and painting with the abominable admixture of sulphur, soft soap, clay, &c. At the time I remember, too, that I could not come near a fire without causing a most disagreeable odour to all present. I determined that, should it fall to my lot to have Vines in care, I would, if possible, dispense with that obnoxious practice.

It appears to me to be an unnatural process to strip off what was intended for a protection. A gentle rub with the hand is sufficient to remove the loose bark, and beyond that point I attempt not to go.

I have known Vine buds injured by the process of scraping, as it used to be termed. For more than twenty years I have dispensed with that practice.

Years ago I was asked for the best destroyer of red spider. "Do not have to deal with it," was the reply. But how to manage? inquired the man of sixty years of paring, painting, &c. By giving pure air, pure water, and a judicious use of the syringe, for I believe in syringing, and have a good soil for the roots, with careful attention to the same.

I remember when the first bunches of the far-famed Lady Downe's White and Black Seedling Grapes were cut from Vines growing in an outside border, the rods in a nursing Pine pit. The border outside was concreted, and had not a drop of water for three years. A gentle heat was kept up by fermenting material on the concrete during February, March, and April, and longer if found to be needed. The soil of the neighbourhood was of a strong retentive nature; being in close proximity to the river, on that account less water was wanted. I mention this circumstance that others may have an idea what is being done by others; we cannot all be guided by one and the same rule.—H.

BIRMINGHAM HORTICULTURAL EXHIBITIONS.

MR. QUILTER, proprietor of the Lower Grounds at Aston, has made a generous offer to some of the public institutions of Birmingham. Last year he began a series of horticultural exhibitions on a scale equalled only by those of the Royal Horticultural Society, and conducted with the same completeness as the Show of that Society held at Aston when Prince Arthur visited Birmingham. Mr. Quilter proposes to continue these exhibitions for the benefit of public institutions, in which he feels a strong interest. He proposes to take upon himself the whole cost and risk of the exhibitions, and then to share the profits with the selected institutions, after the expenses are paid. The exhibition of this year will be for the benefit of the Birmingham Institute, that next year for the Sanatorium, that of 1877 for the School of Art—leave being reserved for the Queen's Hospital to take 1878; or otherwise, if the movement proves successful, the rotation above mentioned will be repeated. In return for his offer Mr. Quilter stipulates for the formation of a General Committee from the Committees of the institutions named, with the addition of other gentlemen who may be disposed to assist. We do not believe in the possibility of failure if the scheme is properly supported. There is a growing demand for horticultural exhibitions on a really important scale, the Lower Grounds afford unusual opportunities for holding them, Mr. Quilter himself has acquired great experience in their management, and with these advantages, combined with hearty work on the part of the Committee, there is no reason why a large profit should not be realised for the institutions which have consented to accept Mr. Quilter's proposal. That the proposal itself is very generous requires no proof; and we hope the public will by liberal support enable Mr. Quilter to realise his liberal design. The first exhibition will be held on Thursday, July 1st, and on the following Friday, Saturday, and Monday for the benefit of the Midland Institute Building fund; and the details of the arrangement will be shortly announced.

COLLETIA HORRIDA.

I WAS much pleased with the article in your Journal (page 562) relative to Colletia cruciata, as I am quite sure the Colletias are not half so widely known or cultivated as they should be.

It may be interesting to your correspondent Mr. Robson and others to know that C. horrida, when well established, flowers much more profusely than cruciata; and as it also flowers much earlier in the season than that species, it is less liable to be injured by frost. Besides, it has time to mature its seeds, which it does here by thousands in favourable seasons like that just past.

On referring to London's "Encyclopædia of Trees and Shrubs," the berry is there described as whitish; here the seed vessel is three-celled with small black seeds, seedlings from which come up in a few days if sown in pots and placed in a little bottom heat. Cuttings of C. cruciata strike readily in a little sandy loam and peat, and placed on a little bottom heat; but I have failed in striking C. horrida under the same circumstances.

Many trade plant catalogues mention four varieties of this curious plant—Bictonensis, cruciata, horrida, and ferox. In justice to the public who may be desirous of getting these plants, these names should be reduced to two—viz., C. cruciata and C. horrida, as the first and second named are undoubtedly the same, and the difference of the third and fourth, if any, is so little that it is not worth retaining the two names. There is a large bush of cruciata here about 30 feet in circumference and 8 feet high, and also one large bush of horrida about the same dimensions.

The Colletias are not particular as to situation, but no doubt would prefer a dry one, although we have some growing remarkably well in swampy places, and where they have been deluged for days with sea water uninjured.—W. Osborne, *Co. Cork.*

VINE GRAFTING.

The following facts may be interesting to Mr. Grieve. I inarched a Muscadine on a Madresfield Court, the former being in a pot, the latter in a large tub. I am not referring to an experiment I related in this Journal some few months back—*i.e.*, "the causing of oval Grapes to become spherical." After two years I cut away the Muscadine. The year after the Madresfield Court produced spherical berries, and although very sweet and luscious, there was no Muscat flavour. I am now trying an experiment with the Muscadine which was cut away. The Madresfield Court graft has grown a long rod. The Muscadine has thrown-up a rod below this graft. I have now inarched these two rods. It will be interesting to watch what Nature will now do.

The Golden Champion grafted on the Black Hamburgh has done remarkably well with me this year; the berries and bunches very fine, and no spot. I had intended cutting this Grape down, but Lord Calthorpe, who has also been very successful with it, advised me not to do so. A Black Alicante grafted on this Grape has for two years borne berries and bunches precisely the same as when on its own roots.—Observer.

MESEMBRYANTHEMUM CORDIFOLIUM VARIEGATUM.

I have found this to do well under the following treatment:—In the autumn I take as many 6-inch pots as may be required, fill them nearly half full of drainage, covering the drainage with charcoal, and the charcoal with moss. Then, putting a little sandy soil in the pots, and 1 or 1½ inch of fine river sand, I plant the cuttings round the edges of the pots, and a few in the middle; after a good watering, I set them in a cool vinery, partly shaded, kept moderately dry. They root soon and do well, and, potted-off early, they afford plenty of cuttings in the spring. They should be kept free from drip and damp, for both are fatal to their well-doing.—H.

ANTS AND IXORAS.

Permit me to express a doubt as to the ants having attacked and barked the Ixoras of "S. J. A." May he not be mistaken? This morning I was in one of my stoves, and having just read "S. J. A.'s" letter, I watched with some curiosity some ants upon a young Ixora. In the fork of one branch I saw a small mealy bug and a scale close together. I killed them both, but left them there to see whether the ants would touch them. I was not kept long waiting. One of them raised the dead bug, and carried it off down the plant on to the soil of the pot, and then disappeared, I assumed, to its nest. Another ant grasped the scale several times, but ultimately left it, from which I concluded that its flavour did not meet with approval.

Now in the same house I have several fine specimen Ixoras, on which I often notice ants creeping, but no damage is done to the bark, or indeed of any kind; though I am bound to add the ants are not numerous. The woodlice, I suspect, are your correspondent's foes.

The Rev. J. G. Wood, in his "Illustrated Natural History," says that ants are easily destroyed by pouring boiling water or naptha into their tunnels. I need hardly warn your correspondent to be careful how he applies this remedy to a plant in a pot.—T. M. Shuttleworth, F.R.H.S."

CUCUMBERS.

Recent articles on Cucumbers have been very interesting, but they do not explain why I have not been successful with a temperature under 60°. I have always found them thrive better over than under that temperature. For the last three years I have had great trouble with what I suppose is the ambury. They grow and flourish very well for about three months, when by degrees the roots all get knotted, the foliage cannot stand any sun, and the plants soon wither away and ultimately die.

My Cucumber bed is tank-heated, and covered with ridge tiles, over which are laid slabs. The drainage is good. I have tried all kinds of soils—turfy loam, loam and peat, brick earth, leaf mould, and rotten dung, with and without the addition of lime, soot, and charred material. The soil I have had from different places on the estate five miles apart. I have had the house washed with clean water, and all kinds of nostrums mixed with the whitewash, but all seem to suit the disease much better than some of them have the plants.

I usually grow Telegraph, and have bought seeds from long distances, and likewise obtained them from friends, to see if a change would do any good. I usually have grown two crops in a year, and used never to be without a Cucumber, but this year my winter crop went off sooner than ever. If anyone can give me advice I shall be very pleased.

We ought to chronicle our failures as well as our successes, and for the present this is my failure. I may mention that club-root is not at all prevalent here in the garden.—John Platt, *Norfolk.*

[We sent the specimens of the roots which you enclosed to a well-known naturalist, and the following are his notes:—"They are a diseased condition of the cellular tissue, caused by the presence of minute worm-like infusoria called vibrios, creatures common in decomposing infusions, &c. We have carefully examined your roots with the microscope, and the vibrios as originally described by the Rev. M. J. Berkeley are present in abundance from the egg state upwards. The correctness of Mr. Berkeley's observations has been questioned, but we are fully able to confirm their positive accuracy, borne out not only in this instance, but on former examinations of these singular nodosities on Cucumber roots. It is much easier to examine and describe a disease than effect its cure. The recommendation generally is to utterly destroy all the diseased roots and the surrounding soil.—W. G. S."]

SOME OF THE VEGETABLE PRODUCTS OF CEYLON.—No. 6.

Gamboge of excellent quality has been produced, and has been pronounced by competent authorities equal to the finest (Pipe) Gamboge of Siam. The tree from which it is produced in Ceylon is called the Gokotòo Gamboge. Dr. Christian of Edinburgh wrote to General Walker (at that time Deputy Adjutant-General in Ceylon), to the effect that the Ceylon Gamboge might be made to compete in the European markets with the finest qualities from Siam if more care be taken in collecting it and making it up.

The Ficus elastica, or the Indianrubber Tree, grows luxuriantly throughout the central province. It is propagated by cuttings. The juice is collected from incisions made in the tree, and is placed in an earthen glazed vessel some time; water is then added to it, and both are allowed to remain for forty-eight hours. The latter is then drawn off, and a small quantity of arrack (about one-sixth), is added, and the vessel is well corked and covered over with canvas painted with the juice as it exuded from the tree. The extension of the cultivation of this valuable tree in Ceylon, it would appear, would be highly desirable, and Dr. Thwaites is instituting experiments with the Assam caoutchouc-producing tree.

The Palma Christi is found over the greater portion of Ceylon. Mons. Bois, a French chemist, has made some important discoveries in Algiers, and has found that a piece of ground there will yield three times as much oil* as olive oil, and twice as much as palm oil. By distilling castor oil upon concentrated potash the sebacic and caprylic alcohol are extracted as separate products, which may be turned to good account. Sebacic acid can be employed in the manufacture of candles,† and caprylic alcohol can be used in illumination and in the composition of varnishes.

Dr. Thwaites reports that the printing for distribution of some simple instructions for the planting of this valuable plant and the preparation of the seeds for the market has had an excellent effect. He further reports that amongst both European and native gentlemen possessing land at low eleva-

* There are numerous other valuable vegetable oils in Ceylon.

† If the Tallow Tree of China (the Stellingia sebifera), which forms a very large trade in the southern parts of China, were introduced into Ceylon, it might probably prove of great importance to the colony. At Shanghai a large sum is realised annually by the cultivators. For burning the tallow is excellent; it gives a clear, bright, and inodorous flame, and is without smoke. The timber is white and close-grained, and well fitted for printing-blocks. The leaves, too, are valuable as a dye. The tree is raised from seed, and grows with great rapidity. Its properties as a lubricator for railway machinery have been tested, I have not learned with what success.

tions a disposition is being shown to take up Chocolate cultivation. All the seeds produced this last season from the chocolate trees growing in the Péradeniya garden have either been disposed of to purchasers, or plants have been raised from them for increasing our own plantations. There is so little difficulty attending the cultivation after the young plants are once established, and the fruit would soon be found to furnish so agreeable a beverage to the native cultivator himself, that it may be fully expected that in a few years this plant will in very many of the Cingalese village gardens take the place of Coffee—that is, in situations too low for the healthy growth of the latter.

Fodder Grass.—Dr. Thwaites mentions that he is distributing the seeds of the Paspalum conjugatum, which is likely to prove valuable feeding for horses and cattle.

I think I have now touched upon all the principal vegetable productions of Ceylon. The colony has been singularly fortunate in having had a succession of able governors, an energetic body of planters, ever prepared with their brains and money to develope its productions, and last, but by no means least, has had the inestimable advantage of a free press, without which the prosperity of a colony cannot, in my humble judgment, be legitimately insured.—E. Rawdon Power, F.R.G.S., *Ceylon Civil Service (Retired), Tenby, South Wales.*

POINSETTIA PULCHERRIMA FOR TABLE DECORATION.

Plants for the purpose of table decoration, like many other things, must not be presented too often, or they lose their power of pleasing, and, of course, of giving satisfaction. Now, where two or three plants are required each evening, it becomes a matter of much importance to the gardener to have always on hand a good variety in a presentable condition for this purpose. With this object in mind it has occurred to me that a few remarks on this subject would not be unacceptable to many of those gardeners who have to keep up a constant supply of such plants.

I would put in a special plea for a plant which is seldom seen on the table, I mean the Poinsettia pulcherrima, which, when carefully and judiciously trained, is one of our finest and most attractive plants for table decoration. The following method has been practised here for some time, and the result has always given entire satisfaction to all concerned:—When the wood is sufficiently ripe select the required quantity of the best pieces, cut them into lengths of about 2 inches, stick them into thumb pots filled with loam, leaf mould, and silver sand, one part of each; water well through a fine rose. Plunge the pots into a gentle bottom heat, where they soon strike root and burst into leaf: not more than two shoots are allowed to grow on one plant; if more be allowed they cannot, of course, be expected to mature such fine heads. When well rooted turn them out of the cutting pots, shaking off a little of the soil: select three of equal growth, and place them in a triangular form in a pot sufficiently large to contain the three balls comfortably. The compost used is made up of fibry turf, leaf mould, sand, and sheep manure. The pots are then returned to their old quarters and shaded for a few days, where they remain until another shift is necessary, when they are finally moved into 8-inch pots—this being a convenient size for the vases generally used. Towards the latter end of May is a good time to give the last shift. They are then placed in a cool frame, and a little balloon-shaped trellis about 14 inches high and the same in diameter is placed on each pot; the shoots are then carefully trained on the trellis. The shoots should not be allowed to grow more than 3 inches without being tied, otherwise they are apt to crack and bleed, to the great injury of the plant. The only further care required is a liberal supply of liquid manure.

About the latter end of September they are taken into the stove, where they develope their great scarlet heads, each measuring from 10 to 14 inches across. Six of these flowers, along with the rich green foliage of the plant—none of the trellis being discernible without close scrutiny — make a magnificent show on a table, with one of those noble-looking Ferns, Adiantum farleyense, placed at a distance on each side. —R. C. (from *The Gardener*).

Larks Garden-marauding.—During the late sharp weather the larks have attacked the Broccolis and spring Cabbages with a severity I have never before witnessed. Sprouting Broccoli have been literally stripped, and a bed of some seven thousand promising spring Cabbages have been nearly or quite spoiled. I hope other parts of the country have not suffered in like manner from the ravages of these birds. — J. A., *Netley, Hants.*

FLOWERS FOR OUR BORDERS.—No. 46.

FUNKIA ALBO-MARGINATA.—White-edged-leaved Funkia.

The genus Funkia, separated from Hemerocallis by Sprengel, comprises four species and several varieties, all of which are well deserving of cultivation, especially those forms possessing variegated foliage, of which Japan, the country *par excellence* of variegated plants, has furnished us with a notable contingent.

Fig. 1.—Funkia lancifolia albo-marginata.

Of these the variety here illustrated may be taken as a type, though not perhaps the most striking one. We preserve the name under which it was originally published, but it has been reduced by Mr. J. G. Baker, a very competent authority, to the rank of a variety of F. lancifolia; and the various handsome forms of the so-called F. undulata, so valuable for decorative purposes, are also regarded as mere varieties of the lancifolia.

The Funkia albo-marginata is a hardy herbaceous perennial, producing numerous radical lance-shaped leaves in a tuft; each leaf is from 2½ to4 inches long, with a channelled petiole of about the same length; while young, the margin is slightly tinged with yellow, but it ultimately becomes pure white, increasing considerably the attractions of the plant. The scape, or flower stem, is about 18 inches high, and bears from ten to fifteen blossoms of a pale violet blue, and about 2 inches in length, including the short peduncle. Each blossom arises from a pointed bract one-third longer than the peduncle. Although the bracts are arranged spirally round the stem, the flowers face only in one direction; whilst in bud the flower is inflated in its upper half, and when expanded displays six spreading lobes. Both stamens and style are what is termed declinate—that is, instead of occupying the centre of the flower as in most plants, they all incline to one side, which in this case is the lower one; whilst in bud they are quite straight, but after expansion the extremities both of stamens and style curve inwards, as in the Alstrœmerias. It blooms in August, continuing in flower three or four weeks, several spikes being produced in succession. It grows freely in ordinary garden soil, and is quite hardy. In most seasons it ripens plenty of seed,

from which it may be increased; but the readiest method of propagating it, is by dividing the roots in October.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

PLANT-GROWING—SIZE OF POTS.

Growing plants in pots to a state of the highest possible perfection, requires an amount of attention and care which is not requisite to the same degree for any other of the duties devolving on the gardener. Where high-class plant-growing is attempted, an uninterrupted watchfulness is necessary as regards watering, shifting into other pots, and exterminating, or, better still, preventing, of infesting insects; and even with these indispensable wants fulfilled to the letter, such seemingly unimportant items as feeding, pinching, tying and staking, position of plants whilst growing, and such like, may render entirely null all the previous care and work spent upon them. That some members of the profession have a natural aptitude for plant-growing there is no reason to doubt; at the same time, it is an aptitude that may be acquired by a patient study of the habits and observance of the treatment most suitable for the different subjects coming under the plant-grower's care. This aptitude for plant-growing, which is synonymous with a knowledge of the wants of plants when confined at root to the limits of the flower pot, applies to all the varied genera cultivated in pots, whether these be soft or hard-wooded, fruits or flowers. The idea that, compared with others, some classes of plants are more easily grown, such as Chrysanthemums or Cinerarias, as compared with hardwooded Heaths, Leschenaultias, or such-like, is to some extent correct, but to a great degree erroneous and misleading. The Chrysanthemum anybody can grow, or get to exist, as it happens in too many cases, but it is not everyone who can "do" it to perfection; and though the amount of skill and care required to grow it well is not such as an Erica requires, yet, to a great extent, it differs only in degree. The slightest knowledge of plants will enable anyone to flower the Hyacinth; but it requires something more to extract all the flower possible out of the bulb. Again, Orchids will exist under the worst treatment; but comparativelyf ew understand them thoroughly. To turn to fruits—Strawberries, Grapes, Peaches, Pines may be grown in pots by the merest tyro; but the best results are only attainable by those conversant with these subjects. So we might go on to enumerate examples *ad infinitum;* but enough. It will be more profitable to call attention to a few general principles applicable to plant-growing in pots, and without which satisfactory results are very doubtful, if not impracticable. One of the main principles of successful plant-growing centres in the size of pot, for by far the great majority of plants do best in comparatively small pots. It is quite possible, for example, to cram sufficient soil into a pot not exceeding 8½ inches in diameter at the widest part, by 8 in depth, to grow many soft-wooded plants to the greatest possible perfection. Last summer we saw some specimens of Show Pelargoniums perfect in every respect, and from 2½ to upwards of 3 feet through, with the roots confined in 6 and 7-inch pots: it requires one to be no novice who can attain to results like these. At this time we wish to draw attention more particularly to growing pot plants for home use without trenching on those for exhibition, and would respectfully ask those who have been used to giving liberal shifts to small plants to treat them to less in quantity, though the quality may be more looked to; but even if the quality of the potting material may be poor, it is better to feed when the pots are getting filled with roots than to give them such a quantity of soil as they never appropriate.

Commonly-grown plants, which do better in small pots than large ones, are Primula sinensis, P. amœna (Sieboldii), P. japonica, P. denticulata; all the species of the Pelargoniums, Show, Fancy, Zonal, Double or Variegated; Cinerarias, Pompon Chrysanthemums, Petunias, Phloxes, Carnations, Picotees, Pinks, Cyclamens, double Wallflowers, Salvias, Stocks, Mignonette, Bouvardias, Calceolarias, Hyacinths. Of plants requiring a stove temperature (such as Aphelandras), Euphorbia jacquiniæflora, Justicias, Eranthemum pulchellum, Poinsettias, Thyrsacanthus rutilans, Clerodendron fallax, may be all grown into nice serviceable plants in 6 and 7-inch pots. Amongst hard-wooded plants, Ericas of the Hyemalis type, melanthera, hybrida, Epacrises, Azaleas, Cytisus racemosus; Acacias, such as grandis, armata, and Drummondii, make nice plants when properly treated in these sized pots. Orchids, Tillandsias, and plants of this class, and Nepenthes, should always have small pots or baskets for the size of the plants.

But there are plants which require liberal treatment at root as regards size of pot, in order to attain perfection in their cultivation. Plants of this class are Lapageria rosea and L. alba, Bougainvillea glabra, Clerodendrons, Allamandas, and climbing plants generally. Ferns, such as Gymnogrammas, Adiantums of the trapeziform type, Davallia Mooreana and pentaphylla—Tree Ferns. Many stove foliage plants, as Dracænas, Crotons, but more especially Alocasias, Marantas, Anthurium Scherzerianum, and others of this genus. Palms also, though they do well, many of them, in comparatively small pots if well fed, are very fond of liberal shifts. Fuchsias are fond of a large pot to the size of plant, though it is quite possible to grow neat plants in small pots. With regard to fruit culture in pots, as good results are obtainable with small pots as with large ones. Strawberries grown in 7-inch pots will be no better than those grown in 6-inch, and for early work 5-inch pots. In the case of the Pine Apple, it has been demonstrated in many instances that as good fruit may be grown in pots 10 and 12 inches in diameter as in those of 14 or 16 inches. With pot-Vines, 10-inch pots are found as useful as those 3 or 4 inches wider; and it is doubtful whether the many failures in growing Peaches in pots may not be attributable to growing them in those of too large size.

These are merely hints thrown out to be appropriated by those who see anything worth noting in them. There are, of course, many things omitted which may be filled up in practice, as in the case of plants like the Dracæna and Croton, which, in some of their sorts, are indispensable grown in small pots for decorative purposes; but for these plants, as they increase in size the liberal treatment here recommended must be resorted to. For the great majority of cultivated pot-plants a restricted space at root is one of the first conditions necessary to their successful cultivation. It seems scarcely necessary, so often has it been insisted on, to say that all plants lifted from flower bed or border, to be wintered in pots, should absolutely have their roots crammed into as small pots as possible. Space will not at this time permit a glance at any other of the essentials to be observed in plant-growing.—R. P. B. (from *The Gardener*).

MR. CHARLES NORVAL THOMPSON.

Amongst those who administer to the necessities of the horticultural world are men of very differing stamp—some who are well known to fame either by their practical efforts in advancing the culture of the many objects that interest, or by their pens wielded on its behalf; while there are some who unobtrusively do their work and, save a few persons, no one knows of the value of their labours. One of the latter class is the subject of this brief notice, one to whom the readers of the Journal are more indebted than they are aware of, for to his careful and painstaking labours they owe those reports of our metropolitan shows which have certainly not been exceeded by any gardening journal published. More, perhaps, than anyone, save the Editors themselves, I have been thrown into contact with him, and have ever admired the quiet, modest, and thorough way in which he did his work. His attainments were of no ordinary character, and he knew a great deal more than more pretentious men; but he never obtruded his knowledge; it was only by conversing with him that it came out.

He has died young, and, like many others, had not time to make provision for his young family. He had, I believe, insured his life for a small sum, but beyond that he left nothing. Am I wrong in supposing that there are many readers of the Journal who would be willing to aid in anything that might be suggested on his behalf? An effort must be made to get some of his children into an orphanage, and this cannot be done without money, as I know from experience; and if the Editors would consent to receive subscriptions I feel sure something could be done, and it would be to me a melancholy pleasure to aid it in my small way. He was a Christian man, and therefore he has still stronger claims on many of us.—D., *Deal.*

[We have now before us the testimonials of our horticultural contemporaries, and of one who well observed him, to the worthiness of our late sub-editor. Not one word in those testimonials is an exaggeration. Mr. Thompson was a well-educated man, quiet, unobtrusive, indefatigable, and ever mindful of the interests of this Journal. We have lost by his death a staunch friend and able assistant. Mr. Thompson came of a family of gardeners who held the highest positions in their day. His maternal grandfather, Mr. Norval, was long gardener at Raith, in Fifeshire; his paternal granduncle was

gardener to Mr. Skene, of Skene, in Aberdeenshire; and his father was the well-known and much respected pomologist, Mr. Robert Thompson, who superintended for so many years the fruit department of the Royal Horticultural Society at Chiswick. He died on the 23rd December last, aged forty.—THE EDITORS.]

NOTES ON VILLA AND SUBURBAN GARDENING.

A SUDDEN, and to all appearance a general, thaw having set in with the glass standing high, giving a promise of open weather for a time, and as operations have been suspended for a time through the snow, which has pretty well all disappeared, this opportunity must be taken to proceed with all work yet unfinished, such as pruning and nailing, not only fruit trees but also plants growing on walls and houses for ornament. I allude to such things as Jasminum nudiflorum, Lonicera or Honeysuckle, Magnolias, Clematis, Chimonanthus fragrans, Bignonias, Virginian Creepers, Corchorus japonicus, and the Pyrus japonica, and several sorts of Roses. All the above are deciduous, and are commonly met with and used for adorning walls or houses in the suburbs of towns and elsewhere. The principal idea to bear in mind in pruning is to extend the medium-sized and well-ripened shoots over the space to be covered, but not lay them in at their full length, or unless they are exceedingly vigorous and the shoots not numerous, the eyes will only break into growth here and there, leaving blank places to be filled-up on a future time, which is not the most satisfactory. Prune the shoots back to half their length, or what is better, is to be guided by their strength, leaving the strong well-ripened wood longer than that of the weak. This will induce the one to break strong and the other weaker, so as to bring an equal balancing of the growth throughout the tree. As I say, see to this first, and then turn to the thinning of wood in the thickest places. This operation is not needed every year, but it is well known that where such things grow fast they are liable to become matted, or so much entangled in their shoots here and there as to make them look remarkably unsightly, especially as by allowing this freedom of rambling they become thick as a bush at one place, and the other parts of the plants are comparatively bare. This shows a want of attention and bad management. In thinning-out the shoots in the thick places they should be cut entirely out and not spurred, or there is a chance of their becoming thicker still; but in the thin places where more wood is needed the shoots should be spurred. They then break into growth, and in time the plant is well and evenly furnished with medium-sized shoots, which enhances its appearance very much. The Bignonia radicans, being a coarse-growing plant, and producing its clusters of bloom at the extremity of the current year's growth, must be spurred-in all over except where shoots are wanted, and then they ought to be shortened. Then there is the Jasminum nudiflorum in flower at this time, therefore the pruning or thinning must be deferred. There are several others which produce numerous fine shoots, such as the Chimonanthus, Elæagnus, and Virginan Creepers, which it is necessary to leave, not only for the flowers but for the principal object of clothing the wall more effectually. The decidnous kinds of Magnolias too, which throw out such beautiful large flowers, are also generally vigorous growers; but at this time of the year the flower buds may be seen at the extremity of the shoot, so that in pruning this will be an advantage.

We now come to a few plants that are evergreen, such as Cratægus pyracantha, Jasminum officinale or the white Jasmine, Elæagnus, Escallonia macrantha, Ceanothus of sorts, and the many different and very pretty sorts of Ivy, as well as Cotoneasters Simondsii and microphylla, and the Banksian Roses, and several other plants of similar habits, where the system of pruning should be to extend if necessary and thin out, always bearing in mind that a proper qualification is to have them neat and evenly grown over the whole tree. With regard to Ivy, more especially the coarse-leaved green sorts that have established themselves, a very proper plan is to let them alone till the beginning of April, and then clip the whole of the leaves and shoots off close to the wall with a pair of shears. The plants, no doubt, will look bare for a week or two till they break into growth again; after that, the benefit of this close cropping will be seen, as it will result in producing a very neat closely-grown plant of no mean ornament. Most of the variegated kinds are too delicate in growth, and it will be some time, if ever it does come, for them to be subjected to this manner of treatment. No matter what plant is grown against a house, it should be neatly trimmed, instead of being allowed to ramble at will, of course having due regard to its habits of growth; and as to the time of pruning, I prefer and feel safe if it is done on the first opportunity after the new year comes in, but no pruning whatever should be done in hard frosty weather.

I may also say that whatever planting remains unfinished, get it done as soon as the soil is fit to work upon. It often happens that matters of planting come to a push in the spring, especially in the suburbs of a town, where it arises through the unfinished state of the many residences yearly built in such neighbourhoods, but every preparation should be made, so that the work may done as well and expeditiously as possible. At such times when there is always a certain risk to run through its being late in the season, the work had better be passed off till autumn than to do it in anything but a proper manner. Late planting might be more practised than it is if there was a security that the plants would receive the treatment they require, particularly in the matter of watering, which I hold to be the principal recovering agent if applied frequently and plentifully; but where there is not the means or convenience for this being attended to, and the other wants of the plants looked after, it would be much better and a saving of time and money, as well as after-satisfaction to those concerned, if the planting on such places as I have stated were put off till a more seasonable time.—THOMAS RECORD.

ARCHERFIELD.—No. 1.

THE SEAT OF THE RIGHT HON. R. A NISBET HAMILTON.

MY northern visit was a flying one. After rattling away in the wee small hours of the morning I found myself over the border at Berwick-on-Tweed at 5 A.M. on a smart, chill, September dawn. Dirty, drowsy, shivering, and perhaps just a trifle testy, I was not in the best condition to appreciate the beauties of the land of poetry and chivalry. Beauties have I said? Drop down as I did, and ask for a waiting room, and be told in what was to me grim wit, "No waiting room open, but plenty of room for waiting," with a gentle reminder, which was hardly necessary, of "Hech, man, ye're no i' England the noo," and appreciate beauty if you can. Yet under the corduroy was a kindly feeling, and I was given the post of honour on a greasy bench, by a cosy fire, in a grimy but warm porters' cabin. In an hour was a train for Drem, the junction for Dirleton two miles from Drem, and from Dirleton station it is about two miles by road to Archerfield. A coast run of two to three hours, with a bright sun and brisk sea breeze, with walls of rugged rocks, hills, and fertile vales alternating, worked a steady improvement, and I began to think there might be something worth seeing in Scotland after all. In the distance, leaving Dirleton station, was a towering pile surmounted by a fluttering flag; and in answer to a passer-by, "Is that Archerfield?" was favoured with, "Archerfield, man! That's Dirleton Castle. Ye mun gang awa across the green, and ye'll ken the gate where braw folk enter, an that'll tak ye to Archerfield." And sure enough it did.

At the gate of the "braw folk" is a neat lodge with a garden of shrubs and cheery with flowers, the first little foretaste of the treat to follow. Through an undulated park the broad drive sweeps, and the cleanliness and perfect order of this approach shadows forth the high keeping of the entire homesurroundings. The situation is both charming and salubrious. On the left is rising ground lightly wooded, through which the distant hills peep and where the village nestles. On the right is a steady, clean, and almost unbroken yet partially wooded slope to the sea, distant about two miles, which is the boundary to Mr. Hamilton's demesne, and where he has a marine villa. Straight ahead is a more heavily timbered site, and within the skirts of these fine old trees is the spacious mansion of Archerfield. The edifice is plain and substantial, and savours of what it is—the quiet comfortable home of a Scottish laird with a predilection for rural pursuits and unobtrusive retirement, rather than an ornate structure of a newly-made millionaire, who would attract by the magnet points of architecture of a highly embellished exterior.

As there is nothing further to note here we will go to the garden. This is distant from the house about half a mile through a straight avenue of fine trees. But there are two distinct gardens a mile apart, and each a long stretch from, and quite out of view of, the residence. It may be here mentioned that a characteristic of many places in Scotland is the separation of the garden from the mansion, and it is quite common to find gardening of the very first order, yet unassociated with mere scenic effect, and as a consequence the pencil of the artist, which is in some places so potent, can be of no real use to the pen of the litterateur in his duties of description. Of this type is Archerfield. There is no such thing as getting an attractive and ornamental view of grounds and residence, and no chance indeed of doing justice to the best separated examples of gardening by a colourless impression. Yet gardening is good, and has been good for a long time. In flower gardening Archerfield is almost a household word. It is the scene of the best accomplishments of that accomplished

master of the art, Mr. D. Thomson. It is perhaps the main practice ground from which was evolved the matter of that excellent book of modest title—a work which all should read—the "Handy Book of the Flower Garden." Gardening here was assuredly good then, and it is assuredly good now. The mantle of Mr. Thomson has evidently fallen on an able successor in Mr. Kettles, the present superintendent. Let us look at his work. We are in the Archerfield, or kitchen and glass garden, in contradistinction to the Dirlston enclosure. But even the kitchen garden at this place would make many a flower garden blush for its fame and envious of the effect created by its borders. On entering this walled garden in the centre of the south walk one must perforce stand still. With the telling ribbon borders in the direct line of vision, and a sea of flowers to the right hand and to the left, and a fine range of glass behind, the strange visitor if alone is compelled to halt between two or three opinions: he is, as it were, spell-bound by an overpowering sense of flowers, and knows not which way to turn for the best. It is not so much the arrangement or mere quantity that is so striking as the surprise in entering what is expected to be (and in fact is) a garden of vegetables, and see nothing but flowers. Yet the area of colour and its order of disposition is not to be passed by without a note of examination. The extent of the ribbon borders is about 120 yards, and are in their finish perfect. Their tone is quiet, chaste, and pleasing rather than brilliant and gorgeous. Beginning at the margin of the walk, the lines are planted as follows:—1, Cerastium; 2, Dwarf Ageratum; 3, Dactylis; 4, Iresine Lindeni; 5, Silver-foliaged Pelargonium; 6, Purple Lothian Stocks; 7, Scarlet Gladioli, bounded by closely pinched and planted pyramid Pears, and beyond these rows of Sweet Peas and Scarlet Runners as a divisional fence between the flower borders and general vegetable ground. I am sure Mr. Luckhurst, who so worthily advocates quiet and repose in floral arrangement, would have appreciated these borders, as that is their prevailing tone, with just sufficient streaks of colour to prevent him being hushed to a point just beyond repose—sweet sleep. But no fear of that, or here is an awakening.

Running parallel with the south walk is a close and rather tall fence of espalier Pears. Between these and the walk is a border, with a rather sharp slope, about 6 yards wide and 150 yards long. This border is in three divisions; it is a mass of colour, planted as follows:—Take an end division; the back row next to the hedge of Pears is Tritoma, next maroon and white dwarf Dahlias, then a strong silver Pelargonium. Fronting these rows is a mass, 5 feet wide, of Waltham Seedling Pelargonium, dotted down the centre at intervals of 5 yards with large plants of Centaurea ragusina. In front of this mass again is a line of Dactylis, another of dwarf Ageratum, finishing next the walk with a row of Lobelia and Polemonium in alternation. That is a fine and telling border, the 150 feet by 5 of Waltham Seedling showing to great advantage. For a mass like this it is a question if a better Pelargonium could be found, its free, bold, upstanding trusses and good colour marking it as still one of the best for large masses.

The other end division of the border is similarly planted, except as to the Pelargonium, where Excellent is substituted for Waltham Seedling, and with a less telling effect. The central division of the border is differently planted. It is more quiet, and certainly more beautiful than the ends. In front of the Dahlias at the back is a fine row of yellow Calceolaria, the row next following being of Dell's Crimson Beet. Now comes the 5-feet mass, which is a mixture of Beaton's Silver Nosegay Pelargonium and Purple King Verbena, both in perfect trim as to growth and bloom; the flatness of the mass being relieved by graceful specimens of Yucca oleifolia variegata plunged at wide intervals along the centre. In the front of this fine mixture is a row of Iresine Lindeni, followed by Christine Pelargonium, Cineraria maritima, broad row of Crimson King Verbena, with a margin of Cerastium.

This centre border is, if I recollect rightly, wider than the ends, but taking the whole expanse of bloom from end to end of the three divisions the just balance of high colours with neutral tints, the lines relieved by masses, and the flatness broken by the distinct Yuccas, and the picture disarms criticism by its powerful appeal to one's whole capacity of admiration. There is nothing complex, intricate, or dainty about it. It is just grand in its light yet massive, simplicity—in a word, it is worthy of Archerfield, and with this remark I leave it. On the opposite side of the walk are the Vine and Peach borders, but they are narrow—only 3 or 4 feet wide. These are also planted with flowers, principally with Tricolor and Bicolor Pelargoniums in variety, relieved by fine plunged standard plants of Solanums laden with fruit, eventually to be attractive objects for winter indoor decoration. Such is the south and principal walk of the kitchen garden of Archerfield. It surely savours little of culinary produce. For this we must go behind the scenes—the espaliers and bush fruit trees which line the walks. Here we find just as much attention given as to floral matters. A few varieties of vegetables, and of these the best-suited to particular wants, appears to be the guiding principle in cropping. Not a weed is to be seen, or hardly a decayed leaf visible. Every bit of ground is cropped, and every crop well tended, the whole doing credit to the departmental overseer.

The soil is a good sound loam, rich and deep, of a fine staple for fruit and vegetables, except the upper portion, which is rather light, and, as a consequence, the Pears on the east wall lack stamina. The walls are mostly covered with Pears and Plums carrying fair crops. On the north aspect are Morello Cherries, with Currants and Gooseberries trained vertically from horizontal mains, and in this cool aspect the season of these fruits is usefully prolonged, and is easy to protect from birds. Outside the square is a spacious and useful skirting for fruit and coarse vegetables. Within this skirt on the south aspect of the wall are fine Plum and Pear trees, which bear produce of the first quality. Peaches are grown under glass. The kitchen-garden ground may be about four acres. Apples not a full crop, but whenever we came to a tree of the useful Blenheim Orange it was laden with fine fruit.

We now look at the glass department, which is rather extensive, comprising eleven spacious houses and a considerable extent of pits and frames. The principal range is in the walled kitchen garden, and comprises a central staged house for flowering plants, with four houses on either hand planted with Peaches and Vines. The plant house, as a conservatory, is hardly worthy of Archerfield; the stages, by their elevation, do not show the plants to advantage, which were good. The lean-to's are capital houses, and carry capital crops of fruit. The end ones for late Grapes have a steep pitch, and are well adapted for keeping purposes. Early Grapes and Peaches were gathered, but the late vineries were carrying excellent fruit. Muscats were very good, but the Barbarossa, which is largely grown, was the most striking by its numerous and massive bunches. This variety, which is in many places shy, is free enough here, Mr. Kettles having no difficulty in getting a houseful of bunches. His plan is the very sensible one of training-up young rods, and shortening them at pruning time according to judgment, insuring thereby a choice of spurs and young wood, and what is better, insuring also a crop, guarding against overcrowding. This is a safe plan of getting Grapes, and the Vines are furthermore in a constant and steady state of renewal. Lady Downe's is also fine in the berry, but, of course, not so big as Gros Colman. This latter Grape is not well coloured, one Vine especially being curious in always producing colourless fruit, yet the berries are of large size, and equal in flavour to the black ones on the next Vine. This range of houses is heated by one pipe running along the front. It is flat, 1 foot wide by 4 inches deep, and troughed its whole length three-quarters of an inch deep, which, Mr. Kettles says, gives off too much moisture, and he uses portable evaporators of less superficial area. The front wall is on arches, and the best roots are probably in the inside borders, the outside ones being only 3 to 4 feet wide, and cropped with flowers, although the soil under the walk is made good; but for the matter of that all the soil is good in the garden, and would of itself grow Grapes well with the otherwise good culture here given. There is also another fruit house in the south wall of the outskirt garden about 150 feet long. This is a very light and excellent structure. It is principally planted with Plums, and wired about 4 feet up the roof, so that the back wall has light over this Plum trellis to the very bottom. Besides, from the trellis a branch is carried from the Plums up each rafter Vine fashion. The rafters are 6 feet apart. The back wall is covered with Peaches, having splendid fruit. There are also in this house Figs, Guavas, &c. This useful house is heated, and gives an immense quantity of fruit. It was, moreover, particularly gay, the floor being covered from end to end with healthy and well-bloomed plants of Mr. Pearson's and other good Pelargoniums, than which, in their now varied colours, nothing can give a finer summer display, and what is of first-rate moment, they carry no filth into a fruit house.

In what may be called the forcing ground is another block

of glass. Here Pines are grown in considerable quantity, the plants being remarkable for their dwarf stocky habit of growth. They are grown on what may be called the coal-saving-and-fruit-getting system, Mr. Kettles being no advocate for an extreme high temperature in culture, and of this prefers as much as possible from fermenting material to the caloric of the coal pit. His suckers are raised on dung beds without any linings, removed, of course, in late autumn to the houses. Under this cool treatment fine fruit is produced from plants much dwarfer than is often seen in Pine-growing. All the Pines are grown in pots.

It is not necessary to enumerate the contents of the plant houses; suffice it to say their occupants are in the first order of health. Large specimens are not attempted, hardy stuff for decorative purposes being the point aimed at. Relays of plants for successive seasons are grown in cool pits, and in these plunged in a gentle fermenting material. Such stove plants as Gesneras and Poinsettias were flourishing to perfection, although the bottom heat had long since departed.

The use of one very old hardy plant may be noted—Sedum Fabaria. It is grown in pots for balcony decoration, and serves its purpose admirably. No sort of weather seems to affect it; and as grown here, with heads as large as Hydrangeas, it is ornamental indeed. To see the plant as one generally sees it in undisturbed clumps in the herbaceous border, or settled for life and seemingly immoveable on the rockery, with its little tufts of rosy bloom, one could hardly credit what it is capable of doing under high generous cultivation in or out of pots. It is a hardy, everybody's plant. Let those who have it grow it better, and those who have it not get it and

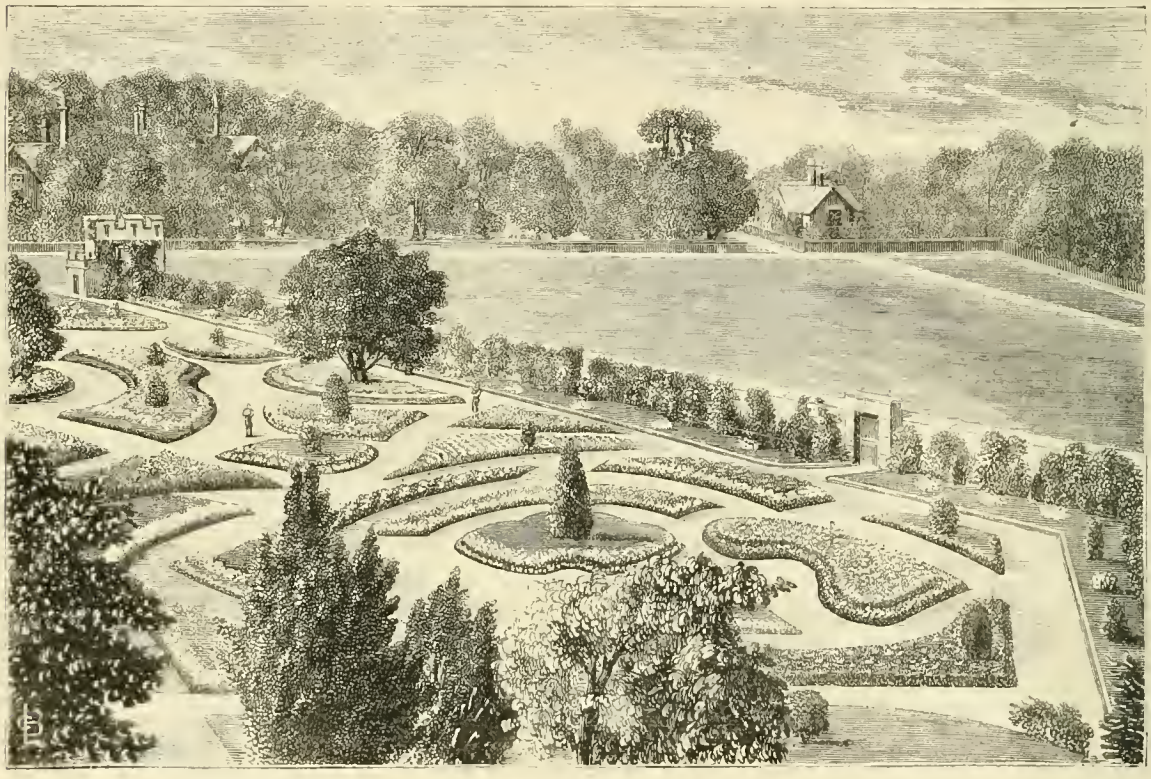

Fig. 2.—Dirleton gardens.

grow it well. But there is the Dirleton garden yet to be looked at—that is, the flower garden proper. It must be deferred. Archerfield is a fine place without it, but with it its interest and beauty is immensely enhanced.—J. Wright.

THE AVIARY.

We have much pleasure in this, the first number of another volume, in presenting our subscribers with an engraving of an elegantly-designed aviary, accompanied with a few remarks as to the necessary fittings.

In furnishing and carrying out the interior the aid of a clever wireworker and other skilful artificers will be required. The following remarks will, no doubt, be acceptable to those desiring to fully enjoy the pleasures of an aviary.

"An Eye-witness" says—I will first remark upon the perches, which should not be arranged or fixed immediately over each other, neither should they run in a transverse direction. One advantage will be not to have the perches long or continuous; for by having numerous small perches and others of various lengths here and there jutting out from the sides of the aviary, the birds will be more advantageously distributed over the same. Sets of perches can be made so as to be fixed in almost any part of the aviary, constructed as to open out in a similar manner as a pair of steps; or three long strips of wood secured with a piece of wire at the top can be opened out in a triangular form, and circular perches or hoops of various size (three or four) can be slipped over the triangular framework and the whole so extended as to prevent the birds upon the upper perches soiling those upon the perches beneath. Some aviary-keepers adopt the plan of procuring suitable branches of trees, the butt ends of which they either have fixed in large garden pots or small firkins filled with mould. If firkins are used they can be dressed up with cork or bark to make them more ornamental.

For aviaries seed-hoppers are preferable, for the birds cannot waste or soil the seed as when it is supplied in open troughs. The hoppers can be placed in various parts of the aviary. They are better when constructed with sliding glass fronts than entirely of wood, for it may be better ascertained when the hoppers require replenishing with seed. Potteryware is better than either wood, tin, or zinc to give soft-billed birds their food in, for they can be the more readily cleaned. The birds kept mainly upon soft food would be better kept apart from those living almost entirely upon seeds. In an aviary this could easily be effected by a wired partition.

The floor of the aviary should always be abundantly supplied with coarse grit sand or very fine gravel (red looks best, and plenty of it can be obtained from the London bird-dealers); and sand retreats or recluses are particularly acceptable to the Tit tribes, the cork bark here again being used, besides small branches fixed up in the corners for the birds to occasionally retire to or roost in.

Aviaries can be thoroughly ventilated by the aid of perforated zinc fixed at the topmost part of the structure, without any fear of draughts of cold air. The windows should all be protected with wirework.

A very essential matter in an aviary is a good supply of water daily and the free use of the bath. Where some of the birds are partitioned-off from the others they cannot equally enjoy the free use of the bath, therefore they must now and then be supplied with a bath on a smaller scale than the one I refer to below. I will give an instance how the water supply was managed in an extensive aviary.

A detached aviary house (which was well sheltered from the north by a copse of trees), not so spacious or elegant in design as the illustration given, had an entrance-door in the centre, with the aviaries situated right and left. Inside, about a yard from the outer door, were also a pair of folding doors, through which I had to pass before fully enjoying a good view of the aviaries. One side was appropriated to the larger kinds of birds, and the other to the smaller Finch tribes, Canaries and Mules. Upon the floor, in the centre of each, a small grotto or rocky pile was constructed, and through the centre of each ran a very thin tube as a fountain. Surrounding this tube, about 4 inches from the top, ran a piece of zinc spouted around, off of which the water ran on to the rock or grotto below, the water being

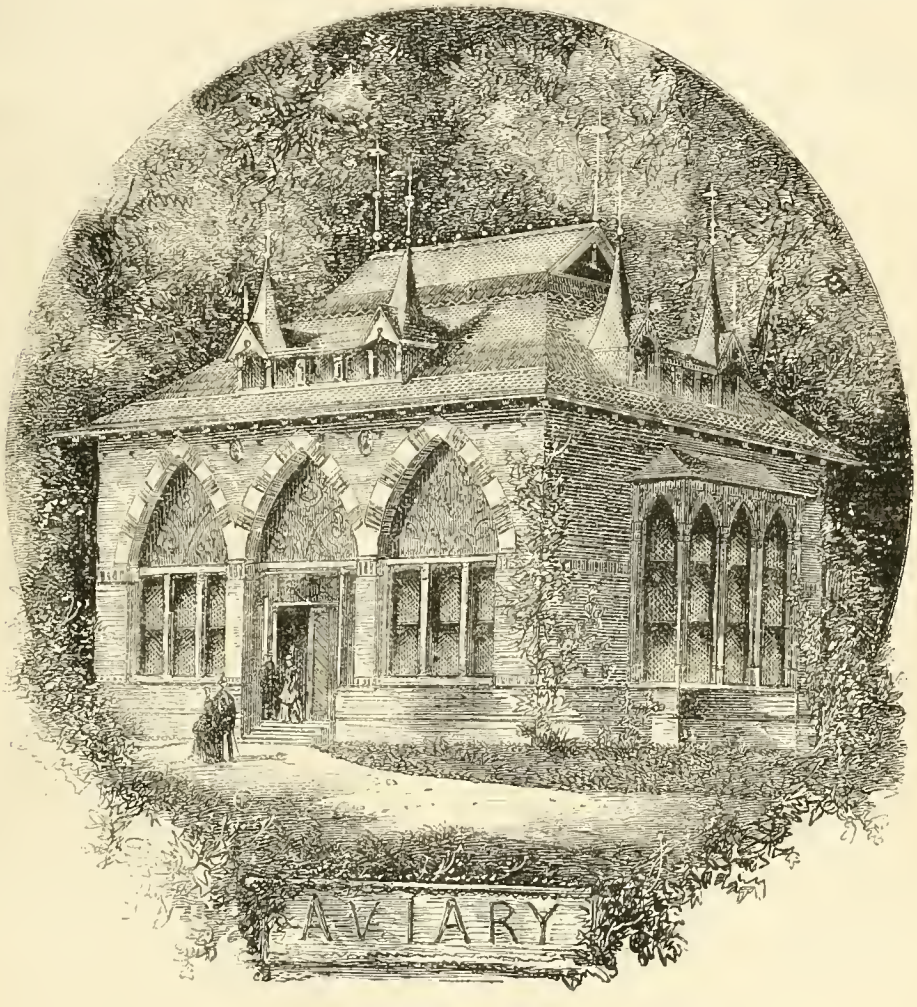

Fig. 3.

received in a bath surrounding the grotto. The baths (the sides of which were about 6 inches high) contained about 3 inches of water, never more, the bed being formed of loose shingle, and small sea shells and rock. The fountains were each supplied through pipes inserted into the bottom of a deep cistern fixed at the back part of the building, into which the rain water from the roof was conveyed. At other times the cistern was supplied by hand. Not having the advantage of waterworks in the vicinity, the fountains in very dry weather did not play so well. In the pipes leading from the cistern taps were fixed to turn on the water, which when more than 3 inches deep in the baths was conveyed through other pipes into a well or covered cistern outside, and afterwards made available for the flower borders surrounding the aviary. There was another provision made, that when the outer cistern filled beyond a certain mark the water ran off into a drain.

Inside the building, skirting each side of the aviary, were fixed rustic-looking chairs or seats, and numerous pots of choice greenhouse and other plants were arranged. The whole had a pleasing effect, and was interesting. Similar plans could be carried out in the aviary of which we furnish an illustration taken from the American "Fanciers' Journal."

DOINGS OF THE LAST AND PRESENT WEEKS.

The lowest temperature at Loxford was 16° Fahr.; on the same night the mercury at Bury St. Edmunds dropped to 4°, or 28° of frost. Bedding Calceolarias require a thick covering of straw over the usual protection afforded by mats. When the frost was severe, even in the daytime the covering was not removed at all, but on Saturday morning about half an inch of rain fell, and the temperature got higher until daybreak, when it again fell to the freezing point, leaving the roads and paths sheets of ice. At midday the glass rose to 41°, and all coverings were removed and the plants overhauled, everything being in as good condition as they were before the frost. In the Auricula frame were a number of decaying leaves on all the plants, but more so on the Alpines. These were picked off, and not a plant injured in the least. The Carnation frame did not require any attention, ex-

cept to draw the lights off for a few hours; this was done to all the frames, to the great benefit of the plants.

FORCING HOUSES.

Pineries.—In the fruiting house are a few plants swelling their fruit; and if the house was full of such, it would be desirable to maintain a minimum temperature of 65°, rising to 70° or 75° by day; and all fruiting pineries ought to be sufficiently supplied with hot-water pipes, so that this temperature may be kept up even in severe frosty weather if necessary. A house 15 feet wide, and sufficiently high for fruiting Pines, and of the constitution of what is called half or three-quarter-span, should not have less than six rows of 4-inch pipe. The best succession houses are half-span, and may be from 10 to 12 feet wide with four rows of 4-inch pipe. But to return to the fruiting pinery. Our temperature in very cold nights is sometimes as low as 55°, but 60° is the most usual. We have had fruit swelling and others in the flowering stage about the new year in previous seasons; and although the temperature was but little increased until March, the Pines swelled and ripened-off well, and not unfrequently gained first prizes at the early summer shows in London. We merely mention this, as many growers think a much higher temperature absolutely necessary. On the other hand, we have found out that a great mistake may be made if the minimum is 5° lower through the winter months. We had charge of a house of early fruiters many years ago, and owing to the house destined for them being required for early Vines, the Pines were placed in a house and plunged in a good bottom heat, but through insufficient piping the night temperature could not be kept up to 55°, but fell to 50°, and sometimes even lower. During this time the fruit began to throw up, and though the plants were all that could be desired, the fruit when ripened-off were miserably poor and badly shaped. Succession houses are also kept quiet as yet, very little moisture in the atmosphere and no water at the roots. In none of the houses is moisture supplied from the evaporating troughs over the hot-water pipes.

VINERIES.

The Lady Downe's in the late house have shrivelled rather more than usual this year. Where it is necessary to keep up a high degree of warmth in the hot-water pipes to keep out the frost for many weeks together, it is to be expected that some berries will shrink a little; but they had done so previous to much firing, and in our peregrinations round the country we have seen other people's very much worse than our own. No doubt the ripening of the fruit in August has a good deal to do with it. In Essex Lady Downe's will ripen without artificial heat after the fruit is set and thinned, but it is better with, and probably if we had been more lavish with fuel in August the fruit would have been much firmer and have kept better. Gros Guillaume has kept well, and not a single berry was shrunk when the bunches were cut with the branch attached for bottling. Muscat of Alexandria had not kept quite so well, but only a very few berries had shrunk, and a few mouldy ones had been cut out. The only other white Grape kept up to this time is Royal Vineyard, but it does not keep any better than the Muscats —indeed, they did not keep so well this year. Mrs. Pince also kept badly; it cannot at all be compared to Lady Downe's for keeping, nor with Gros Guillaume. The great desideratum is still a Grape that will keep with Lady Downe's, black and white, with a flavour equal to Mrs. Pince. In the room where the Grapes have been suspended the frost is just kept out by a small stove; all fruit decays quickly after having been frozen. Pruned the Vines immediately that the fruit was cut, and had the woodwork of the house washed, the Vines washed with soapy water and dressed with the mixture that had been used in the early houses.

CUCUMBER HOUSE.

The plants which were put out in October for winter-fruiting failed to a large extent; why, we have not yet discovered. Seeds sown about the second week in December vegetated freely, and the plants are now making vigorous growth. They are close to the glass, the pots being placed on a shelf rather than having them plunged in bottom heat, where a quicker growth would result from it, but not a healthy one. The greatest care is necessary to see that no insect pests attack the plants; thrips and green fly do the most mischief. We would rather that the night temperature in this house does not fall below 65° at night. Where the trellis is covered with the growing vines of the Cucumbers it will be necessary to look over the plants once in a week or ten days, and remove all superfluous growths and leaves that show some signs of decay, nor ought the leaves to be too thickly crowded together.

Strawberries.—The earliest batch of Black Prince have been removed from a house where the temperature was 50° to one of from 5° to 10° higher. The flower trusses were not showing, but the new leaves were pushing out of the centre of the plants. The next lot, composed partly of Black Prince and Keens' Seedling, were taken from a cold frame to fill the place of those that were removed higher up. Alternate watering with weak manure water is of much service to the plants, and should be applied as soon as the centre leaves show themselves. If any of the pots are not far removed from hot-water pipes the mould may become dry between the times of watering, and should such be neglected for a day the plants may suffer, when red spider will be sure to attack them.

Orange trees that had been at rest in a cool house have been removed into heat. They were starting into growth before removal, and in one instance the flower-buds were visible. St. Michael's and Maltese Blood varieties ought to have the flowers expanded early in February; even then the fruit will not ripen much before Christmas. Tangierine will ripen fully a month before the above varieties.

Figs in pots have been started in an early vinery with the Vines. We have always been most successful with Figs in pots when a little bottom heat could be applied to them, either by plunging in some fermenting material or by placing the pots over hot-water pipes; either way the plants should not be far removed from the glass, and fully exposed to the light.

PLANT STOVE.

Thanks to the aristocratic Orchid family, there need be no lack of flowers during the whole of the winter months, and most of them are comparatively of easy culture. Lælia anceps and varieties of it are the showiest and best of that genus in flower now. Phalænopsis grandiflora, the Moth Orchid, is most useful at this season; but those who are fortunate enough to possess a dozen plants of it may have it in flower nearly all the year. Eucharis amazonica, this snow-white beauty, is now a mass of flower; and as soon as one set of flowers are over, in a month or so another set is thrown-up, so that with three good-sized plants we are seldom without flowers of it. All the treatment that it requires is good turfy loam with a little leaf mould for the plant to grow in; it also requires plenty of pot-room, liberal supplies of water at the roots, and a temperature of from 60° to 65°.

We have been enabled to do nothing in the stove department, except to clean and train plants. Thrips next to mealy bug is the most difficult pest to deal with. Fumigating, if persistently followed-up, will destroy them, but then tender plants are often injured also. Washing them off with a sponge and soapy water is the safest, and now that little other work can be done this should be seen to.—J. Douglas.

TRADE CATALOGUES RECEIVED.

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

Books (*A. B., Knowle*).—Our "Garden Manual," which you can have for twenty postage stamps by post from our office. W. Paul's shilling "Book About Roses." Kent & Co., Paternoster Row.

White Grape for South Wall (*Wantage*).—The Royal Muscadine.

Royal Horticultural Society's Provincial Meeting (*Resurgam*).—The place and time for 1875 is not yet decided.

Twelve Select Hyacinths (*H. W. S. C.*).—The list we published in our No. 717 was furnished by a grower from a foreign list, and they are not obtainable in England. We have applied to Messrs. Cutbush, florists, Highgate, so well known as Hyacinth exhibitors, and they have obliged us with the following:—"The following are easily procurable, which will please any cultivator—Macaulay, deep rose, striped crimson; Florence Nightingale or Fabiola, very pale pink, with light carmine stripes; Von Schiller, deep salmon pink; Robert Steiger, bright crimson; Gigantea, deep blush; Queen of the Netherlands, pure white; Mont Blanc, pure white; Grandeur à Merveille, pale blush; Baron Von Tuyll, deep blue; Charles Dickens, greyish blue; Grand Lilas, azure blue; Prince Albert, purplish black. We could, of course, add plenty of other first-class varieties, but do not think there are many better than the above."

Utilising Space in Unheated Vinery (*J. C.*).—It is folly to seek any great advantage from a growing of many things in a house that is only suitable for few. Cucumbers, also Melons, would do fairly, but Tomatoes better than either. Small saladieg might give you some return; and Sea-kale, Rhubarb, and Asparagus gently forced, commencing, say, the beginning of February, would answer, the vapour of the fermenting materials not injuring the Vines in a dormant state. The fermenting materials if placed upon the Vine border must be removed ere the Vine have rooted much into them; better if it be done before.

Surrounding Pipes for Bottom Heat to Cucumbers (*Beginner*).—The soil ought not to be placed upon the pipes, but be surrounded by rubble, brickbats, or clinkers, and brought over the pipes about 6 inches, and over these a layer of sods or the rough parts of the compost, and upon this the soil. The soil should be broken up rather fine, but not sifted. Mille's treatise on Cucumber culture is probably the best, but we think it is out of print. Cuthill's is also good.

Heading Maiden Apple Trees (*J. H.*).—Being planted the past autumn they will be best headed-back in February, or so soon afterwards as the weather is mild, but doing it at the first mild weather after the middle of the month.

Erecting a Vinery (*H. B.*).—Arrange by all means to have the Vines planted inside, 18 inches to 18 inches from the front wall. It will be well, if the subsoil is clay or wet, to pave the bottom either with bricks or pebbles, and run the joints with cement. This base should have an incline to a drain, or rather to a certain part where should be a drain, and laid upon the cemented floor, and this drain must have proper fall and outlet. You will need a drain for the outside as well as inside border, and lengthwise of the border, having the inside one about 3 feet from the front wall, and the other about 4 feet from the outside of the border. The front wall ought to be arched, having 14-inch pillars, with 2-feet to 2-feet-3-inch openings between each. The top of the arches should be flattish, so as to raise the top and allow the roots to have freer access, nearer the surface, to the outside border than were the arches semicircles.

Raspberries Unfruitful (*H. L. E.*).—The situation is unquestionably the cause of failure, the shade being unfavourable to the perfection of the growths. If they are a good kind you may safely make a new plantation from them, but choose an open though sheltered situation. Manuring would help, and so would watering, the fruit to swell, but the Lime roots would appropriate a good deal of both.

Peach and Nectarine Trees not Thriving (*Idem*).—Your soil is against the healthful growth of the trees. We should lift the whole of the trees, and manuring liberally and adding some fresh soil—rather strong turfy loam is best, and making the soil of the border very firm. The "wash" will not cure the cancerous development, but is good against insects. The leaves "blister" owing to cold and sudden changes of temperature, which may be obviated or lessened by copings and canvas protection.

Scale on Peach Trees and Myrtles (*G. M.*).—The sprigs of Myrtle and the shoots of Peach trees are infested with brown scale, which causes the leaves and everything under and around the infested plants to be covered with a gummy exudation or secretion called honeydew, and this drying affords a medium for the development of black fungus. If you remove the scale the other appearances will disappear. A solution of soft soap, half a pound to a quart of water, adding to it half a wineglassful of spirits of turpentine, and thoroughly mixing and applying with a brush will destroy it, applying it at a temperature of 120° to 140°, taking care not to allow it to run down to the roots, but to apply it to every part infested with the insects, both sides of the leaves, and all round the shoots.

Painting Flower Pots (*V.*).—It is injurious to paint the outside of flower pots, as it takes away their porosity, shutting the roots out of atmospheric influences. The pots ought to be kept clean washed, free of mossy accumulations.

Trees for Lawn (*C. J. W.*).—The following are fine evergreen trees for a lawn, but we should advise you to employ them at the margins or boundary, leaving the centre comparatively open. Many lawns are spoiled by trees upon them, as if the object were to cover it with trees without any regard to effect:—Abies excelsa alba; Cryptomeria elegans; Cupressus Lawsoniana and vars. gracilis, glauca nana, and stricta; Juniperus chinensis, J. virginiana; Picea grandis, P. nobilis, P. Nordmanniana, P. pinsapo; Pinus excelsa, P. cembra; Retinospora pisifera, Taxus adpressa stricta, T. pyramidalis, T. elegantissima, T. fastigiata; Thujopsis borealis; Thuja Lobbi, T. orientalis, and vars. aurea and elegantissima; Cedrus Deodara, C. atlantica, and Araucaria imbricata, with Wellingtonia gigantea, which you name. Those are all evergreen and Coniferæ. Have a few Gold and Silver-variegated Hollies, and a Portugal Laurel or two, and some Rhododendrons as specimens. We should also have a few weeping trees, as Betula laciniata pendula, Fagus pendula, Fraxinus excelsior pendula, Salix americana pendula, S. capres pendula, and Camperdown Elm. A few flowering standard trees, as Cerasus japonica multiplex, Double Pink, White, and Scarlet Thorn, Cytisus pendulum, Liriodendron Tulipifera, Magnolia conspicua, Pyrus communis Bollwylleriana, and Pyrus præcox.

Everlasting and Ornamental Grasses (*C. K.*).—Acroclinium roseum and var. album, Ammobium alatum, a small white Everlasting; it and the two preceding being half-hardy annuals. Helichrysum bracteatum and var. alba, H. monstrosum album flore-pleno, and the following double varieties of, H. monstrosum flore-pleno—atro-coccineum, luteum, purpureum, and roseum; Rhodanthe maculata, its white variety (alba), and atrosanguinea, R. Manglesi. The Rhodanthes are half-hardy annuals. For quantity, the best plan is to procure a "collection of double Helichrysums in ten varieties," they being the best, adding the Acroclinium, Ammobium, and Rhodanthe if you wish, but they are not nearly so profitable. Grasses are—Agrostis nebulosa, A. argentea; Briza gracilis, B. maxima; Eragrostis elegans, Lasiagrostis argentea, Paspalum elegans, Piptatherum Thomasi, and Stipa elegantissima.

Pæonia Moutan Failing (*H. B. H.*).—The tree Pæonies require no particular treatment, but require a rather light and moderately rich soil, enriching it with leaf soil, vegetable refuse, or well-rotted manure, and planting high rather than low, and about the same depth as before, dishing around the plant for watering, which should be done in dry weather copiously, for want of which we think your plants have died. They require a sunny sheltered situation. The plants, if they show for flower the year of planting, ought not to be allowed to do so, but take away the bud when it is clear of the leaves.

Conservatory Construction (*A Constant Reader*).—The size of the squares will depend upon the description and thickness of glass. If you use ordinary 21-oz. sheet glass, the squares should not be more than 12 to 15 inches in width, and about three times the length of the width. When 26-oz. or 32-oz. glass is used the squares may be 15 to 18 inches in width, and 3 to 4 feet in length. We have these sizes, and with an eighth to three-eixteenths of an inch lap, there has not been any breakage of glass from frost in four years. We should have in each house a slate tank of 6 feet length, and 3 feet width and depth, which will give you about three hundred gallons of water, and will be sufficiently large for a house of the dimensions you name. Have it raised so that you can water your plants with a hose-pipe. It is desirable to have rain water, which is the best of all for the plants, and in the tank it would be heated to the same temperature as that in which the plants are growing.

Roller for Blind (*F. T., Dublin*).—The diameter of the roller should be 3 inches, and the wheel twice the diameter of the pole or roller, and have an indent of about 6 inches width and 2 or 3 inches deep to receive the cord. The roller only rests upon the rafters, and the wheels are clear, running alongside of the outside, and by having a wheel at the other end it will move up and down straight, about half an inch of play being left at each end. The shading must, of course, be pressed each time the roller is run up or down, but it does not injure the material any more than a mangle does linen.

Elliot Copings (*J. E.*).—We have a letter for you, but have mislaid your address.

Arbor-Vitæ Planting (*A. B.*).—Four feet apart is not too close for the purpose you have in view, but the roots will extend into the Asparagus bed and injure the plants.

Garden Labels.—Mr. J. Smith, Royal Label Factory, Stratford-on-Avon, writes to us to say that it might be inferred from what has appeared in our columns that he has discontinued making "imperishable metallic labels." That this is not the case, we may refer to Mr. Smith's advertisement now in our columns.

Names of Fruits (*H. W.*).—The Pear is Thompson's, and the Apple Royal Somerset. (*D. M. P.*).—*Apples*—1, Braddick's Nonpareil; 2, Old Nonpareil. *Pears*—1, Gilogil; 2, Not known. (*James Ducker & Son*).—Devonshire Buckland.

POULTRY, BEE, AND PIGEON CHRONICLE.

MILLOM (CUMBERLAND) SHOW of POULTRY, &c.

(*From our own Correspondent.*)

For several years, owing to the closing of the Ulverston Poultry Show, the extensive district of Lonsdale North of the Sands, Lancashire, containing as it does many keen breeders of poultry, was unrepresented. To remedy this, three years ago a committee of gentlemen in the adjacent county of Cumberland, connected with the Millom and Broughton Agricultural Society, conceived the idea of holding a Show of poultry on New Year's Day. Seeing that the Society has a wide radius, there being no exhibition within a circle of some thirty miles, no astonishment will be felt when we say that at the Show this year there were no less than 272 entries. The Exhibition was held in the new Town Hall, Millom, and was numerously attended. The various classes were all well represented, nine silver cups, a silver cream jug, and a silver cruet stand, in addition to the money prizes, being offered for competition.

"Cannie Cumberland" has an eye, it will be deduced from the above, to the substantial as well as the beautiful. Before the laws made it actionable for cock-fighting, few districts were more noted for the breed of *Game* birds than was this, and the pursuit has not been relinquished, a splendid class facing the Judge on Friday. Mr. Teebay, one of the most experienced of judges, said it was a long time since he had handled a better bird than the one he awarded first cup honours to in Class 2, belonging to Mr. John Wilson, of St. Bees, an exhibitor known favourably at all the principal shows in the kingdom. The *Game Bantams* were also a large class and much admired. *Brahmas, Cochins,* and *Dorkings* showed to advantage, and as table birds almost put Turkeys to the blush, some of the birds being of great size and extraordinary weight, whilst their eggs shown on a table in the centre of the Hall, gave the lie direct to Mrs. Partington's recently uttered libel on eggs generally. *Ducks* were also a capital class, and the prize pens belonging to Mr. J. W. Brockbank, The Croft, Kirksanton, an exhibitor of wide note, led the uninitiated to ask whether they were not looking at Geese, so large were they in their proportions.

The *Pigeon* Show this year was a new feature, yet many very nice birds were shown.

Game.—*Any variety.*—*Cock.*—1, P. & W. Sumpton, Bother, Aspatria (Brown Red). 2, J. Tremble, Aspatria. 3, S. Riley, Sunbreak. *hc*, W. Boulton, Park house (Brown Red). *Black-breasted and other Reds.*—Cup, J. Wilson, St. Bees. 2, E. Swainson, High Nibthwaite. 3, R. B. Hudson, Dalton-in-Furness. *hc*, S. Riley; W. Grice, Bootle. *Any other variety.*—1, W. Higgin, Ulverston (Duckwing). 2, J. Muckereth, Cumberland (Duckwing). 3, J. W. Brockbank, Kirksanton.

Brahmas.—Cup, C. J. Myers, Broughton-in-Furness. 2 and 3, J. W. Brockbank. *hc*, T. Bellman, Backbarrow (2); W. Birkett, Bootle. *c*, T. M. Swainson; G. Sanders, Bootle, Carnforth.

Cochins.—*Buff and Partridge.*—1, J. O. Rigg, Ulverston. 2, C. J. Myers. 3, E. Fearon, Whitehaven. *c*, Mrs. Brockbank, Garthland. *Any other variety.*—1, T. M. Swainson, Millom (White). 2 and 3, J. & T. Weeks, Bootle, Carnforth (White).

Dorkings.—1, E. Fearon. 2, J. Wilson. 3, Miss Knowles, St. Bees.

Spanish.—Cup, J. Wilson. 2, J. W. Brockbank. 3, J. Tremble.

Game Bantams.—*Black-breasted and other Reds.*—Cup and 2, W. Grice. 3, H. A. Clark, Aspatria. *hc*, H. A. Clark; J. Burrow, Low Wood. *Any other variety.*—1, 3, and *hc*, J. W. Brockbank (Duckwings). 2, T. Bellman (Piles). *c*, W. Higgin (Piles).

Hamburghs.—Cup, J. Jackson, Drigg Station. 2, T. Bellman. 3, H. A. Clark.

Any other Variety.—1, C. J. Myers (Houdans). 2, J. Allinson (Houdans). 3, H. A. Clark (Golden Polands) *hc*, R. J. Robinson, Ulverston (Houdans); Miss H. Robinson, Wigton (Houdans).

Ducks.—*Rouen.*—1 and 3, J. W. Brockbank. 2, S. Thornton, Millom. *hc*, R. J. Robinson. *White Aylesbury.*—Cup, 2, and 3, J. W. Brockbank.

Selling Class.—*Cock or Drake.*—Cup, L. Casson, Ulverston (Duckwing Game). 2, J. Taylor, Bootle (Buff Cochin). 3, J. White, Ulverston (White Cochin). *hc*, E. Fearon (Cochin); J. Jackson (Golden-spangled Hamburgh)

C. J. Myers (Houdan); J. Robinson (Brahma); J. Mackereth (Duckwing Game); W. Higgin (Pile); J. & T. Weeks (White Cochin); J. Leech, Ulverston (Pile Game); J. W. Brockbank (Dark Brahma and Drake); W. Grice (Game Bantam); L. Casson (Duckwing Game). *c*, R. J. Robinson (Houdan); J. Robinson (Brahma); R. B. Hudson (Aylesbury).

Selling Class.—*Hens or Ducks.*—1, H. J. Nicholson, Millom. 2, W. Higgin (Game). 3, J. & T. Weeks (White Cochins). *hc*, E. Fearon (2); H. J. Nicholson; J. O. Rigg; W. Grice (Game); W. Bell, Cumberland (Golden-spangled Hamburghs). *c*, E. Fearon; J. Mackereth (Black Red Game).

Local Class.—*Chickens.*—Cup and 2, J. W. Brockbank. 3, T. M. Swainson, *hc*, W. Birkett; J. W. Brockbank.

PIGEONS.

Carriers.—1, J. & W. Towerson. 2, J. Cook.
Pouter.—1 and 2, J. & W. Towerson, Egremont.
Tumblers.—1, J. Cook, Egremont.
Jacobins.—1, J. Cook. 2, J. & W. Towerson. *hc*, Mrs. Brockbank.
Any other Variety.—1 and 3, J. & W. Towerson. 2, C. J. Myers (Magpies). *hc*, J. Cook.

Judge.—Mr. R. Teehay, Fulwood, near Preston.

THE POULTRY-KEEPER.—No. 29.

HAMBURGHS.

Of the Hamburgh are several varieties. The principal are the Silver-spangled and pencilled Hamburgh, and the Golden-spangled and pencilled. This name Spangled alludes to the spots like spangles with which a great part of their plumage is covered, and the Pencilled to irregular lines on the feathers. Besides these there is the Black Hamburgh.

SILVER-SPANGLED HAMBURGHS.—HEN.

General Characteristics.—Plumage white, black-spangled; rose comb; gait extremely lively and graceful; form rounded. A little below middle size.

Head.—Strong, flattened at the top.

Eye.—Very large, of a dark colour and brilliant; iris dark brown, pupil black.

Cheeks.—Red and bare round the eyes, sprinkled with little fine white feathers in the other parts.

Comb.—Rose, with little long regular points, forming an almost flattened surface, oblong, rounded in front, pointed behind, covering the base of the beak, diminishing in size at the side, and finely pointed at the back of the head.

Wattles.—Placed well under the beak, perfectly round and concave.

Ears.—White, like mother of pearl, placed flat on the cheek, very small.

Tufts.—White.

Beak.—White, light blue at the base.

Legs.—Ashy-blue colour.

Laying.—Excellent, eggs very delicate and of middle size. Non-sitters.

Fig. 4.

Fig. 5

Feathers of the head, on the borders of the comb, and on the upper part behind the neck, white. Hackle feathers (fig. 4), white, marked with a deep black spot at the end. The upper feathers of the hackle near the head are very small, increasing in size as they get to the base of the neck. The size of each spot is in proportion to that of each feather, only the spots are longer. The breast feathers (fig. 5), have a great resemblance to those of the hackle, and are marked more regularly and uniformly. The feathers of the loins, the shoulders, the covert of the tail, the thighs, and the legs should be as much as possible like those of the back and breast. The large wing feathers (fig. 6), white, edged by a thin black border wider at the ends. Large wing feathers quite white; large tail feathers (fig. 7), white with

Fig. 6.

Fig. 7.

the exception of the ends, regularly marked with a black band. The feathers of the sides and abdomen are of a dark grey. The white of the plumage is pure, like ivory. The black is iridescent with deep violety green.

HUDDERSFIELD POULTRY SHOW.

The first Show for a great many years was held on the 29th and 30th of December, in the Armoury, or Volunteer Hall. The entries were very large, there being upwards of eight hundred, 120 of which were dogs, and, unfortunately, they occupied the best portion of the hall—viz., the side of the room where the best light was. In respect of light the building was not one of the best places, and this, together with the fact that the weather was very heavy and the pens being in double tier, the bottom ones were rather dismally placed, and yet the most was made of the room at command. These remarks refer to poultry and Rabbits, for the Pigeons being round the gallery were in splendid light and position. On our arrival at about ten o'clock on the morning of the Show all things were in a very backward state, said to have been caused by the pens not being set up, and this caused the judging of the specimens to commence late; and the public being admitted soon after, it was a great impediment to the Judges' progress. The awards were not completed till near four in the afternoon, and yet, though the Committee was quite a new one, all was well carried out, Mr. Hudson of Hull rendering the utmost assistance in the management. The Show was in one sense a double one, as in all sections there were local classes, some of which, notably the Cochins and Rabbits, showed up uncommonly well; the specimens, if not quite equal, being close upon the general classes in quality.

To start with the general classes. *Dorkings* had but two entries, but the *Cochins* were numerous and grand in quality, Mr. Walker's model pen of Buffs securing the section cup; second were two good pens of Partridge, and third White. *Bantams* were numerous and good, the first a grand old pen, and second and third chickens. There were but five pens of Light, but these of fair quality. *Spanish* were moderate, and the winners old birds. In the *Hamburghs*, which were mixed classes as regards colour, only the winners were good; the first in both classes being Gold, and second Silver. *Game* were a capital class—scarcely a pen but that deserved a mention, and the awards were made to first Blacks, and second and third Brown Reds, but the light was so bad here that it was with the greatest difficulty the awards were arrived at. The Variety was a great feature, almost every pen being good, and the winners champions of their order. First-and-cup for the section a faultless pen of Silver Polands, second an equally good pen of La Flèche, and third Black Hamburghs. Pen 230 (Harvey), Gold Polands, contained a marvellous hen. *Game Bantams* were a grand class, first were Piles, second and third Black Reds. *Bantams*, any other, were first Whites, second Blacks, and third Blacks. In the Selling class, Partridge Cochins, Brahmas, and Pile Game won.

Rouen *Ducks* were an even lot except as regards the first, which, however, stood clear of the rest. Aylesburys were but a moderate lot, the second no doubt one of the best pens living, but altogether too dirty and overshown.

Pigeons.—*Pouters* first, the cup going to a grand Blue Pouter cock in the best possible order, the second a hen also Blue, and third a cock. In *Carriers*, a Black cock well known in the fancy stood clear of the rest; second being a Dun quite young and good in all points; third a Black of extraordinary length and style. Of Almond *Tumblers* there were but four pens. Any other colour were a good class, the first a Black Mottle of exquisite quality, colour, and marking; second a Light Red Mottle of good head properties; and third a very sound-coloured Red. *Antwerps* were good, the Bradford cup-winner, a Silver Dun cock, first; second a grand Long-faced Blue Chequer, and third a short-faced Blue Chequer; the whole of these in addition to the head properties having short, clean-cut, Antwerp wings and tails, and not the long, slouching, Barb-like appearance and carriage. Many others were noticed. *Jacobins* a good lot, a Red cock first, and immediately claimed; second Red, and third White. *Trumpeters* only three, but very good. *Turbits* a grand class, the first a Black of rare excellence, second Yellow, and third Blue, all spike-headed. *Fantails* all noticed, which fact speaks much for the quality. *Barbs* contained four of the best birds in the kingdom, shown by Messrs. Firth and Harvey; in fact, it is a treat to see such birds. *Dragoons* a good class, the flat-skulled birds left out: first a capital Blue of the good old stamp; second a grand-skulled bird, but a little too down-faced and somewhat thin at beak-end, and third a young Yellow. In the Variety class, first was a real good English Owl, second a Spangled Ice, third a White Owl, an extra second and third being awarded; but the Selling class contained nothing of note, and in point of quality the local classes did not show the spirit of the poultry section.

There were 153 Rabbits, and they were a grand lot, but the Lops were badly placed as regards light, being on the lower level and under the Silver-Greys and Himalayans. Cold as the weather was they measured well and that without undue pulling. The first went to a Black-and-white full-propertied doe 22¼ by 4¾ inches; second to a very large Fawn doe with immense dewlap, 21¼ by 4¾ inches; and third to a Black-and-white doe 22¼ by 5 inches, but low in condition, many others measuring well; but we are sorry to say there was one doe, a Black-and-white, 23 by 4¾ inches, which would no doubt have won the first, had its eyes badly hurt, by what cause it did not seem to be known. Silver-Greys were a very heavy class, and all were noticed; the first winner, Miss Mortimer's buck, won also the cup for the best Rabbit in the Show, and two extra prizes were awarded, the winners running very close in quality. Only those noticed were good in Himalayan, but the first was a massive doe very good in her points, second a smaller young Rabbit but very good, as also the third. Angoras were also good, Mr. Swetnam coming first and third. Most were noticed. The first in the Variety class was a young Black-and-white Dutch good in all points, second a very large Patagonian, not so good on its pins, and third a Black-and-white Dutch. The first in the Selling class was a real good Silver-Grey.

There was a good show of Cats, and rare interest was manifested, by the ladies especially. In the first a real good Tortoiseshell stood well, the others being Tortoiseshell and White. Persian were but moderate, but Any other variety a grand class. The first in these, a young Grey Tabby, was a beauty; the second a grand Black, also a Tabby.

Dorkings.—1, J. Walker, Rochdale. 2, W. Harvey, Sheffield.
Cochins.—Cup and 1, J. Walker. 2, A. Bamford, Middleton. 3, W. G. Urwin, Whitby. *vhc*, J. White; H. Beldon, Goitstock, Bingley. *hc*, H. Dean, Keighley; W. H. Crewe, Etwell. *c*, D. & J. Ibeston, Whitby; A. Spencer, Liverpool.
Brahmas.—*Dark.*—1, W. Whiteley, Sheffield. 2, J. W. Stansfield, Halifax. 3, Dr. J. Holmes, Whitecoats, Chesterfield. *vhc*, E. Ryder, Hyde. *hc*, Dr. J. Holmes; Bridgewater & Yoxhall, Wednesbury; E. Sharratt, Rugeley. *c*, Dr. J. Holmes; W. Whitaker, Woodley; W. T. Millett, Fairfield; A. Bamford; J. Walker; F. Steele, Halifax.
Brahmas —*Light* —1, H. Beldon. 2, H. Chawner, jun., Houndhill. 3, J. Fox, Huddersfield. *c*, J. Steele, Luk; H. Chawner, jun.
Spanish.—1, H. Beldon. 2, J. Thresh, Bradford. 3, J. F. Walton, Rawtenstall.
Hamburghs.—*Gold or Silver-spangled.*—1, J. H. Booth, Hartholes. 2, H. Beldon. 3, M. H. Broadhead, Holmfirth. *hc*, G. Haigh, Holmfirth; H. Beldon; A. Wilman, Dewsbury Moor; W. McMellon, Glossop; W. Johnson, Highstown.
Hamburghs —*Gold or Silver-pencilled.*—1 and 2, H. Beldon. 3, W. Johnson. *hc*, J. Anderton, Gilstead; J. Roberts, Holmfirth.
Game —1, E. Aykroyd, Eccleshill, Leeds. 2, A. Sugden. 3, W. Ormerod. *hc*, W. Jagger, Wakefield; J. F. Walton; H. Walker; R. Walker, Gomersal; W. Tillotson, Leeds; F. Sales; D. Clayton. *c*, G. White.
Any other Variety except Bantams.—Cup and 1, H. Beldon. 2, E. Walton. 3, W. Bentley. *vhc*, H. Beldon; W. Harvey; A. & W. H. Silvester, Sheffield. *hc*, J. F. Walton; W. H. Crewe; H. Grant, Bradford.
Bantams.—*Game.*—1, B. Taylor, Heckmondwike. 2, A. Sugden, Cleckheaton. 3, F. Holt, Dewsbury. *vhc*, E. Walton, Rawtenstall; B. Firth, Heckmondwike. *hc*, A. Smith, Halifax; H. H. Thompson, Sunderland; W. Backerville, Manchester. *c*, J. Crosland, jun.; A. Smith; E. Farrington; J. Forsyth.

LOCAL CLASSES.

Cochins.—Cup and 1, J. Brooke. 2 and *c*, North & Wood. 3, J. Fox. *hc*, C. Rhodes; North & Wood.
Brahmas.—*Dark.*—1, North & Wood. 2 and *vhc*, J. Fox. 3 and *hc*, H. Digby. *c*, J. W. Rhodes; J. & R. Broadhead. *Light.*—1, G. Heap. 2, H. Digby. 3, A. H. Haigh.
Hamburghs.—*Gold or Silver-spangled* —1, G. S. Jarmain. 2, S. Arnold. 3, G. Blackburn. *c*, H. Digby; T. Stringer; J. Lancaster. *Gold or Silver-pencilled.* —1 and 3, H. Digby. 2, G. Blackburn.
Game.—1, W. Sugden. 2, J. Brooke. 3, G. Nicholson.
Any other Variety except Bantams.—1, North & Wood. 2, B. Boothroyd. 3, S. Arnold. *c*, H. Digby; G. Blackburn.
Bantams.—*Game.*—1, J. Rushworth. 2, North & Wood. 3, J. Popplewell. *hc*, A. L. Jordan; J. Brooke. *c*, J. & R. Broadhead. *Any other variety.*—1, J. Brooke. 2, S. W. Anderson. 3 and *hc*, North & Wood.
Selling Class.—1, G. Blackburn. 2, G. Heathwaite. *hc*, S. Arnold; H. Digby (2). *c*, J. Brooke; C. O. Harling.
Ducks.—*Rouen.*—2, W. V. Wilkinson. 3, J. Fairley. *hc*, S. Wilson; H. Digby. *Aylesbury.*—1, North & Wood, Huddersfield. 2 and *hc*, H. Digby. 3, J. Hey. *c*, T. Moody.

PIGEONS.

Pouters.—*Cock or Hen.*—Cup, 1, and 2, W. Harvey. 3, A. Spencer. *hc*, S. Dronsfield, Oldham; W. Nottage; J. Hawley; G. J. Taylor, Fartown. *c*, G. J. Taylor.
Carriers.—1, Miss F. Seanor, Leeds. 2, W. Sefton, Blackburn. 3, J. Hawley. *hc*, J. Smithers, Sheffield; Miss F. Seanor; J. C. Ainsworth, Bury; W. Sefton; W. H. A. Miller. *c*, H. Simpson, jun. (2).
Tumblers —*Almond.*—*Cock or Hen.*—1 and 3, A. & W. H. Silvester. 2, S. Lawson, Preston. *Any other variety* —*Cock or Hen.*—1, J. Hawley. 2, A. & W. H. Silvester. 3, J. Walker. *hc*, J. Walker; W. Brydone, Dewse; A. & W. H. Silvester. *c*, W. Moore.
Antwerps.—*Cock or Hen.*—1, R. Brierley. 2, J. Crosland, jun. 3, Waddington & Booth. *vhc*, J. Crosland, jun.; F. Steel. *hc*, R. Brierley; J. Holden; S. Lawson; J. C. Ainsworth. *c*, C. Sutcliffe; J. Smithers.
Jacobins.—*Cock or Hen.*—1, J. Smith. 2, W. Brydone. 3, G. J. Taylor. *hc*, J. Smith; S. Lawton (2); W. Harvey; F. Steel; G. J. Taylor (3).
Trumpeters. - *Cock or Hen* —1 and 2, W. Harvey. 3, J. Earnshaw.
Turbits.—*Cock or Hen.*—1, J. Walker. 2 and 3, A. & W. H. Silvester. *hc*, H. G. Poole; W. Moore; J. Walker; R. Woods; W. Brydone; G. J. Taylor. *c*, R. Woods.
Fantails.—*Cock or Hen.*—1, J. Walker. 2, F. Steel. 3, J. F. Loversidge. *vhc*, W. Lumb. *hc*, J. F. Loversidge; J. Walker; F. Steel. *c*, W. Harvey.
Barbs.—*Cock or Hen.*—1, 2, and *vhc*, J. Firth, Leeds. 2, W. Harvey. *hc*, S. Dronsfield; J. Thresh; W. Harvey. *c*, J. Thresh; W. Brydone.
Dragoons.—*Cock or Hen.*—1, W. Sefton. 2, A. Roote, Crewe. 3, J. G. Dunn, Ryton. *hc*, W. Marchant, Halifax; S. Dronsfield (2); R. Woods (2); Miss Seanor; W. Sefton; Waddington & Booth, Burnley. *c*, R. Woods; W. Sefton.
Any other Variety.—*Cock or Hen.*—1, J. Thresh. 2, G. J. Taylor. Extra 2, S. Dronsfield. 3, F. Steel. Extra 3, W. Harvey. *hc*, S. Dronsfield; W. Harvey; A. & W. H. Silvester (2); F. Steel; G. J. Taylor.
Selling Class.—*Cock or Hen.*—1, W. Brydone. 2, W. Harvey. 3, A. & W. H. Silvester. *hc*, W. H. A. Miller, Walsall.

LOCAL CLASSES.

Pouters.—*Cock or Hen.*—1 and 2, J. H. Sykes, Huddersfield.
Carriers.—*Cock or Hen.*—1, 2, and 3, J. H. Sykes.
Tumblers.—*Cock or Hen.*—1 and 2, J. H. Sykes. 3, J. B. Hogley.
Trumpeters.—*Cock or Hen.*—1, J. H. Jordan. 2 and 3, J. H. Sykes.
Fantails.—*Cock or Hen.*—1 and 2, J. H. Sykes. 3, J. W. Rhodes.
Barbs.—*Cock or Hen.*—1 and 2, J. H. Jordan. 3, J. H. Sykes. *c*, A. Broughton; J. H. Sykes.
Dragoons or Antwerps.—*Cock or Hen.*—1, A. Broughton. 2, T. Iredale.
Any other Variety.—*Cock or Hen.*—1, G. Fewsdale. 2, J. H. Sykes. 3, T. Milnes.
Selling Class.—*Cock or Hen.*—1, S. W. Anderson. 2, T. Iredale. 3, J. Blackburn.

RABBITS.

Lop-eared.—*Buck or Doe.*—1, J. Boyle, Blackburn. 2, T. Myton, York. 3, T. Schofield, jun. *hc*, T. Schofield, jun. (4); J. Quick, London (3); T. Davis Southwell; J. Irving, Blackburn (2). *c*, J. Irving; W. B. Mapplebeck, jun., Birmingham (2).
Silver-Grey.—*Buck or Doe.*—Cup and 1, Miss Mortimer, Roes. 2 and Extra 3, A. Hudson, Hull. Extra 2, J. Hallas, Huddersfield. 3, J. Firth.
Himalayan.—*Buck or Doe* —1, S. Ball, Bradford. 2, Dr. J. D. Eames, Great Driffield. 3, G. Wilson, Huddersfield. *hc*, J. T. H. Chappell, Rochdale (2); J. Hallas; J. H. Hedley, Hexham.
Angora.—*Buck or Doe.*—1 and 3, H. Swetnam, York. 2, Hutton & Gelder, Bradford. *hc*, L. Turner; E. Walton; S. Ball; J. T. H. Chappell. *c*, L. Turner; W. Russell, Hull; J. Blakey; S. Buckley.
Any other Variety.—*Buck or Doe.*—1 and *vhc*, J. Hallas. 2, M. Marsland. 3, A. Lund, York. *hc*, T. Schofield, jun.; J. T. Billett, jun.; H. E. Gilbert, Rugby; W. Russell; J. Hallas; J. T. H. Chappell. *c*, J. Tebbutt; A. Hudson (2); J. Hallas.
Selling Class.—1, A. W. Whitehouse, Northampton. 2, C. King, London. 3, J. Roberts, Deighton. *hc*, S. Hinchcliffe, Huddersfield; T. Schofield, jun.; J. Quick (3); C. King; A. Hudson; S. Ball; F. Sabbage, Northampton; J. Hallas. *c*, J. Hallas.
Local Class.—*Any variety.*—*Buck or Doe.*—1 and 3, J. Hallas. 2, A. Atkinson, Huddersfield.

CATS.

Tortoiseshell or Tortoiseshell-and-white.—1, B. Charlesworth, Lonewood. 1, R. Redshaw, Huddersfield. 3, W. Greenwood, Huddersfield. *hc*, D. Woffenden.

Persian or Angora.—1, W. Sims, Moldgreen. 2, Mrs. Morrison. 3, Miss Armitage, Huddersfield.

Any other Variety.—1, Miss Learoyd, Huddersfield. 2, J. C. Sykes, Huddersfield. 3, J. H. Crowther, Huddersfield. *vhc*, Miss I. Cheesbrough, Leeds. *hc*, Miss E. Spivey, Huddersfield; D. Bottomley; H. Wigney, Huddersfield; Miss Caygill; A. Oxley; W. B. Mapplebeck, jun.; J. Cowgill, Huddersfield. *c*, J. Hellewell.

The Judges were Messrs. Wm. Cannan, Bradford; and E. Hutton, Pudsey, Leeds.

FORFAR POULTRY SHOW.

This Show was held on January 1st and 2nd in the Reid Hall, Forfar, and was an excellent display, more especially of Game fowls, which muster strongly there.

The schedule opened with Black Red *Game* cocks, of which twenty-one entered. We did not at all like the first-prize bird, it was short in neck and leg, and not at all equal to pen 15, unnoticed; second and third were good, as also 16, highly commended. Black Red Game hens were a grand lot, but the pens they were shown in too narrow. Every bird was good, but the winners were all there. Brown Red Game cocks were headed by a fine bird, as were the Brown Red hens, the latter taking the cup for the best Game bird. Second was a fine hen, fully better in some respects than first; but no one could quarrel with the judgment. Game cocks, Any other colour, first a splendid Pile; second ditto; third Duckwing. Hens of the same reversed this order, Duckwing being first (a beauty); ditto third; Pile second. Black Red Game *Bantam* cocks came next. Here we could not agree with the Judge; the second was much more stylish and smaller, the latter a point too often forgotten in judging this variety; third was not a nice bird. Cocks, Any other colour, an easy win for one of Mr. Brownlie's little Piles. In Any other variety Bantams, first were Blacks, but we much preferred a pen of really first-rate Silver Sebrights, which were unnoticed. *Hamburghs* were numerous and good in all classes, which may also be said of *Dorkings* and *Spanish*. *Brahmas* were very good; the first three cocks had little white. Hens were extra fine. *Cochin* cocks saw a large Partridge first and cup, shown in bad light, or the Judge must have seen his red breast and fluff; second was a fine Buff. Hens were good; first a nice bird, as were the other prize-winners.

Pigeons were not very numerous. In *Pouters* a pair of fair Blacks first. *Carriers* only one good pair. *Fantails* were better, all being good, but the winners much the best. *Tumblers* contained some good birds, first going to good-headed Black Mottles; second and third Almonds. There were some good *Jacobins* shown, while first in the Variety class went to good Yellow Barbs; second a nice pair of Ice.

The Show was well conducted, except that the Hall was excessively cold, no effort being made to heat it. Some of the water dishes were frozen to the bottom. By the way, why don't the Committee have a Pigeon Judge, and thus induce more entries?

Game.—*Black Red.*—*Cock.*—1, S. Riach. 2, J. Mollison. 3, J. Nicoll. *hc*, W. Baillie; J. Mason. *Hen.*—1, C. Jamieson. 2, J. Mason. 3, W. Ferguson. *hc*, C. Jamieson (3); Boath & Tosh; J. Morrison. *c*, J. Richard.

Game.—*Brown Red.*—*Cock.*—1, T. Mason. 2, G. & A. Blair. 3, W. Nicol, jun. *Hen.*—1 and Cup, C. Jamieson. 2, J. Salmond. 3, D. Harley. *hc*, W. Nicol; J. Clark; T. W. Mitchell; G. & A. Blair.

Game.—*Any other colour.*—*Cock.*—1, D. Harley. 2, J. Welch. 3, G. & A. Blair. *Hen.*—1, D. Harley. 2, C. Jamieson. 3, J. Morrison. *hc*, J. Welch; D. Gibson; A. Dawson.

Game Bantams.—*Black Red.*—*Cock.*—1 and Cup, Mrs. J. Wilkinson. 2, R. Brownlie. 3, J. Ferry. *hc*, D. Teviotdale; J. Greive; A. Spence.

Game Bantams.—*Any other colour.*—*Cock.*—1, R. Brownlie. 2, T. Barker. 3, D. Teviotdale. *Hen.*—1 and 3, T. Barker. 2, W. C. Baxter. *hc*, R. Brownlie. *c*, G. Bell; T. Ritchie; Mrs. Abel.

Bantams.—*Any other variety.*—1, J. Taylor. 2, R. H. Ashton. 3, R. Frew. *c*, P. Symon.

Hamburghs.—*Spangled.*—*Cock.*—1 and Cup, R. M'Donald. 2, G. Campbell. 3, T. Thomson. *hc*, G. Stalker; D. Draper, jun.; W. Ferguson; J. Stewart; J. M. Campbell (2). *c*, E. Robinson. *Hen.*—1, J. M. Campbell. 2, G. Campbell. 3, H. Wilkinson. *hc*, J. M. Campbell; G. Campbell. *c*, H. Gibson.

Hamburghs.—*Pencilled.*—*Cock.*—1, J. Taylor. 2, W. Milne. 3, G. Caithness. *Hen.*—1 and 2, R. Dickson. 3, G. Caithness. *hc*, A. Pratt. *c*, J. Taylor.

Dorkings.—*Dark.*—*Cock.*—1 and Cup, Mrs. W. Chalmers. 2, J. Clark. 3, J. Turnbull. *hc*, A. Bruce; D. Draper, jun.; G. Cuthill; J. Turnbull; P. Lesslie; D. Gellatly. *Hen.*—1, 2, and 3, D. Gellatly. *hc*, Mrs. M. Chalmers; A. Bruce; D. Draper, jun.; J. Crawford; W. M'Intosh; J. Turnbull; P. Lesslie. *c*, P. Symon.

Dorkings.—*Any other colour.*—*Cock.*—1, W. Hendry. 2, J. Fothringham. 3, Mrs. J. Laird, jun. *hc*, D. Annan. *Hen.*—1 and *hc*, Mrs. J. Laird, jun. 2, Mrs. G. Armitstead. 3, J. Turnbull. *c*, W. Hendry; D. Gracie.

Brahma Pootra.—*Cock.*—1, J. A. Dempster. 2, J. Turnbull. 3, J. Smart. *hc*, A. Burnett. *Hen.*—1, H. Wyse. 2, J. Sandeman. 3, J. A. Dempster. *hc*, R. Brown; A. Burnett; H. Wilkinson. *c*, A. C. Russell; A. Fullick; W. Falknon.

Cochi China.—*Cock.*—1 and Cup, Mrs. G. Armitstead. 2, G. H. Procter. 3, Mrs. W. Steven. *hc*, A. C. Russell; R. Blyth; Mrs. W. Carnegy; W. M. J. Paton; Mrs. C. B. Taylor. *Hen.*—1, Mrs. W. Steven. 2, Mrs. W. Carnegy. 3, W. M. J. Paton. *hc*, W. M. J. Paton; G. E. Cartmell; D. Welch; J. Wyse. *c*, C. Jarvis.

Spanish.—*Cock.*—1, W. C. Hardie. 2, Mrs. W. Steven. 3, G. Stewart. *c*, H. Wilkinson. *Hen.*—1 and Cup, W. C. Hardie. 2, J. Crawford. 3, H. Wilkinson. *hc*, Mrs. W. Steven; D. Kidd; H. L. Horne.

Any other Variety.—*Cock.*—1, G. Caithness. 2, J. Taylor. 3, W. Linton (Crève-Cœur). *c*, J. Smart. *Hen.*—1, D. Draper, jun. 2, Mrs. C. B. Taylor. 3, J. M. Wilson. *hc*, Mrs. W. Steven; J. Taylor; W. Linton (Crève).

Selling Class.—*Cock.*—1, J. Morrison. 2, J. Macintosh. 3, W. Robertson. *hc*, J. Sontar; W. Falknor; A. Bruce; D. Morrison; Mrs. A. Duncan; J. Morrison; G. Cuthill; Mrs. J. Laird. *c*, P. Symon; G. Cuthill. *Hen.*—1, D. Gellatly. 2, A. Bruce. 3, D. Shepherd. *hc*, W. Stewart; J. Crawford.

PIGEONS.

Pouters.—1, J. Mullion. 2 and 3, F. M'Crae. *hc*, J. Mullion; F. M'Crae.

Carriers.—1, J. E. Spence. 2, R. J. Wilson. 3, J. R. Abel.

Fantails.—1, J. E. Spence. 2, W. Hendry. 3, J. Smart.

Tumblers.—1, J. Smart. 2 and 3, D. Kennedy.

Jacobins.—1 and 3, W. & R. Davidson. 2, W. Hendry. *hc*, J. Boath; J. E. Spence.

Any other Variety.—1, J. E. Spence. 2, J. Cowe (Ices). 3, J. Baxter (Dragoons). *c*, J. Boath (Archangels); I. M. Abel (Archangels); M. A. Frew.

CANARIES.

Scottish Fancy.—*Yellow.*—*Cock.*—1, W. & R. Davidson. 2, W. Wood. 3, A. Lowson. 4, W. Ferguson. *Hen.*—1, W. Wood. 2, A. Morris. 3, J. Shanks. 4, A. W. M'Kendrick.

Scottish Fancy.—*Buff.*—*Cock.*—1, F. Batchelor. 2, A. Morris. 3, G. Stewart. 4, A. Stewart.

Judge.—Mr. J. Martin.

HEXHAM POULTRY SHOW.

The third Show of the Hexham Ornithological Society was held on the 31st ult. and 1st inst. in the magnificent Corn Exchange. This Society is most flourishing, having by judicious management secured the confidence of the fancy, and the entries were extremely good. The pens were Fothergill's of Sunderland, and were well placed; but for the future we would certainly advise that the Hamburgh varieties and Selling classes be placed on the top tier in place of the Game and Game Bantams, for no judge can feel thoroughly satisfied after adjudicating upon these classes when placed at such a height; and these, being two of the leading ones, ought by all means to occupy a better position. All the specimens were well attended to; in fact the attendance was such as is rarely seen, large basketfuls of meal balls being in readiness on the arrival of the birds. An arrangement had been made to get all the birds that were entered at Huddersfield, but, the mail having missed at York, a large number did not arrive till one o'clock, and yet the Committee were so kind as to wait for them; but this threw the judging till very late, and the consequence was that it was far past daylight when the arbitrations were completed in the Pigeons.

In poultry, *Cochins* came first, and these were a capital lot. First and cup for the section a massive pair of Buffs, second Whites, third Buffs, and very highly commended Whites. *Brahmas* were also a good lot; the first adult well developed and good in colour; second chickens, as also the third. *Dorkings* were but poor. *Spanish* good, but not numerous. *Hamburghs* were mixed classes, and only good as regards the prizewinners. The first Gold-pencils were very good. *Polish*, all noticed, were first and third Gold, and second White-crested Black. *French* were a fair class. The section cup pen, a grand pair of La Flèche, won the first here; second a very good pair of Houdans. *Malays* were a fair lot and all Reds. *Game* were next, Reds being a heavy class. First a handsome pair of Brown Red chickens; second also Brown Reds, and third Black Reds; the pullet in this pen spoiling their chance with colour, being too red. In the following class was one of the best pens of Duckwing chickens we have seen this season, and the cup for Game was awarded here. Red Game *Bantams* were a large class, and, as before stated, were very difficult to handle, being placed too high. The winners were all Black Reds, the first and second chickens, and third old birds, most of the birds being full of style and quality; the first very smart and stylish. In the following class the whole of the prizes were won by the same exhibitors, the first to Piles, and second and third to Duckwings; but the latter were not well matched, one pen containing a grand cockerel, and the other a capital pullet. In the next class Silver Sebrights were first, and Blacks second and third. Single Bantam cocks were a capital lot, the first and cup for Bantams going to one of the best Black Reds we have ever seen—a bird, in fact, that compels us to ask, Where can the next improvement be made? The second and third, also Black Reds, were very good. In the Variety class the first were a fine pen of Turkeys, second Black Hamburghs, and third Guinea Fowls. *Ducks* were very good throughout, and the cup awarded to a massive pair of Aylesburys. The Selling classes were very large, and many very good birds competed, eighty-nine pens in all.

Pigeons had an excellent room, the light being equal and good in all points, the Pouters placed in a grand position for showing themselves. Black Red and Yellow cocks were a capital lot, but the cup was won by a large Yellow hen. In Any other colour were thirteen good Blue cocks, but the first went to a capital White. Both classes of Carriers were very good; the cup was won by a good Dun cock. In young birds several were unnoticed by the Judge as looking too old. Almonds were a wonderful class, while in the other colours were some capital headed birds, first going to a splendid Yellow Whole-feather, second to Black Mottle, and third to Yellow Agate. Barbs were good, Dun first, Black second, and Yellow third. Foreign Owls were a capital lot; the first and third White, and second Blue. Jacobins were both good classes; as also the Dragoons, and birds of the right stamp being placed in all cases. In Short-faced Antwerps Mr. Gamon cleared the deck with some good birds, his old Red Chequer being placed first; but we must

confess a preference for that gentleman's Silver Dun. Long-faced were very good and well placed; and English Owls a grand class. After this point the birds were judged under great disadvantage, it being dark, and the hall had to be lighted. There were three classes for Turbits, and these well filled, and some exquisite birds were shown. Long-faced Tumblers were also provided with three classes, and these were very good, especially the Mottles in the Variety class. Frillbacks had also a class, and here Mr. Ord was to the front with some grand birds; we think and hope with those that were lost in transit from the Washington Show. Nuns were all Black; but in Magpies the first was Yellow, second Red, and third Black. In the next class Mr. Yardley won the cup with his Satinette, the second going to an Ice, and third to Turbiteens. There were some good birds in the Selling classes; but these were not proportionately large with the poultry classes.

The show of *Cage Birds* was large and good.

Lop-eared *Rabbits* were but moderate, but the variety good, but many pens were empty in this section, no doubt on account of the intense cold.

Cats were provided with two classes, and the entries very good; but the Long-haired were but moderate in quality. In the Variety class were some handsome Cats; the first a Silver-Grey Tabby; second Tortoiseshell of fair quality; and third Black, many others being noticed, and an extra prize awarded. These were mostly by local exhibitors, and they were certainly a great credit to the exhibitors.

COCHINS.—1, Cup, and 2, G. H. Procter, Durham. 3, G. E. Cartmel, Kendal. *vhc*, J. Benn, Matfen. *hc*, W. Stephenson, Dudley; Mrs. Lowray, Corbridge. *c*, I. Baty, jun., Hexham.

BRAHMA POOTRAS.—1, J. Watts, King's Heath, Birmingham. 2, R. Maxwell, Dumfries. 3, H. Wilkinson, Earby. *vhc*, W. Swann, Bedlington. *hc*, T. Allan; W. Nattrass, Alston; T. Webb, Sutton Coldfield. *c*, J. H. Davison; Mrs. Elliason.

DORKINGS.—1, G. Pounder, Kirby Moorside. 2. J. Coulson, Shotley Bridge. 3, J. Watts. *hc*, Simpson & Dodd, Bedale; R. Reed, Hollinhurst. *c*, R. Reed.

SPANISH.—1, H. Wilkinson. 2, Willoughby & Purvis, Hexham. 3, W. Jagga, Blyth.

HAMBURGHS (Gold or Silver-spangled).—1, J. Stewart, Dudley. 2, R. Keenleyside, Aycliffe. 3, G. Dodd, Clowsgillhouse. *hc*, G. Alderson, Hartlepool; D. C. Cheyne, Cowpen.

HAMBURGHS (Gold or Silver-pencilled)—1, D. C. Cheyne. 2, W. Dixon, jun., Shipley. 3, R. Blackburn, New Choppington. *vhc*, Parsons & Wilson, Bedlington. *hc*, A. S. Stephenson, Dudley; G. Alderson; Robson & Linton, Crook; B. Myers, Birtswith *c*, Robertshaw & Dean, Ovenden; W. Wilson.

POLISH.—1, T. Dean, Keighley. 2, T. Webb. 3, J. T. Proud, Binchester. *hc*, Parsons & Wilson. *c*, J. Jackson.

FRENCH.—1 and Cup, E. Walton, Hornclife. 2, J. G. Milner, Hamsterley. 3, H. Robinson, Wigton. *vhc*, G. A. Tate, South Shields. *hc*, M. Lamb; J. Bedn.

MALAYS.—1, J. F. Walton, Rawtenstall. 2, R. Hawkins, Seaham. 3, E. Symons, Hebburn New Town.

GAME (Black or Brown Reds).—1, W. Ormarod, Walsden. 2, H. Leighton, Milnthorpe. 3, Miss M. J. Nelson, Cockshaw. *vhc*, T. Dodd, Seaton Burn. *hc*, J. Stark; Mrs. M. Young, Bebside; J. Durning; Webster & Adams; R. White; Miss M. J. Nelson. *c*, T. Young.

GAME (Any other colour).—1 and Cup, Miss M. J. Nelson. 2, J. F. Walton. 3, T. Young, Morpeth. *hc*, Webster & Adams, Beverley; R. White, Cockshaw. *c*, W. Teasdale.

GAME BANTAMS (Black or Brown Reds).—1, E. Walton. 2, W. Atkinson, Kendal. 3, W. Wardle, South Goaforth. *vhc*, G. Bell, North Seaton; Miss M. J. Nelson. *hc*, J. Short; T. Hedley, Hexham; R. Smith; Webster & Adams; Miss M. J. Nelson. *c*, W. Atkinson; R. White.

GAME BANTAMS (Any other colour).—1, 2, and 3, Miss M. J. Nelson. *hc*, E. Walton; J. Cook; R. White; Mrs. J. Dye, Hexham. *c*, G. F. Hedley.

BANTAMS (Any variety except Game).—1, T. P. Carver, Langthorpe. 2, J. Watts. 3, R. H. Ashton, Muttram. *vhc*, J. G. Milner. *hc*, J. Durning.

BAMTAMS (Any variety).—*Cock.*—1 and Cup, Miss M. J. Nelson. 2, M. Young. *vhc*, J. Short. *hc*, H. H. Thompson; W. Wardle; J. Cooke. *c*, R. Hope; H. H. Thompson; W. Atkinson; E. Walton.

BARN-DOOR FOWLS.—1, G. Robinson, North Frodingham. 2, G. Pounder, Blackburn. 3, H. Cotes, Darlington. *hc*, G. Robinson; J. Gales.

ANY OTHER VARIETY.—1, J. T. Prond. 2, T. P. Carver. 3, W. H. Young, Driffield. *vhc*, T. Marplaa. *hc*, E. Walker; W. Wilson. *c*, Miss G. B. Elliott; H. A. Cave.

DUCKS (Aylesbury).—1 and Cup, W. Stonehouse, Whitby. 2. T. P. Carver. 3, G. Surtees, Hesley. *hc*, Robson & Linton; C. Holt. *c*, F. E. Gibson.

DUCKS (Any other variety).—1, Miss M. J. Nelson. 2, R. White. 3, W. Swann. *vhc*, T. Wakefield. *hc*, Mrs. Lowrey; Miss M. J. Nelson. *c*, Miss J. Walker.

SELLING CLASS.—*Cock or Drake.*—1, Mrs. W. Ridley, Hexham. 2, J. S. Rooth, Chesterfield. 3, G. E. Cartmel. 4, D. & J. Ibetson, Whitby. 5. E. G. Reay, Birmingham. *vhc*, Webster & Adams. *hc*, T. Dobson; J. Watts; G. H Procter; C. Venables, Castle Eden; H. Dale; G. Dodd; W. Ormerod; J. T. Proud; R. Smith; J. H. Davison; B. Myers; J. Pattison; G. F. Hedley; J. Barkas, Stanhope; R. Reed; Guthrie & Hope, Hexham. *c*, G. Pounder; T. Wakefield; T. Young; G. A. Tate; G. H. Procter; Mrs. Lowrey; Miss M. J. Nelson.

SELLING CLASS.—*Hens or Ducks.*—1, Webster & Adams. 2, J. Short, Bedlington. 3, E. G. Reay, Birmingham. 4, Willoughby & Purvis, Hexham. 5, J. S. Rooth. *vhc*, G. H. Procter. *hc*, J. T. Proud; H. Civil, Hexham. *c*, T. Webb; T. A. Tata; J. Ridley, Tanfield Lea.

LOCAL CLASS.—*Chickens.*—1, M. Wilson, Anick. 2, 1. Baty, jun. 3, Miss M. J. Nelson. *hc*, W. Murray, Hexham; T. Newbegin.

PIGEONS.

POUTERS (Black, Red, or Yellow).—*Cocks.*—1, H. Pratt, Hampton-in-Arden. 2, E. Beckwith, Monkwearmouth. 3, R. Fulton, New Cross, London. *vhc*, Ridley & Dye, Hexham. *hc*, Ridley & Dye. *c*, J. M'Culloch, Moss Bank, Glasgow; R. H. Blacklock.

POUTERS (Black, Red or Yellow).—*Hens.*—1 and Cup, H. Pratt. 2, Ridley and Dye. 3, E. Beckwith. *hc*, J. M'Culloch; J. Baker, Kew Bridge, London. *c*, R. H. Blacklock, Sunderland; R. White.

POUTERS (Any other colour).—*Cocks.*—1, Guthrie & Hope. 2, Ridley & Dye. 3, R. H. Blacklock. *vhc*, H. Simpson, Cramlington. *hc*, J. M'Culloch; J. Baker. *c*, R. H. Blacklock; H. Pratt.

POUTERS (Any other colour).—*Hens.*—1, R. Fulton. 2, H. Simpson. 3, J. Baker. *vhc*, Ridley & Dye. *hc*, H. Pratt. *c*, J. M'Culloch; Ridley & Dye.

CARRIERS (Any colour).—*Cocks.*—1 and *vhc*, Ridley & Dye. 2 and 3, R. Fulton. *hc*, G. F. & A. T. Umpleby, Boroughbridge; E. Beckwith. *c*, J. & W. Towerson, Egremont.

CARRIERS (Any colour).—*Hens.*—1 and *vhc*, Ridley & Dye. 2 and 3, R. Fulton. *hc*, H. Yardley; W. H. A. Miller. *c*, E. Beckwith.

CARRIERS (Any colour).—*Young.*—1, G. F. & A. T. Umpleby. 2, J. Baker. 3, A. E. Massey, Spalding. *vhc*, J. Stanley, Salford. *hc*, H. Cockton, Middlesborough. *c*, A. N. Dodds, North Shields.

TUMBLERS (Short-faced Almonds).—1 and Cup, Webster & Adams. 2, R. Fulton. 3, W. R. Pratt. *vhc*, Webster & Adams. *hc*, R. Fulton. *c*, T. Rule; E. Beckwith.

TUMBLERS (Short-faced, any other colour)—1, Webster & Adams. 2, R. Fulton. 3, H. Yardley. *vhc*, R. Fulton. *hc*, E. Beckwith. *c*, J. Baker; W. B. Mapplebeck, jun.

BARBS.—1 and 3, R. Fulton. 2, J. Baker. *hc*, H. B. Massey. *c*, J. Stanley.

OWLS (Foreign).—1, J. J. Sparrow, Berkley Square, London. 2, T. Rule, Durham. 3, W. H. A. Miller, Walsall. *vhc*, W. Brydone, Langton Mains. *hc*, G. Alderson. *c*, J. J. Sparrow.

TRUMPETERS.—1 and 3, R. Fulton. 2, J. Lederer, Bootle. *hc*, T. Rule. *c*, J. and W. Towerson.

JACOBINS (Red or Yellow).—1 and 2, R. Fulton. 3, H. W. Webb, Lower Sydenham. *vhc*, W. Brydone. *hc*, W. Beckwith. *c*, G. Sadler; R. W. Richardson, Beverley; J. Baker.

JACOBINS (Any other colour).—1, R. Fulton. 2, J. Baker. 3, J. Thompson, Bingley. *hc*, T. Rule.

FANTAILS.—1, A. Smith. 2 and *c*, E. Beckwith. 3, T. Rule. *vhc*, J. F. Loversidge. *hc*, T. Rule.

DRAGOONS (Blue or Silver).—1, Ward & Rhodes, Otley. 2, W. Sefton, Blackburn. 3, W. Smith, Liverpool. *vhc*, W. Sefton. *hc*, W. Gamon; H. Yardley; W. Sefton. *c*, A. McKenzie, Liverpool; R. Fulton; Guthrie & Hope.

DRAGOONS (Any other colour).—1, F. Grnham, South Birkenhead. 2, R. Woods, Mansfield. 3, J. Watts. *vhc*, J. G. Dunn, Ryton. *hc*, F. Graham; J. G. Dunn. *c*, R. Robson, jun., Newcastle.

ANTWERPS (Short-faced).—1, 2, and 3, W. Gamon. *hc*, H. Yardley; J. Stanley. *c*, J. Lister, Keighley; J. Stanley.

ANTWERPS (Long-faced).—1, J. Lister. 2, W. Gamon. 3, J. Robertshaw, Thornton. *vhc*, W. R Pratt. *hc*, T. H. Stretch; W. Gamon. *c*, W. Gamon; R. J. Smith; Miss M. A. Clemitson, Hexham.

OWLS (English).—1, Ward & Rhodes. 2, J. Young, Bishop Auckland. 3, Miss M. A. Clemitson. *vhc*, J. W. Edge, Nuhills, Birmingham; Miss M. A. Clemitson. *hc*, W. H. A. Miller; Miss M. A. Clemitson (2).

TURBITS (Blue or Silver, Point-headed).—1, W. H. A. Miller. 2, J. Baker. 3, T. Gallon, Felling. *vhc*, M. J. Green, Hexham. *hc*, W. Croft, Killinghall, Ripley. *c*, Ridley & Dye.

TURBITS (Any other colour, Point-headed).—1 and 2, W. Croft. 3, J. Lister. *vhc*, T. Gallon. *hc*, T. S. Stephenson; H. Simpson. *c*, J. H. Hedley; J. G. Orr, Beith; M. Green, Hexham.

TURBITS (Any colour, Shell-crowned).—1, T. Gallon. 2, T. P. Carver. 3, Ridley and Dye. *vhc*, J. Baker. *hc*, W. Croft. *c*, W. Brydons; W. Croft.

TUMBLERS (Long-faced Almonds).—1, J. H. Hope, Hexham. 2, J. J. Runciman, Newcastle. 3 and *vhc*, E. Walker, Hexham. *hc*, T. C. Taylor. *c*, E. Beckwith.

TUMBLERS (Long-faced Balds).—1 and *vhc*, W. Hill, Manchester. 2, A. Jackson, Chequerbent. 3, A. J. Sticks, Newcastle. *hc*, J. Watts; T. E. Stephenson; W. J. Donkin, Newcastle. *c*, A. Jackson (3).

TUMBLERS (Long-faced Beards).—1, *hc*, and *c*, Ridley & Dye. 2, E. Beckwith. 3, W. Hill. *vhc*, J. Murray, Ouschurn.

TUMBLERS (Long-faced, any other colour).—1, J. Ford, London. 2, W. B. Mapplebeck, jun. 3, J. Watts. *vhc*, J. G. Orr. *hc*, W. Hill (2); Ridley & Dye. *c*, W. A. Hyde; Miss M. A. Clemitson.

FRILLBACKS.—1, 3, and *c*, M. Ord, Sedgfield. 2, J. & W. Towerson. *hc*, H. W. Webb.

NUNS.—1, W. Croft. 2, T. P. Carver. 3, J. Watts. *vhc*, R. W. Richardson. *hc*, J. Baker. *c*, W. Croft.

MAGPIES.—1 and 2, P. Wilson, Pegswood. 3, J. Bakar. *vhc*, J. Watts, *hc*, E. Beckwith. *c*, M. Ord.

ANY OTHER VARIETY.—1, H. Yardley. 2, M. Ord. 3, R. Fulton. *vhc*, J. Watts. *hc*, J. Watts; T. Gallon. *c*, J. & W. Towerson; H. W. Webb.

SELLING CLASS.—*Pair.*—1, G. F. & A. T. Umpleby. 2, J. Murray. 3, H. Simpson. 4, W. F. Clark, Newcastle. 5, J. F. Loveraidge. *vhc*, J. Thompson; J. Smart. *hc*, J. Watts; E. Beckwith. *c*, W. Nottage; J. Smart.

SELLING CLASS.—*Single Bird.*—1, A. B. Massey. 2, G. F. & A. T. Umpleby. 3, J. Young. 4, W. Moore, Pickering. 5, T. Paxton, Hexham. *vhc*, Ridley and Dye; Guthrie & Hope. *hc*, J. Robertshaw; Ward & Rhodes. *c*, Ridley & Dye; E. Beckwith; J. Young.

CAGE BIRDS.

BELGIANS.—1, 2, and 3, J. Rutter, Sunderland.

NORWICH.—1, J. Stephens, Middlesborough. 2, T. Tenniswood, North Acklam. 3, Cleminson & Ellerton, Darlington. *vhc*, W. Smith, Birmingham. *c*, M. P. Potts, Leadgate (2); J. Bexson, Derby; A. Armstrong, Newcastle (2); W. Smith (2); Cleminson & Ellerton; Baxter & Percival, Newcastle.

CREST (Any variety).—1 and *hc*, W. J. Hampton, Darlington. 2, B. Hackworth, Newcastle. 3, Baxter & Percival.

LIZARD.—1 and 2, R. Ritchie, Darlington. 3, Cleminson & Ellerton.

EVEN-MARKED (Any breed).—1, T. Clemitson. 2, J. Rutter. 3, J. Gilhespie. *vhc*, W. Henderson, Whithy; J. Gilhespie. *hc*, W. C. Burniston, Middlesborough; T. Bainbridge.

CINNAMON.—1 and 2, Cleminson & Ellerton. 3, W. Smith. *c*, R. Hawman; W. Smith.

GLASGOW DONS.—1, T. Smith, Newcastle. 2, W. Clark. 3, J. Davison, Seaton Burn. *vhc*, W. Clark; C. Hobkirk, Newcastle. *hc*, H. Armstrong *c*, W. Redhead; J. Davison; W. Clark; R. Gilhespie.

GREEN CANARY.—1, H. Armstrong, Newcastle. 2 and 3, J. Allison. *vhc*, W. Redhead. *hc*, J. Stephens; T. Tenniswood. *c*, Robson & Linton.

MULE (Clear or Marked).—1, R. Hawman. 2, J. Stevens. 3, G. Stephenson. *vhc*, J. Bexson.

MULE (Dark).—1, R. Simpson, Whithy. 2, R. Hawman, Middlesborough. 3, J. Bexson.

GOLDFINCH (Moulted).—1, W. & C. Burniston. 2, W. Rogers. 3, Robson and Linton. *c*, G. Stewart.

LINNET (Moulted).—1, G. Stephenson, Gateshead. 2, T. Hedley. 3, W. Carrick, Middlesborough. *hc*, J. Maddison.

BRITISH BIRDS (Any other variety).—1, J. J. Jameson, Hexham. 2, Baxter and Percival. 3, R. Pearson, Whithy.

FOREIGN BIRDS (Any variety).—1 and Medal, T. Barrow, Monkwearmouth. 2, W. Haxwell, Newcastle. 3, Baxter & Percival. *hc*, E. Hutchinson.

COLLECTION OF SIX CAGE BIRDS.—1, Cleminson & Ellerton. 2, W. J. Hampton. 3, Baxter & Percival.

SELLING CLASS.—1, R. Simpson. 2, J. Bexson. 3, T. Clemitson. *hc*, W. & C. Burniston; J. Stevens; T. Clemitson; R. Pearson. *c*, W. Smith.

RABBITS.

LOP.—1, J. Murray, Ouschurn. 2, E. J. Tall. 3, J. Jackson, Tow Law. *hc*, T. Northorpe, Monkwearmouth; J. S. Robinson, Darlington; J. Lumaden, Gateshead. *c*, T. Northorpe.

ANY OTHER VARIETY.—1 and Medal, E. Walton, Hornclife. 2, 3, *vhc*, and *hc*, J. H. Hedley, Hexham.

CATS.

LONG-HAIRED.—1, 3, and *hc*, Mrs. E. Charlton, Hexham. 2, Mrs. F. J. Shields, Hexham. *c*, Dr. A. Hayes.

ANY OTHER VARIETY.—1, Mrs. F. J. Shields. 2, J. H. Hedley, Hexham. 3, J. Sargisson. 4, J. Robson. *vhc*, A. Scott, Hexham; W. Taylor, Hexham. *hc*, D. Nichol, Morpeth; M. Welch, Hexham; J. Hunter, Hexham; M. S Temple, Hexham. *c*, Miss H. F. Young, Hexham; J. Fenwick, Hexham; H. Lishman, Ryton-on-Tyne; R. White, Cockshaw.

The Judges were of—*Poultry, Rabbits, and Cats:* Mr. E. Hutton, Pudsey, Leeds. *Pigeons:* Mr. H. Allsop, Spencer

Street, Birmingham. *Cage Birds:* Mr. W. A. Blakston, Sunderland.

CUPAR ORNITHOLOGICAL SOCIETY'S SHOW.

THE first Show of poultry, Pigeons, and Canaries was held in the Corn Exchange, Cupar, on the 31st of December and 1st of January. There was a fair assemblage in most of the classes, as a pretty liberal schedule deserved. With some exceptions the quality was good throughout. Silver-Grey *Dorkings*, cock and hen, were a fair lot and well judged, which may be also said of the Dark Dorkings, which came next. The latter were not so good nor so numerous. *Spanish* were a capital class, first and second being specially notable; but the second we thought fully better than the first. *Brahmas* were very poor; the first-prize pen was one of the worst of them, the cock especially we could not see a single good point in. The next class was rather a mixture of nationalities, being for the best pen of *Scotch Greys* or *Polands*. First went to the former deservedly; second Golden Polands of small merit, seemingly introduced merely to countenance the foreign element in the class. *Cochins* were headed by a pen of Whites of no great merit, the cock being fully more yellow than white, and looking as if he had been overdone with washing-blue. Second were the best pen in the class, and should have been easily first. *Hamburghs* were divided into Spangled and Pencilled, and were the two best classes in the Show. In Spangled, first were good Silvers well placed; second and third Golden, all good. Pencilled were a fine lot, and must have troubled the Judge a good deal. First went to Golden, the hen in which was a beauty; but the cock, though otherwise good, had an ugly twisted neck-hackle. Second were Silvers: here again the hen was very good and the cock faulty. We liked the highly commended pen as well as any. *Game* were well judged, amongst them nothing noticeable. Game *Bantams* (Reds)—first one of the nicest pens we ever saw, only excelled by the same owner's well-known Pile in the next class, also an easy winner. Any other variety Bantams—first Silver Sebright, second Black, third Golden Sebright, all fairish birds. Any other variety contained some first-class birds, the pick of them being Mrs. Frew's very highly commended pen of Crêves. First were a pen of Houdans, fair birds, but not so good of their breed as pen 135, commended, also Houdans. Second were a pair of Silkies; third a pair of we don't know what—apparently meant for Leghorns, very ugly. *Ducks*, for which there were three classes, were both numerous and good, as were also *Turkeys*.

Pigeons were a small show. Pouters were fair; first and second Whites, third Reds. Fantails, first and second first-rate, others not worth taking home. Carriers had only three entries and the prizes withheld, Mr. Smith's pair of fine birds apparently frightening away all comers. Tumblers, no competition. Any other variety, a large class; first fine Dun Barbs, second and third Jacobins.

DORKINGS.—*Silver-Grey.*—1 and *hc*, D. Annan, Cupar. 2, Admiral Dongall' Scotscraig. 3, D. Sime, Letham. *c*, R. Blyth, Kettle. *Coloured.*—1, R. Boyle, Carnoustie. 2 and 3, D. Annan.

SPANISH.—1, W. Smith, Cupar. 2, J. Norval, Alloa. 3, W. M'Beath, Tillicoultry. *c*, J. Wright, Tillicoultry.

BRAHMAS.—1, Miss G. Morrison, Kirkcaldy. 2 and *hc*, W. G. Duncan, Dundee, 3, D. Annan. *c*, W. Bruce, St Andrew's.

SCOTCH GREY AND POLES.—1, D. Annan. 2, J. Laird, Johnstone. 3, R. Scott, Longrigg. *c*, D. Waldie, Edinburgh.

COCHIN-CHINA.—1, R. Blyth. 2, J. Ireland, Tayport. 3, J. Williamson, Edinburgh. *c*, G. Wilson.

HAMBURGHS.—*Spangled.*—1, Mrs Keddie, Cowdenbeath. 2, D. Jackson, jun.; Newburgh. 3, R. Clark, Newburgh. *hc*, J. Ireland; J. M'Andrew, Carnoustie; R. Clarke. *Pencilled.*—1, A. Pratt, Ceres. 2, R. Clarke. 3, A. Wallace, jun., Cupar. *hc*, J. Pratt. *c*, J. Miller, Falkland; A. Wallace, jun.; P. Campbell' Markinch.

GAME.—*Black or Brown Reds.*—1 and 2, R. Stewart, Blairadam. 3, R. Clark. *c*, A. W. Penman, Leslie. *Any other colour.*—1, R. Stewart, 2, J. Hall, Leslie. 3, Master A. Frew, Sinclairtown.

BANTAMS.—*Reds.*—1, R. Brownlie, Kirkcaldy. 2, D. Nairn, Cupar. 3, D. S. Edmond, Cupar. *hc*, Miss R. P. Frew. *c*, J. T. Cathcart, Pitcairlie. *Any other colour.*—1, R. Brownlie. 2, Miss R. C. Frew. 3, R. Anderson. *Any other variety.*—1, Miss R. Frew. 2, Miss B. P. Frew. 3, W. Phillips, Montrose.

ANY OTHER PURE BREED.—1, R. Blyth. 2, Miss J. M. Frew, Sinclairtown. 3, A. Angus, Kettle, *vhc*, Mrs. R. Frew, Sinclairtown. *hc*, J. Sandeman. *c*, J. Smart; Mrs. Dykes, Cupar.

DUCKS.—*Aylesbury.*—1, W. Bogie, Cupar. 2, R. Sorley, Lathrisk. 3 and *c*, J. Tod, Cupar. *Rouen.*—1 and 2, Admiral M. Dongall. 3, D. B. Meldrum, St, Andrews. *Any other pure breed.*—*hc*, J. Tod. *c*, J. T. Cathcart.

TURKEYS.—*Any variety.*—1, Mrs. Cathcart, Pitcairlie. 2 and *vhc*, D. Annan. 3 and *hc*, Admiral M. Dongall.

SELLING CLASS.—*Cock*—1, J. Curr, Newburgh. 2, R. Stewart. 3, T. Williamson, Falkland. *hc*, J. Curr, Newburgh; A. Pratt. *c*, J. Denmilne; R. Anderson; D. Annan. *Hens.*—1, A. Ridpath, Edinburgh. 2 and 3, D. Annan. *vhc*, A. Pratt, Kirkcaldy. *hc*, R. Anderson; T. Williamson. *c*, Miss A. B. Paul; G. Wallace; Miss R. Frew.

PIGEONS.

POUTERS.—*Any colour.*—1, 2, and 3, G. Henderson, Pitlessie. *c*, J. E. Spence.

FANTAILS.—*Any colour.*—1, A. Smith, Broughty Ferry. 2, J. E. Spence, Broughty Ferry. 3, D. L. Russell, Cupar.

CARRIERS.—*hc*, A. Smith.

ANY OTHER VARIETY.—1, J. E. Spence. 2, A. M'Conachie, Kirkcaldy. 3, J. T. Cathcart. *c*, R. J. Wilson.

SELLING CLASS.—1, J. E. Spence. 2, G. Grieve, Cupar. 3, Miss R. Frew, Kirkcaldy.

CANARIES.

SCOTCH FANCY.—*Yellow.*—*Cock.*—1, J. Pratt. 2, G. Paul, Glasgow. 3, W. Paton. *hc*, D. Stewart. *Hen.*—1 and 3, W. Paton. 2, J. Pratt. *hc*, J. Wright. *Buff.*—*Cock.*—1 and 2, W. Paton. 3, J. Culbert, Cupar. *Hen.*—1, D. Stewart, Cupar. 2, B. Currens, Cowdenbeath. 3, J. Culbert.

PIEBALD FANCY.—*Yellow.*—*Cock.*—1, R. Dalrymple, Dundee. 2, J. Pratt. 3, J. Culbert. *Hen.*—1, R. Dalrymple. 2, W. Paton. 3, J. Pratt. *Buff.*—*Cock.*—1 and 3, W. Paton. 2, B. Currens. *Hen.*—1, T. Curran, Cowdenbeath. 2, J. Thomson, Markinch. 3, G. Spence, Coalgate, Dysart.

MULES.—1, Mrs. W. Walker, Cupar. 2 and *c*, W. Kirk, Dunfermline. 3, T. Wotherspoon, Treulaws, Leslie, *hc*, D. Black, Ceres.

SELLING CLASS.—1, J. Stewart, Cupar. 2, J. Ramsay, Ferrybank, Cupar. 3, *hc*, and *c*, W. Paton.

RABBITS.—*Any breed.*—1, 2, and 3, D. L. Russell.

JUDGES.—*Poultry:* Mr. Brown, Perth. *Pigeons and Canaries:* Mr. McGill, Elie.

HITCHIN POULTRY SHOW.

THE second annual Show of the Herts and Beds Agricultural Society was held on December 31st and January 1st, at Hitchin. The Committee are to be congratulated on its great success both as to the number and quality of the birds, which far exceeded that of their Show last year. We only wish the Show-room had been better filled with visitors than it was on the first day. The management seemed excellent and orderly to the minutest detail. The cold was intense, and everything was done that could possibly contribute to the comfort of the birds. Little gas stoves were kept burning, and Spratt's food was given mixed hot with barleymeal and beer. One or two birds were cramped from their long cold journeys, but these were taken to a fire. If such care were only taken at all shows we should be much more willing to trust our best birds on long expeditions.

Dorkings were divided into two classes. The cup pair of Coloured birds were admirable, short on the leg and deep-breasted, and of the true Dorking type. Second were large and fine birds, but far longer on the leg. The third pen contained a beautiful cockerel with a fair pullet. Mr. Darby showed a nice Rose-combed pair, but the cock's comb apparently prevented their winning. In the class for Any other variety Dorkings a lovely White pair took the cup. We were sorry to see the cock's grand sickles broken from that common omission, a bit of canvas behind the open pens. Silvers were second, a large and handsome pair, but the hen somewhat red in wing. The third pen contained a spendid cockerel, but the hen seemed pinched with cold. *Cochins.*—The Buff class was poor. The first-prize pair were good, but the cock in the second pen had a bad comb, and the hen was poor and uneven in colour. We should have placed Mr. Burnell's highly-commended pen second, the only fault in it being that the hen was too pale to match the cock. The third-prize was the only patent error we saw in judging. They were in bad condition, and the hen had a darkly-striped neck-hackle. In the other Cochin class a noble pair of Partridge chickens were first. Second were Mr. Woodgate's Whites in excellent feather and trim, the cock singularly pure in colour. Third also went to Whites. Pen 42 (Fowler) contained beautifully-shown Whites, but the hen insufficiently feathered on the legs. In pen 41 (Shrimpton) was a very young and promising Partridge cockerel. Capt. Talbot's pens both appeared over-shown; the cock from one was obliged to be removed. *Brahmas.*—The cup pen for Darks contained an exquisitely-pencilled and now well-known pullet, the cock poorly feathered on leg and unequal to her. Mr. Lingwood took both second and third. We cannot say that we admire the style of tail of the second-prize cockerel. The hen in the third pen was a beautifully-pencilled bird, and the cock, though not large, a finely-shaped bird, and well feathered. The fourth pair were out of condition, and the hen coarse in pencilling. We liked pen 61 (Percival). In Lights the cup cock was a noble bird, slightly tinged with yellow, but otherwise good in every point; the hen perhaps hardly his equal. The second cock was decidedly small, but unexceptionable in points save white in his tail; the hen magnificently hackled, but she showed a little brown on the back. Third an excellent cock with beautifully-edged sickle; the hen poorly feathered, but very white. *Crèves.*—The cup cock was deficient in crest, but short-legged, and our ideal of a Crève in shape. Second cock magnificent in crest, but both he and the hen coarse in comb, and not in first-rate condition. Third was a grand cockerel, too long in the leg, still we should have put the pen second. Mr. Knight showed a nice pair. *Houdans.*—Here we did not entirely agree with the awards. In the first-prize pen the cock was very dark, with straw colour in his saddle hackle, and the hen small. Second a fine cock, to our idea somewhat too dark; the hen nicely mixed in colour, but not large. Mrs. Vallance's third-prize pen had fine tufts, and were excellent in colour; we should have placed them first. Mr. Quibell's very-highly-commended pen were decidedly good. *Game* had two classes. In that for Reds Mr. Matthew took the cup with a splendid pair of Brown Reds, entered as Black Reds. Mr. Pope's second-prize pen contained a perfect Black Red pullet. Brown Reds were third. In the other class Mr. Winwood was first with small Duckwings good in colour. Second were Piles. Pen 141 (Mason) contained a noble Duckwing cock, though too full in tail. *Spanish* were few, but good. The first pair excellent all round, young birds, and in beautiful condition. The face of the second cock singularly large and smooth. *Hamburghs* had five classes, and were a most remarkable lot for the south of England. The awards in these classes were not

finished when the doors were opened, and the Judge appeared to take immense pains in sifting their merits. Golden-spangles came first. The first-prize birds in faultless condition and good. Third coarse in comb. A nice pen of Mr. Tickner's would have won but for poor condition. The cup for the best pen of Hamburghs went to Mr. Beldon's Silver-spangles, a superb pair, with spangles beautifully round without being too dense. Third were neater birds than the second, but with less round spangling. In Golden-pencils there were seventeen entries, and the competition very close. Mr. Cresswell's first-prize cock was a beautiful bird, and the pullet wonderfully barred on the tail. Second also an excellent pair. The third cock by no means equal in comb to the first and second, but the hen well and evenly barred. Pen 173 (Long) were prevented by condition from winning. Silver-pencils were by no means equal to the Golden. The first cock had a nice tail, but his comb-peak was crooked. In Blacks the prize birds were good, the rest of the class not remarkable. *Any other variety.*—This class was not well filled, but the first (Golden) and the second (Silver) Polands were grand and valuable pens. The Local class was large and well filled. Cochins seem special favourites in these counties. *Bantams* had four classes. In that for Red Game the winners were all Black Reds. First very small; second a well-shaped cockerel; third very stylish. The Black Rose-combed were fair, but not remarkable. A rich-coloured, though somewhat large, pair of Gold-laced were first in the Variety class, and well-shown White-booted second. *Ducks* had four classes and one cup, which was awarded to Mrs. Acton Tindal's Aylesburys. They were apparently hard pressed by a gigantic pair of Mr. Fowler's.

Pigeons had nineteen classes and four cups between them. Days are now too short to examine every pen in a show minutely. *Pouters* and *Carriers*, each with two classes, contended for the first cup, which went to Mr. Yardley's grand Black Carrier cock, a marvellous bird in wattle. We admired the form of the third Dun Carrier cock. Pouters were not specially good. In cocks a Black was first, in hens a Red. *Barbs*, *Tumblers*, *Owls* (English and foreign), and *Turbits* contended for the second cup, which was awarded to an exquisite black-shouldered Turbit, perfect in form and very rich in colour. The English Owls and Turbits were both remarkable classes. In the third group the cup was taken by a very pretty White Jacobin. The *Jacobin* class was generally good. Two neat Reds were equal second, and a Black third. Mr. Serjeantson's *Fantails* were very perfect, especially the first-prize bird; they were large birds. Third was a little Scotch bird with beautiful carriage. *Dragoons* had three classes and a cup between them. The class for Blue or Silvers was an extraordinary one, though the cup was awarded to the first bird in the Red and Yellow class. An Archangel was first in the Variety class, and a Magpie second. The Pigeous were shown singly throughout. From an unfortunate mistake in one of our contemporaries paire were sent in many instances, and of conrse disqualified.

The Show promises to be a leading one, and deserves all support. Hitchin is so easily reached from London that we cannot bnt think there would have been many more visitors but for the intense severity of the weather.

Dorkings (Coloured).—1, F. Parlett, Great Baddow. 2, Rev. E. Bartrum, Berkhampstead. 3, C. Turner, Abbotts Ripton. *hc*, J. Gee, Oxford; J. James, Fen Ditton; Mrs. J. E. Allerton, Leighton Buzzard.

Judges.—*Poultry:* Mr. W. H. Nichols. *Pigeons:* Mr. P. H. Jones, and Mr. F. Gresham.

MIDDLESBOROUGH PIGEON SHOW.

This was held in the Odd-Fellows Hall on the 29th and 30th of December. The following is a list of the awards:—

Pouters—*Red or Yellow.*—*Cocks.*—1, A. Shaw, Middlesborough. 2, T. Wood. *hc*, E. Horner, Harewood, Leeds. *c*, E. Beckwith, Monkwearmouth. *Hens.*—1, R. Blacklock, Sunderland. 2, E. Horner. *hc*, J. Hairsine, Hull.

Pouters.—*Blue.*—*Cocks.*—1, E. Beckwith. 2, E. Horner. *vhc*, J. P. Fawcett, Flowergate, Whitby. *Hens.*—1, E. Beckwith. 2, J. Harrison, York. *hc*, E. Horner.

Pouters.—*Any other colour*—*Cocks.*—1, H. Severs, Middlesborough. 2, R. Blacklock. *vhc*, G. H. Lambert, Whitby. *Hens.*—1, E. Horner. 2, G. Destner, Driffield. *vhc*, H. Severs. *hc*, H. Mapplebeck, Birmingham.

Carriers.—*Black.*—*Cocks.*—1, T. H. Stretch, Ormskirk. 2, E. Horner. *hc*, E. Beckwith; E. Horner. *Hens.*—1 and 2, E. Horner. *hc*, H. Yardley, Market Hall, Birmingham.

Carriers.—*Any other colour.*—*Cocks.*—1, E. Horner. 2, H. Yardley. *Hens.*—1, E. Horner. 2 and *vhc*, E. Beckwith. *c*, H. Severs; H. Yardley.

Tumblers.—*Short-faced Almond.*—*Cock or Hen.*—1, E. Beckwith. 2, H. Yardley. *vhc*, E. Horner.

Tumblers.—*Short-faced any other colour.*—*Cock or Hen.*—1, *vhc*, and *hc*, E. Beckwith. 2, H. Yardley.

Tumblers.—*Long-faced, any colour.*—*Cock or Hen.*—1 and *hc*, E. Beckwith 2, T. C. Taylor, Middlesborough. *c*, E. Horner.

Owls.—*English.*—*Cock or Hen.*—1, J. Young, Bishop Auckland. 2, A. Mackenzie, Liverpool. *vhc*, W. B. Miller, Walsall. *hc*, J. Richmond, Oswaldwistle. *c*, G. Alderson, West Hartlepool. *Foreign.*—*Cock or Hen.*—1, S. Lawson, Preston. 2, J. J. Stott, Preston. *vhc*, J. J. Sparrow, Grosvenor Mews, London. *hc*, G. Alderson. *c*, E. Horner.

Turbits.—*Red or Yellow.*—*Cock or Hen.*—1, T. S. Stephenson, Newbegin, Beverley. 2, E. Horner. *vhc*, H. Mappleheck. *c*, E. A. Thornton, Hull. *Any other colour.*—*Cock or Hen.*—1, W. Moore, Pickering. 2, G. Alderson. *vhc*, J. Young. *hc*, E. A. Thornton.

Trumpeters.—*Cock or Hen.*—1, J. Lederer. 2, E. Horner. *hc*, H. A. Ayrton, Saltburn.

Dragoons.—*Cock or Hen.*—1, A. Boote. 2, R. Woods. *vhc*, A. Boote, Crewe; J. G. Dunn, Ryton-on-Tyne. *hc*, R. Woods, Mansfield; W. Smith, Liverpool.

Barbs.—*Black.*—*Cock or Hen.*—1 and *vhc*, E. Horner. 2 and *hc*, E. Beckwith. *Any other colour.*—*Cock or Hen.*—1, E. Beckwith. 2, W. Bulmer, Stockton-on-Tees. *vhc*, H. Yardley.

Fantails.—*Cock or Hen.*—1 and *hc*, E. Beckwith. 2, J. F. Loversidge, Newark. *vhc*, E. Horner.

Jacobins.—*Red or Yellow.*—*Cock or Hen.*—1, J. Smith, Walkley, Sheffield. 2, W. Stirling, Queenstown. *vhc*, J. Aconley, Pickering. *hc*, J. Thompson, Middlesborough; S. Lawson; T. C. Taylor.

Nuns.—*Cock or Hen.*—1 and 2, E. Horner. *hc*, W. Bulmer. *c*, J. Young.

Magpies.—*Cock or Hen.*—1, J. Richmond. 2, M. Ord, Sedgfield, Durham. *hc*, E. Beckwith; R. H. Scott, York; E. Horner.

Antwerps.—*Short-faced.*—*Cock or Hen.*—1, J. Watts, King's Heath, Birmingham. 2, J. Smith. *vhc*, J. J. Stott. *hc*, W. Ellia, Idle, Leeds. *Long-faced.*—*Cock or Hen.*—1, R. Blacklock. 2, E. Horner. *hc*, W. Ellia. *c*, J. J. Sparrow.

Any other Variety.—*Cock or Hen.*—1, H. Mappleheck. 2, J. Richmond. *vhc*, M. Ord.

Selling Class.—*Price not to exceed £2.*—*Cocks or Hens.*—1, J. Young. 2, J. R. Torbock, Middlesborough. *vhc*, H. A. Ayrton. *hc*, J. R. Torbock. *Price not to exceed £1.*—*Cocks or Hens.*—1 and *vhc*, J. R. Torbock. 2, F. Hodgson, *c*, E. Beckwith; J. Watts.

BIRMINGHAM COLUMBARIAN SOCIETY'S EXHIBITION.

This was held in the Athenæum Rooms, Temple Street, Birmingham, on December 31st, 1874. There were fifty-six exhibitors and 559 pens.

YOUNG SINGLE BIRDS, EITHER SEX.

Carriers.—*Black.*—Cup and 3, H. Hallam, Birmingham. 1, G. Gordin, Birmingham. 2, T. Hallam. *hc*, G. E. Sawdon, Leede; F. Smith, Selly Oak; H. Allsopp, Birmingham; G. F. Whitehouse, King's Heath; Capt. De Winton, Hereford; T. Hallam, Birmingham. *Dun.*—1, A. Billyeald, Nottingham. 2 and 3, Capt. De Winton. *hc*, W. Cartwright, Birmingham; E. T. Dew, Weston-super-Mare; G. Gordin. *Any other colour.*—1, E. T. Dew. 2 and 3, J. Watts, King's Heath, Birmingham.

Pouters.—*Blue.*—1, H. Pratt, Hampton-in-Arden. Cup and 2, G. Holloway, jun., Strond. 3, J. Guthrie, Hexham. *hc*, R. Barratt, Stroud; G. Holloway, jun. *Black.*—1, H. Pratt. *Red.*—1, 2, and 3, H. Pratt. *Yellow.*—Cup, 1, 2, and 3, H. Pratt *White.*—Cup, 1, and 2, H. Pratt. 3, H. Simpson. *c*, H. Simpson, Spalding; J. E. Spence, Bronghty Ferry.

Tumblers.—*Almond.*—1 and 2, T. Hallam. 3, R. Barratt. *Mufed.*—Cup, 1, and 3, E. D. Careless. 2, F. Bowker, Edgbaston. *hc*, J. Watts. *c*, E. D. Careless (2).

Tumblers.—*Short-faced.*—*Baldheads.*—1 and 2, W. Woodhouse, King's Lynn. *Beards.*—1, W. Woodhouse. *Any other.*—1, T. Hallam. 2 and 3, E. D. Careless. *c*, J. Watts (2); T. Hallam.

Tumblers.—*Long-faced.*—*Clean-legged.*—1 and 2, J. M. Bott, Acocks Green, 3, J. Watts. *c*, E. D. Careless; J. Guthrie. *Balds or Beards.*—Cup, 1, and 2, J. Watts. 3, W. Ridley, Hexham.

Jacobins.—*Red or Yellow.*—Cup, 1, 2, and 3, W. Woodhouse. *c*, W. T. Breeden, King's Heath (2). *Any other colour.*—Cup, 1, 2, and 3, A. A. Yander Meersch, Tooting, London, S.W.

Fantails.—Cup, 1, and 2, J. E. Spence. 3, J. F. Loversidge, Newark-on-Trent. *hc*, J. F. Loversidge; H. Simpson; F. A. Seale, Dublin (2).

Turbits.—*Red or Yellow.*—Cup, 1, and 2, W. E. Easten, Hull. 3, A. Riddell, Lichfield. *Any other colour.*—Cup and 1, W. Ridley. 2 and 3, E. T. Dew. *c*, R. W. Richardson, Beverley; E. T. Dew.

Trumpeters.—1, A. A. Vander Meersch.

Barbs.—Cup, 1, and 3, F. Smith. 2, R. W. Richardson.

Archangels.—1, G. E. Sawdon.

Nuns.—Cup, 1, and 2, A. A. Vander Meersch. 3, J. Watts. *c*, G. Packham, Exeter.

Owls.—*English.*—Cup and 1, G. E. Sawdon. 2, W. Ridley. 3 and *hc*, J. W. Ludlow, Birmingham. *c*, W. Ridley; G. E. Sawdon. *Foreign.*—2, G. Holloway, jun.

Dragoons.—*Blue.*—Cup and 1, F. Graham. 2, W. Smith. 3, W. Gamon, Chester. *hc*, G. Packham; W. Smith; W. Gamon. *c*, J. Watts. *Silver.*—1, W. Gamon. 2, J. Guthrie. 3 and *hc*, F. Graham. *Yellow and Red.*—Cup and 1, G. F. Whitehouse. 2 and 3, F. Graham. *hc*, J. Watts. *c*, R. W. Richardson. *White.*—1 and *c*, F. Graham. 2, G. Packham. 3, G. F. Whitehouse. *Any other colour.*—Cup, 1, and 2, J. G. Dunn. 3, F. Graham.

Antwerps.—*Dun.*—Cup and 1, J. W. Ludlow. 2, W. Gamon. 3, H. Gough, Wolverhampton. *hc*, W. Gamon; T. Clolee; J. Forrest. *c*, S. Foster, Birmingham; T. Clolee, Birmingham; C. F. Copeman, Solihull; J. Forrest; J. W. Ludlow. *Blue.*—Cup and 1, H. Gough. 2, J. Wilkinson, Birmingham. 3, J. W. Ludlow. *c*, J. Wilkinson; J. W. Ludlow; H. Gough.

Antwerps.—*Blue-chequered.*—Cup, 1, 2, and 3, J. W. Ludlow. *c*, C. F. Copeman; G. Phelps, Handsworth; J. W. Ludlow. *Red-chequered.*—Cup and 1, S. Foster. 2 and 3, W. Gamon. *c*, E. Thompson, Selly Oak; W. Gamon.

Magpies.—Cup, 1, and 2, J. Watts. 3, J. W. Ludlow.

Swallows.—1 and *c*, J. W. Ludlow. 2 and 3, J. Watts.

Any other Variety.—Cup, 1, 2, and 3, J. W. Ludlow. *c*, J. Watts; G. Holloway, jun.; G. Packham; J. W. Ludlow; J. Wilkinson.

BIRDS OF ANY AGE.

Carriers.—*Black.*—*Cocks.*—Cup and 1, H. Allsop. 2, G. F. Whitehouse. 3, W. Cartwright. *hc*, F. Smith; J. James; G. F. Whitehouse; R. Barrett; T. Hallam; P. R. Spencer, Hereford. *Hens.*—1, G. F. Whitehouse. 2, H. Allsop. 3, G. Gordin. *hc*, P. R. Spencer; T. Hallam; H. Hallam.

Carriers.—*Dun.*—*Cocks.*—1, G. F. Whitehouse. 2, E. Booth, Birmingham. 3, J. James. *hc*, E. T. Dew. *Hens.*—1, H. Hallam. 2, G. Gordin. 3, H. Allsop. *hc*, G. Packham.

Carriers.—*Any other colour.*—*Cock.*—1, E. T. Dew. 2, J. Watts. *Hens.*—1, E. T. Dew. 2, J. Watts.

Pouters.—*White.*—*Cocks.*—1, H. Pratt. 2, G. Crookes, Owlerton. 3, P. R. Spencer. *hc*, R. Barratt. *Hens.*—1 and 2, H. Pratt. 3, R. Barratt.

Pouters.—*Any other colour.*—*Cocks.*—Cup, 1, 2, and 3, H. Pratt. *c*, G. Crookes. R. Barratt; H. Pratt. *Hens.*—1 and 2, H. Pratt. 3, R. Barratt.

Tumblers.—*Almond*—Cup, 1, Extra, and 2, T. Hallam. *Short-faced.*—1 and 2, T. Hallam. 3, R. Barratt.

Tumblers.—*Long-mufed.*—1 and 3, F. Bowker. 2, W. T. Breeden. *c*, G. Phelps. *Clean-legged Long-faced.*—1 and 3, J. M. Bott. 2, J. Watts.

Barbs.—1, F. Smith. 2, G. E. Sawdon.

Owls.—*English.*—1, J. W. Ludlow. 2 and 3, G. E. Sawdon.

Fantails.—1 and 2, E. A. Seale. 3, P. R. Spencer. *c*, E. A. Seale; J. F. Loversidge; P. R. Spencer.

Jacobins.—1, W. T. Breeden. 2 and 3, A. A. Yander Meersch. *c*, W. E. Easten; E. A. Seale.

Turbits.—1 and 2, E. A. Seale. 3 and *c*, E. T. Dew.

Nuns.—1, E. A. Seale. 2, G. Crookes. 3, W. E. Easten.

Magpies.—1, E. A. Seale. 2, J. Watts.

Trumpeters.—1 and 2, A. A. Yander Meersch. 3, G. Packham.

Dragoons.—*Blue.*—1, J. Watts. 2, F. Graham. 3, G. F. Whitehouse. *c*, S. Foster. *Silver.*—1, F. Graham. 2, H. Allsop. *Yellow or Red.*—Cup and 1, F. Graham. 2, G. F. Whitehouse. *White.*—1, G. F. Whitehouse. 2, F. Graham. 3, J. Watts. *c*, J. James. Birmingham.

Antwerps.—*Dun.*—1 and 2, H. Gough. 3, W. Gamon. *c*, J. Forrest, Birmingham; J. W. Ludlow. *Blue*,—1, W. Gamon. 2, H. Gough. 3, J. W. Ludlow. *c*, C. F. Copeman. *Blue-chequered* —1, W. Gamon. 2 and 3, J. W. Ludlow. *c*, J. W. Ludlow; C. F. Copeman. *Red chequered.*—1, W. Gamon.

Antwerps.—*Cocks.*—1, W. Gamon. Cup and 2, J. W. Ludlow. 3, J. Wilkinson. *c*, G. Phelps; J. W. Ludlow; J. Watts; W. Gamon; H. Gough; T. Clulee.

Any other Variety.—*Pairs.*—Cup, 1, 3, and *c*, J. W. Ludlow. 2, J. Watts.

Any other Variety—*Single.*—1, 2, 3, and *c*, J. W. Ludlow.

Any other Variety.—*Single.*—1, F. Smith. 2, E. D. Careless. 3, J. Watts. *c*, E. D. Careless; J. W. Ludlow.

Judge.—Mr. T. J. Charlton, Bradford, Yorks.

MANCHESTER BIRD SHOW.

The second annual Exhibition took place in the Cotton Waste Exchange, Manchester, on December 31st, and January 1st and 2nd. The Show on the whole was a successful one, to judge of the 450 entries effected. Two exhibitors or firms alone entered fifty-one birds each—namely, Messrs. G. & J. Mackley of Nantwich, and Messrs. Evans (Secretary), and Smethurst of Manchester. The Society's gold medal fell to the lot of the Norwich firm for twenty-eight points, the Manchester firm thus losing by one point. The judging could not be got through the first day, only the first half-dozen classes having been completed—namely, the Lancashire birds, so styled by some recently, but better known for years past as Manchester Coppys and Plainheads. The postponement of the judging was caused through a dense fog, "which hung like a pall" over the city during Thursday. Certainly this was a very great disappointment. Throughout the entire classes many excellent birds were exhibited.

Clear Yellow.—*Lancashire Coppy.*—1, Evans & Smethurst, Manchester. 2 and *vhc*, J. Fielding, Rochdale. 3 and *hc*, J. Shackleton, Rochdale. *c*, R. Wood, Oldham. *Lancashire Plain-head.*—1 and 2, J. Fielding. 3, Evans and Smethurst. *vhc*, J. Meakin, Manchester; Evans & Smethurst. *hc*, R. Wood. *c*, Hamer & Bardsley, Oldham.

Clear Buff.—*Lancashire Coppy.*—1 and 2, J. Fielding. 3, B. Harrison, Oldham. *vhc*, J. Shackleton. *hc*, Hamer & Bardsley. *c*, Evans & Smethurst. *Lancashire Plain-head.*—1, J. Fielding. 2, B. Selling Class.—1 and *c*, G. & J. Mackley. 2, J. Thackrey. 3, S. Bunting (Mule). *vhc*, J. Shackleton (Lancashire Plain-head); J. Athersuch & Son. *hc*, W. Richards, Bulwell (Lizard); J. Spence, South Shields (Buff Grey Mule); G. Cox.

MULES.

Goldfinch and Canary.—*Clear or Ticked Yellow or Buff.*—1, G. & J. Mackley. 2, S. Bunting. 3, Evans & Smethurst. *Dark.*—1, G. Cox. 2, Moore and Wynne. 3, R. Hawman. *vhc*, S. Bunting. *hc*, G. & J. Mackley.

Goldfinch and Canary or Linnet and Canary.—*Unevenly-marked.*—1, Evans & Smethurst. 2, J. Moore, Boston. 3, S. Bunting. *vhc*, W. Grantham. *c*, J. Fielding.

Linnet and Canary.—1 and 3, J. Spence. 2 and *vhc*, Evans & Smethurst. *hc*, Brown & Gorton, Northampton.

Any other Variety.—1 and 3, Evans & Smethurst (Bullfinch, Goldfinch, and Grey). 2 and *c*, G. & J. Mackley (Linnet, Siskin, and Canary). *vhc*, Evans and Smethurst (Bullfinch and Goldfinch); G. & J. Mackley (Linnet).

BRITISH BIRDS.

Goldfinch.—*House-moulted.*—1, G. Cox. 2, S. Bunting. 3, R. Hawman. *vhc*, Evans & Smethurst. *hc*, J. C. Bamber, Preston. *c*, J. Meakin.

Linnet.—*House-moulted Brown.*—1, R. Hawman. 2, S. Bunting. 3, Simnet and Ward, Derby. *vhc*, Evans & Smethurst. *hc*, J. Page.

Skylark.—*House-moulted.*—1, 2, and 3, Evans & Smethurst. *vhc*, J. Fielding. *hc*, J. Royle, Prestwich.

Any other Variety.—1, 2, and 3, G. & J. Mackley (Song Thrush, Bullfinch

and Blackbird). *vhc*, Evans & Smethurst. *hc*, O. A. Watts, Brixton, S.W. (Black Cap). *c*, J. C. Bamber.

FOREIGN BIRDS.

ANY VARIETY.—1, S. Bunting (King Parrot). 2 and *vhc*, G. & J. Mackley (Botta-Botta and Parroquet). 3, J. Mills, Rochdale.

The Society's Gold Medal was won by Messrs. G. & J. Mackley, of Norwich. Mr. J. Fielding, Rochdale, won Mrs. Meakin's Silver Cup for most points in Lancashire Coppy Classes.

KIRKCALDY POULTRY SHOW.

THE above old-established Exhibition held its annual Show on Monday and Tuesday, the 4th and 5th of January, and was as usual well got up and managed. There was a large entry of stock in every department, and the quality was first-rate in many instances.

Game take the lead here both in the prize list and in actual numbers, and the catalogue will show that almost all the leading spirits of the variety in Scotland, and not a few from England, attended. The birds which struck us most were the second and third Black Red cocks, both of which we considered better than the first, the second-prize Black Red hen, and a fine Duckwing cock which stood first in his class. The Duckwings are always well represented at Kirkcaldy, and the quality good; while in *Spanish* the winners were very good, and Mr. Teebay was not the person to err in that class. *Cochins* were few in number, though what was of them was good. *Brahma* cocks brought out a grand bird of Mr. Raines', the best we have seen this season. We have seen *Hamburghs* much more numerous at this Show. Pencilled hens were best. The first-prize birds were well matched and pencilled. The second not so good in comb. We liked a pen of pullets shown by Mr. Lockhart in this class about as well as any. The Variety class, first went to good Crêves, second Houdans. *Bantams* were not so numerous as usual, for which we suspect the fortunate owner of the lot of little Piles, which have done so much execution this season, is accountable. However, what was there was first-rate, and while the Pile cocks were all good, one of the hens in the first-prize pen was, as a hen, better.

Pigeons were in greater numbers than for some years, and a good lot of Pouters were shown, the best bird in the whole lot being the third-prize White cock. Carriers were, with a few notable exceptions, of no great quality. Fantails were all good, and Tumblers the same. There were a good few Jacobins of fair quality, Turbits and Owls the same; while first in the Variety class were good Dun Barbs, very middling Black second.

Canaries were in great force as regards numbers, and the quality we were told, as we know nothing of them, first-rate.

The Committee was very unfortunate in the weather, still a good number of visitors turned out to this well-conducted and agreeable Exhibition. Mr. Teebay judged the poultry, and Mr. A. Frame, Larkhall, the Pigeons, and their awards were generally well received.

GAME (Black Red).—*Cock.*—1, W. Beveridge, Kirkcaldy. 2, J. Mason, Worcester. 3, J. H. Herriot, Kirkcaldy. *hc*, J. Beveridge; J. Allan, Dunfermline; J. Wishart, Kirkcaldy; J. Nicoll, Forfar. *Hen.*—1, J. Nicholl. 2, R. Stewart. 3, J. Mason. *hc*, A. Watson, Kirkcaldy; D. Harley; C. Jamieson; J. Wishart (2); J. A. Mather (2); Boath & Tosh.

GAME (Brown Red).—*Cock.*—1, D. Harley. 2, J. Brough. 3, R. Stewart. Local Cup and *vhc*, W. Webster. *hc*, P. Speedie; H. W. Hutchison. *c*, H. L. Horne. *Hen.*—1, R. Stewart. 2 and Local Cup, W. Webster. 3 and *c*, D. Harley.

GAME (Any other colour).—*Cock.*—1, J. A. Mather. 2, D. Harley. 3, S. Young. *c*, S. Young. *Hen.*—1, C. Jarvis. 2, J. Lyall. 3, R. Stewart. *hc*, A. Watson.

DORKINGS (Silver).—*Cock.*—1, D. Annan. 2, W. Hughson. 3, T. Raines. *hc*, R. Blyth; D. Annan. *Hens.*—1, W. Hughson. 2 and 3, D. Annan. *hc* T. Raines.

DORKINGS (Dark).—*Cock.*—1, T. Raines. 2, J. Turnbull. 3, D. Annan. *hc*, R. Lockhart; D. Gellatly. *Hens.*—1, G. S. Robb. 2, T. Raines. 3, D. Gellatly. *hc*, G. S. Robb; R. Lockhart. *c*, R. Blyth.

COCHIN-CHINAS.—*Cock.*—1, Mrs. W. Steven. 2, W. J. Paton. 3, R. Blyth. *Hens.*—1, W. J. Paton. 2, R. Blyth. 3, Earl of Rosslyn.

BRAHMA POOTRAS.—*Cock.*—1 and 2, T. Raines. 3, A. M'Donald. *hc*, R. Blyth; W. Henderson. *Hens.*—1, Miss G. Morison. 2 and 3, T. Raines. *hc* H. Brownlie; Miss G. Morison; Mrs. W. Stephen, Montrose; J. A. Dempster, Stirling.

SPANISH.—*Cock.*—1 and 3, W. Hughson. 2, A. Grieve. *c*, A. Ridpath. *Hens.*—1, A. Somerville. 2, W. Hughson. 3, A. Ridpath, Edinburgh. *hc*, R. Blyth, Kingskettle.

HAMBURGHS (Pencilled).—*Cock.*—1, D. Cheyne. 2, R. Dickson. 3, A. Pratt. *hc*, W. Cook; R. Paton; R. Thomson; H. Russell; J. Lockhart. *Hens.*—1, R. Dickson. 2, A. Pratt, Kirkcaldy. 3, T. Hanson. *hc*, R. Paton; J. Lockhart, Newburgh.

HAMBURGHS (Spangled).—*Cock.*—1, J. Pollock. 2, W. R. Park. 3, G. Stalker. *hc*, J. Morrison; Mrs. W. Keddie; J. Stewart; J. M'Andrew. *Hens.*—1, J. Stewart. 2, W. R. Park. 3, Mrs. Brown. *hc*, R. Clark; J. Pollock; Mrs. Keddie.

DUCKS (Any variety).—1, J. A. Mather. 2 and *hc*, Mrs. Dickie. 3, R. Torley. *c*, G. Thompson.

ANY OTHER VARIETY EXCEPT BANTAMS.—1, Mrs. W. Steven. 2, R. Blyth. 3, Miss R. Frew. *hc*, J. M. Wilson; J. Crawford. *c*, D. Handry.

GAME BANTAMS (Reds).—*Cock.*—1, P. Henderson. 2, H. Brownlie. 3, Master D. Laing. *hc*, Master D. Laing; H. Brownlie; Miss B. P. Frew. *Hens.*—1 and 2, H. Brownlie. 3, T. Raines.

GAME BANTAMS (Any other colour).—*Cock.*—1 and 2, H. Brownlie. 3, A. Kilgour. *Hens.*—1 and 3, H. Brownlie. 2, Master A. Frew.

BANTAMS (Any other variety).—1, Mrs. R. Frew. 2, R. Frew. 3, Miss J. M. Frew.

SELLING CLASS.—*Cock.*—1 and *c*, Miss M. Morison. 2, T. Raines. 3, W. Paterson. *hc*, Lieut-Col. C. Rice; A. Pratt; T. Raines; D. Annan. *Hens.*—1, A. Ridpath. 2, D. Gellatly. 3, T. Raines. *hc*, Miss Morison; P. Robertson; R. Somerville; A. Pratt; W. Webster. *c*, Lieut-Col. C. Rice.

PIGEONS.

POUTERS (Whits).—*Cock.*—1 and 3, J. M'Gill. 2, A. Anderson. *hc*, J. Mullion. *Hen.*—1, 2, and 3, A. Anderson. *hc*, W. S. M'Allister.

POUTERS (Any other colour).—*Cock.*—1, M'Gill Skinner. 2, R. W. Bryce. 3, A. Anderson. *vhc*, T. Mullion. *Hen.*—1 and 2, M'Gill Skinner. 3, T. Mullion. *hc*, A. Anderson.

CARRIERS.—*Cock.*—1, A. Smith. 2, J. E. Spence. 3, T. Raines. *Hen.*—1, A. Smith. 2, T. Raines. 3, J. E. Spence. *hc*, J. Lamont, jun.

FANTAILS.—1, A. Smith. 2, J. E. Spence. 3, A. Lockhart. *hc*, A. Crosbie.

TUMBLERS.—1, D. Brash. 2 and 3, J. M. Kidd.

NUNS.—1, J. Lamont, jun. 2, R. Laurie. 3, A. Duthie.

JACOBINS.—1, R. W. Bryce. 2, T. Raines. 3, J. E. Spence. *hc*, T. Nicol, Forfar.

TURBITS OR OWLS.—1 and 3, A. Anderson. 2, R. Lauria. *hc*, A. Crosbie; J. E. Spence.

ANY OTHER VARIETY.—1, J. E. Spence. 2, R. W. Bryce. 3, A. Crosbie.

CANARIES.

SCOTCH FANCY (Yellow).—*Cock.*—1, T. Scott, Carluke. 2, R. Hunter. 3, H. M'Dougal, jun. 4, R. Aird. 5, J. Kerr. *Hen.*—Special and 1, R. Jackson, Carluke. 2, H. Hoggan. 3, R. Chalmers. 4, T. Scott, Carluke. 5, D. Black, Dunfermline.

SCOTCH FANCY (Buff).—*Cock.*—1, H. Hoggan. 2, R. Hunter. 3, W. Innes. 4, A. Baird, Leith. 5, H. M'Dougall, jun. *Hen.*—1, M'Ewan Downie, Kirkcaldy. 2, J. Tweedie. 3, T. Scott. 4, G. Greig. 5, J. Kerr.

FLECKED (Yellow).—*Cock.*—1, R. Aird. 2, R. Hunter. 3, G. Greig. 4, R. Chalmers. 4, G. Spence, Dysart. *Hen.*—1, G. Spence. 2, R. Chalmers. 3, D. Kilgour. 4, J. Meiklejohn. 5, R. Hunter.

FLECKED (Buff).—*Cock.*—Special and 1, T. Scott. 2, H. M'Dougall, jun. 3 and 4, R. Chalmers. 5, W. Innes. *Hen.*—1, T. Scott. 2, R. Hunter. 3, B. Currens. 4, J. Elliott. 5, M'Ewan Downie.

GREEN.—*Cock or Hen.*—1, C. Cairns. 2, G. Greig. 3, G. Spence. 4, H. Hoggan. 5, J. Robertson, Edinburgh.

FOUL-FEATHERED.—*Cock or Hen.*—1, G. Cooper. 2, G. Greig. 3, P. Gray, Dunfermline. 4, J. Kerr. 5, T. Brown, Oakley.

MARKED GOLDFINCH MULES (Buff).—*Cock.*—1, 4, and 5, J. Robertson. 2 and 3, D. Young.

MARKED GOLDFINCH MULES (Yellow).—*Cock.*—1 and 3, J. Cowan, Dunfermline. 2, W. Kirk. 4, J. Robertson. 5, W. Bonthron.

THE MEALY POUTER.

MANY thanks to Mr. Huie for the straightforward and manly course he has taken to bring the Ponter controversy to a practical issue. In the Journal of December 24th he has made it known to the fancy that, so far as he is concerned, the long-despised and badly-treated Mealy is to be raised to a position of equality with other standard-coloured birds, and treated as such, giving your readers very cogent reasons for so doing. It now behoves other fanciers to strengthen his hands and do what they can in the same direction, and the issue is certain. With Mr. Huie on this side and the "RECTOR" on the other, with more to follow, we have the wedge well nigh driven home. If fanciers generally would accept Mr. Huie's resolve as a compromise, and agree to shake hands and be friends at this befitting season, the fancy will have no cause to regret that the controversy had been engaged in with, at times, a trifle more acerbity than the subject demanded.

The prize for the best Red, Yellow, or Mealy at the Kilmarnock Show was the gift of Mr. Gibson, a great friend of the Mealy, and was given with the view of raising it to its proper place, and he meant that it should be judged as a standard colour; but unfortunately the Committee overlooked this, and Mr. Huie, left without instructions, could not well do anything else than he did. Had the Committee acquainted Mr. Huie before he began his work as Judge what their object was in classifying the Mealy with Reds and Yellows, Mr. Mitchell's hen, which was left out in the cold, would have occupied a high position in the class, as she was certainly a splendid bird.

I do not know why it is, but somehow or other the Mealy has never found favour with fanciers in England. From my short experience I find that Mealies not only are more perfect in marking and superior in style, but they are more robust in constitution. I do not think any of those who set forth their claim ever made reference to this, whether intentional or not I do not know. We find that fanciers have always a wrinkle which they keep to themselves. Even Mr. Fulton, in his article on the Carrier—although he promised to tell all he knew—takes care to conceal from the novices the devices resorted to by the knowing ones in preparing their birds for exhibition. But this is a digression. I was saying that they were of a hardier constitution, and so are their young. My friend Mr. Ruthven facetiously described the disappointed fancier when a grand, vigorous, promising young bird declared itself a despised Mealy. Three chances to one, had it not been a Mealy it would not have survived to tell the tale.

Young fanciers know full well the difficulty they have in getting evenly-marked birds, even while breeding from evenly-marked parents. Let them try a Mealy, and report their success, that others may be encouraged. The first four years is the Pouter-fancier's Slough of Despond; the Mealy will help

them over that trying period, and the way to success after is clear.—David Lawrie, *Kilmarnock.*

DO BEES SLEEP?

It has not, we think, been proven that bees ever sleep. We have never seen one either in winter or summer asleep. Analogy and their very active industrious habits would lead to the belief that they do sleep. When, where, and how they do sleep, we have hitherto being unable to discover. In summer they work both night and day, and never seem to tire. In early life we thought they worked harder after a day of rest—that is to say, if weather kept all at home for twenty-four hours they were recruited in strength and vigour, and worked better on the day following. In later years we have considered, that in the absence of outdoor labour more work was done in the hive. When weather is favourable and honey abundant we know that frequently honey is gathered into hives faster than the indoor labourers can manage—it accumulates too fast on their hands. The cessation of outdoor work for a time enables the bees to remove the accumulations of honey from the centre combs, and store it up in their outer and upper edges. Thus the domestic arrangements are advanced, and room made for more honey, and more labourers are set at liberty to gather it. When bees have no domestic work to attend to, as is the case when a swarm is put into a hive of empty combs, they work prodigiously fast. By-and-by the brood and honey of such a hive require much attention. Hence, outdoor-work activity seems to abate. But when no bees leave their hives we have never been fortunate enough to find one asleep or anything like it. Young queens on coming to perfection sometimes pipe or call for seven days without cessation. During that time they can get no sleep. And if it be true that pregnant queens deposit in cells two thousand eggs a-day—that is, eighty eggs every hour, throughout the summer months, when, pray, can they find time to sleep?

In winter bees have few domestic duties to perform, and there is no honey to gather. But the question of bees sleeping or hybernating in winter is just as difficult to answer as that of sleeping in summer. I know what others say on this question, but I like to read nature through my own eyes; and I trust the readers of this Journal will ever be guided in great measure by their own observation and intelligence. I have examined hives at all seasons, even when there was 20° degrees of frost, and I never found a bee asleep. Still I do not say that they never sleep. Can any of our readers give evidence on the question?

Bees rest in winter, and crowd together for mutual warmth. To-day (2nd of January), the wind being south, and the mercury 2° above freezing, my bees attempted to come out for an airing, but were prevented owing to the snow being still on the ground. Up to the present time bees have been healthy this winter, and if prevented from leaving their hives while snow is on the ground, will likely be in good condition when spring comes. But absolute confinement is hurtful to bees. When weather permits they prefer to go abroad to evacuate, and if they do this when snow is on the ground they fall into it in hundreds and perish. Hence their doors should be shut when snow is on the ground.

The question as to whether a north or south site is the better for bees in winter, has often been put and discussed. Mr. Nutt who had a hive of his own was rather an impulsive bee-keeper, and came to hasty conclusions. "In November, 1834, Mr. Nutt placed three hives on the north side of his house and three remained on the south side.

SOUTH.	lbs.	NORTH.	lbs.
No. 1 weighed	35	No. 4 weighed	42
„ 2 „	38	„ 5 „	32
„ 3 „	40	„ 6 „	37
	113		111

On the 26th of the following March they weighed as follows:—

	lbs.		lbs.
No. 1 weighed	15	No. 4 weighed	37
„ 2 „	16	„ 5 „	27
„ 3 „	19	„ 6 „	32
	50		96

The first three—those on the south side—lost 63 lbs., on an average 21 lbs. each; those on the north only 15 lbs., average 5 lbs. each. The three last—those on the north—swarmed in May, the three first not till July."

Some apiarians may consider the experiment conclusive that a north aspect is better for bees in winter than a south one. The results of the experiment have no weight with us, believing that if any unbiased man had been on the spot he would have been able to trace the difference of results to something else than position of hives. At present we are not going to attempt an analysis of Mr. Nutt's experiment. In our experience we find that hives do as well in one position as another—that on the north side of a house the bees are abroad at the same time as those on the south side—and that neither the consumption of honey nor the times of swarming are much affected by the position of an apiary. We have hives looking east, north, west, and south, and have invariably failed to find any advantage that one may have over the other. The strength of the hives in autumn is of far more importance than their position or aspect. Strong hives eat more honey, are less affected by severe winters, and swarm earlier than weaker ones. Warm covering of hives in severe winters and early spring months is of great advantage to bees.—A. Pettigrew.

OUR LETTER BOX.

Great Yarmouth Poultry Show (*J. Watts*).—The Secretary ought to have replied to your applications. Your course to pursue is to ascertain from the railway officials' parcel book if your birds were delivered, and then you will know who to proceed against.

Manchester Poultry Show.—Mr. J. Lederer informs us that he took the first prize in the Trumpeter class at Bells Vue, Manchester.

Houdan and Brahma Characteristics (*G. B.*).—Good crest and muffling, comb neatly branched, legs with five toes like the Dorking, sound-coloured, free from a yellow tinge, size, shape, and style, are the principal characteristics of the Houdan. Brahmas should be very large with a neat pea-comb, heavily feathered in the legs, but not vulture-hocked. We would advise you to attend some of the poultry shows and closely examine the winning birds in connection with the points to which we have referred.

REMARKS.

30th.—Cold but sunshiny morning, and a fine frosty day.

31st.—Very thick and very dark all day, and bitterly cold.

Jan. 1st.—Much finer, but still very cold and frosty till the evening, when there was a slight fall of snow, and a thaw and fall of rain at midnight, freezing on the ground.

2nd.—Foggy morning, very fine in the middle of the day, but a wet night; much warmer.

3rd.—Bright all day till 3 P.M., then dull; but fair till night, when it rained. Snow all gone, but the roads very sloppy.

4th.—Very dark early, but soon clearing off; fine in the middle of the day; warm and damp in the evening.

5th.—Dark, but fair early; fine from 10 A.M. to 3 P.M., then dull; still warm.

With the old year the frost may be said to have ended; for the silver thaw of Friday evening was merely the result of the frost left in the ground. December 31st was remarkable for the very low maximum temperature.—G. J. Symons.

COVENT GARDEN MARKET.—January 6.

There is no revival of trade of any consequence yet. Supply was rather better in consequence of the favourable change in the weather, prices remaining nearly the same.

From observations taken near London during forty-three years, the average day temperature of the week is 42.3°; and its night temperature 30.10°.

POTATOES IN 1874.

THE above title is intended to imply a caution that the noble tuber as grown in this country is variable according to the climatic conditions of each year; and as the past may be looked upon as a test year, the season having been an unusually trying one, a few notes of failures and successes may deter or captivate.

I have had on trial here about seventy so-called varieties—early, general crop, and late. The soil on which they were grown is an adhesive but well-drained calcareous loam, almost devoid of silex, and the general result I will first endeavour to define.

A batch of earlies, previously sprouted in the light, and under like conditions (an important consideration in testing early Potatoes), were planted in sunny and sheltered spots in the open air on the 21st of March in land in good condition, without manure. These were injured by the frosts of the 11th and 17th of May, and produced little more than seed again, although the quality was good.

Another batch of earlies and second earlies, planted in deeper soil in good heart with a special Potato manure mixed with about three times its bulk of burnt earth and rubbish in rows 3 feet apart on the 11th of April, turned out a good crop both in quality and quantity, but from the extreme drought in this district in the spring and summer at "dig-day," they showed a tendency to eupertuberate.

On the 16th of April I planted, after the plough, a large quantity of earlies on a shallower soil with the same kind of manure sown in the drills. This planting barely produced seed again, although the quality was very fine. The land never got thoroughly pulverised, and on raising the crop in August the manure turned up as sown, no rain having reached it.

The late varieties, planted from the 18th to the 24th of April without manure, had, when tried in August, vigorous haulm with scarcely any tubers, and when lifted in October they turned out a heavy crop of fair quality, but have since shown considerable disease, and keep otherwise badly.

Amongst the earlies and main crop I only found a single instance of disease, which appeared in the robust-growing kidney Excelsior. And I may, perhaps, be pardoned for here observing that I have always found that the more vigorous and healthy a plant is the more susceptible is it of an attack of parasitic fungus, in case any check is sustained in its growth, and providing the seeds of the fungus be present.

On the 23rd of February I planted under lights in a slight bottom heat good-sized tubers of Early Handsworth and King of Earlies, both round varieties; Mona's Pride, Walnut-leaf, old Early Ashleaf (the green sprouting variety from Messrs. Hooper & Co.), and two other early varieties, which turned out to be Walnut-leaf and Early Ashleaf. The Early Handsworth was the first ready to lift. This variety was sent out about fifteen years ago by Messrs. Fisher, Holmes, & Co., of the Handsworth Nurseries, and, after trial by the Royal Horticultural Society, was then considered to be the earliest, and this was confirmed by my own trials about the same time. I afterwards accidentally lost the stock, and although I ordered it of several respectable firms, I could not succeed in getting it true until I wrote to Messrs. Fisher, Holmes, and Co. It has also the shortest top of any Potato I know. It produces from four to six fair-sized tubers at each root, with few small. The flesh is firm, but yellowish; flavour good. It has probably gone out of fashion from being somewhat below the average in productiveness; but for earliness it is invaluable. The absence of this variety and the Coldstream Early from the recent trials at Chiswick is somewhat singular; the latter variety having also obtained a high character for earliness. In my own trials the Coldstream was, however, later and taller than the Handsworth and several of the other early varieties.

King of the Earlies (American) is the handsomest of the early round Potatoes, having firm white flesh; is nearly as early and more productive than Handsworth, but the flavour is sweetish, and unsuited to English tastes. With this variety I took the prize for round Potatoes at Northampton in September last in competition with most of the well-known sorts produced on the fine garden land in that neighbourhood. The true old Ashleaf followed the Handsworth next under glass, and is to be preferred also, on account of its shorter haulm, to the other kidney varieties for forcing. But for open-air culture Myatt's Ashleaf, or—what appears to be a very fine stock of it—Veitch's Ashleaf, is the only one of the class I intend to grow in future.

For the general crop I have selected for quality from the second earlies Mr. Fenn's Rector of Woodstock, a very handsome flattish round Potato; Climax, very prolific; the new American Snowflake, handsome and good; Cobbler's Lapstone; Red Emperor, from Messrs. Barr and Sugden, a good-looking reddish Potato; and Mr. Fenn's Bountiful, a first-rate medium-sized kidney. I shall also grow again President, King of Potatoes, Beaconsfield, and Premier (from Mr. Gilbert), all handsome, and apparently useful sorts, but not tried here in sufficient quantity at present. For appearance Parker's Ashleaf, a scarce flattish-round variety; Giant King, and Jackson's Kidney I think the handsomest of all Potatoes, and in this I am supported by the opinions of Mr. C. Frisby, the clever gardener to Mr. Chaplin, through whom I originally received the sort, and Mr. Gilbert; but it is smooth-skinned, and as it has rarely more than a single eye, it requires great care in planting, for if the sprout be rubbed off the tubers sometimes never start at all.

As a special and limited selection from the above for small amateurs who garden in the rich old humus of towns, I would recommend for early work Early Ashleaf and Early Handsworth, to be followed by Veitch's Ashleaf, and for general crop Rector of Woodstock and Cobbler's Lapstone. These are true garden Potatoes. It is not advisable to plant the coarse-growing later sorts in such a position, as they can usually be produced more

profitably and of better quality as an agricultural crop. Some years ago I found myself in a dilemma as to the best sort to grow in town gardens for general work, and was kindly referred by Mr. Fenn to the Lapstone, the best-flavoured of all Potatoes; and judging from results, it would appear to have been one of that indefatigable cross-breeder's aims to secure a good town-garden Potato, and in this he seems to have succeeded admirably with Rector of Woodstock, which has larger tubers and is more fertile than the Lapstone. Formerly I used to grow Early Oxford in such situations, and found it a very valuable early and yet long-keeping sort. I, however, lost it, and have never again been able to get it true. Singularly also the true variety does not appear to have reached the Royal Horticultural Society.

Of latish main crop varieties I have selected, as the best for quality and appearance, Oxfordshire Kidney, rough-skinned, and very good; Late Rose, large, and very prolific; Model, very handsome and good; Brownell's Vermont Beauty—of which I received two varieties, one through Mr. Dean and Messrs. Hooper & Co., said to be Messrs. Bliss's type—a handsome, longish, and sometimes kidney-shaped sort, of a similar tint to Early Rose; the other from Messrs. Carter & Co., a handsome roundish variety, of a darker red in colour, and apparently intermediate between Wood's Scarlet Prolific and Red-skin Flourball, but which of the two is the true Richard I am unable to determine. From the Chiswick Report of 1873 the former would appear to correspond with the variety tried there. Both sorts were late with me. Scotch Blue, synonymous with Duncan's Seedling, is purplish-skinned, and another good main-crop sort, and not so late in ripening. Prairie Seedling and Willard's from Messrs. Sutton, also Red Fluke from Mr. Dean, showed sufficiently well to induce me to grow them again. Regents, of which Gryffe Castle and the Dunbars are the best. Flukes and Paterson's Victoria, or rather the selection from that variety called The Queen, which is undoubtedly A1 as a general-crop late Potato, cannot be dispensed with by large growers. Red-skin Flourball, from Messrs. Sutton, I have grown here for three years, the last two in considerable quantity; but on this soil it is coarse, waxy, and liable to disease, and not so good for very late purposes as Wood's Scarlet Prolific. We have a very late sort grown in this locality with numerous eyes, known as the Pink Kidney, and it is undoubtedly a good keeper, but its flavour is too strong to suit my palate.

From the trials I have been unable to discover sufficient distinction between Veitch's, Rivers's, and Myatt's Ashleaf, Gloucestershire Kidney, King of the Kidneys, and Caversham Defiance; and in rounds, Early Gem did not come up to King of the Earlies. Amongst the Lapstones, which include Pebble White, Taylor's Hybrid, Berkshire Kidney, Ashtop Fluke, and Cobbler's Lapstone, I shall retain only the latter, as, if not identical, they have all a strong family likeness. Belgian Kidney, which has a distinct long tuber, and Wonderful Red Kidney, being good in appearance and of fair quality, are worth attention for exhibition. Rintoul's Early Dun and Fortyfold are both Regents in type, the former said to be a graft hybrid. Silver-skin, Excelsior, Dawes's Matchless, Webb's Imperial, and Prince of Wales are very fine second-early kidneys, but watery, and apparently unusually subject to disease. Amongst Americans, Extra Early Vermont seems very like Early Rose, very prolific, and useful in a dry season like the past, but usually unsuited to the English palate and climate, except where mere quantity is a desideratum; for this reason I shall discard Peachblow and Bresee's Prolific and Peerless, the two latter both very fine in appearance. Compton's Surprise, the chief recommendation of which variety appears to be its productiveness, I have not tried.

We are, however, greatly indebted to our transatlantic friends for an entirely novel strain. As a rule their Potatoes are vigorous and rapid growers, and in a hot summer or dry climate like that of most of the American States, where our firm-fleshed small early sorts would probably be worthless for produce, their flavour is doubtless improved, and the growth less luxuriant. The best seem to be Early Rose, said to have originated in Alaska, and perhaps the parent of most of the new American sorts. Late Rose, a selection from it, King of Earlies, Brownell's Beauty, and Snowflake, these will be of service to those who like a light-fleshed Potato, easy of digestion, and will probably come in for cross-breeding purposes to increase the fertility of our earlies. But for an Englishman's Potato we must look to the advances made by the late Mr. Paterson and Mr. Fenn. His Rector of Woodstock ought also to displace the Irishman's Potato, which appeared to be the Early Shaw, a sort very much run upon in Ireland, and the only one I met with at table during a fortnight I spent there in August last in the south and west. It is a deep-eyed and waxy second-early variety, of good flavour, but unprofitable where Potatoes are jacketed before being brought to table. I never saw a kidney Potato there, although constantly changing my quarters.

Of novelties to come—and they seem to be thickening—we have Mr. Fenn's Early Market and Early White Kidney, both of which are said to be first-rate, and have been certificated by the Royal Horticultural Society; also his Perfection Kidney, a quasi-graft hybrid, the earliest and handsomest of the Lapstone family; and The Favourite, a dwarf second-early variety, of superb quality, and good for exhibition. These are being sent out by Mr. Dean, of Ealing and Bedfont. From America, Alpha (Pringle's), 12*s.* per lb.! is said to be ten days earlier than Early Rose, and both it and Messrs. Thorburn's Early Paragon to excel their British compeers. Mr. Brownell's Early Nonsuch and Eureka are pronounced as first-rate, and are likely to be competitors for the Whitcomb prize of $200 to be awarded there four years hence for the best seedling Potato. In France La Reine Blanche is stated to be excellent in quality and well adapted for variable seasons; and if we add to these Cattell's Eclipse, Dwarf White, Early Dimmock, and Barron's Perfection, all certificated by the Royal Horticultural Society during the past season, and Messrs. Lee's Early Hammersmith Kidney, we have fourteen sorts—surely enough for the most enthusiastic Potato-maniac to experiment on! and what with the prospect of International Potato Shows at the Crystal Palace and in France next autumn, the noble tuber appears in a fair way to become an enthroned dignity amongst vegetables as the Rose is amongst flowers; and at this rate some of your readers may live to join a Potato Society, and to read the Potato Chronicle.—Thomas Laxton, *Stamford.*

SELECTION OF ROSES.

I was much delighted with, and interested in, the Rose tournaments or elections which were reported in your pages. The wonderful manner in which certain Roses obtained almost unanimous votes of confidence in spite of necessary differences of climate, soil, and temperature surprised me; and I considered these lists very valuable to the amateur Rose-grower, and perhaps also to the nurserymen, as indicating the sorts likely to be in demand. But I confess the selections of Roses made occasionally in your columns puzzle me. Taking a selection of twenty Roses made in your issue of December 24th by the Rev. W. F. Radclyffe, commencing "1864, Achille Gonod." I placed my own list of the twenty best Roses alongside it, and was surprised to find the two lists had no Rose in common. In this list, and in the amplified one in your paper of December 31st, the Roses are probably not intended to be placed in order of merit; but the fact stated above suggests to my mind that anyone asking for a selection of Roses should state, first, proposed mode of cultivation; second, climate; third, soil. I have purposely placed them in this order. Let me, then, state my position to commence with. 1st, I am cultivating in a high double greenhouse up the rafters, similar to growing Vines (there were Vines there before). 2nd, Climate is the ordinary greenhouse, with sufficient heat to induce flowering in March and April. 3rd, The soil is the best turf-mixture one can make, in slate boxes, between the wall and pipes, but not touching the pipes; and we give them some pretty strong drink when we see the flower shoots. Now, I want to know what Roses your correspondent would recommend me; and please to remember I am fearfully hard up for a crimson. Meantime I will tell that I have given up two Roses I bought marked climbing: Climbing Devoniensis, stock unknown, because it would not climb; Climbing Victor Verdier, same offence, coupled with aggravated mildew.

I give my most successful trials in their order of merit. 1st, Fortune's Yellow, magnificent flame colour, the finest half-open buds I ever saw; 2nd, Maréchal Niel, Céline stock from Curtis of Torquay, enormous flowers; 3rd, Rêve d'Or, summer-flowering yellow, very free; 4th, Gloire de Dijon, flowering now; 5th, Devoniensis (not marked climbing), on seedling Briar, from Prince of Oxford. N.B.—The above five have reached from 15 to 20 feet long, with clean stem 4 feet. 6th, Duc de Magenta, apricot colour, about 8 feet. And I am now trying the following:—1st, Perle de Lyon, a splendid deep yellow, but I think a doubtful climber; 2nd, another Maréchal;

3rd, Souvenir de David, crimson Tea, lovely colour, seems Hybrid China, from Curtis of Torquay, doubtful climber. I think I might make Safrano climb; but I doubt if either Belle Lyonnais or Sombreuil are worth trying, though certainly the former will climb.—Sucker, *West Kirby, Birkenhead.*

A FEW FERNS NOT USUALLY WELL GROWN.

Some people think, say, and even write, that Ferns are the simplest plants imaginable to grow. I differ entirely from such an opinion, and after an experience of many years I find a good many of them that puzzle me still.

That more Ferns are killed by heat than by cold, every year shows me more and more clearly; but the result of my own experiments recently leaves no doubt whatever on my mind that such is the case, and further convinces me that the reason why there are so many failures is that cultivators coddle them to death. Some of your readers may say here, "Nonsense. I never saw a Fern yet that I could not manage easily enough;" and of such a Fern-cultivator I ask, Have you succeeded easily, or indeed at all, in the case of the following kinds?—Didymochlæna trunculata or truncatula. This is classed as an evergreen stove Fern. I find it is nothing of the kind. Did you ever find the pinnæ drop off, and wonder at the reason? I grew this in a stove for several years, and though the plant thrived apparently, and threw up plenty of fronds, all the pinnæ invariably dropped off, leaving the stems bare and unsightly. I adopted all kinds of ideas, but none of them succeeded. Lastly, resolved either to kill or cure, I potted my solitary specimen in strong loam only, and removed it from the stove to my British fernery, which has no heat beyond a flow and return 4-inch pipe to exclude frost. The result has been almost magical, for the plant throws up fine fronds of a brilliant colour, and though I repeatedly shake them purposely, every one of the pinnæ keep their places, and at this moment all the fronds have been on many months, and still look as fresh as paint, with all the pinnæ perfect. I am greatly pleased with my success in this instance, for this Fern is truly a beautiful one when grown as I am now trying it. Lomaria cycadæfolia and zamiæfolia, decidedly two of the handsomest of their tribe, and, when well grown, charming: the same remarks apply to both of these, which are in my British fernery, and have been so all this severe winter, the frost occasionally getting inside the house 2° or 3° (my boiler would not work, being badly set), and no injury whatever resulting. Grown under perfectly cool treatment these two Ferns throw up much stronger fronds, are quite clear of insects, and the vivid green of cycadæfolia is a marked contrast to the pale sickly colour of it when coddled, or even moderately heated. I have tried the latter system, and failed miserably.

In the same house I have had all winter three large specimens of Gleichenia flabellata which perfectly revel in strong loam, plenty of water, good drainage, and absolutely cool treatment.

Mr. Findlay, the Curator of the Manchester Botonical Gardens, who visited me a few weeks ago, expressed his astonishment at the treatment first of all, and next at the luxuriant growth of these Gleichenias in particular, and he added that the moment he returned home he would remove his own plants from heat to cool treatment.

Unless G. flabellata is cultivated in a perfectly cool house it produces small, yellowish-coloured, sickly fronds—a marked contrast to the vigorous, bright glossy green, immense-sized fronds, the result of cool treatment, some of which on my largest specimen measure more than 2¼ feet across. I enclose portion of an old frond 15 inches long, and rather over 3 wide—most unusual size, I think.

Much doubt was expressed at the Pomona Palace Show, held in Manchester the first week in December, whether my large plant of Gleichenia rupestris (awarded the silver medal as the finest plant in the Exhibition) would survive the extreme cold to which it was there subjected. I had no such fear myself, as the plant had been previously hardened-off almost within an inch of its life, and it is now growing vigorously. I will return to the subject shortly.—T. M. Shuttleworth, F.R.H.S.

Deficient Rain.—On page 585, No. 718, of the Journal, Mr. Wright says that from the end of March to the 22nd of July only 3·24 inches of rain fell, and asks, Is not that unparalleled in Britain? In 1868 we had only 0·88 from April 20th to July 20th, as may be seen by referring to the Journal of July 30th, 1868, page 76. We have had a most extraordinary variation of temperature here. On January 1st we registered 26° of frost; and on January 4th, at 8 P.M., the glass stood at 50°.—John Platt, *Hillington, King's Lynn.*

WEATHER, WORK, AND MEANS.

The work of the garden must be done. It cannot be done in spite of the weather, nor to the greatest advantage, without due and sufficient means. Every man endeavours to do work at the proper time of doing it, or at least he should so endeavour with his whole power, as that is the most creditable to himself and most profitable to those employing him. In the great majority of gardens aid only just sufficient to the carrying on affairs is allotted, even if the weather is fairly favourable to the steady prosecution of routine proceedings. Many circumstances of which the *employé* can know nothing may conspire to prevent the owner feeling himself warranted in providing a prodigality of aids to meet every want and emergency of his garden. An enthusiastic gardener may, and no doubt does deeire all this, and is surprised that his employer cannot see the same as he. But then the coachman, the keeper, and the butler are the same. All wonder where the master puts his eyes. Each one thinks his own department, at any rate, shonld be abundantly provided for, whatever else may be restricted. That is human nature: nor can any fault be found for this high estimate of their calling by those who represent it. It is in itself a worthy and creditable feeling which impels every man to do the best in his position, and for the honour of his craft. But we cannot make or reasonably expect a gentleman to look at everything through a pair of garden, or game, or stable magnifiers continually. He will look with his natural vision at all, divide his interest over the whole, and form his judgment on the dictates of half a hundred other things unconnected with either. That may be taken as fact, and it is as well to admit it at the outset, as paving the way to a more sober and just estimate in one's judgment of another. Whatever, then, the gardener may be, we must accept the fact that every garden owner is not a garden enthusiast; yet, for all that, such owner may derive much pleasure and benefit from his garden. He may, and no doubt does, enjoy its beauty, neatness, and health of its crops, without, however, making it the be-all and end-all of his outdoor domestic pleasures. Certainly the garden is full of them if they could but be brought out by a more lively interest and sympathetic care. This class of garden owners (and they are the great majority), apportion aid to this department which, by thoughtful application and hard work, are made fairly sufficient for the purpose in the absence of any natural and unpreventible impediments preventing the right work being done at the right time. That is the very keyhole of good and profitable gardening. The neglect of a week, aye, even the neglect of a day, in the completion of any given work, may, and has, and will again, make a momentous difference in the looked-for results. Indeed, all the difference between success and failure may be locked up in the small period of less than a week. Neither can it be expected that an employer is able to recognise this, for the very sufficient reason that it may be many months before the effect follows the cause, and by this time both the said cause and the circumstances which produced it are vanished from the memory of the master, yet not so from the man, but to whom it is hard work to explain a failure, which by a little timely aid might have been prevented.

A season of extreme drought is an immense trial to a man who under ordinary circumstances always has his hands full. He must work with redonbled effort to keep things going, by watering and other efficient means to the same end. Eventually the rain comes. Planting must be done, but the ground is not ready. Celery must be got out, but the trenches are undug. By the time this necessary work is done the showers are gone and the burning sun is as fierce as ever, and planting must be done under unfavourable conditions, and extra labour be involved to carry on the unestablished and struggling crops. The week—all-important—was lost, and nothing can afford adequate compensation. Yet there was no help for it. A little extra aid at a timely juncture and under pressing circumstances would have made all the difference between a full and satisfactory, and a partial and unsatisfying result. The autumn comes with its falling leaves and interminable litter. Ground is cleared, waiting for manure and spade. The hands of the worker may itch to get at it. But a tidy appearance

must be kept as well as may be; and when it is not raining the immediately pressing work is cleaning, and securing, and protecting. The frost and snow come, even perhaps before all is secure, and the ground is still undug—unmanured. That is the inevitable result of a wet autumn and early winter. We have next early spring upon us, and not only the winter's but much autumn work in arrears. There has been no help for it. All has been done that was possible under the conditions, yet here is the work undone. What is—what must be—the result? The owner is uncomfortable, but his discomfort is not nearly so keen as the gardener's, who has plodded on under a crushing sense of self-conscious helplessness, and now is drinking the bitters he knew must come. Here is autumn—winter's—work crushed on spring, and a jumbling-together of the three when summer's work cries aloud for labour. The year's muddle is complete, and the garden, instead of being a pleasure and delight, is a source of trouble and anxiety to owner and workman.

In hundreds and thousands of cases the position at this moment is as just described. The long, drizzly, littery autumn was followed by a sudden, early, and prolonged winter. The work, which in an ordinarily mild season would have been completed, is pushed on spring, when every day brings its own demands on the worker, and arrears must be left undone, or at least shuffled over, to the certain disadvantage of everybody concerned. There is a remedy, but the golden season of autumn is lost. That is the time of time of times to press on, by a little extra labour, the seasonable work of the garden. As soon as ever ground is cleared a double-quick march should be made to get it turned up and the manure under. Digging before the surface has become cold by frost or logged with surface water is the royal road to a profitable goal. That makes a garden in winter enjoyable by a sense of order and neatness, benefits the ground by a way nothing else can, gives health and freedom to future crops, lessens summer labour, and concentrates—what is there—adequate strength to the ever-recurring work of the hour, and secures also this great—important—desideratum of making master satisfied and man contented. That may be done by a little timely aid at a critical time, and assuredly nothing pertaining to a garden is better worth the doing. But that time is past, and yet much autumn—winter's—work undone.

The position is this: The work of two terms heaped on one, and within one short march of another, for spring will soon be on us with its urgent call to duty. To extricate himself unaided, one man must do the work of two. Logic and experience alike drive to that plain fact. Can he do it? Clearly not. He must have aid, or work be half done and the summer a muddle. Experienced owners who care for their gardens will recognise the state of the case, and their practical acquaintance with seasonable routine will suggest the aid they will give unasked. That is pleasant and satisfactory. Those less experienced will naturally lack that discernment, but may not lack the consideration when the case is put before them. A modest, hopeful, plodding man has diffidence in putting his own case, and keeps plodding on. The time comes when he is out of his depth, and compelled in self-defence to revert to the cause of his difficulty. How many kindly employers would then reply, "Why did you not tell me at the time, and I would have helped you?" No doubt there are many such. This is to let them know, while there is yet time, what the position is now, and what they may do to make their home-surroundings enjoyable and prosperous in the ensuing season. Not, be it observed, as altogether conferring a favour on the man, although he will so regard and appreciate it, but as a work whereby he himself will benefit in the better state and prosperity of his garden, and as winning, by encouragement given at a happy moment, the more willing and consequently more profitable services of a good servant; and if he happens to be only moderate and such encouragement fails to improve him, well then ——, but I will not pass judgment.

Now, have I been leading too fast, and shall I apply the lash? Perhaps it may be necessary. Do not, then, be in haste to make up for lost time in putting on force to manuring and digging the moment inclement weather takes its departure. Let the ground have time to drain, and the surface become naturally firm, dry, and clean to work. Do not be driven to turn under any frost and snow; the earth is cold enough without any such violently cooling supplement. It takes half the summer to warm ground in which ice is buried 6 inches deep, and plants cannot grow freely in a soil-temperature too low for their natural requirements, but only exist and invite insects. It will therefore be wise to wait awhile for favourable conditions and then press on. In the meantime there is another kind of waiting—steady industrious men waiting for work, with dependent families made hungry by frost. They will be glad to bring up arrears and be benefited. Their labour will be profitable; the garden manager will have a fairer field for his skill, and produce a better reward by his industry; and the employer may rejoice in the good he has done—good of the best kind, inasmuch that by benefiting others he has benefited himself—a fitting inauguration of the yet new year. —J. Wright.

OUR FORGET-ME-NOTS.

Who has not while strolling by some water side paused to admire our beautiful Forget-me-nots, and whose lovely blue wins attention and charms the eye? Myosotis palustris—why do we not see this native gem in our moist borders in greater abundance? Is it because it is to be seen in almost every ditch and pool, or is it too common to be taken into consideration? Be this as it may, we have not a more beautiful flower on our native soil, nor one more easy to cultivate when once established. It requires very little care, and will prosper by land or by water. It may be increased by seed or division; it sows itself, and the seedlings may be moved to the place intended for it when large enough. It is a most useful plant for bouquets, and may be made available for indoor decoration. Grown in pans in a cold pit or frames with plenty of air, and well attended to with water, it may be kept in bloom nearly the year round. Beautiful as it is when cultivated, it is seen in its greatest beauty in its own native habitat by the pool in the early morning, when the sun is just peeping upon it and its flowers are bathed in dew, or when evening's mantle subdues the light which falls on them.

It should hold a very prominent place in the early spring garden; will succeed in most soils, but should be well supplied with water in dry situations. When past its best it is easily removed to be replaced by other occupants of the garden.

Myosotis dissitiflora is a very desirable border flower, often cheering us with its lovely flowers from early spring till late in autumn. It is of compact habit, is easily increased by seed, requires little care, but often requires the hoe to hold it in check.

I think there is a little confusion respecting this and other Forget-me-nots which, if it could, would be as well cleared up. Have we not the same plant under different names? They are a widely distributed family both in our own and other lands. The alpine species do well on a moderately moist rockery. They are not very particular as to soil; a compost of good loam, sandy peat, leaf mould, coarse grit or charcoal dust will suit most of them. They require drainage and attention in watering.

Myosotis azorica is a real gem and an acquisition to any collection. M. californica is a very desirable plant, its flowers being white producing a fine contrast with the blue varieties, and requiring the same treatment. M. rupicola, the queen of the family, ought to be on every rockery in the land and in every collection. Being one of our own native species makes it the more desirable. It is well adapted for edging the foot of the rockery, but requires good drainage and a rather shady situation. It may be grown in pots for indoor decoration, and should be seen in masses to be appreciated; when so seen it cannot be easily forgotten.—Veritas.

DO VARIETIES WEAR OUT?

The Journal of Horticulture has reproduced an article written by Professor Asa Gray, in the *New York Tribune*, on the wearing-out of varieties.

Mr. Asa Gray having done me the honour to notice my opinion on the subject, I have thought it necessary to send him the following answer.—Jean Sisley, *Lyons*.

"Sir,—In reply to the article you have published in the *New York Tribune*, and in which you have done me the honour to refer to me, I take the liberty to lay before you that, in my opinion, there are two incontestable facts—

"1, The unity of universal life.

"2, That every individual is a variety.

"It follows that in all the universe and among all beings life is transmitted in like manner. That every creature which exists ought to die and re-enter universal life to make room for other beings of its kind, or more highly perfected than itself.

"That variability is manifested everywhere. That there are

not two leaves of the same tree which identically resemble each other. That no two beings, not even twins, are exactly alike. That the seeds of the same plant, of the same capsule, never identically reproduce the mother, and that no one of them is identically similar to the others, not even among annual plants.

"Then if that is so, man cannot by artificial means perpetuate that which Nature has made variable. Man cannot have the power of changing anything to natural laws. Those who say that man by artificial means can prolong indefinitely the existence of a variety (of an individual), can they furnish the proof? Is the life of man long enough to enable him to know the duration of the existence of a plant? We know that annual plants die when they have accomplished the act of reproduction. Has anyone studied the duration of perennial plants?

"It may be objected to the extinction of varieties, that Nature has provided a great number of vegetables with the faculty of continuing their existence by suckers, tubers, or rhizomes. But as alongside of this means of reproduction, Nature has put that of the continuation of the race of the species by seed, I conclude from it that the first means cannot be but temporary, and that the second warrants the admission that Nature does not wish perpetuity of the variety, because it would be contrary to the law of variability.

"Why does man study natural laws—why does he seek to discover their secrets, if is not to appropriate them to his wants? If not that, what would this knowledge serve him? It is, therefore, useful to know that varieties cannot be perpetuated. For man knowing that, utilises the means Nature offers him to regenerate varieties and ameliorate races.

"This is what has already been done instinctively, unconsciously, for the Potato and for fruit trees, and is done daily in all the branches of horticulture.—Jean Sisley."

JOTTINGS ON LAST YEAR'S GARDENING.

The year 1874 will ever be memorable in horticultural annals, Mr. Hunter having grown and exhibited a bunch of Black Hamburgh Grapes weighing 21 lbs. 12 ozs, the greatest triumph in Grape-growing achieved in this or any country. All honour to Mr. Hunter, his name will continue on the page of horticultural history to the end of time. Had the feat been accomplished by any large-bunching kind, as, for instance, the Syrian, little indeed would have been the wonder, for had not Mr. Speechly at Welbeck in 1781 grown a bunch of Syrian to the weight of 19½ lbs.? Prodigies, it appears, in Grape-growing occur about once in a century. Speechly's 19½-lbs. bunch of Syrian has been described as a monster of a comparatively inferior kind. And what is a 19½-lbs. bunch of Syrian as compared with what it does grow to in Syria? A mere fleabite indeed if the figurative ideal given of the spies laden with the fruits of Canaan be at all faithful; a cluster of Grapes being a load for two men. Ideals of this kind have yet to be realised, and we certainly are advancing towards it, for Speechly's 19½-lbs. bunch is so far outstripped by a bunch of Syrian grown and exhibited by Mr. Dickson in 1872, weighing over 21 lbs.—a clear advance in very nearly a century of 1½ lb. The following year (1873), Mr. Hunter advances to the front. Four pounds is a good weight for a bunch of Black Hamburgh Grapes up to that date, but he grows and exhibits a bunch of this kind weighing 13 lbs. 2 ozs.; and in 1874 raises the weight of a bunch of Black Hamburgh Grapes to, as before stated, 21 lbs. 12 ozs. The *modus operandi* by which such bunches are produced will, no doubt, never be told. Seeking to find it, as some have striven to, by insinuations of its being due to adroitness in adding bunch to bunch by experts at grafting, has not been attended with result other than disfavour; spurned, indeed, by every gardener of Anglo-Saxon origin throughout the world. Condescend to such knavish tricks they do not; acting openly, not placing their light under a bushel, but upon the exhibition table, subjecting the products of their skill and industry to the world's light of criticism.

Beyond the grand "output" of the Lambton Castle bunch of Black Hamburgh Grapes, 1874 were the least remarkable, horticulturally, of its predecessors. No introduction of extraordinary note of plant or fruit has taken place. There has been no innovation of any system, subject, or thing calculated to turn horticulturists off the track they have hitherto pursued, otherwise much to spur them on in that they have been so successful by in years past, and only one by which it is to be expected in those to come.

Culturally the Royal Agricultural Society has, to its own satisfaction no doubt, proved there are no kinds of disease-proof Potato. It is hoped the public, and especially the ninety-four essayists, will be convinced that the prize of Earl Cathcart was justifiably withheld. Singular indeed would have been any other result by subjecting any kind of Potato to the culture practised by a majority of agriculturists. Expect to find disease-proof Potatoes, forsooth, following the treatment most calculated to produce it, which none know so well how to effect and compass as farmers. Certain kinds were not, I suppose, submitted for trial as disease-proof, cultivated upon a system most conducive of disease, its propagation and therefore continuance; but certain kinds were named by "several of the essayists" as disease-resisting when cultivated upon the system propounded by the essayists, the object of which is to prevent the Potato plant attaining growth favourable to attack by the fungus. Culturally as well as by disease-resisting type of haulm, the Potato disease may, and will, be rooted out. Never will it be until there is a radical change in the system of culture. There will be no change amongst the great producers until it is by public opinion forced upon them. Another Potato famine would do more to remove the cloud than ninety-four multiplied into itself of essays. It would be more convincing than seeking to provoke by a liberal prize an antidote for the disease, and apply it in such a manner as destroy its efficacy—administer the antidote as the patient shall dictate, ignoring the precise instructions of the physician. Who would think to cure a patient of a complaint induced by stimulants by prescribing their continuance? Instead of arresting the disease, it would be the best possible means to adopt with a view to a fatal issue.

Respecting the other issue of the Potato essays, the life history of the Potato fungus, we are encouraged by the statement that the resting places of the oospores is likely to be settled. Granted, they are found on the Potato, or on the soil, or existed on plants of some kind. What then? A solution for dipping the sets in prior to planting, an application to the land of mineral substance, with avoidance or riddance of certain plants, and maybe districts, will be suggested; and there it will, I have no doubt, all be found in the essays, so that practically we shall know as much as the essays would have given us at a much earlier date. Climatal conditions inducing to disease over which the cultivator has no direct or certain control are not to be ignored, nor could they well be in any essay otherwise than alluded to, for if the cultivator may not change the climate, it is his to adopt such precautionary measures in advance, as well as at the time of attack, as will lessen the virulence of the disease and stay its progress.

Everybody knows all this and much more, but the agricultural mind is so wedded to its own ideas as not to admit any innovation from without, believing themselves ruined beforehand by everything intended for their good, and receiving no change of ideas until altered circumstances forcibly put upon them cause them to do so, in the end finding themselves and others every way benefited.

If the Royal Agricultural Society is not to be congratulated upon finding disease-proof Potatoes, the country has cause for thankfulness in the comparative freedom of the Potato crop from disease, giving it less need of bread, and less dependant upon foreign supplies.

The season 1874 was a dry one, but favourable upon the whole to most descriptions of crop. The hay crop light, but secured in good condition. A light hay crop is a certainty of the early part of the summer having been dry. Grain crops upon the whole good, but Beans may be set down a failure. Root crops were upon the whole good, and yet there were some partial failures through drought.

The season was not remarkable for great heat, though it was 91° in the shade, but nevertheless warm and dry; and the warmth and congeniality of autumn were remarkable, being continued until late in November, when we had cold and snow, and that ever since. Christmas week was bitterly cold, reaching its climax on the evening of the 29th and morning of the 30th December, when the temperature (in Yorkshire) was at 6°, or 26° of frost.

Spring fine and dry but with sharp frosts at night in April and May, the early part of June being very cold and did much injury in some places, especially to Pears. Ours were in blossom and had the flowers destroyed. Early Potatoes had their tops blackened by the frosts of April and May, and some damage done to fruit blossom, especially to Apples. The crops of fruit upon the whole good, Pears and Apricots with Plums being a good crop. Apples were in some places good, and in others indifferent. Bush fruit, excepting Black Currants, was

good, Raspberries being inferior in size and maggotty. Black Currants were very inferior in crop and quality. Nuts abundant, and wild fruit unusually so, Brambles especially, hanging in clusters not unlike Grapes. The Scarlet-berried Elder was particularly fine, and the common Elder plentifully fruited. Mountain Ash bore in plenitude its attractive berries, and the quantity of heps on the Sweet Briar enormous, rendering them beautiful objects in contrast with the snow of December. Cotoneaster microphylla was resplendent with its coral beads upon its deep shining green-setting; C. Simmonsi, though having larger berries, and being more or less plentiful, are not nearly so effective as those of C. microphylla, from the leaves of C. Simmonsi becoming partly bare, it at best being only partially evergreen. It is fine, however, for cutting for decorative purposes, its orange fruit having a fine effect. For cutting, however, no berried plant is equal to the Euonymus europæus var., their opening capsules being very beautiful; they are, however, soon over. Berberis (Mahonia) aquifolia fruited very freely, as also B. Darwinii, but the fruit of these though very profuse is not nearly so beautiful as that of the common Berberry, or B. dulcis. The fruit of the common kind, B. vulgaris, and its white and yellow-fruited varieties, are very ornamental in early autumn. Sloes plentiful, but Crabs were thinner than usual, though the Siberian was heavily loaded, and what a beautiful object it is with its highly-coloured fruit! Haws were not abundant, and Holly is often much more heavily loaded with its berries, which gives it its charm for Christmas decorations. The fruit of the wild Raspberry was not nearly so fine as I have known it, and it is plentiful in the woods here, having unquestionably been sown by birds, to whose agency is to be attributed the springing-up everywhere of Currant and Gooseberry bushes, especially in the vicinity of the kitchen garden. Guelder Rose is not sparing of its berries, but they are not attractive; and though we have no finer object in the landscape in spring than the gorgeous bloom of the Bird Cherry (Cerasus padus), it fruits very sparingly. Aucubas do not berry from the circumstance of quadrupeds stumping them, otherwise they are very beautiful. I might linger over the berries of the Portugal and common Laurel, also Yew and many others, not omitting the beautiful Skimmia japonica, which is of no use whatever where there is hare or rabbit, only to afford them a dainty morsel; and there are the Gaultherias and many other berry or fruit-producing plants, all of greater or lesser beauty; and the reason I allude to them is to point the beauty they impart to woodlands, yea, and ornamental grounds too, when the flowers are becoming scarcer day by day, and the yellow falling leaves acquaint us of the sealing of vegetation in winter's embrace.

Those berries and fruits, what do they remind me of? They cause the mind to picture in its eye the richness of the spring tide of promise. The landscape all aglow with the bright golden yellow of the Whin and Broom, the snowy whiteness of the Blackthorn, the Bird Cherry heightened in effect by the delicate tinting of the Crab, remind of the time of blossom and flowers —Nature's promise of future benefits. They remind of the time of the singing of birds, without which the woodland, the field, the garden is without its amplitude of charm. Well may the birds sing. Instinctively they love to sing amid flowers. The drier the atmosphere the clearer their note; yea, they sing as the promise is of a rich full crop of fruit. If there are none of these berried shrubs, fruit-bearing trees, the landscape is a barren one in spring and autumn—a wilderness that knows only the note of the solitary birds.

Berries and fruits tell us of the provision Nature has made for the recipients of its bounty. The birds, whose songs all delight to hear, will be spared to us over a severe winter to gladden us with their song again in spring. Yes, if birds are wanted provide those for them upon which they subsist. It is futile to plant fruit or berry-bearing plants and not expect to have birds, and equally puerile to expect birds to sing sweetly in spring, to busy themselves in destroying slugs, worms, grubs, beetles, caterpillars, moths, butterflies, and swarms of lice—one, other, or all blighting more or less the hope of the husbandman and of the birds—and not calculate that they will help themselves to the fruit. What are the poor creatures to live upon when the juicy insect food fails? Are they to keep the trees free of the grubs at the roots, and the caterpillars and lice of the head, without hope of reward? Instinct, setting aside reason, point they ought not; but as the fruit of the garden is for more rational beings, let us not forget that the labourer is worthy of his hire. Let no one be so selfish as to delight in the song of birds, admit his help when no harm is done, but when the harvest arrives deprive the birds of their share. I do not mean admit them to the fruit unrestrained, for this would be instinct governing reason; nor destroy them, for that would be to deprive us of their song, and the further use they will be in destroying insects. But whilst we prevent them of the fruits of the garden by nets, provide for them in the ornamental grounds shrubs and trees that produce fruit or berry, to them a substitute for the fruits of the garden. Upon these grounds I advocate fruit and berried plants.

If the berried and fruit-bearing plants are beautiful in themselves, in spring covered with blossom, and laden with fruit in autumn; if birds are attracted by them, being most abundant in and near gardens, and orchards, farmyards, and vineyards, plant such things, the wild fruits of our land, for our native and migratory songsters.—G. Abbey.

CHANGING THE COLOUR OF FLOWERS.

If flowers naturally coloured violet are exposed to the smoke of a cigar, they are observed to change colour and assume a green hue, which is more pronounced the more intense the original colour. This effect may be had—*e.g.*, with the Thlaspi Violet, or Iberis umbellata, and the Julian, or Hesperis matronalis. The change is due to ammonia in the tobacco. Starting from this phenomenon, an Italian Professor (M. Gabba) has made a number of experiments to ascertain the changes produced by ammonia in the colours of different flowers. His method was to put a little ammoniacal solution in a basin, and place a receiver over it containing the flower. In this way he found blue, violet, and purple flowers became green, carmine-red flowers black, white flowers yellow, &c. The most singular changes were presented by flowers in which several tints are combined; the red lines change to green, the white to yellow, and so on. Another remarkable example is that of Fuchsias with white and red flowers, which the ammonia changed to yellow, blue, and green. After the flowers have undergone these changes, if they are placed in pure water they retain their new coloration several hours, then gradually resume their original hue. Another observation by M. Gabba is, that the flowers of the Aster, which are naturally inodorous, acquire an agreeable aromatic odour under the influence of ammonia. They change from violet to red when moistened with dilute nitric acid. On the other hand, if enclosed in a wooden case where they are exposed to vapours of hydrochloric acid, they assume in six hours a beautiful carmine red, which they retain when placed in a dry and shaded place, after being dried in the air and in darkness.

[The above extract has been sent to us with a query whether we know of any other changes to be effected in a flower's colour. We know that many may be rendered white by submitting them to the fumes of burning sulphur. We were told by an amateur gardener that he had rendered the flowers of the Primrose purplish by growing the plants in cow dung. Can any of our readers inform us of such changes of colour induced by applications to the roots of growing plants?—Eds.]

DEATH OF MR. JOHN GIBSON.

Horticulture has lost one of its brightest ornaments in the death of Mr. John Gibson, late Superintendent of Hyde Park, and formerly of Battersea and Victoria Parks. He died after a long and lingering illness on the morning of Monday last at half-past five.

Mr. Gibson's father was gardener to Sir Edmund Antrobus at Eaton Hall, Congleton, in Cheshire, where the son was born in 1815. He has, therefore, finished his course at the comparatively early age of fifty-nine. Mr. Gibson's gardening career began with his father, but in 1832 he was apprenticed to Mr. (afterwards Sir Joseph) Paxton, then gardener to the Duke of Devonshire at Chatsworth. Such were the progress he made, and the characteristics he exhibited, that he was commissioned by the Duke to proceed to India as a collector of plants, and especially to bring home living specimens of the famed Amherstia nobilis. The success which attended his efforts is well known; the Amherstia was introduced, and flowers of that gorgeous tree have occasionally been exhibited at flower shows; and along with it some of the finest Orchids which now grace our plant houses and exhibitions. Of these we may merely mention Dendrobium Devonianum, Gibsoni,

Paxtoni, densiflorum, Cambridgeanum and formosum, Anæctochilus setaceus, Vanda teres, Saccolabium denticulatum, Camarotis purpurea, Cœlogyne Gardneriana, &c.

Mr. Gibson left Chatsworth in 1849 to take the superintendence of Victoria Park, and subsequently of Greenwich Park, and when in 1858 the planting of Battersea Park was begun he was transferred to take the management and direction of a work with which by the admirable way in which it was executed his name will always be associated. Battersea Park is now beginning to develope its beauties, the planting so skilfully managed is producing its effects, and becoming, as every returning year rolls by, a more impressive monument of him who executed it. It is to Mr. Gibson that, while at Battersea Park, subtropical gardening was carried out with such successful results, and which has tended to alter and improve the monotony which so long prevailed in our flower gardens and dressed grounds.

In 1871 Mr. Gibson accepted the appointment of Superintendent of Hyde Park and Kensington Gardens, vacated by the death of the late Mr. J. Mann. Some months ago he was stricken with paralysis, which incapacitated him for his office, which is now filled by his son; and as a mark of sympathy for him in his affliction, and a tribute to the estimation in which he was held, a handsome testimonial in money was presented to him by those who loved him as a friend and admired him as a man.

EXHIBITION AT ANTWERP.

There is to be a Jubilee Fête at Antwerp on the 4th, 5th, 6th, and 7th of April on the occasion of the 125th Horticultural Exhibition of the Royal Horticultural and Agricultural Société of Antwerp. It is to consist of horticultural products and objects of art, tools, and implements relating to horticulture. The schedule is a liberal one, and the large prizes, which range as high as £16, may be taken either in medals or in money.

THE LATE MR. C. NORVAL THOMPSON.

We have had numerous inquiries from readers of this Journal to know if any steps are being taken to relieve the necessities of the widow and orphans of the late Mr. Thompson. We are happy to say that a movement is being organised and will speedily be announced. We commend this case most heartily to the charitable and benevolent, and trust that they will help in their hour of need the bereaved family of one whose object in life was to do his duty and to minister to the wants of others according to his ability. The Editors of this Journal will be happy to receive subscriptions in the meantime, till an organisation is formed; and let us remind our readers of the proverb, "He gives twice who gives quickly."

ARCHERFIELD.—No. 2.

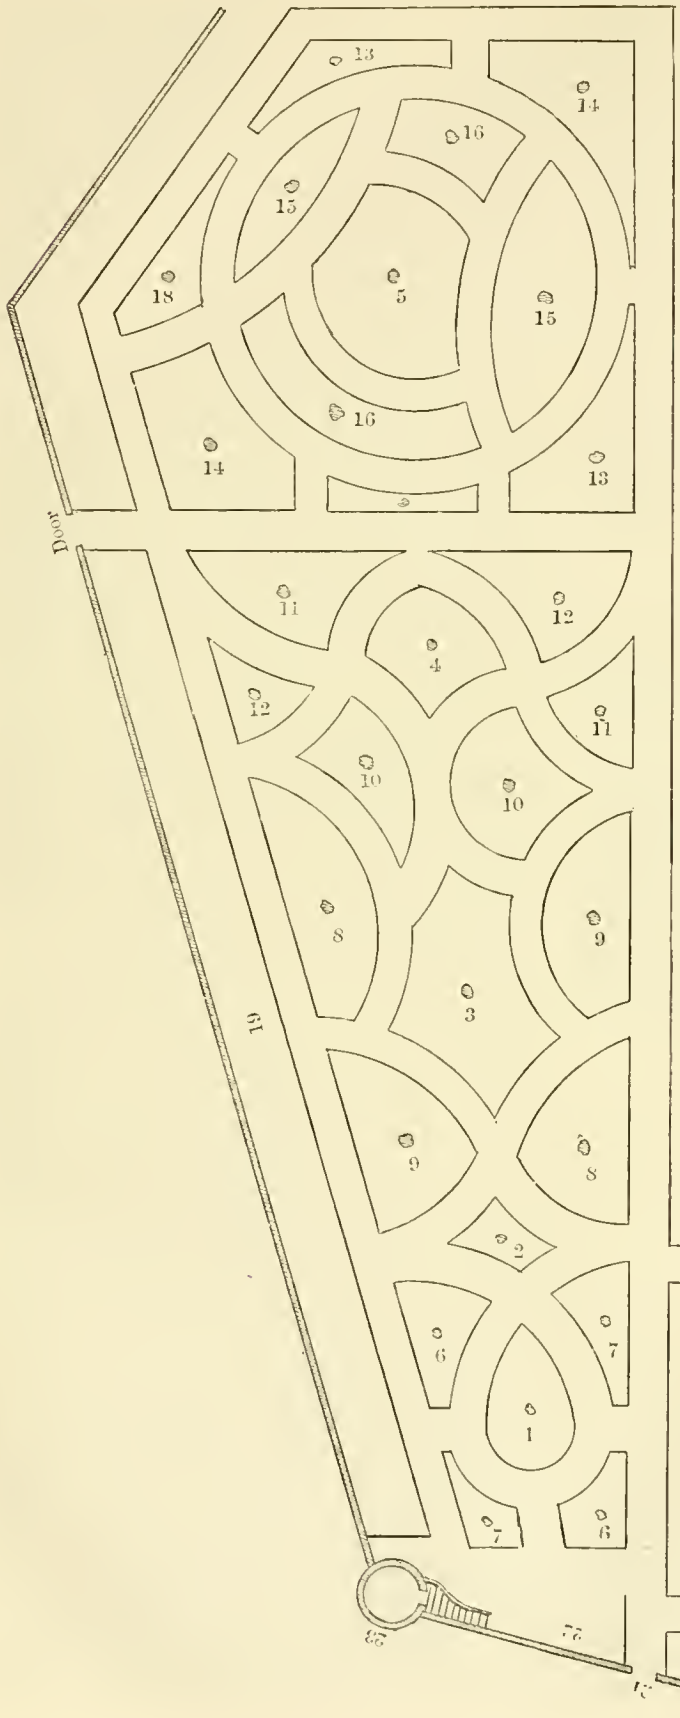
THE SEAT OF THE RIGHT HON. R. A. NISBET HAMILTON.

DIRLETON GARDENS.

Any notice of the gardens of Mr. Hamilton would be incomplete without an allusion to the castle enclosure. Here the archæologist and horticulturist may revel; the one in the ruins of the massive pile, and the reflections of the life, habits, and turmoil of the remote past; the other in the glowing beauty of the modern flower garden, the conscious quiet security, the peace and repose of the present. Such a place as this is a standing, tangible, incontrovertible example of the advancement of civilisation, the refinement of manners, the improvement of habit, morals, law. It tells us as plain as stones can speak that once might was the rule of right, and force the soul of law; and it tells us not less clearly in the pure soft breathings in which flowers ever appeal, that conflict and turmoil have departed from the scene, and that order, immunity from strife, intellectual pleasures, and an ennobled taste reign in its stead. We may cherish the memory of the prowess and deeds of daring of our forefathers, and linger over their recital as "o'er a tale of love;" but let us not regret they are alien to this age of ours, or repine that the nation is less masculine than of yore, for such is but an empty fear and groundless notion. Encroach but on our honour, our liberty, or rights, and, in obedience to duty, the martial spirit and latent courage of the race comes out anew, and is still untarnished by an epoch of peace. But a greater triumph than the combats of the past is the triumph of the present over the passions of men; the physical has succumbed to the intellectual, leaving, however, the *physique* unimpaired. That is a triumph to be proud of. How has it been won? By appeals to the higher faculties; by education in its different phases as religious, political, artistical. When will the unobtrusive plodding brainworkers who are moulding the national mind in all that makes a nation truly great and good, when will they have a due meed of national honour and encouragement? We give to our men of war swords, and statues, and medals, and none begrudges them their reward; but when will the pioneers of peace, of home comforts, and prosperity—the tutors of a right-respecting, law-abiding people—when will they have the same meed of correlative and commensurate reward meted? Well, the time is coming. Music and painting and the sister arts have honourable recognition in their skilled representatives—even horseracing has royal patronage; but has not horticulture done, and is doing, something to elevate the national taste? Is not the practical skill that spreads such a feast of pure enjoyment in the public parks and gardens of the land worthy of a tangible tribute of public appreciation? Ought not those who open the gates of their private homes to recreate the masses—ought not they to have what they merit, something more than a few casual words of approval? Is it too much to expect that those who spend their days and nights of mental labour seeking to evolve that which will benefit their fellows—nay, that which has benefited by the instrumentality of garden literature, which has been so powerful, so potent, so beneficent in its results—is it too much to expect that this great educator will one day have some crumbs of recognition which can well be spared from the tables heaped-up in honour of the civilisation of the sword? There is, however, the reward of an appreciative people, and herein is the very proof of the higher tastes, the improved sentiments, of the present over the past.

These thoughts had birth at Dirleton, and are such which could hardly fail to occur to any reflective mind. There is the past on one hand in the magnificent ruin, with the remains still visible of its moated barrier and protective portcullis, its ponderous masonry, outlooks, and dungeons—all savour of war. There, on the other hand, is the present—the bright smiling flowers, the luxuries of lawn and shade, free for the enjoyment of hosts of admirers who flock to the feast of nature and of art. Here, side by side, is the ancient and modern, the memories of war and the fruits of peace. We cannot see these without reflecting on the agencies producing them, neither would we if we could.

We may dwell for a moment on an outline history of this grand old relic of feudal times, of which much has been written. An authority says that the Anglo-Norman family of De Vallibus or De Vaux obtained a grant of the Manor of Dirleton. In 1298 De Vaux's castle was besieged by Antony Beck, the marshal Bishop of Durham, on behalf of Edward I., to whom, after a desperate resistance it surrendered. Eventually we find the estate in possession of Sir Walter Halyburton, who, marrying the daughter of the Regent Albany, was created Lord Dirleton. The eldest daughter of the sixth Lord Dirleton carried the estate into the Ruthven family, and was included in the forfeiture, and bestowed by the King on Sir T. Erskine, who was in turn created Baron Dirleton. In the civil wars the castle was occupied by the Scottish guerillas, known as Moss Troopers, and who surrendered to Monk in 1650. After the Restoration it became the property of Sir John Nisbet, from whom it has descended to its present owner, Mr. Nisbet Hamilton, who uses every care that the interesting pile shall be preserved in its pristine beauty to generations to follow. It is repaired with great taste, and the cleanliness of its rude interior betoken the oversight of owners worthy of being trusted with the keeping of this grand old memorial of the past. Sir Walter Scott in his "Border Antiquities" states that this castle and estate was the bribe which the last unhappy Earl of Gowrie held out to the cupidity of Logan, his associate in conspiracy. It seems to have been coveted by that person in the highest degree. "I care not," says Logan in his correspondence, "for all the other land in the kingdom if I may grip of Dirleton, for I esteem it the pleasantest dwelling in Scotland." "We know not," says another writer, "a more lovely scene than is presented by this village, with its fine green, its noble pile of Ivy-clad ruins, and the distant rock-gemmed firth." This village green is a fine expanse of turf, bounded on one side by the castle enclosure, and around which the cottages are scattered, each in its own garden plot. In architecture these are plainly ornamental, and tell one on the



PLANTING.

1, Dwarf Ageratum and Polemonium mixed, edge Crimson King Verbena.

2, Purple King, edge Mesembryanthemum cordifolium variegatum.

3, Yellow Calceolaria, band of Dell's Beet, band of Artemisia, edge Lobelia.

4, Bronze Pelargonium, band Purple King, edge Alyssum.

5, Pelargonium Stella, band Christine, edge dwarf Ageratum

6, Pelargonium Golden Chain, edge Lobelia.

7, Pelargonium Flower of Spring, edge dwarf Ageratum.

8, Purple Stock and Artemisia.

9, Pelargonium Christine, edge Verbena.

10, Pelargonium Trentham Rose, edge Nepeta teucrifolia.

11, Dactylis and Purple King mixed, edge Golden Feather.

12, Pelargonium Little David, edge Cerastium.

13, Yellow Calceolaria, edge Iresine Herbstii.

14, Pelargonium Vesuvius, edge Alyssum and Lobelia mixed.

15, Pelargonium Bijou and Verbena venosa mixed.

16, Dark Calceolaria, band of Chrysanthemum Sensation, edge Tropæolum Cooperi.

17, Viola Perfection, edge Viola White Perfection.

18, Pelargonium Crystal Palace Gem, edge double Lobelia.

19, Border by wall.

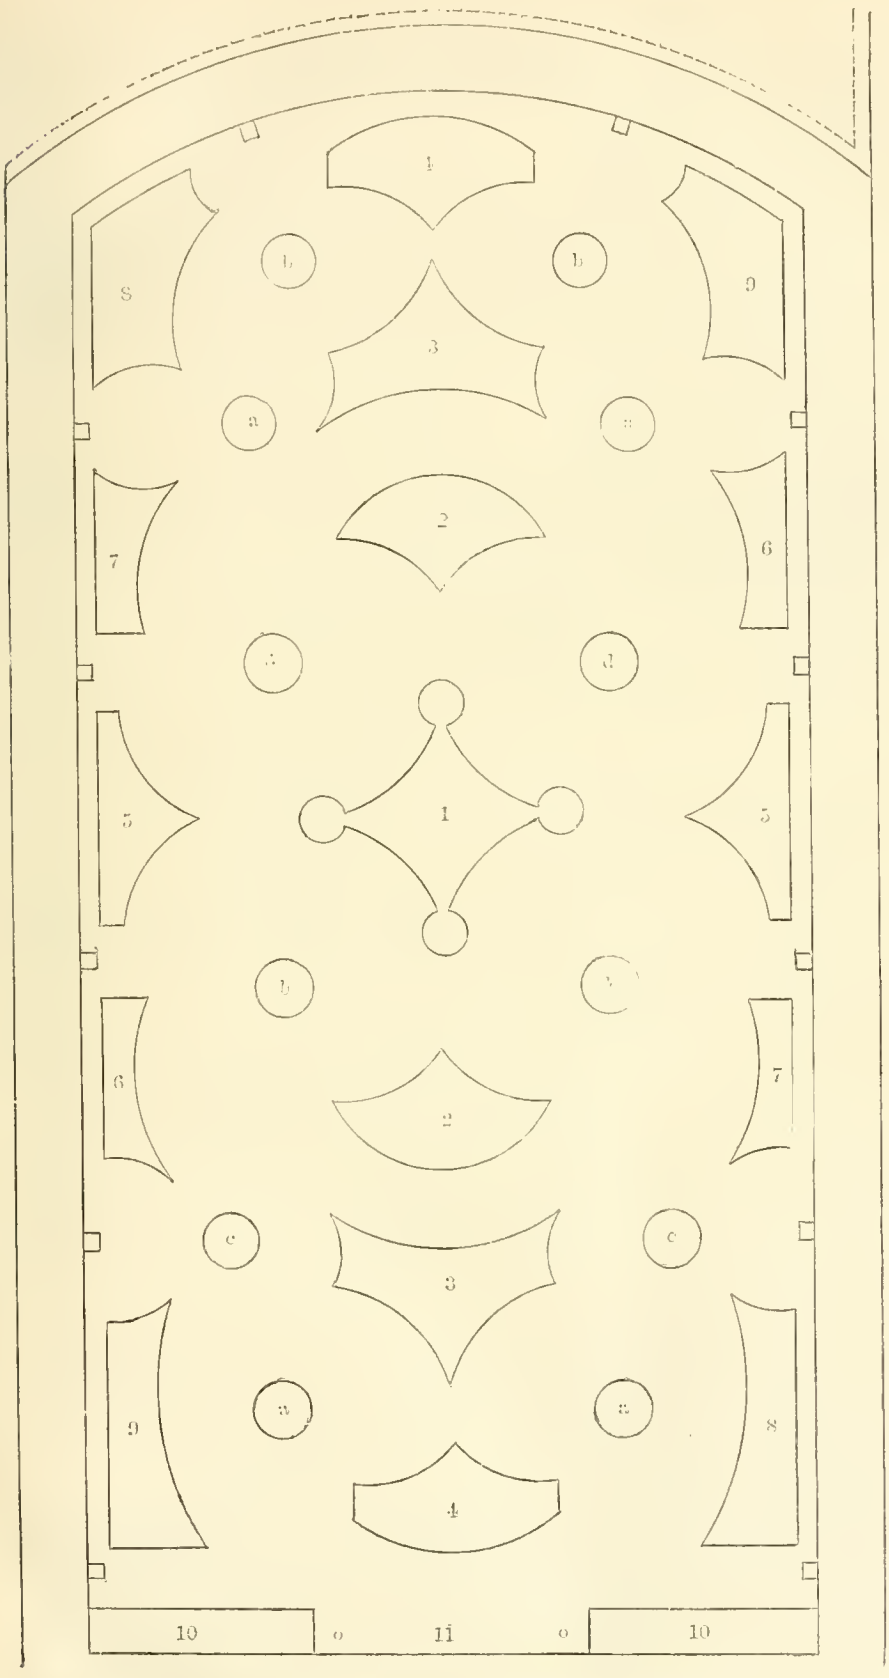
20, Ornamental-foliaged plants.

21, Entrance.

22, Palms.

23, Tower.

Fig. 8.—On gravel.



PLANTING AND ARRANGEMENT.

SMALL CIRCLES.

a, *a*, *a*, *a*, Four Araucarias.

b, *b*, *b*, *b*, Four Irish Yews, large.

c, *c*, Two Cupressus Lawsoniana,

d, *d*, Two Cedrus Deodara.

□, Twelve vases, 2½ feet high.

o, o (recess), Two large vases, 4½ feet high.

BEDS.

1, Clematis Jackmanni; edge Euonymus radicans.

2, 2, Groundwork Saponaria calabrica, with Ricinus and Cannas dotted in.

3, 3, Perilla with 3½-feet plants of Acer Negundo variegata dotted in.

4 4, Clematis Jackmanni; edge Gnaphalium lanatum

5, 5, Groundwork Sempervivums of sorts. Raised plants, Agaves, Yuccas, and Chamæpeuce; edge Echeveria secunda glauca.

6 6, Abutilon Thompsoni and Iresine Herbsti; edge Kleinia repens.

7, 7, Groundwork Echeveria abyssinica. Raised plants, Solanum macrantherum; edge Iresine Lindeni.

8, 8, Groundwork Echeveria metallica. Raised plants, Coprosma Baueriana variegata; edge Mesembryanthemum cordifolium variegatam.

9, 9, Groundwork Echeveria secunda glauca. Raised (large) plants, Sempervivum Youngianum; edge Mesembryanthemum cordifolium variegatum.

Fig. 9.—Grass garden.

face of them that the comforts of the inmates are considered. It is striking to a southener to find the old Fuchsia Riccartonii growing up to the eaves, pruned each winter like Vines, and blooming each summer in elegant profusion. Yes, indeed, this is a pleasant place, and salubrious, a covering of snow being seldom seen, and 12° of frost not often exceeded.

But it is time we look in the flower garden. It is bounded by a massive wall, and entered by a door at, I think, the north-west corner. On entering is a burst of beauty. Straight ahead is an irregular strip—an outside slice, as it were, of the grounds, laid out in beds on gravel. These beds are of considerable size, varying from 30 to 60 feet over. They were one grand dense mass of bloom; no "enamelling" or anything of that kind, but light or glowing masses of colour. The gravel paths, being 9 to 10 feet wide, permit of easy promenade by the hundreds of visitors. In fact, there is room to enjoy the feast in comfort. These broad paths and large beds were an idea well carried out by Mr. D. Thomson, who must have had no small difficulty in fitting a suitable plan to a site so irregularly bounded. Its mere copying was a "take-in," but it is given as nearly accurate as possible. Each bed had a centre shrub of choice variety, or a pyramidal trellis of Clematis, Nasturtium, &c., which are a pleasing relief to the general flatness of the garden. This garden is about 360 feet in length, and the view from the tower at one end, and the abrupt rising ground, the castle mound, on the other, is a sight worth seeing. It is bounded on the right by a Yew hedge, and on the left by the boundary wall. By the tower is planted a plant of Wistaria sinensis, covering a length of wall of 220 feet, a noble plant, which blooms profusely. The rest of the wall is covered with the best varieties of Clematis. The long border is planted in squares, relieved by Irish Yews and variegated Maples at intervals. It is not necessary to dwell on the planting; suffice it to say the high colours were very telling, and the mixtures chastely effective, all being well filled and finished.

But there is another flower garden on grass in this enclosure, at right angles with the one on gravel—that is, on entering, the gravel garden is straight ahead, and the grass garden stretching away to the right. This latter is about 170 feet long by 100 feet wide. It is not nearly so brilliant, but is fully as interesting as the former garden. The one is expressive of past active life, the other of cool, quiet repose. The one intoxicates, the other soothes and sobers the mind. The plan of this garden is exceedingly plain, and like most plain designs is exceedingly effective. Beautiful and healthy specimens of Conifers are here introduced, and the beds are mostly filled with succulent and fine-foliaged plants. There are, however, some flowers, notably the centre bed, which for richness without glare is not easy to surpass. It is a diamond-shaped bed with circles at the four points. In the centre is a tall shrub, and in the four circles lower ones. It is edged with Euonymus radicans, and planted closely with Clematis Jackmannii in rich soil. The Clematis was permitted to climb over and cover the shrubs. It was a pyramid of impenetrable bloom, some of the individual flowers being 5 inches in diameter. This is a fine flower anywhere—on walls, trellis, or roots; but to see it in all its glory, treat it as treated here, and rejoice. It put all the beds in the place into the shade. It was the first in bloom and the last out. It was something to be proud of, a credit to the man who grew it, and an honour to him who raised the plant. The bed was 35 feet over, and 8 to 10 feet high at the centre point. This garden is adorned by twelve vases. The beds need not be further described, a plan being appended. It is easily adaptable to a place large or small, and is a nice example of the systematic and harmonious arrangement of shrubs, vases, and flowers. The old castle is quite hid from these flower gardens by large trees. In the centre of these is a sunken bowling-green for the amusement of visitors. Altogether this enclosure is a charming place, a retreat full of interest and beauty. On one day a-week it is open to all who appreciate the privilege, by enjoying without molesting. The place is in perfect order of cleanliness and good keeping, every necessary being allowed by the owner, and ably applied by the gardener. It lacks one thing. A mixed garden of old, hardy, herbaceous plants would be singularly appropriate within its confines. But it must be admitted that room for this is not easy to find, and to remove a single feature from such a place is an idea not to be lightly entertained.

Without entering further into particularities, it may be said generally and without reserve, that Archerfield and Dirleton are good and well-managed gardens in the several departments. To Mr. Kettles I am indebted for much courtesy and hospitality, and to him and his kind helpmate I owe thanks for the first real rest (after a long, dark, tiresome journey), "over the border."—J. Wright.

A GARDEN OF HERBS.

By A. E. Barr.

The Greeks had a proverb, "Many worts and pot herbs in Syria," though Syria was only the heir of Babylonia, whose priests knew well the hidden virtues of herbs, and gathered many of them with magical observations, the traces of which remain in northern Europe unto this day. Certain it is that on this subject we are not the people with whom wisdom was born, and equally certain that much of the wisdom of the ancients died with them, or has come to us only as the bare tradition of a forgotten lore. I need but name

> "the sweet balsamic oil
> Which wept from herbs in Juda's fertile soil;"

the balm that Jacob thought a noble present for the royal Pharaoh, the plants of which were so precious that Pompey, Titus, and Vespasian all boasted of having brought one or more to Rome. Josephus says that in his day Gilead had become exhausted, and that the royal garden of Balm was near Jericho. This garden, on their downfall, the Jews attempted to destroy, but were prevented: and henceforward the precious herbs shed their fragrant gum for heathen deities and the odaliques of the Turkish seraglios. Now the very plant cannot be certainly identified—it has become simply "a name to conjure with"—a password for the nostrums of quack and impostors.

Of a very different spirit was the herb Basil. The Romans sowed it with maledictions, and while they trod it down with their feet, forbade it to grow, averring that, so contradictious was its temper, it always did best what it was forbidden to do. In Mary's and Elizabeth's reign a pot of Basil was considered a compliment to any lady, but remembering its peculiar habits, it is just possible the compliment was a covert sarcasm. No plant has had so bad and so good a name. Old Gerarde greatly praises it, and says, "It is good for the heart and the head, and taketh away sorrowfulness which cometh of melancholie." Tusser has a little sneer for its dainty tastes; and again, Lord Bacon commendeth its "fat and succulent leaves," which are yet such favourites with the French that none of their soups or sauces want the aromatic fragrance of Sweet Basil.

"Why should a man die who has Sage in his garden?" was a popular saying of Campania: for greatly was this herb valued for its healing qualities, and its power to strengthen the memory and induce wise thoughts. It has still some reputation as an emollient, and I saw instances during the late war when the leaves dried and smoked in a pipe greatly allayed that irritability common to men deprived of their customary tobacco. I would not speak positively as to the "wise thoughts," but I know the words were more reasonable after it. The Chinese are immoderately fond of Sage tea: and the early Dutch traders there drove an excellent bargain on this basis: 4 lbs. of best Young Hyson for 1 lb. of dried Sage leaves. In England, until within the last century, it was frequently mixed with cheese. Thus Gay writes:

> "Marbled with Sage the hard'ning cheese she pressed."

Within my own memory it was eaten with bread and butter or chopped fine and baked between rich pastry. Toads have a strong passion for it, therefore it is customary to plant among the Sage bushes a little Rue, a herb specially distasteful to them.

> "'Here's *Rue* for thee,' the poor Ophelia cried."

Rue, which Shakespeare calls,

> "sour herb of grace,
> Rue, even for ruth;"

and makes it grow where a wronged queen has dropped a tear. I think he is a little unjust. Rue has a record which deserves more honourable mention. Every physician knows that it was the chief ingredient of the famous antidote of Mithridates, the true receipt for which was as follows:—"Two dry Walnut kernels, two Figs, twenty leaves of Rue, one grain of salt, pounded into mass. Whoever eats of this confection, fasting in the morning, no power shall hurt him that day." All the ancients, however, believed that for medical or magical purposes Rue ought to be stolen from a neighbour's garden.

Pliny says that the Romans put this herb into their wine to prevent headache, and that painters and carvers chewed the leaves to preserve their sight. That some faith in its beneficence towards vision existed, even in the seventeenth century, is evident from Milton making the angel Michael purge Adam's eyes "with Euphrasy and Rue" in order to enable him to see down the long centuries of time.

It is said that weasels, before hunting rats, seek for Rue, and that in warm climates they find in it an antidote for the bite of snakes. Whether for its power of antidoting evil, or for that of conferring clearer vision, it received the honour of being used for sprinkling holy water, I do not know. However, in the middle ages that was its religious office. Later on it was used as a powerful disinfectant, and was also made into a pickle, the leaves being first boiled and then preserved in vinegar—the same plant that charmed the bravest King of Pontus, that aromatised the Cæsars' wine, and gave insight to Grecian sibyls—the same, "but oh! how different!"

Perdita, in the *Winter's Tale*, beautifully mingles Rue with Rosemary, thus:

> "For you, there's Rosemary and Rue: these keep
> Seeming and savour all the winter long.
> Grace and remembrance be with you both."

And the fair Ophelia also uses the fragrant, dainty Rosemary in the same manner:

> "There's Rosemary for you; that's for remembrance:
> Pray you, love, remember."

The accepted type of fidelity in love and friendship, it was (and is yet in some places), the favourite funeral flower, the very best gift of love to the departed, placed upon the lips just before the coffin-lid is closed. To this custom Kirke White pathetically alludes while contemplating his own early death:

> "Come, funeral flower, who loveat to dwell
> With the pale corse in lonely tomb
> And throw across the desert gloom
> A sweet decaying smell.
> Come, press my lips and lie with me
> Beneath the lonely Alder tree;
> And we will sleep a pleasant sleep.
> And not a care shall dare intrude,
> To break the marble solitude,
> So peaceful and so deep."

Rosemary has been a favourite subject with many English poets, particularly Herrick and Shenstone. It is very partial to gardens over which sea breezes blow, and I have seen cliffs which were wet with the spray of high tides covered with this delightful plant, whose fragrance is often the first land perfume that greets the homeward-bound. I am astonished that Rosemary (Dew of the Sea) is not a greater favourite with married ladies: for it is a universal tradition "If Rosemary flourishes in the garden, then the lady rules the house." And how do we know what occult power is hidden in a sprig of Rosemary? Surely it is a fair and fragrant sceptre. Bees are exceedingly fond of Rosemary, and the far-famed honey of Narbonne derives its exquisite flavour from the abundance of this herb in the vicinity.

Rucellai says that Nature made Thyme on purpose for bees to make honey of. If so, they improve her gifts much better than we do God's best gifts to us. The famous honey of Thymettus was not only the extract of its fragrant Thyme banks, but the condensation of Grecian sunshine, of cloudless skies, and heavenly atmospheres. Bees are not the only lovers of Thyme.

> "Where the wild Thyme perfumes the purple heath,
> Long loitering there the fleecy tribes extend."

The Thyme banks of the Cheviot Hills are the secret of the Cheviot mutton; and the celebrated Southdown—a saddle of which is a dish to be named with respect—owes its delicate excellence to the same source. In Spain they use a decoction of Thyme to wash out vessels for wine, and the Anglo-Saxon all over the world appreciates its flavour in his soups, ragouts and forcemeats. Thirty years ago it was used instead of box wood for bordering flower beds—an old fashion now, I know, and one I never think of apart from some drowsy, quaint cathedral town—but it would bear transplanting to our fresh modern gardens: for if the borders are kept trimly cut, nothing can be sweeter to the smell or fairer to the sight.

Mint is also a great favourite with bees, and if rubbed with honey inside bee hives it very soon attaches them to a new home. From the story of Baucis and Philemon we are led to infer that the Greek peasants scoured their tables with this herb; and the habit was probably just as common among the Roman farmers, for Pliny says "You will not see a husbandman's board in the country but is all seasoned from one end to the other with Mint;" and he also mentions the custom of putting it in vinegar to eat with meats. Spearmint prevents the coagulation of milk, and is therefore an excellent salad for those who use a milk diet. Another variety, Peppermint, makes a popular confection, and also gives a name to a favourite American beverage composed of Mint, sugar, ice, and brandy. Omitting the last ingredient, we would venture to say it was at least "better than might be."

Surely, there are bitter cups enough in life without mingling them, yet even Wormwood has had its day. It was the "bitters" of the Egyptians and Romans; and if anyone desires to try it instead of "Plantation," here is the receipt: 1 oz. of Wormwood, 3 scruples of Arabian gum, 3 scruples of Spikenard (Lavender), 3 scruples of Saffron, and 180 gallons of old wine." I rather think the proportion of Wormwood to the wine is something after the kind of Falstaff's "halfpenny worth of bread to an intolerable deal of sack." The Greeks dedicated Wormwood to Diana, probably because dogs are great lovers of it, and use it in all their diseases. The English dedicated it to St. John the Baptist, and then, with strange inconsistency, used it (before the discovery of hops) in brewing their ale. Still, its consecration was believed to have made it a potent spell against witches; perhaps it was still more successful against moths and other insects. Nevertheless, the gift of Isis and the plant of Diana is now little more than

> "the fat weed
> That rots itself in ease on Lethe's wharf."

Yet surely there is some significance in herbs, else why has "the Hyssop that springeth out of the wall" been so specially set apart for purifying and propitiatory services? This herb was distinctly ordered to be used in striking the lintels and doorpost with the blood of the Passover lamb. It was prominent in the purifying services for the healed leper, and in the ceremonies for cleansing unholy or unclean places. David, in the very depth of his self-abasement, cries out, "Purge me with Hyssop, and I shall be clean:" and when the Great Atonement was offered for the sins of the world, a sponge filled with vinegar, and lifted upon Hyssop to the lips of the Lamb of God, was the consummating rite of that stupendous sacrifice.

See, then, how

> "the meanest plant that grows can give
> Thoughts that do often lie too deep for tears."

Are there not wayside flowers that consecrate "the fair humanities of old religion," secrets in a weed's plain heart well worth the winning, and homely herbs rich with the spoils of time and nature? Do not fear, then, the lowliness of the subject, for

> "Wisdom is oftentimes nearer when we stoop
> Than when we soar."

—(*Medico-Pharmaceutical Abstract.*)

PROVINCIAL HORTICULTURAL EXHIBITIONS.

Secretaries will oblige us by informing us of the dates on which exhibitions are to be held.

THE DISEASE OF CUCUMBER ROOTS.

Nearly every grower of Cucumber plants is more or less acquainted with the peculiar disease which manifests itself in knots or nodules on their roots. These diseased roots have frequently been sent on to us for examination, and those forwarded last week by Mr. John Platt were so characteristic that to better explain their nature we here illustrate a section of part of one of the smaller nodules. The letter from Mr. Platt in last week's Journal, page 5, well explains the symptoms of the disease, which are, however, well known to most gardeners.

The root-nodules in question are generally assumed to have a fungus origin, but the Rev. M. J. Berkeley long ago described the disease, and showed it to be caused by a parasite of another nature. The description he illustrated with the utmost accuracy. It would seem that the pest which causes the mischief is not always readily seen, or maybe it escapes into the surrounding soil, or, after working the mischief, perishes; but that it is sometimes difficult or even impossible to detect Mr. Berkeley himself confesses. On this account Mr. Berkeley's observation has unfortunately been questioned, but he has quite recently been able to satisfactorily confirm its positive

accuracy in *Gardeners' Chronicle*, Sept. 5, 1874. For our part we have frequently seen the interior of the nodules just in the condition described by Mr. Berkeley, with the parasites in all stages of growth, from the egg condition upwards.

Our illustration represents on the left the diseased roots natural size, and on the right a thin slice through one of the nodules of the roots forwarded by Mr. Platt. The latter is an exact reflection from a camera lucida attached to the microscope, and shows the cellular tissue, A; pitted and spiral vessels, B; the worms coiled up in the eggs, C; worms emerged, D; and empty eggs, E, from which the worms have escaped. Mr. Berkeley refers these parasites to Vibrios, which belong to the infusoria (properly confervoid Algæ), common in fœtid water, &c., and always, we believe, extremely minute in size; but it will be seen from our figure, which is enlarged 160 diameters, that the animals there shown are just over one one-hundredth of an inch long, whilst Vibrios are ten times smaller, and do not arise from eggs, but increase by the formation of new joints and separation at the articulations. The parasite appears to us to belong rather to the oviparous section of the genus Anguillula, which includes the "vinegar eel," and except that it is only one-half the size, it is very similar in all stages of growth to A. Tritici, an eel found infesting blighted wheat.

It is often complained that men of science cannot specify cures for the diseases they describe, but it should always be remembered that in regard to cures pathological botanists considerably resemble doctors of medicine. It does not follow that, because a doctor can tell by certain symptoms his patient may have Asiatic cholera or cancer, that he can therefore cure the disease; or because a fireman sees your house is being

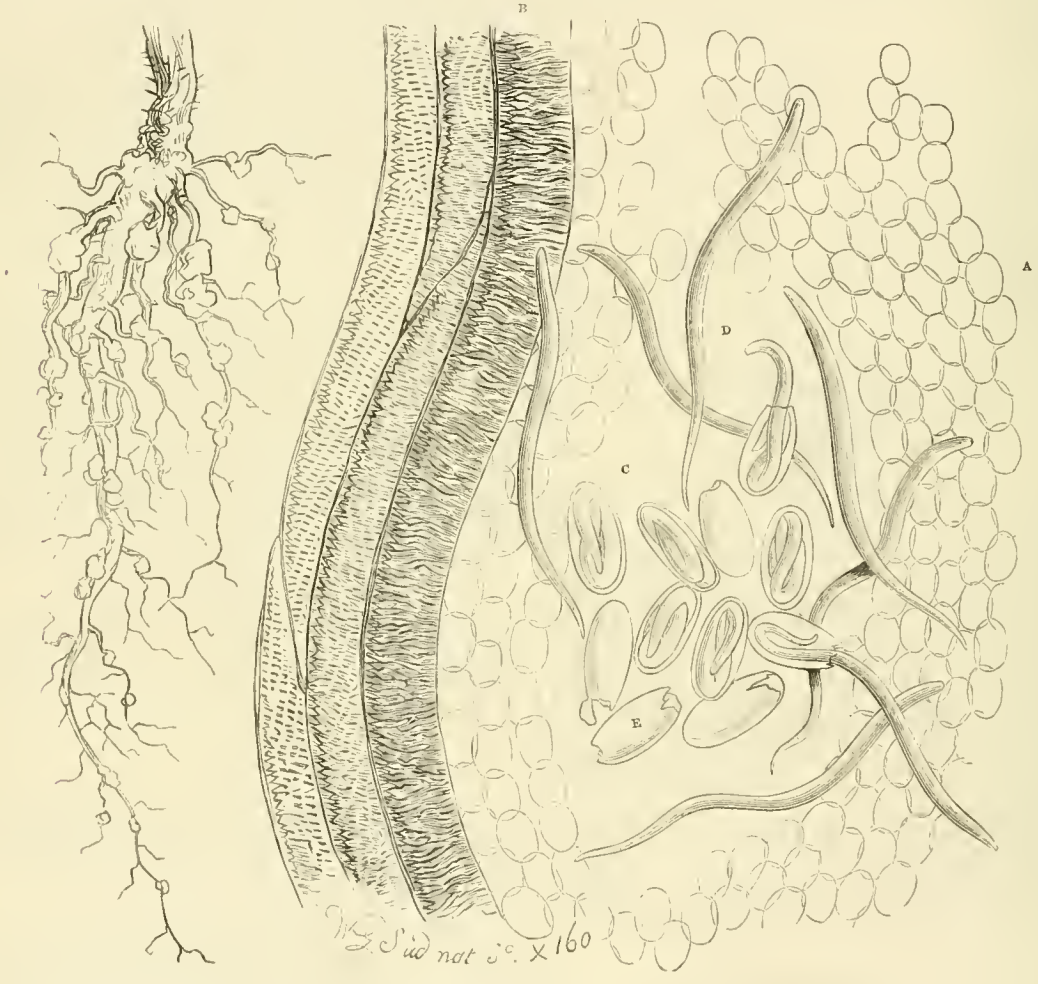

Fig. 10.—The Disease of Cucumber Roots, enlarged 160 diameters.

destroyed by fire, he can from that mere fact extinguish the blaze. Physic and water sometimes do wonderful things, and in the case of worms in the roots of Cucumbers, the best remedy is to destroy the plants and look to the compost, which probably harbours the parasites.—W. G. Smith.

THE ARECA PALM.

The most useful of all the vegetable orders are the Grasses, and next to them the Palms. They supply food, and shelter, and oil, and cordage, and beverage, and writing sheets to millions of easterns, besides many minor luxuries such as those obtained from Areca Catechu, the Areca Palm or Betel-nut Palm.

It is a product of the East Indies and southern China. Its timber is used by the natives; its leafstalks for making ropes; its spathes for wrappers; and the kernels of its nuts, which are harsh and astringent, for masticating. For chewing, a native takes a green leaf of a Betel-pepper, one or other of the genus Chavica, stimulating as its name implies, spreads on it a little moistened quicklime (chunam), and scrapes on to this a little of the Areca nut, folds up the leaf, and it is then ready for chewing. It is commonly called "pawn." All classes indulge in the practice, and practice only can render it endurable, for it is intensely stimulating and injurious to the palate. The Malays carry their Betel or pawn-box as Europeans carry a snuff or tobacco-box, and offer its contents to a friend as a courtesy. The habit may be salutary to a population living on vegetables, for, as Sir Emerson Tennant observed, the compound is antacid, tonic, and carminative. At the same time it is disfiguring, for the mouth and lips are dyed purplish red by the saliva which it colours; and it is so destructive to

the teeth that those of a man at the age of twenty-five are often quite destroyed.

Meyen states that "on all the coasts of the East Indies and the adjacent South Sea Islands, the Philippines, the Carolinas, the Marian, and Society Islands, where chewing the Betel is a more or less common practice, the Areca Palm is planted near the dwellings, where it, in company with the Banana, forms a beautiful object. In the town of Manilla we find the

Fig. 11.—The areca palm.

Betel Palms planted in regular rows before the houses; and Plantains, Anona squamosa, Averrhoa Bilimbi, and other tropical trees grow between them.

"In consequence of the enormous consumption of Betel in the Indian Peninsulas and in China, the Betel nut forms a very extensive branch of traffic. The export of it to China from the Eastern Peninsula and Sumatra is very large. Sumatra furnishes yearly at least between 40,000 and 60,000 pikels (a pikel is 133⅓ lbs. English), which are shipped from May until August. Sumatra together with the adjacent countries, indeed, exports 80,000 or 90,000 pikels annually, which for the most part go to China.

"The Areca Palm, although probably wild only on the Sunda Isles and the adjacent Philippines, is most extensively cultivated not only in Sumatra but in India. In Ceylon, and especially throughout Malabar, and still higher up the coast,

there are vast plantations of this beautiful Palm, and their produce is of great importance, for as everyone chews Betel, the consumption of Areca nuts in India is incredibly great."

NOTES ON VILLA AND SUBURBAN GARDENING.

With the spring dawning upon us, and the weather mild, and the soil comparatively dry and workable, reminds one that it is time for action in many gardening matters. The first of which should claim attention is the sowing of a crop of Peas, and planting a crop of Broad Beans. A warm border should be selected for both, and then, if the weather should not prove too severe, they may be expected to come in for use within a very short time of those sown in November, and with much better results as to produce, arising from the fact that they are reared nearer their proper season of growth. If the ground is not yet ready for the reception of the Peas or Beans they may be very profitably raised under hand-lights, to be afterwards planted out. Both of the above crops, if not improved by transplanting, are certainly not injured by it. It may be as well to mention that, when the soil is very wet and cold and not of the best staple, the Peas would be best sown very shallow and covered over with soil made up for the occasion. This system prevents the seed from rotting, which a wet heavy soil always favours more or less. But it must be borne in mind that, through the seed being sown shallow and the soil bad, the roots will have a tendency to grow but just under the surface; therefore during their growth they must be surface-dressed or mulched to keep them in health and growing order. The Broad Bean is not so particular about soil, as a heavy one if of moderate stability will most likely suit it better than a lighter one. A few Carrots of the Early Horn kind should be sown at once under a frame; if on a bed of heating material so much the better. This ought to be the second crop sown on the same conditions. A small crop should also be sown in the open ground, provided it is in a warm spot and dug. The Long Scarlet Frame Radish, too, may be sown with them. Some people complain of the loss of Cauliflower plants, not only those pricked out under walls, but many of those in hand-lights. When such is the case sow some seed in a frame—or a box no doubt would be more convenient for small gardens; these to be afterwards pricked out on protected borders. They do not generally turn in quite so soon as those sown in autumn, but they do form a good succession, both tender and finer than older plants. The same precaution must be taken with regard to Cabbage, many of which have gone off in the beds.

Now is a very convenient time to make up a hotbed. Perhaps no time is so suitable for the amateur gardener. He can raise so many things by its help. If not wanted for Cucumbers or Melons for a permanency, the young plants can at least be raised in it, to be finally planted elsewhere; and besides that, the general bulk of plants wanted for either department of the garden may be successfully raised in it.

FRUIT GARDEN.

Do not delay the pruning of anything now. Even Peaches, Nectarines, and Apricots must be now done, and especially outdoor Vines, which if left too late are apt to bleed, to their injury for the next season's growth. Orchard trees, or those grown in that fashion in the garden, must be pruned also, which consists in the thinning-out of the old wood and branches where they are thick. Rhubarb in forcing beds must be watched this mild weather, and admit air and light to that fit for use, keeping the succession crops a little closer.

FLOWER GARDEN.

In the flower garden there is not much to do but to trim and dress-up plants and dig the ground. Even the soil in the flower beds will be the better if once more turned over to a good depth. Lay turf during this suitable weather, and make any alterations on the lawn that necessitate the removal of turf. See to the edgings, and in cutting them take care that they are well defined; even a small terrace embankment, if allowed to get out of shape its appearance is spoiled. Take care that the ground is thoroughly rammed, to prevent the sinking of the soil and the unlevel appearance which the lawn will assume if it is not properly done. Admit plenty of air to frames and places containing cool-house plants; and as the bedding Calceolarias are well rooted it would be better to take the point out of every shoot, otherwise they become drawn and almost useless when planted out. All bedding plants that are growing unevenly, the tallest should be pinched back. The same may be said of Verbenas and many other things of the same class.—T. RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

FRUIT GARDEN.

SINCE the third day of the present month the thermometer has not fallen lower than 36°, so that the frost is quite out of the ground. The Apple, Pear, Plum, and Cherry trees trained as pyramids and in the bush form had been pruned in the autumn, and needed only to be looked over, and to have any branches that were crowded or crossing each other to be removed. The Cherry trees have been planted ten years, and are furnished from the ground to the tips of the branches with fruit buds. They have grown so large that it is difficult to cover them with nets, and if they are not thoroughly covered-in with strong nets, when the fruit is ripe the birds will risk their lives to get at it. Indeed, it is so difficult to preserve it that we are digging out some of the trees and planting Apples in the place of them. In our shallow gravelly soil trees worked on surface-rooting stocks are the best, and the course of treatment required for them is very different from that given to those which are worked on stocks that send their roots down deeply in the ground and far outwards in search of sustenance. The trees of the latter are planted where they have opportunity to grow to a considerable size; and when they have arrived at the stage of growing crops of fruit, a dressing of manure over the roots and forking it in will in most instances benefit the trees. In light soils the best treatment for trees on a dwarfing stock is to mulch over the roots with rotted manure; cow and horse mixed is better than the latter by itself. Very often the spent dung from a Mushroom house or from a hotbed that may have been overheated is used, but cow manure is the best for light soils, and for heavy soils stable manure should be used by itself. In relaying the Box edgings they were raised a little to allow of a dressing of gravel over the walks without taking any of the old gravel out. This arrangement left the borders in which the fruit trees are planted a little lower; and the way we have done this year has been to give the surface of the borders a good dressing with manure, and then to cover this over with soil that had been dug out to renew the vinery borders. If this had not been done the soil would have to be wheeled out, and then carted away where it would be of little value. When the trees were planted the union of the graft with the stock was not covered: the present dressing will just cover the union. Now, from previous experience we believe that this is the right course to pursue with our trees. New roots will be emitted from the stock quite up to the point of union, but not above it, and the roots of previous years which have penetrated the border in all directions will work up to the rich moist surface-dressing instead of downwards to the sterile subsoil.

When *Strawberry* plants in the open ground are exposed to very severe frosts they suffer much, but while the frost lasted they were covered with snow, which effectually protected them from injury. The Dutch hoe had been repeatedly used between the rows up to the time the autumnal rains set in. The few weeds that remained were picked-out by hand, so that the quarter has now a clean and tidy appearance. Some fine day in March the hoe may be run through them again. Many persons mulch their Strawberry beds in winter. This we have done, but found that it caused an over-luxuriant growth, and that a much better course of treatment was not to apply the mulching of manure until the dry weather set in, which with us is usually some time in May, and before applying the dressing the beds usually receive a good soaking of water. We had begun to dig, or rather fork over, the ground between the rows of Raspberry plants when the snow and frost stopped us. No time will be lost in getting this done, and all other digging amongst fruit trees will be done without delay.

FRUIT AND FORCING HOUSES.

Where many houses of different degrees of temperature are heated from one boiler some experience is necessary to regulate the valves so that the greenhouses, &c., may not be overheated. Our own experience in regard to this is rather different from that of Mr. Taylor, who gave his in a recent number; in his case the temperatures were reversed. The houses that ought to have been 65° were down to 40°, and the greenhouse up to 65°. Now, if this is the case his heating arrangements are very imperfect. Our own experience of the one-boiler system extends over many severe winters, and such a blunder has never happened in any houses under our control. No doubt all the evil Mr. Taylor complains about is caused by the return pipes being higher than the flows. No heating apparatus could do its work with satisfaction arranged in such a way. It is not at all necessary, as Mr. Taylor suggests, to go to the expense of pipes 5 and 6 inches diameter for the main pipes. Three-inch pipes are sufficient for all ordinary purposes, but the flow must be fixed at the highest part of the boiler, and the main pipes must rise gradually to the point furthest removed from the boiler; 1 foot in 100 is sufficient, but, of course, the water will flow more rapidly if the incline upwards is greater. The return pipe must be fixed at the lowest part of the boiler, and by the use of elbows near the boiler both flow and return may be carried along at the same level for convenience. Castings in the form of a T are used at each house to connect the flow and return with the pipes used in heating the house. From this the flow must again rise to the furthest point, and gently fall through the pipes to the return.

EARLY VINERIES.

In houses that are forced early it is necessary to bend the

rods down, so that the points are brought to a level of the lowest buds. Unless this is done it is quite possible that the eyes at the highest part of the house will start first, while those lower down the rod will start weakly or not at all. When it is seen that the eyes are starting regularly the rods must be tied-up to their proper position. In our earliest house this was done, and at the same time the roots received a good application of water, giving a dressing of manure on the surface afterwards to retain the moisture. Future waterings will wash the nourishment out of this dressing down to the roots; it also encourages the active feeders up to the surface of the border, otherwise their natural instincts are downwards, even if the subsoil is quite unsuitable.

Dwarf Kidney Beans are not much in request, nevertheless we would grow a few pots of them; but the space that used to be available for them is now occupied with more valuable plants. We have tried different ways with them, but the best is to sow the Newington Wonder thickly in shallow boxes, and when the seed leaves are fully developed pot the plants deeply, four or five in a 7-inch, using a compost of four parts good loam and one of rotted manure. A good margin ought to be left for applying a rich surface-dressing when the first gathering has been obtained. By watering the plants bi-weekly with manure water, and picking the pods as soon as ready, if they are not required, they keep well for a week in winter if the pods are tied-up in small bundles and the end of the bundle inserted in a shallow dish of water. The plants must be syringed freely to prevent the appearance of red spider.

GREENHOUSE AND CONSERVATORY.

We grow a very large collection of Chrysanthemums. Some of the varieties flower very early and others late, so that by growing a few plants of each the season is much prolonged, but the latest of the late have been cut over this week. And we have commenced to put in cuttings of all the different sections. The Japanese section is not yet so extensively cultivated as it ought to be. Many good gardeners are yet ignorant of the time of flowering and of their great merit as decorative plants. It is believed by many that they flower late, and some horticultural writers have helped to promulgate this fallacy. Some of the Japanese sorts are amongst the earliest to flower, and some of the varieties are also late. Elaine and James Salter are the finest and earliest, followed by Fair Maid of Guernsey, a snow-white flower, as big as a soup plate. There are scores of good midseason sorts, but very late are Grandiflora, a splendid yellow, Dr. Masters, Comet, and G. F. Wilson. We place the pots in a sheltered position out of doors in case some of the cuttings fail, and we like to help our friends who have not yet got such a good collection as we have. Cyclamens are throwing up hundreds of flowers, and we find it necessary to look over the plants about twice a-week to remove any mouldy leaves or flowers. One decaying flower concealed in the centre of a plant makes sad havoc if it is not removed for a week. Primulas are now of great value as decorative plants, but if the flowers are required for cutting the double sorts must be grown. Any plants that show signs of damping-off have the decaying part dressed with dry lime. The latest-flowering Hyacinths have been removed from the plunging material out of doors into a cold pit, the crowns were covered over with small pots inverted for a few days. We have ceased to grow large plants of stage and fancy Pelargoniums, as they are not nearly so useful for mixing with other plants in the greenhouse as smaller plants that require no training. Those who find it answer their purpose to grow large specimens should now fix a wire ring round the pot and train the growths down to it.

FLOWER GARDEN.

We still continue to pot off Zonal Pelargoniums and other plants. Now is the time to take a minute survey of the entire stock of bedding plants, and set-to to propagate those in which there is a deficiency. The first batch of cuttings of Verbenas should be put in. It is best to strike as many cuttings now as will plant the beds. Spring-struck cuttings are far preferable to the old stunted plants that have been kept in store pots through the winter. Went over the grass edgings with a broom, swept the walks, and will roll them on the first favourable opportunity; stones had been swept on to the grass with the snow, and the walks had been injured by sweeping, shovelling, &c. —J. Douglas.

TRADE CATALOGUES RECEIVED.

Suttons' Miniature Spring Catalogue and Amateur's Guide, 1875.—This is a novelty in the way of catalogues, and is a typographical gem of 127 pages, which may be covered by the palm of the hand.

New Plant Company, Lion Walk, Colchester.—*Japanese Bulbs, Plants, and Seeds.*

Dickson & Robinson, Market Place, Manchester.—*Vegetable and Flower Seeds.*

Dick Radclyffe & Co., 129, High Holborn, London.—*Seeds, Implements, &c.*

W. Rollisson & Sons, Tooting, near London.—*General Seed Catalogue.*

J. & C. Lee, Royal Vineyard Nursery, Hammersmith, London.—*Catalogue of Seeds, Kitchen, &c.*

J. Dickson & Sons, Eastgate Street, Chester.—*Vegetable and Flower Seeds, &c.*

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Books (*Capt. Lyon*).—The "Cottage Gardeners' Dictionary" contains the information you need.

Bay Tree Propagation (*A. B. C.*).—It may be propagated by layers, cuttings under a hand-glass late in summer, and by pieces of the root. For winter Cucumber culture see an answer in our last number.

Early Potatoes and Peas (*W. Berry*).—Ross's Early, Fenn's Onwards, and Ash-leaved Kidney Potatoes. Laxton's Alpha and Ringleader Peas.

Wild Ginger.—Sir S. Baker, in his recent work, "Ismailia," says, "We now left the Fabbo path, and struck off to our left for several miles, over ground that had been cleared by burning, which showed in many directions the crimson fruit of the wild Ginger, growing half exposed from the earth. This is a leathery hard pod about the size of a goose egg, filled with a semi-transparent pulp of a sub-acid flavour, with a delicious perfume between Pine Apple and Lemon peel. It is very juicy and refreshing, and is decidedly the best wild fruit of Central Africa." A correspondent wishes to know the botanical name of the plant.

Glazing without Putty (*J. H. Howard*).—Send us an outline drawing with an explanatory note.

Climbing Roses (*St. Edmund*).—Yours is a question often asked but difficult to answer. There is no real perpetual climber that is a good red, though there are some old summer climbers, as the old red Boursault. One of the best Perpetuals to be trained against a wall is General Jacqueminot. Any of the strongest H.P.'s, as John Hopper, Charles Lefebvre, Madame Clemence Joigneaux, will do for a wall if not required to climb too high. Climbing Devoniensis will suit your purpose very well, and we could recommend you to try Celine Forestier. One of the best plants for a porch facing north is Clematis Jackmanni; you might also plant the Ampelopsis Veitchii; the foliages of the two harmonise well together.

Roses under Glass, &c. (*Rev. E. Liddell*).—1, We should advise Roses to be planted both in boxes and in an outer border, to be trained-in after being established, those in boxes in the house supplying bloom in the first instance. 2, The foliage will not hurt if restrained within bounds and if properly syringed. Roses in a house want plenty of ventilation—*i.e.*, not draughts, but air and light. 3, Marechal should be your standard dish—no other Rose is so well worth growing in a house. Celine Forestier, Climbing Devoniensis, Madame Willermoz, and any of the strong-growing Teas are also worth growing. We do not know of any red climbing Rose for a greenhouse, though very likely Cheshunt Hybrid will succeed.

Coprosma Baueriana variegata Propagation (*J. S. B.*).—This, as you say, is one of the most beautiful of variegated plants, either for summer bedding or greenhouse decoration. It is rather difficult of propagation, doing best from layers, which should be made from now to March, toegueing them as for Carnations, and securing with pegs. By autumn they will be well rooted, and may then, or in spring, be detached from the parent and potted singly, keeping rather close and moist until they are growing freely. It is also propagated by cuttings in spring, taking off the points of the shoots with two joints and the growing point, inserting in sandy loam with a little thoroughly-reduced leaf soil or sandy peat intermixed, the pots being well drained, and the surface half an inch deep of silver sand. They require to be placed in a gentle bottom heat of 75°, and kept close, moist, and shaded until well rooted. Avoid making the soil very wet, or the cuttings will turn black. They also strike in a close frame in August without bottom heat, shading from sun.

Planting Conifers and Ivy (*H. B.*).—The best time to plant Conifers is in autumn, the first moist weather after the end of September and up to the first severe weather of winter. The next best time is from the middle of February, weather being mild up to their beginning to grow. These latter remarks apply to young trees and such as have been frequently transplanted. We have transplanted a great number of Conifers, and find they are moved quite safely in early April, or when they are beginning to grow; but it is necessary, if the weather continue dry, to water occasionally, and if the soil be dry at planting give a good watering at the time of planting, and if showers fall frequently for a few weeks they will seldom require any more. Ivy is best planted in February, or so soon after as the weather is mild, and up to its commencing to grow. The quickest-growing subject for a hedge as shelter to a Rose garden will be Evergreen Privet, but it is of no use for turning cattle. A Thorn or quickset fence is best for that purpose, and it may be made semi-evergreen by planting a Holly in every yard along with the quicks. The sweetest hedge we ever remember having seen for a screen was Sweet Briar, the plants being planted a foot apart, and it was cut like any other to keep it trim.

Vines and Peach Forcing (*J. W.*).—Vines when very early forced to be ripe in April and May are better for bottom heat, and especially the outside border if any. The pipes will need to be as many as for top heat, and in a chamber beneath the border. With the border mostly inside, for both the Vines and Peaches bottom heat is unnecessary, as we stated in a former reply, to have fruit in May and June. We meant six rows of pipes including the returns—two flows and one return along both sides of the house, but it would not be other than an advantage to have two flow and two return pipes, or you may have the three or four pipes, whichever you employ, on the level, one of which will only require to be a return pipe. Half at least of the pipe surface should be trenched for holding water for evaporation. We should not plant the Vines as a vineyard, but confine them to the rafters, the roof being wired at 16 inches distance from the glass, and the Vines 3 feet 6 inches to 4 feet apart. Jersey or Guernsey offers no advantages for forcing Vines. The main thing is a favourable climate free from smoke and obnoxious gases

from chemical and other works, a suitable soil, and fuel to be had cheaply. Nothing would be gained by southern clime with fuel at double value.

Geraniums for Button-hole Bouquets (*W. B. G.*).—The doubles are the best for this purpose, as Incendie de Fontenay, Sapeur Pompier, Le Vengeur, Victor Lemoine, Gambetta, and Album plenum. Of the singles—Harry King, Master Christine, Reine Blanche, Bride, President Thiers, Mrs. Sach, and Diana. Charcoal is better for mixing with the soil for Geraniums than crocks, which answer no purpose only to keep the soil open, but charcoal is all carbon.

Sea-kale-earthing for Blanching (*B.*).—It should be earthed for blanching any time between now and growth commencing. If you do it upon the ground, ashes or sawdust would be better than soil, though it will, if of a light sandy nature, answer well. We should earth about the middle of next month. Could you not invert some large pots, boxes, or even hampers, with the bottom out? Anything to allow a space of 3 inches clear of the crowns and 15 inches high will answer, covering these with leaves or litter, so as to exclude air and light, and by this mode you would have it earlier, and another lot covered with ashes would succeed it. The roots will not be injured by the late severe weather, it being very hardy. Ours is not in any way injured. Some we took up after the frost is growing freely.

Fern Case Re-arranging (*T. M. N.*).—The best time to take the plants and re-arrange them is the beginning of March, just before or when they are commencing to grow. A neat-growing plant with small leaves and suitable for ferneries is Ficus repens. It will cling with the tenacity of Ivy to almost anything, and up or down as tendency is given the shoots.

Fruit Trees for Peaty Soil (*J. B.*).—There will be no chance of trees on the free stock coming to a bearing state in a reasonable time, but they will do if liberally manured and well dressed with lime, which for a peaty soil should be magnesian. A hundred bushels per acre is a good but not too heavy dressing. We should prefer the trees on the dwarf stock—*i.e.*, Apples on the Paradise, Pears on Quince, Cherries on Mahaleb. Plums do very well, lime being added and the ground liberally manured on the surface, top-dressing annually. We do not know what you wish as to kinds, but if you wish for the names of varieties we shall be glad to give them if you write us stating what you require. Bush fruit does well, especially Raspberries, and Red Currants; but Gooseberries and Black Currants suffer in a dry season.

Period of Yucca Flowering (*J. P. P.*).—The period at which a Yucca first flowers is variable, but usually about the seventh year, or when the plants are sufficiently strong. After once flowering, the stem and crown from which it is produced die, and fresh plants or suckers issue from the root-stem, and these flower when they are sufficiently grown.

Coiling Vine Rods in Pots (*Idem*).—The system you propose was advocated by Mr. Mearns at Welbeck, and exploded by Mr. Fish in 1835, so that your idea has no claim to originality, nor is it likely to succeed. The cane coiled round the inside of the pot, say half its length, will certainly root and break the eyes freely, but will not have sufficient rooting power to bring to maturity a crop of fruit. Bottom heat is necessary to secure the speedy rooting of the canes.

Vines Transplanting (*Idem*).—Do it early in March, lifting them carefully, also the layered Vines, which we presume have been detached from the parent Vines at least a year, they having been layered six to eight years. They having been spurred and reaching the top of the house is no consequence, only they may break rather weakly, and the only good you could have done them the year before lifting would have been to originate shoots nearer the rod, or train a fresh cane from the bottom, and that you may do this season. They do not require any particular treatment the season before removal.

Apples, Pears, and Plums for Orchard (*Orchard*).—The ground should be dug or trenched, but not bringing-up any of the bad soil or gravel, and if poor be liberally manured. Being of a shallow nature the trees should be liberally top-dressed, so as to keep the roots near the surface, for rooting into the gravel it is likely the trees would be subject to canker. Also see that there is not water in the subsoil, and if there be, remove it by efficient drainage. *Culinary Apples* are—Keswick Codlin, Lord Suffield, Alexander, Cox's Pomona, Rymer, Blenheim Orange, Kentish Fillbasket, Yorkshire Greening, Dumelow's Seedling, Bedfordshire Foundling, Warner's King, Alfriston, and Norfolk Beefing; and for long-keeping, Annie Elizabeth. *Dessert Apples*—Red Astrachan, Devonshire Quarrenden, King of the Pippins, Cox's Orange Pippin, Graveostein, Reinette du Canada, Lord Burghley, Lady Henniker, Boston Russet, Court of Wick, Scarlet Nonpareil, and Stormer Pippin. *Pears*—Jargonelle, Beurré Giffard, Williams' Bon Chrêtien, Flemish Beauty, Beurré Hardy, Beurré Superfin, Urbaniste, Doyenné du Comice, Marie Louise, Beurré Diel, Beurré Bachelier, Beurré d'Aremberg, Zephirin Grégoire, Jean de Witte, and Bergamot Esperen. Catillac, Vicar of Winkfield, and Verulam for stewing. *Plums, dessert*—Green Gage, July Green Gage, Jefferson, Lawson's Golden, Kirke's, Ickworth Impératrice. *Kitchen*—Early Prolific, Mitchelson's, Diamond, Prince Englebert, Prince of Wales, Victoria, White Magnum Bonum, and Winesour; also *Damsons*—Cluster or Crittenden, Prune, and New Large Bullace. *Cherries*—Belle d'Orleans, Black Heart, Bigarreau Napoleon, Elton, Kentish, and May Duke. In respect of trees suitable for different aspects of walls, a south one is suitable for Apricots, Peaches, and Nectarines; east for Plums and Cherries; west for Pears; and north for Morello Cherries.

Tenant Removing Shrubs (*Country*).—Having planted the Roses and other shrubs, you cannot legally remove them without the landlord's consent.

Training Vines to a House (*F. J.*).—You have understood us perfectly as to the training of the Vines, but not as to the origination of the bearing wood or spurs. Originate one at every turn, which will give you a shoot for bearing at every 18 inches along the rod, between these have another midway of the cross or space between the curves. This will give you bearing wood at 9 inches distance apart along the rods, or you may have the spurs or with two shoots, and either at the curves or midway as you may prefer, the main thing being to allow each equal space for proper exposure to light and air. We should wire the wall vertically at 9 inches distance apart, which would be cheaper in the end than wood for fixing eyelets or nails, the wires being good for tying the bearing shoots to, the other only being of use for the rods. You will see the advantage of the wire, which should be fixed at about half an inch from the wall, which though of stone will have joints into which may be driven the eyelets for the wire. The requisites for wiring walls you will see advertised in our columns.

Cucumbers Bitter (*A Very Old Subscriber*).—The principal cause is their being grown too slowly, and therefore long in coming to a useable size. Give more bottom heat, also top heat, and the fruit will be fit to cut in a shorter time and be more tender and less bitter. The kind you have is one of the best. The late dull weather would tend to slow growth, ill-elaborated sap, and consequent bad flavour. Get rid of the present fruit as soon as you can, and encourage freer growth. Slow growth from a low temperature may give fruit, but not of delicate flavour.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 5.

BY T. C. BURNELL.

The mysteries of preparing fowls for exhibition seem almost as terrible to the young poultry-fancier as the prospective gridiron to the candidate for masonic honours; yet the latter may not be found quite so hot as expected, nor the former beyond the power of the simplest beginner. I remember well how, when commencing, I was offered all sorts of preparations for putting on the comb and feathers, and without which it was said to be impossible for a bird to win; however, I managed to get on without them then, and shall hope to do so for the future. As some little preparation, however, is required, I will briefly mention all that I think is necessary.

By far the finest thing to get birds into good condition and brilliant plumage is a good grass run, and if this is obtainable little else will be wanted; but if birds are penned-up in a small yard some little management will be required to get them into good condition. I have before mentioned what a capital thing peas are, and a few should always be given every other day to exhibition birds; and it will be well to bear in mind, too, that soft food produces soft feather, and that though it will not hurt birds to be hungry, but rather tend to "liven them" up, that overfeeding will be certain to give them indigestion, and to turn them black in the comb. It is a common mistake to suppose that Dorkings require to be fattened-up for exhibition. Now-a-days the judges never go by weight. What they look for is a large frame, with plenty of room for putting on flesh. Some breeds look all the better for being fattened, but not Dorkings, which are naturally quite plump enough.

Dorkings stand exhibition worse than any other breed, and if sent from show to show will very soon break down in health, and become as useless for stock as for the show pen. I constantly hear it said that such a bird will "do to breed from," but I don't understand this. If a bird is not moderately perfect it is hopeless to expect perfect chickens from him, and a broken-down constitution is sure to produce degeneracy if nothing worse. Some birds, though in capital health at home, will mope and look wretched when penned. To such a little toast soaked in strong ale may be given the day before; but it must be borne in mind that all unnatural feeding will surely have to be paid for, and that a little cooked meat with a rusty nail placed in the drinking water should be quite sufficient.

Before going to their first exhibition fowls should always be trained to a pen at home, or else when the judge goes round to look at them they will either get into a corner to hide themselves, or else fly and flap about, and most likely send a lot of dirt and rubbish into the judge's eyes, in which case the latter may be very naturally expected to go on to the next pen. The simplest plan will be to purchase a couple of wire pens and water tins from one of the well-known contractors who supply our shows, and to fix them in a convenient corner where the young birds may be accustomed to exactly the same place that they will be put into when at exhibitions, and will thus be made to feel quite at home, and to show themselves to the best advantage. I should always advise that the birds be caught at night, as then there will be no struggling or pulling-out of tails, and the birds will quietly submit to their fate. Some little practice will be required to hold a large bird without damaging his plumage, but a little practice will soon master this. In taking a bird off the perch it will be best to seize him round the wings with both hands, placing the tips of the fingers of one hand under the breastbone to support the body, and in this position you may defy any struggling; but sometimes we can only spare one hand to hold the bird with, the other being required to open the lid of a hamper, administer physic, or wash the dirt from the bird's feet, and here the beginner will find a difficulty, and I must say that until lately I myself was sometimes mastered by a large cock weighing 12 or 13 lbs., but thanks to instruction from Mr. Teebay I believe I am now a match with one hand for a "regular kicker." The plan is this: Place the thumb of one hand over the wing, grasp the thigh firmly with the first two fingers of the same hand, and with the remaining fingers placed under the breastbone you will have the bird fixed as firmly as in a vice. A bird should always be taken out or put into a show pen or hamper head first, otherwise the tail and wing feathers are very liable to be broken. If the fowl is large and the hole small, turn the bird on his side, and he can make no resistance. A fowl should never be caught by the leg, as not only is it a very unworkmanlike plan, but the bird will very likely flap about and hit you two or three smart blows

in the face with his wing, besides scratching your hand with the toe nails of his other leg. The best plan is to catch him by the wing, and if the latter is seized close to the body you may hold the bird from the ground by it without the least injury to the bird or yourself.

A basket, as in the drawing, will be found most suitable for sending about exhibition birds. It has no claim to originality, but is here given for the benefit of those who may not know the best shape. The basket must be round inside, and made of light wickerwork, lined with strong calico or thin canvas. The lid should open in the middle, so as to allow plenty of room for the fowls to be put in and taken out without damaging their feathers or comb. The sides need not be filled-in with wickerwork, but I have found that only one rim round the middle of the basket is not sufficient to make it firm, so it will be better to have two as in the engraving. The top must be made of close wickerwork, as, if only made of open work, the railway porters will catch hold of the thin bars to lift it by, and will very soon break it all to pieces; while if the top is made of close wickerwork they will be obliged to catch hold of the handle in the

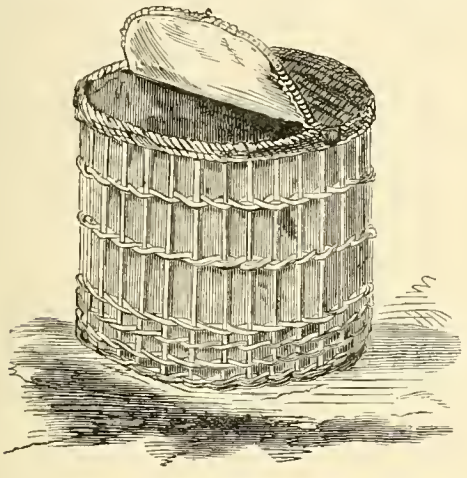

Fig. 12.

middle. The diameter of a basket for a single cock, or a cock and hen, should be about 24 inches; height 27 inches, to allow the cock to stand up without bending down his comb. For hens 15 inches high will be sufficient. The lid should be firmly tied down with string in two places in case one fastening should become undone. If the birds have to go a very long journey a small cabbage or lettuce may be hung up inside the hamper for them to peck at; but anything else put in the hamper will only make their feathers dirty, and corn would be lost. The bottom of the hamper should be covered with clean straw, which should be thrown away when the birds come back, and the hamper put out in the sun to air and freshen for another trip, as a close-smelling hamper with dirty straw is quite sufficient in hot weather to make the birds ill.

The comb, earlobes, and wattles should always be sponged over the last thing before starting for the show, first with lukewarm soap and water, and afterwards with cold water. This will make the birds look very fresh and bright, and if they are in good health nothing more will be required; but occasionally it will be better to smear the comb, &c., over with a little fresh butter, and this is all I ever use. I have been recommended salt butter, but though it may make the birds' combs red for the once, it is too strong, and will very likely cause a tender comb to ulcerate. I have also tried oil, vinegar, whiskey (!) and everything under the sun, but am sure that simple butter is as good as anything, if not better. The feet should be washed with a brush in warm soap and water in which a very little soda has been placed, and afterwards dried. It will be much the simpler plan to get someone to hold the bird while these ablutions are going on, but if this cannot be done the bird may, after a little practice, be held between the knees.

BRISTOL POULTRY SHOW.

WORDS INTRODUCTORY.

Ticket taken—platform run across. Ah, yes! one place empty in this carriage; no time to lose. In—settled—plaid across my knees—Journal for new year got by second delivery, for it is Thursday, January 7th—paper cut open, I prepare to read. Before beginning glance at my opposite neighbour. Why, say I to myself, if that isn't old Smith of St. Boniface's grown very lean and taken to very extreme clerical garb, dog collar, shaven cheek, and all. "Smith, it's you, surely." "Why, ——, it's you, isn't it?" "Twenty-five years make some difference, old fellow. Why, how thin you have grown!" "Yes, and how fat you have grown." "Well, but you are bald." (Smith had just raised his cord-bound round hat). "Don't you talk, for your hair has lost its colour." Eyeing Smith's long coat, and remembering his former tastes as an undergraduate, I say archly, "Don't you find that coat of yours awkward after hounds?" "Hush, hush, I'm an R. D. now." "Yes, I know, Rough Diamond; but you always were." "No, no; Rural Dean, sir." But poking me about old tastes, follies long since forgotten, here he sighed, "I suppose you have outlived your old craze for cocks, and hens, and Pigeons. I remember you wanted to keep the last at St. Boniface's." "Not the least," I replied; "why, I am going now, this very day, to Bristol Poultry Show." "Ah! an excuse for getting from home, I suppose. But tell me, is not all this fuss about the pleasure of poultry-keeping mere fuss and nothing more? One neighbour of mine says he finds great enjoyment in keeping Brahmas, another is wild about Spanish; in fact a great number of my brother clergy down in Blankshire are enthusiastic poultry men." "Glad indeed to hear it," say I; "and mark me, they do not exaggerate. There is the watching the development of form and feather, the wonder as to how this chicken will turn out and that. There is a resource never wanting for country pleasure. No need of constitutional walks, no moping by the fire, no great dependance upon other people. Home, Smith, is doubly home with pets around you. You get amusement; your wife, your children ——." Smith exclaims, "I do not think it right for a priest to marry, so no more about wife and children, please." N.B.—Smith was always in love in old days, and used to read me his letters. "Well, leaving the children out and their mamma, I say," raising my voice, "the pleasure your friends tell you of is not exaggerated. Then, Smith, the shows. Soon we shall be at Bristol station: then I ride through that fine ancient city. Here a glimpse of an old Elizabethan house, there a quaint gable; then the picturesque tower of St. Stephen's, the narrow old-world streets, the busy faces, the charity boys in their queer costume, the drawbridge, College Green, steep Park Street, and to crown all, the Show at the Drill Hall, where friends meet, and criticise, and enjoy feathered form and beauty, &c. Why, here is Bristol station. Good-bye, Smith. Go home, cut off part of your petticoats, take to a wideawake, grow your whiskers and keep poultry, and you will be a happy man yet."

I am soon in the Drill Hall, and say to one much interested, "This is to be your last Show, I fear." "Last Show! Why, it is the first! We have eight hundred more entries than ever, and the Hall is crowded with visitors." Glad, very glad indeed. Well done, plucky Mr. Cambridge; he deserved success, and he has obtained it. The Hall is full of fowls, for the walking spaces are even over-narrow, and many people are in them; for no longer is the Rifle Drill Hall, as in former years, a place to saunter through—you must actually squeeze your way.—Wiltshire Rector.

"Ann how is our patient to-day?" said the doctor. "Thank you, kindly, sir," replied the nurse, "we do think now all danger is over. She has grown more than twice the size she was since you were here last, and we hope now she will do well." And so with Bristol. Thanks to able, courteous, energetic Mr. Cambridge, this Show, so nearly a thing of the past, has entered on a new life, and we think we see a bright unchequered road before it—a road where sunbeams dance, and whereon friends meet pleasantly; a road on which there are no clouds overhead, and need be none below. We consider it most plucky of Mr. Cambridge so gallantly to come to the rescue of this great Show; and certainly he, backed up by his friends, has achieved a great success as far as the arrangements and entries are concerned. We hope when the more serious time of adding up the accounts and paying them comes, that the balance will be considerably on the right side. Imagine 1100 entries more than last year! When we get into four figures it really looks hopeful and encouraging. No doubt many will think the Selling classes account for this huge increase, but not so: not one-quarter of this additional number is brought by the sale classes. No! We believe most assuredly the plan of allowing any number of pens to go in one basket is the chief reason, and we are fully conscious that this great step on the right road has been brought about by one of our own friends, though now no more of us. We feel quite confident this is an important step in the poultry road. The quality of the birds was something quite out of the common; we never saw so few poor pens. The giant strides made during the past two years in most of the breeds are something really wonderful. We notice this as much among the Cochins and Brahmas as anywhere, and the poultry mania is more infectious than ever. People join the poultry world, and float down the "fancy" ways from all circles and all places. Only at this Show we heard of one gentleman who was seized with the fever so badly, that Buff Cochins of the best quality must be had at any cost, and an article of great domestic use was to be sold to supply

the "needful" to purchase some of the best Buffs in the world. No more, then, of talking about the poultry fancy dying out. It is absolutely stuff-and-nonsense. Prize-poultry keepers are now legion—as many in number almost as sparrows—if anything rather too numerous. And this reminds us of the Selling classes, and what they do: we feel we are on delicate ground, yet we do doubt their usefulness. There is a danger of two things, and there must be, and is, fear whether between two stools something must not fall to the ground. We will speak quite plainly. Selling classes are either filled with such utter rubbish as to bring only dire and woeful disappointment to purchasers, or they have two or three very crack, valuable birds, simply placed there to win a good first prize with, or a cup, or to run up the points for a point cup. Well, these choice specimens entered at £2 or £3 fall into the hands of some lucky fancier, and the result—well, the result is that prices for good birds are spoilt, and the poultry world gets overstocked; for the amateur will not pay fair prices for honestly worthy birds, thinking he can pick them up at half the price in these Selling classes.

And now we are on this, the opening day of a fresh season, we must speak of the Sunday business. We cannot think how committees can include a Sunday. We feel certain it must lessen the entries, and for the exhibitors and their servants it is indeed a hard time; besides this, the cost of labour, food, gas, &c., must be a great item in the Show expenses for this, to the committee, completely useless day. Two days are enough for any show. If a show was kept open for ten days someone would come. People keep putting it off, thinking they will go the next day, when, if it was only open for one or two days, they would go on one of them. We seriously hope this will be taken into consideration by the different societies who have hitherto had this Sunday plan. And Bath and West of England above all, do try and manage something better this year.

But we must turn back to this Show and its inmates. The birds were well fed on Spratt's food mixed with ground oats and barleymeal and whole wheat. The pens were freshly chaffed every morning and kept beautifully clean, and the corridors were sprinkled with sawdust, and looked bright and fresh every morning. Altogether the management was admirable, and we hope next year that we may find more entries, and all the long end of the room, which this year had only one row of Pigeons, required for poultry, and the Pigeons consequently over them.

The *Dorkings* were far more numerous than at last year's Show, the best classes most decidedly being the Whites. In Coloured cockerels first was the Manchester first-prize bird, and well placed; he is not, however, very first-rate in the comb. The second was rather too leggy for a Dorking. Third a very good bird, only that his middle toes are badly curved. No. 11 (Denison), a fair bird; the rest indifferent. Coloured pullets a good class. The first a very good and deep bird, her only fault being white earlobes; the second small and narrow; third good, but hardly equal to the same exhibitor's unnoticed pen; fourth a mistake, being feathered on the legs. Pens 18 (Hamilton), and 26 (Newick), were also good. In old cocks therere a we number of massive birds, but with one or two exceptions their combs were over, this latter, no doubt, being caused by the late severe weather. First a large bird with good broad back and nice feet, but hardly equal to the second, the Palace first-prize bird. The third has plenty of bone, but his comb was right over. Pens 37 (Darby), and 39 (Whitworth), were very good and massive, but spoilt by the same defect—lopping combs. Pen 40 (Miss Murray), a thorough Dorking. The first-prize Coloured hen was well placed, it not being the first cup she has won by half a dozen. The second had a very bad corn on one foot, and was hardly equal to Mr. Lingwood's No. 45. Third good, only for an upright comb. No. 47 (Pilkington), large, but in-kneed. 52 (Darby), a nice rose comb. Silver-Grey cocks of any age were a very poor lot, notwithstanding that there were thirteen entered. The second prize was withheld, but one or two birds might well have been thought worthy of this honour, notably pen 63 (Wren), a nice bird with jet black breast and tail, and white saddle and hackle; but the first-prize bird was so far ahead as to throw all the others into the shade. It is evident there is plenty of room for improvement in the cocks of this breed. Silver-Grey hens were a good class. First a nice young bird with good head and feet. Second one of the largest hens we have ever seen, but unluckily the claws of one foot badly put on. The third was a good bird, but hardly equal to No. 76 (Cresswell), the latter being particularly good in colour. White Dorkings, as before mentioned, were unusually good, especially the hens. First was a capital bird, but his comb a little too far over the beak. Second and third also good, but showing a slight yellow tinge. 88 (Cresswell), a nice cockerel; 86 (Robinson), the first-prize Palace bird, but here unnoticed; he had certainly got into better company. Pen 91 (Hayne), deficient in chest. White hens were a grand class. The first-prize hen, being very white and good in feet, comb, and shape, was easily first. The second and third were also very good birds and nicely washed. With one exception the whole of this class were good, and the Judge rightly styled them "a good class."

Brahmas.—Dark cockerels were an excellent class, though lacking the interest that such a class would have had earlier in the season, from the fact that the winners are all now well known. First was the Birmingham winner, a well-shaped and symmetrical bird, peculiarly broad in saddle, where so many cocks now fail; still his comb is narrow and peculiar, and we should have been inclined to give the first place to Mr. Lingwood's grand bird, which was placed third. His size was immense, and the dense blackness of his fluff splendid. Second and fourth were Mr. Ansdell's famous cockerels. The second-prize bird looked out of condition and knocked-up with his successes. The fourth-prize bird is, we think, slightly slipped in wing, but very richly black in breast and fluff. Miss Douglas Pennant, Mr. L. Wright, Mr. Ensor, all showed good birds. Pullets.—First was one of Mr. Leno's beauties, whose pencilling has so often been described; she is very sparsely feathered on the leg. Second a pretty pullet, with bright and silvery ground colour and dense black neck-hackle: she is decidedly hocked. Third, of good size, and a nice bird all round; her back pencilling is somewhat indistinct. Fourth was not a remarkable bird. We hardly thought Mrs. Vigor's pullet worthy of her very highly commended, probably good marking on the back attracted the Judge's attention. Pen 317 (Ensor), was beautifully marked on the breast and dark; she was evidently a very early bird of last year, and had so lost the freshness of the early pullet colour. Cocks.—Here we could not see the *rationale* of the awards. The first-prize bird is narrow in back and devoid of pencilling on the saddle; we much preferred his owner's third-prize bird, a gigantic fellow. Second is a massive bird. If we are not misinformed that he is a bird which we greatly admired as a cockerel two years ago he has hardly fulfilled his then promise; still he is a noble bird, and conspicuous for grouse-feathering in tail. We thought Mr. Lingwood's very highly commended cock the finest bird in the class. He is a broad and magnificent bird, and the silver and green shades on the wings are very clear. Hens.—First was far ahead; her size and shape magnificent; pencilling, too, and leg-feathering good. Second, too, a beautiful bird, pencilled evenly all over, right up to the tail; she was not so large as the first, but quite as beautiful. Third large and good in all points. Lady Gwydyr's highly commended bird was as perfect a specimen as one could wish to see, her pencilling the clearest possible; placed next to the cup hen she did not show to disadvantage save in size. She appeared weak on the legs, which must have lost her a place. Pen 372 (Peake), though small was remarkable for intensely dark marking; and Mr. Evans's two very highly commended hens, though a little narrow, must win almost anywhere as a pair. As a rule the larger pencilling is all in request now, hardly any of those very dark birds with minute markings being shown.

Light cockerels we thought a moderate lot, in no way to be compared with the Dark. First was the best bird, good all round. Second, a showy bird, with nice neck-hackle, but too much hock-feathering, and very yellow. Third, a small heavily-hocked bird, with no particularly remarkable points. Pullets were better. We cannot say that we altogether admired the first. Her neck-hackle was mossy in front. To our idea the second was far the best bird in the class, form good, and such as should grow into a large hen; hackle excellent, still no markings on the back; the only fault we could see in her was creaminess in ground colour. Third was not remarkable, her markings bright and clear; still she was a small bird. Fourth a large-bodied bird. The very highly commended birds of Mr. Crook and Mr. Haines were both good; the shape of the former beautiful, but she will not make a large hen. Cocks.—First was an old friend, and certainly he is a model bird in all but size; second a grand bird, broad and massive—just the form we like, but his comb is not pretty; third had the prevailing fault of a very narrow saddle, otherwise a good bird. Hens.—First a grand bird in shape, size, and leg-feathering; she appeared to us hardly dry from the wash-tub on the first day of the Show, and so not to be seen to the fullest advantage; second a deep and broad bird, but brown in hackle, and not equal to Mr. Crabtree's third hen, which was perfection in shape and colour, though not large; pen 487 (Percival), a fine bird, though a little deficient in hackle.

Cochins.—These were certainly a most wonderful collection, the quality was indeed good throughout. We hope next year Mr. Cambridge will add Black Cochin classes, for this variety had to go to the "refuge" this time. We hear there is a chance, and rejoice accordingly, of that gentleman, who so lately retired from the White Cochin world crowned with laurels, being added to the—(no, not the black book), but list of Black breeders. Cochins, Buff came first, twenty-two cockerels, with Lady Gwydyr's Birmingham champion at the top of the list; his colour is lovely, but he seemed weak in the legs, or would have perhaps run Mr. Burnell's old cock close for the champion cup. The second was also of good colour and large, but rather hocked. Third, capital colour, and will make up a large bird. 119 (Mapplebeck), a most beautiful bird. Buff pullets were also a splendid lot. Lady Gwydyr first again with a very beautiful coloured bird, though

hardly heavily leg-feathered enough. There were one or two pens we liked almost as well. Mr. Crabtree's pens, 132 and 134, both very good. 147 (Burnell), also very good, but a little twisted in hackles. Second we did not much care for, liking the third quite as well. 146 (Darby), a very grand pullet, but she had lost her tail, or we think would have been near first. Old Buff cocks were splendid. The first won the champion cup for best pen in the Show; his colour is very rich, and all his points perfect. We quite hold with this award, and congratulate the owner on his victory. Second and third both rich birds, and well placed. 159 (Tindal), and 158 (Gwydyr), both admirable birds, and perhaps one of them should have been in the third place. The Buff hens were a small but good class. The first was the old Palace winner in bad condition, and looks as if she needed much care. Second was a beautiful colour, but not very large, claimed at £12 12s., and cheap. Third also in poor condition. We almost preferred 166 (Burnell), which was of exquisite colour and good shape. Partridges were four very fair classes indeed. The winning cockerel is very nice, and looks as fresh as ever. Second we did not much fancy, rather preferring 186, very highly commended (Shrimpton). Third was a nice bird and of good shape, and being very young will doubtless make up well. The first pullet was well marked, but her foot-feathering was bad, and her comb had a deep cut in it. Second was not very large, but beautifully pencilled. Third a good bird also. After these we thought 205 (Sugden), as good as any. In old Partridge cocks we thought the winners well placed, though 207 (Crabtree), was a good bird, and so was 216 (Sedgwick). In hens the winner was a beauty, and we should have come here for the cup for best Cochin hen, in preference to the winning White. This Partridge hen was good all round, and larger than the White. Second large, but looking rough. Third was large but rather too gay in colour. We preferred 223 (Tudman), or 218 (Aspden). White cockerels came next, fifteen birds. The first was the Palace winner; he is fearfully hocked and rather narrow, though grand in comb and colour. Invaluable as this bird will be in a breeding pen, we do think he is too hocked to win, although any fair amount of hock we do not object to. The second was poor, being bad in colour, unfirm in comb, and squirrel-tailed. The third was large and good in shape, and should have been higher. We thought 235 (Bloodworth), or 236 (Tindal), much superior birds to the second; the latter is of great promise. 240 (Fowler), very good. In pullets the first was in her prime, being in beautiful order and just on laying. The second we did not like; she was small, and dwarfed-looking. Third, a beautiful shape, but small. 252 (Burnell), was the Palace winner, and might have been in the list here. 256 (Whitehead), small, but good in shape and colour. 257 (Fowler), looked old enough to have sons and daughters in the same class with her. 258 (Woodgate), was, we believe, thought to be as good as any pullet in the class. White cocks were a good class, though many of the birds showed signs of being overshown, notably so Mr. Percival's old White cock, which seemed quite knocked up. The first was very white and smart-looking, with fine clear hackles, his only fault being too large a comb. Second, a fine bird, rather dirty, but of good shape. Third we liked best of the lot, though he is rather short of leg-feather. 266 (Whitworth), very large, but yellow. In hens the cup bird was of splendid colour and possessed much quality; still we preferred the second in spite of her very ugly comb, for her shape was so very grand. Third, a nice showy hen, though we liked 277 (Whitworth), or 279 (Woodgate), just as well. This class finished the Cochins, and we cannot but note the great progress in these classes, even during the last year.

Game.—We thought these classes very good, and we believe the judging was immensely approved of. The winning Black Red cockerel was very smart and good in plumage. Second, wonderfully hard in feather, and showy. Third, a good bird, with fine head. 730 (Stagg), a nice bird, and a good-shaped one. The cup hen was a great beauty, as good as anyone we ever saw, and we consider she well deserved the cup. Second also very smart and well shown. 751 (Pope), a splendid bird. 742 (Tyte), also a good style of hen. The cup for best Game cock fell to Mr. Matthew's splendid Brown Red old bird looking grand. The other winners in this class a long way from him. 762 (Osborn), a good bird. The first Brown Red hen was very good in shape and head. The third we liked as well as second, though there was not much between them. 776 (Wolff), very stylish and good. In Duckwings the winning cock was lovely in colour and fine in head. Second, a good smart bird; third running second close. 798 (Cock), very smart and good. 804 (Phillips), was disqualified for being plucked in hackles. We could not help smiling at seeing this in the catalogue, for, if we remember rightly, this was the party who in a friendly contemporary wrote such an indignant account of Mr. Winwood's misdemeanors. We can only think that Worcester must be a very naughty place, and congratulate Mr. Martin on his departure from a city where Spanish cocks are stolen and evil practices in the poultry line prevail so strongly. The trimming in this case was most palpable, and we hope Mr. Phillips will smart all the more when he hears that had his bird been left alone it must have won. The first Duckwing hen was very good in colour and shape, and in fine feather. Second and third, nice birds. 816 (Dutton), a very smart hen.

Spanish.—Bristol was always the stronghold of this breed, and seems likely to continue so. We still see the old names in the list, and hope long to do so. The cup cockerel was a beauty, fine in colour, good in face, and winning well. Second, a most beautiful bird of great quality; so was third; in fact the whole class was full of beautiful birds, and we did not envy the Judge his work. Perhaps 501 (Jackson), was as good as any of the non-winning ones; this was very highly commended. Spanish pullets were also very good, and the winners may be proud of their places. We think we liked 511 (Palmer), as well as any; this was, we believe, also the cup Yarmouth bird. 542 (Jones), had a capital face, and 547 (Chilcott), was very good all round. Old cocks were the worst represented, though the winners were good, and the names tell us the quality. In hens the first was very good indeed, but we liked one or two more as well. The third was a grand hen; and 563 (Rodbard), good. 567 (Darby), was a magnificent hen, with the largest face in the class, but the bars of her pen were so rusty, and she would take such notice of the outer world, that in continually putting her head out of the window she made her face so red with the rust that she lost her great chance, we should say, of being in the list.

Hamburghs.—All the varieties mustered well, and the names of the winners show all the best birds in the fancy were in the Exhibition. Mr. Long's pens were all empty; we hear this gentleman made a mistake in the day. The Gold spangles were two splendid classes, every cock being noticed, and nearly all the hens. The cup cock was very good—quite a picture; second almost as good; third quite up to the mark. 572 (Duckworth), had a splendid comb, and 573 (Beldon), was very excellent in colour. 575 (Hyde), very stylish and good in comb. The first hen was most beautiful in colour; second and third also very rich and brilliant. 584 (Robinson), well marked. Silver-spangles were also two good classes; the first cockerel easily first; second and third also good. 599 (Ashton & Booth), too large in comb, but well marked. The hens were all good. We liked the third very much, and 619 (Browne), was wonderfully spangled; 623 (Walker), also capital: nearly every bird too was noticed in the Golden-pencilled classes. The first won well, being a perfect gem; second admirable in all points; third we did not like so well as 634 (Cresswell), or 631 (Duckworth). The cup hen was a marvel; we never remember such even pencilling. Second and third were marked birds, but a long way from the first. 647 (Bloodworth), nicely marked; 661 (Mitchell), rather too deep in colour, or else good; 654 (Rollinson), we should have liked to have seen higher. The winning Silver-pencils were capital. The first cockerel had a splendid tail, and was in beautiful condition. We fancy the second was a little wry-tailed; it looked very suspicious. 672 (Webster), had a good tail. The first hen ran in easily; the second was good in all but comb; third a nicely marked bird. Blacks made two good classes, the hens especially. The winning cockerel was good in comb and very red in face, but a little heavy-looking; the second was very fine in colour and good in ears; the third, too, we liked immensely. 687 (Beldon), was very lustrous, and 691 (Bush), a good showy bird. The winning hen was of beautiful shape and colour, but her comb was a little too high at the back; second well placed; third a neat bird. 710 bad in comb, or else of fine colour; 701 (Kilvert), a good, smart pullet.

Polish.—The quality of the winning pens was very good. The Gold cock which won the cup we never saw equalled. The second was a beautiful Silver, and the third also a smart Silver. 839 was a nice White-crested Black. 842 was a beautiful cock, and must have closely approached the third. 846 (Feast), a rich gold, but poor crest. In hens the Silver hen which was first also won the cup for best Polish, Malay, or French hen. She is a great beauty, and was well shown. The second was a fine Gold hen, and the third a Silver with wonderful markings. 856 (Adkins), a beautiful Silver. We were so sorry not to see more White-crested Blacks; we feel this breed wants looking to, or it will be one of the past; it seems gradually slipping from all the exhibitions. We rely on Mr. Beldon, with his great Polish knowledge and experience, doing something for this strikingly handsome breed, and so preventing its dying out.

French.—These made four good classes, Houdans and Crêves mustering well. In Houdan cocks the winner was very large, of great depth and style. The second very dark, and generally good. The third grand in colour and crest. 863 (Dring), a very stylish bird. 865 (Quibell), large in crest and square. 872 (Browne), large, but poor in crest. 876 (Handley), very large indeed. 879 (Handley), splendid in shape. The first hen was very light but good, being large and square. The second also light in colour but large. The third a beautifully marked bird. 893 (Hill), a good large hen. 886 (Quibell), a good dark hen. The winning Crêve cock was splendid; second also good; third fine La Flèche. 910 (Dring), a large bird. 920 (Greenhill), a fine deep-bodied cock. In hens again Mr. Crabtree won with a

beauty; the second was close upon her, however. Third, a fair bird. 933 (Fowler), large and with fine crest, but too much white in it. This class we thought very good.

Malays.—There were two good classes, but hardly so well filled as we had hoped to see. The first cock is an old friend and a great beauty; second much smaller, but good in plumage; third also rather small, but of good quality. The winning hen was capital, being good in plumage and condition. One was very dark and a good size; second a smart dark bird; third pressing close on second. 836 (Rooth), a very fine bird.

Leghorns.—This variety is gradually getting more popular. The birds here were very good. The winning cockerel of admirable colour, and well shown; the second was good, but wanted washing; third a smart Brown. 935 (Ward), dirty, but good in quality; 936 a good Brown. The first hen walked in, being in beautiful condition and very showy; second a very brilliantly coloured Brown; third a capital, well-known White. 950 (Jacomb), grand in comb and head, but rather small; 954 (Fowler), a smart White.

Game Bantams.—In Black-breasted and other Reds the winners were well placed, and looked very smart pens, all being Black Reds. The cup pen especially good. In the next class exquisite Piles won first, and nice Duckwings second and third. The winning Piles were very good in shape, but very dirty. In the single cock class a good smart Pile won the cup, with a beautiful head and of charming shape. Besides the winners there was not much worthy of note in this class.

Black *Bantams* were a large and very good class of twenty-two pens. The Secretary, Mr. Cambridge, did not contend for the prizes, though the superior merit of his birds is well known. The two first pens were very good, there being but little to choose between them, the first containing by far the best hen, while the second held the best cockerel. The third-prize pair also small and neat. 1104 (Shackleton), very good indeed; 1107 (Tindal), cock's earlobe too large, otherwise good. It is perfectly astonishing how the Sebrights have improved in the last two years, twelve pens of these little gems being shown here, and hardly a bad bird amongst them. The awards of the Judge were not very favourably received, it being generally considered that Mr. Leno's two pens and Mr. Hodson's Silver chickens were the pick of the class. The first-prize birds have been a good pen, but the lacing on the cock's breast has moulted-out very badly, and now seems more spangled than laced. The second-prize birds were Golds, but far too heavily laced. Third fair Silvers. Not a single pair of the old creamy Silvers were to be seen. What an improvement! White Bantams were a very poor class. Mr. Tearle's pens were empty. Mr. Beldon's were the only birds in the class that had not stained earlobes.

Waterfowl.— Aylesbury Ducks, only three pens competing, and they were well placed. We were most sorry not to see more entries in this class. The Rouens were much better, the cup pen being very fine in shape and colour. This pen weighed 16 lbs.; the second and third both weighed 17 lbs., and were also capital pens. 1006 (Stott), a very good pen; 1022 (Harvey), seemed close on the third. Black East Indians were beautiful, and we were much pleased with the judging. The Judge, we know, took every possible trouble over them, and his awards seemed most correct. We stand up for colour and shape before mere smallness of size. There were two pens in this class very highly commended which were not marked in the catalogue—viz., 1026 (Sainsbury) and 1028 (Hayne). Mr. Sainsbury's colour is simply exquisite, though certainly Mr. Kelleway's are rather smaller; the third Duck we admired immensely. In the fancy class Japanese Teal won the cup, and looked very pretty. Beautiful Carolinas second and third. We thought Mr. Leno's, however, quite equal to them. The winning Geese were very good, and weighed 53, 41, and 41 lbs. per pen respectively, while the Turkeys weighed 56, 36, and 36 lbs. each. They were three very fine pens, and were well placed, apart from their actual weights.

THE PIGEONS.

These numbered 640 pens, and the point cups were awarded as follows:—That for ten guineas to Mr. Fulton, with 139 points; that for five guineas to Mr. N. Hill, with 103 points. Proceeding in the order of the catalogue I coms to the *Carriers*, and if there was any fear a few years since that these birds were becoming restricted in their admirers, all such fear is at an end, for ninety pens are before me. Old cocks, Black or Dun.—First-and-cup (Horner), a first-rate colour, but second (Fulton), better in head. Third, Black with mandibles far apart. Of the fifteen pens more than half were deservedly noticed. Old hens, Black or Dun.—This an excellent class of fourteen birds. First and third Blacks, and second a good Dun, a particularly nice bird. Old cocks, any colour.—The majority of these were, as might be supposed, Blue, but one White (1454) good enough to get a commendation, while 1458 was marked a Chequer, but lacked the dappled look, being rather a Black with snatches of blue coming through, but, persevered in, good Chequers might be shown. The prizes went to Blues. Second better than first. Pen 1459 (Horner), commended, a good Blue, save that the bars were a little indistinct. Old hens, Any other colour.—First (Horner), a very nice Carrier, Blue, like second and third. There was a Silver brown-barred which might have been shown among Dragoons.

Young Carrier cocks, Any colour.—These showed a wonderful advance at a Bristol Show. First-and-cup a good bird, Dun, and no mistake. Young Carrier hens.—First (Maynard), a capital Dun; so also Mr. Maynard's highly commended pen 1494. Second, Black with a particularly good beak. Third, same owner (Massey), good again.

Pouters.—Fifty pens in all, against the eighteen of last year; verily this is an advance, and the noble Pouter is now to be met with in goodly numbers south of the Tweed. As to the judging of the Pouters there was much discussion, and I think that the prizes would have gone differently in some cases had the birds been put in a judging pen as in Scotland, which is by far the best plan, for comparison in Pouters is necessary, and they are best compared by being placed together. In separate pens they cannot easily be rightly judged, now that happily the tape-line is not the sole guide. Pouter cocks, Black or Blue, any age.—First-and-cup (Yardley), a little too stout for a Blue, but good in colour and leg-feathering. Now, strange to say there was Mr. Bullen's Palace cup bird unnoticed, though very graceful and slender for a Black but honestly shown, the black left in the thighs, and therefore I suppose Mr. Bullen lost, for it was a far superior bird to the first. The third-prize (Hills), had been twice first at Palace and at Glasgow and Oxford, but only third here! No. 1521 a nice bird. Pouter hens, Black or Blue, any age.—A famous class. First, large Blue hen (Bullen); second, same owner, first at Palace, second here; third, Bullen again, a Black somewhat short in limb. 1525, highly commended (Horner), a pretty but pale bird. 1526, highly commended (Fulton), a good bird with beautiful bars. 1532, very highly commended (Bullen), a wonderfully fine Blue bird, only four months old. What will she not be presently? Pouter cocks, any colour and age.—First, Yardley; second, a good Red; third, a pale Yellow. 1535, very highly commended (Fulton); perhaps the very best bird in the class. Pouter hens, any colour and age.—First and second Bullen; third (Hill), a good yellow hen, better than second to my judgment, but oh, strange turn of fortune! there was Mrs. Ladd's lovely white hen, first at Oxford, a bird of exquisite style, only commended here. Oh, for a judging pen!

Almond Tumblers.—Thirteen pens. The real contest lay between Fulton and Yardley, and the latter won the cup. Eight pens were noticed. Any variety of Shortfaces showed about twenty pens of most variously feathered birds—Agates, Kites, Baldheads, and Mottles, but much could not be said for any save the noticed birds.

Fourteen pens of Foreign *Owls*. The *Barbs* of all ages were numerous, the old cocks being the best. Old indeed were some. 'Tis a pity this class shows age so sadly. "Old, Master Shallow! without doubt he's old," I said, whilst looking at some of the watery-eyed old gentlemen. I think some of these are actually unpleasant to look at, and ought to be kept at home, and not sent from show to show.

The *Trumpeters* were but five, but very choice. First-and-cup (Lederer), a noble Mottle.

Jacobins again were good, and it is pleasant to see this bird improves in colour and shape, the dark colour reaching quite to the thighs and over, and the baldhead look gone. Then the length of the bird! and a certain gracefulness in shape with the length is now seen, as at Bristol. A lovely White and good Black appeared, with many excellent Reds. The Black was the first-prize hen, the White the second-prize hen, and, their pens being side by side, the birds showed well, by contrast of colour, each other's beauties.

Fantails were a rough lot.

Turbits very abundant, and many very good.

The English *Owls* were "an extraordinarily good class," and showed that all fears of these fine birds being "lost to sight, though to memory dear," are groundless. It is well that the rage for the delicate African has much subsided; a large, bold variety of bird is quite as much to be admired as an extremely small and tender one.

Nuns and *Magpies*, especially the latter, were good.

That old favourite the *Dragoon*, now as popular as ever, was well to the front, for upwards of ninety birds were exhibited. The greater number were of the London style; and many of the prize birds (and most beautiful in colour most of them were), were very large and even heavy-looking. First hen (W. Hill), a beautiful Yellow; second (Graham), as beautiful a Red, both very heavy birds, which is not to my taste; but once accept the style as correct, they were splendid birds. The Blues were exceedingly good, particularly in colour. Reserving to myself my own ideas of the Dragoon, I own I rejoiced to see such a splendid show of birds, elegant, and bold, and sound in colour, call them what you will, whether Dragoons or Horsemen.

The Short-faced *Antwerps* appear to be fading away before their Long-faced brethren, birds of utility, and at this time very popular.

In the Any variety class were many pretty Toys, the first prize going to a good black Turbiteen; this colour best suits this variety. When the patch on the face is yellow or red, the bird looks so like a clown with his red-marked cheeks. A good Archangel second.

Save in the Selling class the Pigeons were shown in single birds, and the idea, a pleasant one, of "a Pigeon pair" is lost.

Now that that baneful spell "Bristol Show weather" is at last broken, and fine mild weather has succeeded to the direct opposite, and the Show has proved a success, we may anticipate a series of triumphs, for contrary to the general impression, arising no doubt from the pens belonging to the late Committee being for sale, *the Show is to be continued:* and we may expect, with full confidence, that the great treat to west-country fanciers, the Bristol Show, will continue to be their treat, yea, and their increasing treat. We are all this year deeply indebted to Mr. Cambridge, without whose perseverance, in face of great difficulties, show there would have been none.—WILTSHIRE RECTOR.

DORKINGS (Coloured).—*Cockerel.*—1 and Cup, C. Widdas, Beechburn Grange. 2, Rev. G. F. Hodson, North Petherton. 3, Rev. H. F. Hamilton, Combe St. Nicholas. *c*, B. C. D. HARBS.—*Young Cock or Hen.*—1, R. Fulton. 2 and 3, R. W. Bryce. *hc*, H. Yardley (2); N. Hill. *c*, E. Horner.

TRUMPETERS.—*Cock or Hen.*—1 and Cup, J. Lederer. 2, *hc*, and *c*, R. Fulton. 3, E. Horner.

JACOBINS (Red or Yellow).—*Cock or Hen.*—1, N. Hill. 2, R. Fulton. 3, O. E. Cresswell. *vhc*, E. Horner. *hc*, R. Fulton; N. Hill (2). *c*, F. Siedle, Postmorlais.

JACOBINS (Any other colour)—*Cock or Hen.*—1, R. Fulton. 2, J. Hardy, Shepherd's Bush, London. 3, E Horner. *hc* and *c*, N. Hill.

FANTAILS.—*Cock or Hen.*—1, E. Horner. 2, N. Hill. *vhc*, H. M. Maynard. *hc*, Miss J. Milward, Newton St. Loe; N. Hill. *c*, H. M. Maynard; N. Hill; J. F. Loversidge, Newark.

TURBITS (Red or Yellow).—*Cock or Hen.*—1 and *vhc*, W. Croft, Leeds. 2, C. A. Crafer. 3, T. W. Townson. *hc*, R. Fulton; O. E. Cresswell; F. H. Muller, Bristol; W. Tedd. *c*, O. E. Cresswell; E. T. Dew; W. Tedd; N. Hill.

TURBITS (Any other colour).—*Cock or Hen.*—1 and Cup, O. E. Cresswell. 2, G. Hardy. 3, T. W. Townson. *vhc*, N. Hill. *hc*, R. Fulton; C. A. Crafer; W. Croft; S. Salter, Oxford. *c*, E. T. Dew; S. Salter; G. H. Gregory, Taunton; N. Hill.

NUNS.—*Cock or Hen.*—1 and 2, E. Horner. 3, W. Croft. *hc*, J. Baily, jun.; W. Croft. *c*, F. Siedle.

MAGPIES.—*Cock or Hen.*—1, C. G. Hitchcock, Oxford. 2, W. Tedd. 3, N. Hill. *vhc*, N. Hill. *hc*, A. J. Barnes; E. Horner; N. Hill. *c*, G. J. Dewey, Gloucester; E. Horner.

DRAGOONS (Blue or Silver).—*Cock or Hen.*—1, Rev. G. F. Hodson. 2, W. Hill. 3, W. Bishop, Dorchester. *vhc*, W. B. Tegetmeier, Finchley, London; W. Hill. *hc*, R. Woods, Macclesfield; Rev. G. F. Hodson; F. Graham; W. Hill, Manchester. *c*, F. Graham; J. Holland, Manchester; W. Bishop; H. Yardley; N. Hill.

DRAGOONS (Any other colour).—*Cock or Hen* —1, W. Hill. 3, N. Hill. *hc*, R. Fulton; F. Graham (2); W. Osmond, Dorchester; W. Bishop (2); F. W. F. Toomer, Swindon; N. Hill. *c*, R. Fulton

DRAGOONS (Any colour).—*Young Cock or Hen.*—1, R. Woods. 2 and 3, F. Graham. *vhc*, G. H. Gregory. *hc*, R. Fulton (2); J. Cock. *c*, J. Holland (2); G. H. Gregory

ANTWERPS (Short-faced).—*Cock or Hen* —1 and Cup, W. Gamon. 2, J. Kendrick, jun. 3, W. Slater, Gravelly Hill, Birmingham. *hc*, H. Gough, Wolverhampton; H. Yardley; W. Slater. *c*, H. Gough; H. Yardley.

ANTWERPS (Long-faced, any colour).—*Cock or Hen.*—1, W. Gamon, Chester. 2, J. W. Barker, Reading. 3, G. Bairstow, Bradford. *hc*, E. C. Stretch; C. F. Herrieff.

ANTWERPS.—*Young.*—*Cock or Hen.*—3, H. Gough. *hc*, J. Mitchell; J. Kendrick. *c*, A. Farndon, Leicester; A. J. Barnes; J. Holden, Bradford; J. Mitchell; H. Yardley.

ANY OTHER VARIETY —*Cock or Hen.*—1, R. Fulton (Turbiteen). 2, A. C. Merchant, Bristol (Archangel). *hc*, G. Hardy; H. Yardley; J. Baily, jun.; E. Horner; A. & W. Silvester; W. Tedd; N. Hill.

SELLING CLASS.—*Pair.*—1. H. Yardley. 2, D. Young. 3, J. F. Loversidge. *hc*, W. Bryant, Bristol; T. Herrieff; Mrs Ladd; D. Young, Leamington. *c*, J. Baily, jun.; W. D. Richardson, Somerset.

SELLING CLASS.—*Cock or Hen.*—1, N. Hill. 2, E. Horner. 3, R. Fulton. *hc*, T. Herrieff; H. Yardley; S. Salter (3). *c*, J. J. Sparrow.

Mr. Teebay judged the *Brahmas*, *Game*, and *Game Bantams*; Mr. Dixon the *Cochins*, *Hamburghs*, *French*, and *Variety* classes: and Mr. Burns the *Dorkings*, *Waterfowls*, *Variety Bantams*, and *Sale* classes; while Messrs. P. H. Jones and Charlton did the *Pigeons* between them.

DORCHESTER AND PORTSMOUTH SHOWS.—Specimens exhibited at Dorchester may be sent from there in time for the Portsmouth Show, and the Hon. Secs. of the former have promised to get all those entered for Portsmouth sent off so as to arrive there in time for judging on the 29th, provided proper labels are forwarded to them.

ABERDEEN POULTRY SHOW.

THE ninth annual Exhibition of the Northern Poultry Club was held in the Drill Hall, Aberdeen, on 8th and 9th inst. Entries were numerous, and the quality first-rate throughout.

At this Show *Dorkings* always head the prize list, and were divided into four classes—viz., old and young Coloured, and old and young Grey or White. In the old class Mr. Turnbull, Larbert, won well with a well-matched pen of good quality. Young birds of 1874 were a large and good lot, Mr. Clark of Fochabers, a veteran fancier of this breed, winning first and cup with birds which stood high at the Crystal Palace. The other prizetakers in this class were well deserving of their honours. Silver-Grey Dorkings were well represented, the cup in this class going to a large-sized and good pen belonging to Mr. W. Hendry; second were fair. First in young class were small, but good-coloured; second about the same in both respects; the other noticed pens were of average merit. *Spanish*, a small class, and this variety does not seem to hold ground here. The principal prizes were gained by Edinburgh birds (Mrs. Grassick), and easily outdistanced the rest. *Cochins* were good. First, a fine pen of Mrs. Hendrie, Inverness. The other noticed pens were of great merit. In young birds Mr. Proctor, Durham, easily won. *Brahmas* were numerous and good, the old beating the young. First and cup gained by Alex. Burnett, Montrose; 77 (J. Dempster) would have won if not out of condition from overshowing. *Houdans* were numerous and better in quality than usual; 97 was nearly suffocated from being packed in too small a hamper, and during the first day was in a dying condition, otherwise he was best in the class. *Hamburghs* were, as usual here, a good class. *Game* be te than usual, the cup going to a grand pen of Mr. Mason's. *Bantams* were good. First, fine Black Red; second, Piles.

Ducks were large and good, and the same may be said of *Geese* and *Turkeys*.

The show of PIGEONS was the great feature of the Exhibition, and amongst them the *Pouters* stood out prominent; in fact it was a Pouter show, there being 211 entries of them. We are sorry to say the decisions of the Judge in this department gave anything but satisfaction, and our own ideas on the subject will be seen from our notes. Pouter cocks, any age, began with Blues, and here we could by no means endorse the Judge's decision. The best bird was undoubtedly the third-prize, next came pen 244 (Ure); third should have been 241, same owner, a grand class. Black cocks were better judged—that is to say, the prize birds as a whole were the best in the class, but the second was far better than first in all respects. In Red cocks first was a very nice bird, though standing a trifle wide in the legs; second a better colour but short in leg. The best pen in the class was 260 (Lyell), though blind of an eye and solid-shouldered; third was a nice bird. Yellow cocks, the first in this class also won the cup for the best bird in the standard colour classes, but why we failed to see; he was short in leg and badly marked, and not to be compared with fully a dozen of the Blues, Blacks, and Reds. Pen 271 (Ure), was an easy first; second should have been third, and third second. White cocks were much better judged, and all good; 278 (Fulton), might have been third, but this was a small error, if any. Any other colour cocks were a fine class, amongst them some of the finest birds in the Show. Some grand Mealies would have gladdened the heart of Mr. Huie and of any true fancier. Pen 283, Mealy, should certainly have been first. Second a Splash, a fair bird. First a nice Mealy. 288 (Pratt), should not have been shown in this class, being merely a bad Black. Young Blue cocks were a magnificent class and contained some grand birds, but the judging very wide of the mark indeed; Pen 297 (Ure), was one of the best and most stylish Pouters ever shown, to praise it would be painting the lily. First a fair bird, but could not look at the bird named. Black cocks were a good class, but first was a great error in the face of No. 307 (Lyell), a grand bird and with a pair of splendid legs, well set on. 304 (the same owner), should have stood second, The winner was bad coloured and badly marked, being almost swallow-throated. Red cocks were a good class, but as a lot wanting in depth of colour. The nicest bird in the class was third, a most stylish Pouter, in fact we liked him almost better than any bird in the Show. First was bad coloured; 319, commended, was also a good bird, good style and nice clean limbs; 321 was the best coloured bird in the class. Yellow cocks, first the best in style though small. 323 (Ridley), should have been second, second third. White cocks, Mrs. Ladd's pen, 339, was the nicest bird in this class, but unfortunately its owner had forgotten to remove the home marks, and it along with all her other birds (which were in a similar condition), was disqualified. Blue hens, any age: 348, commended, was a fine showy hen, but best of all we liked No. 352 (Ure) unnoticed. 351, third, came next, these were the pick of the lot. Black hens were perhaps

as a class the best in marking in the Show. First a grand and showy hen. This was a well-judged class. Red hens a good lot, first a nice bird short of colour, 368 very long in limb; 370 (White), a handsome showy hen. The first-prize hen in Yellows won besides the cup as the best bird in the old hen classes except White and Any other colour. Why she did so we cannot see, as not only was she far from the best in the lot, she was not even nearly best in her own class; the third-prize should have stood first. White hens a fine class, and the winners all there. Any other colour, a poor Chequer first; second blue-tailed White; third, a handsome Sandy. 391 (Hill), a very stylish hen; 392, Mitchell, a Mealy, and one of the best birds in the Show. Young hens, Blue, first-and-cup not nearly equal to the same owner's second-prize bird, which should have stood first. Blacks were a small class, and first a great mistake, she was without exception the worst in the class, and had not one point to recommend her; second was next her in badness, and stood with her head down and tail up, like an English Fantail. 415 (Pratt), was worth a dozen of both. Red hens poor in colour, many of them otherwise good; we thought second beat first here. White hens a grand lot, well judged. Here we end the Pouters. There were we think, many errors in judging; at least that was our opinion, and that of all the fanciers we spoke to. The whole matter looked as if much too free a use of the measuring stick had been made, and too little of the show pen; but this is of conrse merely conjectnre. The birds themselves were ou the whole an improvement on last year. We saw fewer heavy and rough-legged birds shown, bnt colonr in Reds and Yellows is no better. Blacks, however, are better in colour and cleaner in limb, even allowing for the amount of cleaning done. Blues were certainly at the top of the tree, and some of them, indeed most, were truly grand Pouters. *Carriers* were few in number, though of fair quality. First, a nice Dun hen, which might, however, have given place to second, a stylish Black cock. Young Carriers.—First, a Dun hen, might have put up with second; the second a nice Black; third, good Black, but of poor colour. Almonds few in number, first a good-colour head-and-beak bird; second, better head but too dark. Any other colour.—First, a fair Agate; second, Kite; third, Black Mottle, should have been beaten by a nice little Beard. *Barbs.*—First, a Red of good quality, but getting into the sere and yellow, very yellow leaf; second, a Black, a perfect object, so used-up; third, a good young Dun, and highly commended a good Yellow, should have been second and third. *Fantails* were judged in a manner most trying to the feelings of a Scotch fancier. First and second were English birds, large and coarse, not the least motion; on all hands it was allowed that 476 (Spence), 479 (Ure), 488 (Thomson), 490A (Smith), were the best in the class. *Jacobins* were a fair class and well jndged, while *Trumpeters*, though few, were every one first-rate. *Owls* and *Turbits* were very good, and the judging satisfactory. *Dragoons* we know nothing about. Common *Tumblers* were a fine class, some very pretty Mottles taking the prizes. The Variety class.—First, a sort of cross between a Spot and a Swallow; second a nice Frillback; third, a pretty Ice.

Dorkings (Coloured).—1, J. Turnhull, Larhert. 2, A. Allan, Udny. 3, Miss D. Fordyce, Maud. *Chickens.*—1, Cup, and *hc*, J. Clark, Fochabers. 2, W. Snowie, Monymusk. 3, A. Allan.

Dorkings (Silver-Grey or White).—1 and Cup, W. Hendry, Aberdeen. 2, D. Gracie, Stonehaven. 3, D. Ferrier, Woodside. *Chickens.*—1, J. Duncan, Blackburn. 2, J. Mitchell, Glasgow. 3, D. Gracie. *hc*, J. Watson, Aberdeen.

Spanish.—1, R. Philip, Aberdeen. 2, Mrs. Grassick, Edinburgh. 3, J. Duncan. *Chickens* —1 and Cup, Mrs. Grassick. 2 and 3, Mrs. W. Steven, Montrose. *c*, W. Webster.

Cochin-Chinas.—1, Mrs. J. Hendrie, Inverness. 2, Mrs. G. Armitstead, Inchture. 3, G. H. Proctor, Durham. *hc*, W. & R. Davidson, Montrose; Mrs. G. Armitstead. *c*, R. Blyth. *Chickens.*—1, G. H. Proctor. 2, Mrs. W. Steven. 3, Mrs. M'Kenzie. *hc*, F. C. Parker, Dundee. *c*, R. Blyth.

Brahmas.—1 and Cup, A. Burnett, Montrose. 2, J. Smart, Carnoustie, 3, J. Sandeman, Dundee. *hc*, G. Summers, Whitehouse. *c*, A. Forbes. *Chickens.*—1, R. Maxwell, Dumfries. 2 and *hc*, Rev. G. Wilson, Fetternear. 3, J. Thomson, Aberdeen.

Houdans.—1, R. Mowat, Aberdeen. 2 and *hc*, U. H. Allen, Banff. 3, W. C. King, Aberdeen. *c*, J. Smart.

Hamburghs (Gold or Silver-pencilled).—1, Cup, and 2, W. Hadden, Fraserburgh. 3, J. Brands, Denny. *hc*, P. Campbell; J. Taylor, Montrose. *c*, P. Campbell.

Hamburghs (Gold or Silver-spangled).—1, J. M. Campbell, Turriff. 2, G. Campbell, Pitalligo. 3, W. Ferguson, Inverness. *hc*, E. Robinson, Airdrie.

Game —*Cock* —1, J. Mackay, Arbroath. 2, T. N. Mitchell, Perth. 3, J. Allan. *hc*, J. Nelson, Hexham. *Hen* —1, A. Dawson, Torres Station. 2, T. W. Mitchell, Perth. 3, D. Harley, Edinburgh. *Chickens.*—1 and Cup, T. Mason. 2, J. Waddell, Airdrie. 3, J. Nelson. *hc*, Master A. Frew, Kirkcaldy.

Any other Variety.—1, J. Taylor (Golden Polands). 2, G. Caithness, Carnoustie (Black Hamburgh). 3, C. B. Taylor, Montrose (Silver Polands). *hc*, Miss B. P. Frew, Kirkcaldy. *c*, J. Mackay, Grantown.

Selling Class.—1, J. Clark. 2, Mrs. C. B. Taylor. 3, W. Snowie. *hc*, A. Mitchell, Aberdeen.

Ducks.—1, A. Bowie. Carnoustie. 2, Miss I. Gerrard. 3, A. Skinner, Tullynessle. *hc*, Miss I. Gerrard, Turriff; A. Burnett, Montrose. *c*, J. Mitchell; J. S. Henderson, Aberdeen.

Turkeys.—1, Miss D. Fordyce, Maud. 2, A. Bowie.

Geese.—1 and 2, A. Christie, Kintore. *c*, J. Stephen, Kintore.

Game Bantams.—1 and Cup, J. Grieve, Grandholm. 2 and *hc*, R. Brownlie, Kirkcaldy. 3, J. Nelson. *c*, A. Mitchell.

Bantams (Any other variety).—1, T. & W. Kerr, Beith. 2, J. A. Dempster, Stirling. 3, Miss R. Frew. *hc*, J. Taylor; T. & W. Kerr. *c*, Miss R. C. Frew, Kirkcaldy.

PIGEONS.

Pouters (Blue-pied).—*Cock.*—1, R. Fulton, New Cross, London. 2, J. M'Culloch, Uddington. 3, H. Pratt, Hampton-in-Arden. *hc*, G. Ure, Broughty Ferry. *c*, J. White, Aberdeen. *Hens* —1, W. Ridley, Hexham. 2, J. White. 3, G. Ure. *c*, R. W. Bryce, Edinburgh; J. M'Culloch; G. Ure (2).

Pouters (Black-pied).—*Cocks.*—1, H. Pratt. 2, G. Ure. 3, W. Ridley. *hc*, G. Ure (2). *c*, A. Frame, Larkhall. *Hens.*—1 and 3, G. Ure. 2, W. Ridley. *c*, W. Ridley; G. Ure.

Pouters (Red-pied).—*Cocks.*—1, J. M'Culloch. 2, R. Fulton. 3, J. White. *hc*, W. Ridley; R. Fulton; G. Ure. *Hens.*—1, J. M'Culloch. 2, R. Fulton. 3, W Ridley. *hc*, G Ure. *c*, W. Ridley.

Pouters (Yellow-pied).—*Cocks.*—1 and Cup, R. Fulton. 2, J. Mitchell. 3 and *hc*, G. Ure. *Hens* —1 and Cup, R. Fulton. 2, H. Pratt. 3, G. Ure. *hc*, G. Ure; H. Pratt. *c*, G. Ure.

Pouters (White).—*Cocks.*—1, R. W. Bryce, Edinburgh. 2, R. Fulton. 3, J. White. *Hens.*—1 and Cup, R. W. Bryce. 2, W. Ridley. 3, R. Fulton. *c*, W. C. Thompson, Broughty Ferry; J. White; R. Fulton; A. Anderson.

Pouters (Any colour or marking).—*Cocks.*—1, R. Fulton. 2, J. White. 3, A. Anderson, Edinburgh. *Hens.*—1, R. Fulton. 2, W. Hendry. 3, G. Ure.

Pouters (Blue-pied).—*Young.*—*Cocks.*—1, R. Fulton. 2, J. White. 3, J. M'Culloch. *hc*, W. Ridley; G. Ure. *Hens.*—1, Cup, and 2, G. Ure. 3, J M'Culloch. *hc*, W. Ridley; W. Nottage, Northampton; J. White; J. Mitchell. *c*, A. Frame; W. Hendry.

Pouters (Black-pied).—*Young.*—*Cocks.*—1 and Cup, R. Fulton. 2, W. Ridley. 3, J. White. *hc*, J. C. Lyell, Monifieth. *Hens.*—Medal and 1, A. Frame. 2, H. Thomson. 3, G. Ure.

Pouter (Red-pied).—*Young.*—*Cocks.*—1, R. Fulton. 2, J. C. Lyall. 3, G. Ure. *c*, G. Ure; H. Pratt; F. M'Rae, Aberdeen. *Hens.*—1, A. Robb, Alloa. 2, J. M'Culloch. 3, F. M'Rae. *hc*, W. Nottage. *c*, J. C. Lyell; G. Ure.

Pouters (Yellow-pied).—*Young.*—*Cocks.*—1, J. M'Culloch. 2, J. Mitchell. 3, H. Pratt. *Hens.*—1, N. Hill, Ealing. 2, J. M'Culloch. 3, A. Robb. *c*, G. Ure.

Pouters (White).—*Young.*—*Cocks.*—1, J. M'Culloch. 2, H. Pratt. 3, D. Thomson, Claremount, Alloa. *Hens.*—1, H. Pratt. 2, R. Fulton. 3, J. M'Culloch.

Carriers.—*Cock or Hen.*—1 Cup and 3, R. Fulton. 2 and *hc*, W. Ridley. *c*, J. C. Lyell. *Young.*—*Cock or Hen.*—1 and 2, R. Fulton. 3, G. E. Spence, Seafield, Broughty Ferry.

Tumblers (Short-faced Almonds).—*Cock or Hen.*—1, R. W. Bryce. 2 and 3, R. Fulton.

Tumblers (Short-faced, any other colour).—*Cock or Hen.*—1 and 2, R. W. Bryce. 3, J. Smart, Montrose. *c*, R. Fulton; J. Smart.

Barbs.—*Cock or Hen.*—1, R. W. Bryce. 2, R. Fulton. 3 and *hc*, J. E. Spence. *c*, R. W. Bryce.

Fantails.—*Cock or Hen.*—1, H. Yardley, Birmingham. 2, J. F. Loversidge, Newark. 3, J. E. Spence.

Jacobins.—*Cock or Hen.*—1, R. W. Bryce. 2, R. Fulton. 3, J. G. Orr, Beith.

Trumpeters.—*Cock or Hen* —1 and 2, R Fulton. 3, J. Lederer, Bootle.

Owls.—*Cock or Hen.*—1, R. Fulton. 2, R. W. Bryce. 3, W. & R. Davidson. *c*, Rev. W. J. Steven, Montrose.

Turbits.—*Cock or Hen.*—1, J. G. Orr. 2, W. Ridley. 3, R. Fulton. *c*, J. R. Reanards, Helensburgh.

Nuns.—*Cock or Hen.*—1, A. Dathie. 2 and 3, W. Hendry.

Dragoons.—*Cock or Hen.*—1, R. Fulton. 2, J. Cowley. 3, H. Yardley.

Tumblers (Common Flying).—*Cock or Hen.*—1, J. G. Orr. 2, W. Ridley. 3, W. B. Mapplebeck, jun., Birmingham. *c*, J. G Orr; H. Yardley.

Any other Variety.—*Cock or Hen.*—1, R. Fulton. 2, A. Cowie, Ellon. 3, J. Cowe, Aberdeen.

Selling Class.—1, J. Smart. 2, A. N. Bryce. 3, H. Yardley.

Judges. — *Poultry:* Mr. Paterson, Airdrie; *Pigeons:* Mr. Corker, London.

DRAGOONS.

Allow me, as a Dragoon and Owl fancier, to express my approval of "Wiltshire Rector's" and Mr. Staunton's articles. I am often disgusted to see the heavy first cross from a Carrier winning over pure Dragoons. Until lately we had the same thing occurring in Owls. Anglo-African mongrels always won over pnre English, now we have a distinct class. I trust we shall soon have Horsemen and Dragoon classes, not a number of birds of all styles and sizes competing together.—W. G. Henry.

HARDINESS OF CANARIES.

Seeing an article in your number on Canaries, in which it is said that their being kept in a detached brick building in winter is a pretty fair test as to the amount of cold they will hear, I thought it might be worth while to say that I have had Canaries entirely out of doors for nearly two years. In winter the whole front of the cage, which is 4½ feet long and 3 feet high, has no covering over the wire. During the late severe weather I covered part of the front with a wrapper, leaving about 3 feet quite open. They have a few branches of Austrian pine to shelter in, and are fed with canary and cale seed and groundsel, and when very cold a little hemp seed as well. The thermometer has registered 15° of frost two or three nights, yet my pets have been quite ready for their food and cold bath in the morning, which, if freezing or not, they generally enjoyed, and my songsters hardly ever failed to reward me during the frost. My birds are not troubled with asthma, and are not indulged with sugar, sponge cake, or any other things contrary to their nature. —A. D. A., *Roxwell, Essex.*

BEE-KEEPING, 1874.

Another year has gone, and still we do not all agree which is the best hive into which to place our little pets. Some will have it that one of straw is the best; others prefer wood, and a third party are for wood and straw combined, and a fifth say the Woodbury straw bar-frame is best. Well, who must decide? It is a question not to be decided about too hastily. We all have our fancies; and I must confess that, to have a large harvest of honey and to make money by our bees, I go in for large hives, not less in size than Pettigrew's 18-inch.

I have been a bee-keeper now in the teens of years, and went in at first for straw, my tutor not knowing of any kind but straw. Being anxious for swarms his advice was, "Small hives for swarms, and large ones for honey;" but the large hives of his day were more like supers of this time.

I went on for some time in the old style until I saw a copy of The Journal of Horticulture, and then I found that bee-keeping was carried out scientifically.

I obtained an introduction to our late and lamented friend Mr. Woodbury, and of course I must have some of his hives. I then got hold of Nutt's work on bees. Certainly my apiary would not be complete without one of his hives, so I bought one with its "pavilion of Nature." This led me to read Huber, for whom I have the greatest esteem as a writer, and I must say that of all the hives of wood I like the Huber the best; but my Huber hive is somewhat modified, it is not the Huber proper. The little alteration I have made I think an improvement. In the Woodbury there is sometimes a difficulty in drawing up the frames, which there is not in the Huber; and, again, when you take out a frame of the Woodbury you leave a vacant space, but in the Huber you can contract or expand the hive at your pleasure to what size you like.

I have the Woodbury glass observatory hive with nine bars, and I must confess I would much rather have glass than wood; there is no moisture in it if you will take off the top and put on the quilt to prevent the steam from condensing.

I have also the globular-shaped hive, with which I took the first prize at Manchester last year. I promised that I would let the readers of The Journal of Horticulture know how it had done this season. I think I told your readers that I put a swarm into it last season, but it being late it did not do well, and was not filled with comb when I took it to the Manchester Show. It passed through the winter well, and I had a swarm from it about the second week in June and a cast in eleven days after, and it is now in first-rate order, very full of bees and likely to do well next year. So you see it is rather better than a toy and only fit for exhibition purposes.

I have now twelve stocks all right for the winter, but only one of Pettigrew's 18-inch, which is very heavy and is the best stock I have in my garden, and I shall not have any straws less than 18 inches.

I still keep, and shall continue to keep, the Woodbury, Huber, and Nutt's hives, but only for ornament, as I do my unicomb.

I have had a good season both in honey and swarms, most of the stocks having swarmed twice. I very seldom take honey out of the hives, only use supers and leave the rest for the bees.

Now that the show of bees, &c., at the Crystal Palace is a thing of the past, I hope the success the managers have had will induce them to go on. But I should advise them to remove the show from place to place; say in 1875 let it be in Manchester or Birmingham, or any place they think would take it up. The Manchester people intend holding another next year upon a much larger scale, but to make it attractive the bees should be at work. I am glad to see that agricultural societies are now beginning to take up the encouragement of bee-keeping. The Manchester and Liverpool Agricultural Society, at their Show held at Staleybridge last year, gave prizes for bees and honey. The bees were at work three days in the show yard.—South Lancashire Bee-keeper.

BEE-KEEPING IN RUSSIA.

[Translated from the German, "Russia in the Nineteenth Century." By Von Th. von Lengenfeldt.]

Bee-keeping is every where practised in Russia, more especially in Little Russia and New Russia. In the province of Pultawa (population 2,000,000), there are 500,000, and in that of Yekarterinoslaw (population 105,000), 400,000 hives. In Western Russia it chiefly flourishes in the province of Kowne where the Tchmude tribe are principally engaged in bee-keeping; and in Eastern Russia the Finnic tribes are enthusiastic bee-keepers. In Siberia, the pursuit is mostly carried on about the Altai Mountains, and in Caucasia by the tribes of the Meretinzes and Grusinians. In South Russia artificial bee hives are used, whilst in North Russia the bees are kept in a natural manner in the forests.

In former times Poland was celebrated for its bee culture, and is still now to some extent in the province of Lublin, having everywhere else fallen into decay. The reason why bee-keeping is so industriously carried on in Russia is twofold. First, because the peasants use honey instead of sugar; and secondly, because wax tapers to the value of 1,200,000 rubles (nearly £1,825,000) are required for the churches. Buschen states the quantity of honey annually produced in European Russia to be 600,000 to 700,000 lbs. (9,643 to 11,250 tons), and a proportionate quantity of wax.—John Hunter, 5, *Eaton Rise, Ealing.*

TO OUR READERS.

The great length of the Bristol Show report and large amount of other communications compel us, although we have doubled our Supplement, to omit until next week reports of Fakenham, Paisley, Baildon, Nenthead, and other Exhibitions, which are already in type.

OUR LETTER BOX.

Broughty Ferry Poultry Show.—Mrs. W. Chalmers, Hallyburton, Conpar Angus, informs us that she was awarded the cup for the best Dorking cock.

Dorking Cock Dying Suddenly (*J. E. M.*).—Blood-vessel ruptured on the brain.

Fowls with Ducks (*Portcullis*).—One reason why Ducks and fowls do better apart is that the former delight in slush, and fowls like a dry place. Fowls like a hard surface, and Ducks like a soft muddy one. A Duck may be as filthy as possible in appearance, but a few minutes in the water enable it to come perfect in plumage and perfectly clean. If a fowl gets its legs cased in mud (especially if feather-legged), and the tips of wings and tail draggled, it is a long process for it to get dry. Fifty fowls will drink from a vessel without spilling a drop. Two Ducks will scatter the water all over the place. We quite approve of giving the fowls part of the cow house. It is the only artificial heat we would use. Your pullets will continue to lay. The hens will lay in six weeks. The Ducks will not lay yet. Give them their liberty. They only fatten when they are shut-up, and that is often followed by loss of plumage.

Price of Carriers and Almond Tumblers (*A Novice*).—We do not think it right to recommend by name those who have birds for sale, but the best thing you can do is to write to some of those gentlemen who are famous for taking prizes in these varieties, and whose advertisements appear in our columns.

What Bantams to Keep (*A Subscriber*).—"Wiltshire Rector" is much gratified that his remarks in his New Year's article have pleased you. He recommends you to get a sitting of Black Bantam eggs from some exhibitor. As you already keep fowls you are sure to have a broody hen in the spring or early summer. Black Bantams are hardy and healthy, and lay well and sit well. Then there is no comb-cutting—dubbing as it is called—of the cocks, as when Game Bantams are kept, and this dubbing always shocks little girls. If you breed the Bantams early in the spring they will naturally be larger. But they are, in order to keep them small, bred in early summer. The place you have and subsoil would do well for Blacks, or you might have a little wooden house and wired-in run for them, near the house, as they would be pets for a child, and are best near at hand and most enjoyed.

Belgian Hare and Himalayan Rabbits (*T. M. N.*).—Put them together about four o'clock in the afternoon, and leave them together till the middle of the next day. The age is quite sufficient. We have no doubt this will be found satisfactory.

British Bee Association (*K. W.*).—Write to the Secretary, Mr. J. Hunter, Eaton Rise, Ealing, London, W.

REMARKS.

6th.—A warm, bright, pleasant day throughout.

7th.—Dark in the morning, rather better in the middle of the day; dark afternoon, and wet night.

8th.—Rather foggy morning; dark and dull all day, though not very foggy.

9th.—Fair morning, and until noon, but then dull, though the night was fair.

10th.—Fair early, but very dark here all day, and especially so about noon.

11th.—Rather dark all day, except between 12 and 2 P.M., when there was a little sun.

12th.—A damp, dark, uncomfortable day, frequent slight showers, but not much rain falling.

A rise of 8° in the mean 9 A.M. temperature, and of 10° in the mean minimum since last week. The weather, however, has been extremely damp and uncomfortable.—G. J. Symons.

COVENT GARDEN MARKET.—January 13.

A fair supply but very little business doing among home productions. Imports are large, including heavy supplies of Broccoli from the Channel Islands and France. There is also a large arrival of fresh St. Michael Pines, and Shaddocks and Pommeloes from the West Indies. Potato trade dull, except for superior qualities, which bear a small proportion to the bulk this season.

From observations taken near London during forty-three years, the average day temperature of the week is 43.6°; and its night temperature 32.6°.

WINTER CUCUMBERS.

I FEEL I owe an apology to some of your readers for not answering their queries on the above subject sooner, but I thought probably if left alone they would answer each other. As there seems to be now no hope of this, I will take the queries seriatim, and see if I have anything to add to what appeared in the Journal of November 26th. At the same time be it understood that when I speak of my successes it is in no boastful spirit. I do not for a moment suppose I should succeed so well under the conditions named by some of your correspondents.

"S. J. A." (page 489) is the first querist, and to him, before saying anything about Cucumbers, I will give a word of advice on another matter; probably, however, his good sense will prevent him requiring it. He is acting under another's direction, and the one whose direction he acts under has to bear the responsibility, and therefore is entitled to carry out his own plans, and it is the duty of "S. J. A." to enter into the spirit of them as thoroughly as possible, and carry them out to the letter. It will not do for "S. J. A." to be pulling one way, and the one who gives him directions pulling another. "S. J. A." must make up his mind that Cucumbers can be grown with a night temperature of 70°, and determine to do it. I should if similarly situated. "S. J. A." will probably have the chance some day of using his own discretion as to cultural details, and he will then find that there is a great deal more requiring to be erased from the ordinary garden calendar besides that bearing on high night temperatures. I know of no reason for sowing four or more seeds in a pot, and afterwards breaking their roots in repotting them, necessitating shading until they are re-established, and resulting in loss of vigour and loss of time. Sow in single pots, break not a root, and never shade, unless for an hour or two after a spell of dull weather. I consider it preferable to use liquid manure when required rather than mix dung with the soil. There is very little in the remains of a spent hotbed for plants to feed on, the process of fermenting has taken most of the ammonia away, and what is called manure is often only the packing material which once contained it.

"R. R. S. H." (page 501), is the next querist; but I do not quite understand whether he wants information or an argument. I will suppose it is the former. Arguments generally end in personalities, and impart but little information. Well, then, the Cucumber I grow is called Baron Hill, or Dickson's Favourite, and Dickson's All the Year Round of F. & A. Dickson. I do not say it is the best, bnt it is a good one, and has served me well; therefore, till I prove another to be better, I shall stick to it. Telegraph is also a splendid winter Cucumber. "R. R. S. H." says he cannot get good Cucumbers with a lower minimum than 60°. During the three-weeks frost we lately had my house was more than once below 50°, and the plants are now in beautifnl health, and showing three fruits at almost every joint. Scores of leaves measure 15 inches across, and have stalks 9 inches long. Two plants fill a space of 30 feet by 10 feet. There is not an insect or a speck of mildew on them, and they are clothed with foliage to within a foot of the base.

I have great faith in a good steady bottom heat; I have just tested it under my plants, and find it to be 78° at 10 inches below the surface. The atmospheric temperature at the same time is 62°; and as the weather is mild, and there is not much fire going now, I should say at a guess that the bottom heat is never below 70°. When it is considered what a very high temperature the roots of Cucumbers must sometimes be in when grown on ordinary hotbeds in summer, and how rapidly they grow, and what enormous leaves the plants produce, it is no wonder that they also like to be kept warm in winter; but beyond keeping the plants comfortable, nothing further should be aimed at, excepting by daylight. All growth made in the dark is worse than useless; the brighter the light the higher may be the temperature.

The note by 'W. G. S.," January 7th, is a valuable addition to onr Cucumber knowledge, and I have no doubt Mr. Platt will profit by it. I should recommend him to clear out his Cucumber house—soil, slabs, water, and everything, and scald every part that can be scalded, oiling or painting the woodwork, limewashing the walls, &c., and the slabs if used again should first be passed through a fire or boiling water, and then to adopt my plan of using simply very light turfy soil. This may also be placed over a wood fire and made rather hot before using, but not burned sufficiently to destroy the fibre. I should prefer rubble to water in winter about the bottom-heat pipes, as I think the soil would thereby be kept sweeter. 60° is not generally considered a high minimnm, although I recommend 55° as being sufficiently high. When the article was written which appeared November 26th, I had on my mind those who recommend a night temperature of 65°, and even 70°; the higher figure being recommended that same week in a very influential contemporary. If mine had been at 70° on the last day of the old year, when we had 25° frost, I do not suppose they would now be in as good a condition as they are. The house was nearly down to 50°, and was covered with frigi domo for forty-eight hours. It was merely one long night to the plants, and they suffered far less than they would have done from a strong fire heat.—Wm. Taylor.

BIRDS AND FRUIT BUDS.

In a contemporary a correspondent runs a tilt long and strong against small birds, and especially the house sparrow. He says, after describing the havoc small birds commit in the destruction of fruit buds, "Sparrows are most destructive this way. Such birds are becoming far too numerous." The former he presently qualifies by stating, "In the matter of fruit buds they [sparrows] are almost as destructive as the bullfinch." The sense is so much altered as to reduce sparrows to an inferior rank as bud-destroyers to bullfinches; whereas he sets

out with "Sparrows are most destructive." Then proceeding, he says, "I have watched them closely, and have never yet seen them take insect food; and it would appear almost as natural to see any of the carnivorous animals eating hay as it would to see hard-billed birds, such as sparrows and finches, eating insects." Well may he have "grave doubts," though he has "watched them closely," of sparrows eating insects. But the subject is treated so vaguely; as, for instance, "a few charges of powder and shot soon rid the garden of their [bull-finches'] presence, but to try and reduce sparrows in this way appears to bring hundreds to the funeral."

The whole tenor of his remarks exhibits only prejudice and wanton misrepresentation of the sparrow. I have "grave doubts" that his eyes are so blinded by prejudice as "having eyes he sees not" the good sparrows do in a garden; in fact, he shows ignorance of the habits of this useful bird. Anyhow, the sparrow I know and have known since I can remember anything, and in gardens too, is a very different creature to what it is represented. I put this question to a youth of fifteen summers—"What do sparrows feed their young with?" And his answer was, "Caterpillars."

If there are any that have "grave doubts" of sparrows devouring multitudes of insects, they may in the coming season watch them going to their young with insect food several times an hour, and it is not difficult to ascertain of what this food is derived. It is not to the point to conclude because they are "hard-billed" they do not eat insects, or that carnivorous animals will not eat hay, for the merest tyro in natural history knows cats are, or may, often be seen eating grass. The blue titmouse, though a ravenous eater of flesh, is equally fond of Green Peas; and the sparrow, though a seed-eater—a vegetarian if you will, has his food fitted to its requirements. What seeds has the sparrow in early summer wherewith to satisfy the craving of itself and young? Seeds! Is it likely to find these on Rose bushes, Gooseberry, Apple, and Plum trees? Why does it frequent our gardens, be most busy there during the breeding season? Surely its place is in the farmyard, the barn, at the place where seeds or its vegetarian diet is to be had. But instinct tells this companion of man in every clime, whose footsteps it follows, that it is in the garden, on Rose, Gooseberry, Currant, Apple, Plum, and other subjects there cultivated, aphis and caterpillars are to be had, as well as green food, as the top of Peas. From the first dawn of spring to the time its young is strong of wing the sparrow is one of the busiest of gardeners. Early morning sees the creature at work—labours carried on unceasingly until the sun is low in the west, freeing the trees of which man, his murderer, expects fruit in due time, and as far as the sparrow is concerned he may have unmolested. Not so much can be said of some of the soft-billed birds; and for at least four months of close attention to the garden, ever vigilant, ever searching for, devouring, or taking to its young insect food, this bird is—(because the insect food fails or instinct says is not required, falls upon Green Peas or the tender grain of the fields)—to have levelled against it, not shot, for this brings hundreds to the funeral, but denunciation of its merits, gross misrepresentation of its habits, and upon this find a plea for their destruction as "an unmixed evil." After this what next? Strew poisoned Wheat for them to eat! There is no telling what mischief may be done by the dictation of those denouncing in no measured terms a most useful and confiding creature; and it is with a hope that any of the readers of this Journal having waged hitherto, or determined to wage in future, a war of extermination against these birds, to convince themselves before they do so by ocular proof of the truth of those evils it is said to effect.

Either the house-sparrow that I recognise as such is a different creature to that of others, or the instinctive creature knows his friends and enemies. It were well if it did, leaving its abusers and destroyers to reap the fruit of their labours in swarms of lice and caterpillars covering the land.

The sparrow (Passer domesticus) I know is a bold confiding bird. Wherever man fixes his habitation there we find this bird, courageous and even impudent in its familiarity with his dwelling and its surroundings. The whole of its life is devoted to the service of man. In the forest, the wilderness, it has no place. Its house is made beside—often beneath—the same roof as that it seeks to benefit by taking what would often be wasted, helping itself to anything it can find in the shape of seed or grain or made thereof.

This bird builds its nest beneath roofs of houses or buildings, and in trees, especially evergreens, if there are any near human habitations, and rears two or more broods of young in a season. Its young are reared upon insect food, in the nest mainly if not exclusively, and when taking to wing is led to seek for itself its food upon subjects that have the "seed within itself," or subjects which at no time yield in their fruit the creature its food. As the bird becomes older it takes to Peas, then to grain, in both cases soft, and ultimately to hard seeds or grain, varying its diet with soft or cooked food.

In a garden the sparrow does some harm. What does not? It will take the tender tops of Peas, but a dusting of lime will prevent its doing so; but it will still visit them, and woe betide any weevil or grub that may show itself. It will keep company with the Peas all along, never so happy as when they are in flower. And what does it want then? Why, that the old take to their young, and the young consume on the spot. It eats the young Peas, but is easily scared by an old hat suspended between two stakes, or a net will make all safe. Crocus flowers are pulled in pieces; a black thread suspended over them will mostly keep the birds at a respectful distance. Fruit buds I have never known the sparrows touch. They are not prevented in any way from doing so, and yet they have never eaten any. For full thirty years this is my experience—daily experience, of sparrows in gardens. I know the sparrows are blamed by almost everyone for taking fruit buds, especially of the Gooseberry, but the linnet is never dreamt of, but a more rapacious bud-destroyer, nor more sly and shy bird at it, does not exist. Early morn is the time to see the linnets at work, and away they are with a twitter. Sparrows, because seen on the bushes in broad daylight, are the rogues. I of course do not know what the sparrow may do in other gardens than those of which I have happened to have charge, and these have been gardens in agricultural villages—farm-steadings abundant—away from even those, and in towns where there is no feathered note so familiar in a natural state as that of the sparrow, and in no instance has this bird taken a single fruit bud. To see buds taken, and because the sparrow is seen where or near whence they were removed, is not enough. Proof positive and conclusive is needed, and until this is forthcoming let me ask your readers to stay execution until proof is forthcoming in personal observation and practical experience.—G. Abbey.

NOTES FROM MY GARDEN IN 1874.

The favour with which the few notes I gave on my garden in 1873 were received, and the conviction that experience such as we are all capable of telling does much in aiding others, induce me again to put on record a few simple notes which may be helpful to those situated like myself. Mr. Luckhurst writes from a different standpoint. He has to do with a large place; I, on the contrary, have only a small one, which I have already described, and in which it is my endeavour to do as much in various departments of gardening as I possibly can, laying claim to no superior method of culture—blending, it may be, a good deal—having to tell of many losses and failures, but on the whole getting as much enjoyment out of my little plot as I have any reasonable right to expect.

A few alterations have been made during the past year, and I may perhaps regard them as the last I shall make. I have been enabled to build a wall some 230 feet with a good south and south-western aspect; and this has necessitated the cutting-down of a number of useless Filbert trees, which the soil did not suit, and from which in six years I had not gathered a bushel of nuts. I have also made a rock border, on which I have placed some choice alpines. With these exceptions my garden remains the same as when I made my last year's notes. As in most places it was a trying season, the mild winter, the late spring frosts, and the lengthened drought combined to tax one's capacities; but I do not think we suffered in our neighbourhood nearly as much as in some others from the two last causes. We had rain when we heard not a drop had fallen in other parts, and we heard of losses by the frost which we know nothing of. I think that perhaps I suffered most in the early Peas, some of which seemed regularly scorched by it. And as I have mentioned them I had perhaps better make these first notes to bear on vegetables. And here let me say, that in speaking of sorts I do not by any means wish to disparage others which I have not mentioned; but some are sent to me to try, and as my garden is small I am constantly obliged to refuse persons who wish me to try new varieties, as it would be simply impossible to try all, except to one's own great discomfort and loss. Take for example new Peas: their name is Legion, and still the cry is, They come! It would be impos-

sible for me to grow a row of each kind, and less than that hardly gives a fair trial. Moreover, let it be borne in mind that a great deal in all varieties of vegetables and fruits depends on soil and situation, and I by no means would imply that others, who give other varieties as the best, are not right in their conclusions as far as their situation is concerned.

In Peas I commenced last year with Sutton's Emerald Gem, Sutton's Ringleader, and Carter's First Crop, and also with a small quantity of Sutton's Bijou, a dwarf wrinkled Pea which is being sent out this spring. All these suffered more or less from the spring frosts, and the crops were not nearly so good as usual. The latter (Bijou) I look upon as a decided acquisition of the Little Gem type, a little taller (18 inches), but not so much so as to require stakes, the pods being in pairs, and I have counted from eight to ten good peas in many of them. From its greater productiveness, and from the fact that it is very difficult to procure a good strain of Little Gem, this Pea will be a valuable one, its flavour being excellent. Of later Peas I had the following:—Maclean's Best of All, of which I can only say that it well deserves its name; the crop was abundant, and the flavour, like all Dr. Maclean's Peas, excellent. Improved Princess Royal is another capital Pea for general purposes. Of later Peas I had samples of two new Peas sent to me by the Messrs. Sutton for trial—Giant Emerald Marrow and Duchess of Edinburgh. Of the former I have a very high opinion. Of its distinctness there can be no doubt: it has the same peculiar foliage of Emerald Gem—a rich glaucous green, unlike other Peas; but instead of being a dwarf round Pea, it is a tall (about 5 feet) wrinkled Marrow. The flavour is excellent, and the habit robust. I had an opportunity, besides seeing it in my own garden, of seeing it growing at Reading; and no Pea in the whole trial-ground was more robust. I question if any were so much so. Duchess of Edinburgh is a good wrinkled Marrow of the Ne Plus Ultra type; and if it be, as it promises to be, an improvement on that variety, it will surely be a favourite. For the later crops I had G. F. Wilson, an excellent Pea of the Veitch's Perfection type, and Berkshire Challenge, the latter a very vigorous and prolific Pea, requiring tall sticks.

The only vegetable that in any way takes the place of the Pea is the French Bean, and there is one which I think is destined to take the place of all others when it is more generally known—I mean Canadian Wonder. I have never seen anything to equal it for productiveness. I had three short rows of it, and the amount I gathered from them was positively wonderful. The pods were from 8 to 12 inches in length, and the flavour is excellent—no stringiness, and boiling green and tender. My opinion of it is such that I am not going to grow any other variety this season; and I find that the opinion of such men as Mr. Tillery of Welbeck and Mr. G. Abbey is equally favourable as regards its forcing qualities. Among the taller-growing Beans I had Champion Runner, a very prolific sort, but did not try the Butter Beans, about which so much has been said pro and con. I know that my neighbour Mr. Woodford did, but did not think a great deal of them.

It was a very trying season for Lettuces, and the most approved kinds were difficult to keep from running away. The value of such kinds as Tom Thumb, All the Year Round, and Commodore Nutt was never more apparent, although I myself greatly prefer the Cos Lettuce; but then they will in such dry hot summers so soon run away. I may here mention that I had some seed sent to me by Mr. Wright, gardener to the Hon. A. Leslie Melville, of Branston, Lincoln, which is much thought of by them. It seems to be a selected strain of the Bath Cos, dark in colour, and not liable to run so quickly as some sorts. I found that the only plan to secure Lettuces at all was to sow in succession a very small piece, thinning-out, and letting them stand where sown. Transplanting is fatal. And I have found nothing nothing better in Cos Lettuces than Sutton's Superb White or the well-known Paris White.

As I have something to say on the subject of Potatoes, I shall reserve them and other vegetables for another time.—D., *Deal.*

EXHIBITING ROSES NOT GROWN BY THE EXHIBITOR.

Could not some sort of society be started by amateur Rose-growers to prevent *soi-disant* "gentlemen" exhibiting Roses at shows, such Roses not being their own growing? No doubt many of our great nurserymen could tell of numerous applications to them for particular Roses by a certain day for the express purpose of staging them by the purchasers as their own at some local show. I only hope they, one and all, got a good showing-up themselves instead of the Roses.

A few years since a case in point occurred at a show held not many miles from this neighbourhood. I did not exhibit, but was anxious to know the winner of the first prize for Roses. After congratulating him upon his success, &c., I intimated a wish to see his Roses, if possible to ascertain wherein his marvellous success lay. I called at his rosery! What did I see? A piece of ground about the size of a good large room! No standards, he didn't "believe in them," a few miserable dwarfs barely existing. The secret of his success was patent at once: he obtained his blooms from a nursery—an after-confession too, and for two or three seasons he had with the greatest effrontery shown and taken prizes for them as his own growing; but the season following my visit he was disqualified, and, if I remember rightly, is now not allowed to enter his box. Does not the same thing happen at other shows? What is it but gambling in flowers too, and above all in Roses? I earnestly hope that some of your correspondents with abler pens than mine will take-up the cause, and, if possible, prevent such nefarious schemes.—Geo. W. Jessop, *An Amateur, Bexley.*

MINIATURE STANDARDS FOR HOUSE DECORATION.

The taste which takes pleasure in standards—Roses, Bays, Oranges, &c.—is often questioned by the hyper-artistic who call them by all sorts of stiff ungainly names, and say they are like nothing in nature, and seldom equalled in pure unmeaning ugliness by anything out of it; yet, despite bad name, ugliness and all, standards of many things are favourites with most of plain gardening people, and that not only in the flower garden, but with plants on a smaller scale for indoor and table decoration where a greater degree of artificiality is not only admissible but highly congruous. For this purpose it is best that the plants chosen should be naturally of a somewhat close bushy habit, and the foliage ornamental and not too large; and with these qualities in view some of the best things for the purpose will be found among our commoner plants, which almost everybody grows. The Golden Variegated Thyme, for the perfect symmetry of all its parts when grown as a natty little standard of 5 or 6 inches in height, would delight the heart of any dwarf-loving Chinaman. The easiest way to get them up is to select some year-old plants from a border where they have been pegged down, lifting them in autumn, and potting them in 3-inch pots. After they are somewhat established the stem should be pruned up to whatever height is thought most suitable for the purpose they are required for, and a little judicious stopping and tying soon secures nice semi-globular heads. The best place to grow them in is a cold frame fully exposed to the sun, plunging the pots overhead in charcoal, or, if that be not forthcoming, in coal ashes.

Another very nice plant, but requiring more care and patience, is the Ivy-leaved Geranium L'Elegante. For it a neat wire umbrella trellis is required, which should be painted green, and which, when the standard is perfectly grown, will be entirely hid except the stalk. When the head is fully formed a charming roseate hue can be given to the leaves of both this and the Golden Thyme by puncturing the stems, or by cutting them half through and exposing them fully to the sun.

A very nice and rather curious little standard can be formed by grafting Iresine Lindeni upon the golden-veined variety, I. Verschaffelti. Let the latter be grown until it be 7 or 8 inches high, and then stopped above a joint. After the side shoots have grown away a little remove them all, except the second pair from the top, trim off the top of the stem to where the uppermost pair of laterals were removed, and there wedge-graft a shoot of Lindeni upon it. So easily do they unite that, unless for custom's sake, no wax or clay need be used, all that is necessary being to tie well with soft bast, and round that to bind a little sphagnum. Of course they require shading for some time, and to be placed in a mild moist heat. It is also requisite that the stock and graft should be in about the same condition as to age and hardness of wood. As soon as the graft has taken and begun to grow, the top must be pinched off, and at the same time the two laterals that were left on the stock will need to be stopped either at the first or second joint, and the result will be four shoots, which will

form an elegant border round the head of our composite standard. In this case also a wire trellis is needful, which, when the head is perfectly moulded, either may or may not be removed, according as it is clumsy or otherwise.

The common small-leaved Myrtle as a standard in a tiny tub has an antique air about it, and it is easily grown without wires.

Very beautiful also is the Lavender Cotton plant (Santolina incana), with leafage like delicate silver filligreework, more especially by gaslight.

In growing all such small ware the pots must be kept plunged, and care taken that they do not root into the material used, otherwise on removal they may receive a check which their small stock of vitality may not be able to overcome.—R. D. Taylor.

SIZE OF SETS AND SPACES FOR PLANTING POTATOES.

The best answers to your correspondent "Kittie's" inquiries are furnished by the results of the exhaustive, costly, and carefully-conducted experiments of Mr. George Maw, F.L.S., on the Potato crop at Benthall, near Brosely, in 1864 and 1865, and reported in the "Journal of the Royal Agricultural Society," vol. iii., part ii., as a prize essay, and which will well repay careful perusal.

Mr. Maw in the latter year carried out 129 experiments with various kinds of Potatoes in general cultivation on as many trial plots extending over many acres, using sets of various sizes, both whole and cut, planted with various manures, at different distances, but all in rows 2 feet apart; and in the recapitulation of the general bearing of his systematic experiments, the results of which he describes in detail, he states that—

"Firstly, Every increase in the size of the set, from 1 oz. up to 8 ozs. in weight, produces an increase in the crop much greater than the additional weight of the set planted. The nett profit over and above the extra weight of the sets in planting 4-oz. sets in lieu of 1-oz. sets, amounted on the whole series of experiments to between 3 and 4 tons per acre; and the further profit on the increase of the size of the set, from 4 ozs. to 8 ozs., averaged about 5 tons an acre, all the intermediate steps partaking proportionately of the increase.

"Secondly, The advantages in favour of the large sets are more marked in the late than in the early varieties.

"Thirdly, In the use of small sets of from 1 oz. to 3 ozs. in weight, a larger balance over and above the weight of the sets was obtained by planting from 6 to 9 inches apart in the rows than at wider intervals.

"Fourthly, Increasing the intervals at which the sets are planted, even of the largest size, in the rows to more than 12 inches, diminishes the crop, and the wider intervals induce no increase in the weight of the produce of the individual sets.

"Fifthly, It may be broadly stated that the weight of the crop is proportionate to the weight per acre of the sets, and that small sets will produce the same crop as an equal weight per acre of large sets. The fact is, however, of limited application, as a weight of very small sets equal to a weight of full-sized Potatoes could not be got into the ground, except by planting them so close as to be prejudicial to the crop. The advantage, therefore, of large sets remains practically unimpaired.

"Sixthly, Weight for weight cut sets produce, as nearly as possible, the same weight per acre as whole Potatoes; but for the reasons given above the weight of the sets should not be reduced by subdivision.

"Seventhly, Smaller sets give a larger produce in proportion to their weight than the larger sets.

"Eightbly, When the intervals between the sets in the rows are diminished to less than a foot, the produce of each individual set is proportionately diminished. Though this is not necessarily accompanied by a diminution of the weight of the crop, no increase in the produce of each individual set is caused by placing the sets at intervals wider than a foot.

"Ninthly, With reference to the relative produce of different varieties, a late red sort takes the precedence throughout the experiments; and of the several varieties of Fluke, 'Spencer's King of Flukes' and 'The Queen of Flukes' are much more prolific than the ordinary variety."

But as Mr. Maw's experiments appear to have been conducted principally in one season, and on one kind of soil, and with a view to economical results as a farm crop, some allowance may be made both for season and for the quality and depth of soil, and also for garden cultivation, when it is sometimes found economical to plant the Potatoes in rows at wider distances apart for the purpose of providing for the more vigorous growth and taller tops, or for an intermediate crop of Broccoli, Cabbage, or Brussels Sprouts, which is often secured with advantage by planting them between the rows of Potatoes before the latter are lifted—a practice followed by many experienced gardeners; in which case the rows should not be less than 3 feet apart. Mr. Maw's distance of 2 feet apart may, however, be taken as a fair average for ordinary cultivation. A less distance, taking 14 inches as a minimum, will generally secure a first early crop, and 3 feet as a maximum for a late crop of the coarser-growing sorts, but soil and season must not be lost sight of. Wide intervals between the rows, from the extra ridging or earthing they lead to, tend to make the Potato a preparatory fertilising and cleansing crop, an object which Mr. Maw does not appear to have had in view in calculating economically the results. The preparatory and fertilising effects of the Potato as a farm crop are well recognised in some of the alluvial low lands of Lincolnshire and Cambridgeshire, where it has of late years become a common practice to alternate advantageously Potatoes with Wheat successively for several years.

Another paper, I believe also a prize essay, of the Royal Agricultural Society by the Rev. E. F. Manby on the cultivation of early Potatoes, furnishes a good deal of information as to their profitable cultivation.—Thomas Laxton, *Stamford.*

SELECTION OF FRUITS.

Having under my charge about sixty varieties of Apples, I have much pleasure in forwarding you a list of forty-five sorts—viz., thirty dessert and fifteen kitchen varieties. All the kinds herein named are good, and according to my experience would not be easily beaten for succession and quality combined.

Dessert.

Ashmead's Kernel
Brabant Bellefleur
Court Pendu Plat
Dutch Mignonne
Early Harvest
Early Joe
Juneating, Red
Maclean's Favourite
Margil
Nonpareil, Early
Nonpareil, Braddick's
Nonpareil, Pitmaston
Nonpareil, Scarlet
Pearmain, Baxter's
Pearmain, Claygate
Pearmain, Mannington's (one of the latest)
Pippin, Cox's Orange
Pippin, Ribston
Pippin, Golden
Pippin, Spring (or Baddow)
Pippin, Hughes' Golden
Pippin, Sturmer (very late)
Pippin, Wadhurst
Pippin, Wyken
Pomme Royale
Russet, Pyke House
Reinette, Golden
Reinette, Grise d'Or
Pine Apple Russet

Kitchen.

Blenheim Orange
Beauty of Kent
Bedfordshire Foundling
Calville Blanche
Dutch Codlin
Dumelow's Seedling (or Wellington)
Gravenstein
Hollandbury Pippin (splendid colour)
Mère de Ménage
Northern Greening (one of the latest)
Reinette du Canada
Tower of Glammis (a good sort)
Waltham Abbey Seedling (good)
Warner's King (a very fine sort)
Winter Colman (very late)

It may be well to mention that all the varieties named are grown as bush or dwarf pyramids, and usually bear good crops of fruit. But last season being an unusually bad one for Apples, many of the trees here bore very little or no fruit, the blossoms being completely cut off by the late frosts of the last spring.—G. A. Bromfield, *Prittlewell, Essex.*

ROSES TO CLIMB UNDER GLASS.

Yellow.—Maréchal Niel, Gloire de Dijon, Triomphe de Rennes, Céline Forestier, and Mdlle. Aristide. *Nankeen and Copper.*—Ophirie. *Crimson.*—Général Jacqueminot and Charles Lefebvre. *Rosy Crimson.*—Madame Louise Carique and John Hopper. *Rose Colour.*—Anna Alexieff, Baronne Prevost, La Ville de St. Denis, and Souvenir de la Reine d'Angleterre. *Bright Cherry.*—Jules Margottin and Edward Morren. *White.*—Acidalie. *Bright Red.*—Vicomtesse de Vezins, Glory of Waltham, and Madame C. Joigneaux. *Maroon.*—Empéreur de Maroc. *Blood Purple.*—Pierre Notting. *Blush.*—Souvenir de la Malmaison.

The five first are the strongest growers. Aristide is the strongest grower of all. All will make fine climbers, say 10 feet high or more according to cultivation. The best type of a pole or wall Rose is Ophirie; it covers all its stems with leaves or flowers, and blooms from its base.—W. F. Radclyffe.

The Connoisseur Pea.—I have been favoured last year by several firms with samples of Peas for trial. One remarkable Pea Mr. Laxton sent me with a few other kinds for trial.

What I wish to name is Connoisseur. This Pea is remarkable, and it would be of interest to know its history. My trial was on the limestone, and after sowing scarcely any rain fell during the growth. After all the other Peas were dead Connoisseur was "as green as a Leek." It was a perpetual bloomer and cropper, commenced to fill in July, and bloomed until October. I have heard that there is a difficulty to grow Peas in hot climates, but I fancy we have one in Connoisseur that will be of great service abroad, and also to those that require Peas, say, in October.—R. H. D., *Seaham.*

ROYAL HORTICULTURAL SOCIETY.

JANUARY 20TH.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. A seedling Apple was exhibited by Mr. John Cox of Redleaf, raised from Golden Knob. It is somewhat larger than Golden Knob, of a bright golden russet colour, and with a flesh as tender as that of Cox's Orange Pippin—juicy, rich, and vinous. It was called Redleaf Russet, and received a first-class certificate. Messrs. James Carter & Co. of Holborn sent handsome specimens of Esopus Spitzenberg Apple from California. They were highly coloured, and, though past their best, still retained some of the fine flavour of that excellent Apple. Messrs. Stuart and Mein of Kelso sent several dishes of Apples they had received from Mr. G. Taylor, of Kalamazoo in the State of Michigan, which were much admired for their beauty of colour; but it was the general opinion that they were deficient in flavour. A letter of thanks was awarded to Messrs. Stuart & Mein. A collection also came from Rev. R. O. Bromfield, of Sprouston, N.B., consisting of Golden Noble, Northern Spy, Cellini, American Mother, Mère de Ménage, Gravenstein, Small's Admirable, Royal Pearmain, and Cox's Orange Pippin, all of which were well grown and handsome. Cox's Orange was excellent in flavour. A cultural commendation was unanimously awarded to them. Alfred Smee, Esq., exhibited a dish of Spanish Chestnuts of the crop of 1873, which had been preserved in dry sand, and kept in a dry garden shed. They were as plump and fresh as if they had been newly-gathered, and preserved all their original flavour.

Mr. Battera, gardener, Chilworth Manor, Romsey, exhibited a dish of New Potatoes and Mushrooms, and a fruit of the Variegated Pine Apple, to which a letter of thanks was awarded. Mr. John Stirling of Park Wern, Swansea, sent a dish of Mushrooms. Mr. E. Bennett, gardener to the Marquis of Salisbury, Hatfield, sent four varieties of Cucumbers—Masters' Prolific, Improved Sion House, Duke of Edinburgh, and Telegraph. That which was shown for Improved Sion House was Masters' Prolific; the former being spineless, and the latter having white spines. Mr. Denning, gardener to Lord Londesborough, sent a Cucumber called Epicurean. Mr. G. T. Miles, gardener to Lord Carrington, Wycombe Abbey, sent two very handsome Charlotte Rothschild Pines, which were awarded a cultural commendation.

FLORAL COMMITTEE.—Mr. B. S. Williams in the chair. It was not to be expected that large collections of plants would be sent so early in the year, although for the season the day was remarkably mild, so much so that Orchids and other tender plants might have been brought without fear of damage. A few nice groups of exotic plants were sent by some of the trade growers. Mr. John Wills of Onslow Square staged a very effective group, comprising some nice plants adapted for dinner-table decoration, notably Cocos Weddeliana, universally acknowledged as the most graceful of Palms, Aralia Veitchii also a most famous table plant, Aralia leptophylla, Chamædorea elegans, and Ficus Cooperi, a good decorative species with crimson veins on the leaves. Messrs. Veitch of the Royal Exotic Nursery, King's Road, Chelsea, sent a very fine group of Cyclamens, and a very fine strain of double Chinese Primula from seed. The collection of Primula contained thirty-six pots, the flowers and plants so much alike that one would have thought that all had been propagated from cuttings from a common centre. This strain is named P. sinensis kermesina flore-pleno. The collection of Cyclamens contained some very fine varieties, of which the pure white and deep purplish crimson flowers are the most desirable.

Mr. W. Bull of King's Road, Chelsea, sent a collection of Cycadaceous plants, comprising Dion edule, a very neat-habited species; Macrozamia spiralis, Encephalartos villosus, ampliatus, and others rare and fine, many of them remarkable for the very small pots in which they are grown; but it may be useful to note in passing that all this class of plants succeed most satisfactorily in small pots. To the above collections votes of thanks were given.

New plants were exhibited by Messrs. Veitch, who had Nepenthes intermedia, a hybrid between N. Rafflesiana and an unnamed species with spotted pitchers. It is a very neat-growing species, and the pitchers are very prettily spotted. A first-class certificate was awarded. Mr. Bull had Sophronitis grandiflora superba, flowers large, but not so brilliant as many we have seen; Arisæma sp.; Oncidium pelicanum, with a small spike of yellow and brown-spotted flowers; Hippeastrum Acme, the flower is badly shaped, but the colour a brilliant crimson; Zamia Roezlii, in too small a state to form an opinion of it. A new double Primula sinensis, The Champion, was sent by Mr. H. Harris, gardener to A. Ashby, Esq., Naseby Wooleys, Rugby; the flowers are quite double, of a dull red colour, and freely produced. From Messrs. E. G. Henderson & Son, Wellington Road, St. John's Wood, came Hippeastrum Hendersonii Adrian and Minnie Warren, good flowers, but not superior to many already sent out; Dracæna Duffii, a species with bold, bronzy, metallic leaves edged with crimson. Mr. C. Green, Holmesdale Road, Reigate, sent Prenanthes hybrida elegans, the leaves finely cut. From the Society's own gardens came a group of Chinese Primula of a distinct strain. Mr. R. Parker of Tooting sent cut flowers of Aponogeton distachyon grown in the open air without any protection. This is a very pretty thing, and flowers freely in shallow water in the open air about London. The pure white flowers are very sweet.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE annual Meeting of the Gardeners' Benevolent Institution was held at the Bedford Hotel, Covent Garden, on the evening of Thursday last the 14th inst., Dr. Hogg in the chair. The annual report of the Institution was read, by which it appeared that there were seventy-two pensioners on the Charity receiving £930 annually, that the income amounted to £1747, and that there was now an invested capital of £10,400 in consols. Dr. Hogg was elected a Trustee of the Institution in room of Mr. Huggins, deceased.

TESTIMONIAL TO MR. CUTLER.—After the close of the annual Meeting a supper was provided at Simpson's in the Strand, at which between sixty and seventy members of the Institution were present, to celebrate the presentation of a Testimonial to Mr. Cutler, after thirty-two years' service as Secretary to the Institution. The chair was taken by Dr. Hogg, supported on the right by Mr. John Lee of Hammersmith, and on the left by Mr. Robert Wrench of London Bridge. The company included many of the leading representatives of horticulture. The Testimonial was a very handsome one, the sum realised being £250. It consisted of a very handsome silver tea and coffee service with salver, table forks and spoons, and a massive gold watch-chain; in addition to which were a valuable diamond half-hoop ring and gold watch-chain to Mrs. Cutler.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

EUCALYPTUS CORNUTA. *Nat. ord.*, Myrtaceæ. *Linn.*, Icosandria Monogynia.—Flowers scarlet and yellow. "Amongst the wonderful forms of Australian vegetation this is not the least striking, whether from its singular structure or the colouring of its inflorescence. It is a native of South-Western Australia, where it was discovered by Labillardière in the beginning of the century; and from whence numerous dried specimens are in the Kew Herbarium, from Cunningham, Drummond, Oldfield, Harvey, and others, collected from King George's Sound eastward to Cape Riche. It is the 'Yeit' of the colonists, and, according to Oldfield's notes, it must be a very variable tree, as he describes some specimens as from trees 10 feet high, others from trees 30 to 40 feet high, and others still from trees of 80 to 100 feet high. The bark he describes as rough, hard, persistent, and light brown in the larger trees; as black and half fibrous in others; and as smooth in the smaller trees. At Kew, where two specimens are cultivated in tubs in the south octagon of the temperate house, it forms a slender tree about 9 feet high, with smooth bark and spreading branches."—(*Bot. Mag.*, *t.* 6140.)

CROCUS BYZANTINUS. *Nat. ord.*, Iridaceæ. *Linn*, Triandria Monogynia. — Flowers purple. Native of Transylvania.—(*Ibid.*, *t.* 6141.)

JAMESIA AMERICANA. *Nat. ord.*, Saxifragaceæ. *Linn.*, Dec. andria Digynia.—Native of Rocky Mountains. Flowers white "First described from imperfect specimens by Torrey and Gray in 1840, and named by them 'in commemoration of the scientific services of Dr. Edwin James, its worthy discoverer, the botanist and historian of Major Long's expedition to the Rocky Mountains in 1820, and who during the journey made an excellent collection of plants under the most unfavourable circumstances.' Those were the days when every traveller in the Rocky Mountains carried his life in his hand, and

when to hold it fast reqnired the snbtlety of the savage plus the pluck of the white man. Little was known of this plant for many subsequent years, not nntil it was gathered by Fendler in 1847, and after another long interval by C. C. Parry in 1861, in the very spot where James had discovered it—namely, the head waters of Clear Creek, and on Alpine ridges east of Middle Park, in the Colorado territory, lat. 40° N."—(*Ibid.*, *t.* 6142.)

Blumenbachia chuquitensis. *Nat. ord.*, Loaseæ. *Linn.*, Polyadelphia Polysandria.—Flowers orange and yellow. "A handsome Peruvian herbaceous plant, allied to the Chilian B. coronata, but differing wholly in habit, this having a stout erect, or suberect and leafy stem, with the petioles and axillary peduncles shorter than the leaf-blade, and B. coronata being a tufted plant, with a short procumbent stem, very slender petioles much longer than the blade, and long scape-like peduncles rising from the ground. It was imported from Peru by Messrs. Veitch in 1863, through their collector Mr. Pearce, and there are indigenous specimens in the Kew Herbarium, collected by Lechler in Peru, at San Antonio.

"B. chuquitensis flowered in Messrs. Veitch's establishment in September, and is quite hardy. When first sent to view to be named, in 1865, it was supposed to be the C. coronata, under which name Mr. Veitch has consequently distributed it."—(*Ibid.*, *t.* 6143.)

Odontoglossum maxillare. *Nat. ord.*, Orchidaceæ. *Linn.*, Gynandria Monandria.—Native of Mexico. Flowers white with purple blotches.—(*Ibid.*, *t.* 6144.)

GOLDEN CHAMPION GRAPE.

In reply to Mr. Grieve, I have to say that the Golden Champion was not a sport from any other Vine. It was raised from seed taken out of a berry that was obtained by a cross between the Bowood Muscat and Black Hamburgh, but which was a shy setter, though the berries that did set were very large.

I cannot help thinking that Mr. Grieve is under some mistake when he supposes that his rod of Trebbiano has produced a bunch of Golden Champion. The subject is a very interesting one; and knowing Mr. Grieve to be a man well accustomed to close observation of vegetable distinctions, whether these appear in fruit or flowers, I for one shall feel obliged if he will say whether the foliage of the lateral that produced the supposed Golden Champion bunch on the Trebbiano rod was the foliage of that Vine or of the Golden Champion, for they are very distinct; and if he has saved the wood of the lateral in question, will he grow an eye of it or send me one? and I will grow it, and if possible throw some light on the matter. Is it not possible that the bunch in question was just a short well-swelled bunch of Trebbiano, with berries nearly as large as Golden Champion? The spot on the berry is no criterion, for I have seen Trebbiano, and even Muscats, have the same spot as Golden Champion when grown in too damp an atmosphere.

There was a short plump bunch of Gros Guillaume (Barbarossa), shown at the International Show in Glasgow exceedingly like a Black Hamburgh, and it passed the ordeal of the judges as such, though I and others prononnced it to be what it really was—Gros Guillaume. It was named Pennington Hall Hamburgh, and was offered to the public as a new variety of Hamburgh, when its grower, if he had any discriminating powers at all, must have known by the growth of the Vine and its foliage that it was not a Hamburgh, but a well-known Vine, perfectly distinct from every other. Here, then, we have a Grape, as a rule producing large, long, and heavily-shouldered bunches, producing at times bunches so like the Black Hamburgh as to deceive good judges. No such deception could have taken place had they seen it on the Vine. I mention this circumstance that Mr. Grieve may see that it is necessary to take the foliage and wood into consideration before deciding that the bunch he writes about is Golden Champion.

The Golden Champion will not succeed as a late Grape in a damp atmosphere, but if grown in a Hamburgh house, in a rather dry atmosphere, it will produce splendid fruit that will keep till Christmas.—W. Thomson, *Tweed Vineyard.*

NOVELTIES IN THE ROYAL GARDENS, KEW.

In the Succulent house we observe an unusually fine specimen of the Turk's Cap, Melocactus communis. It has just been imported, and, like all that have formed the cap, is only of use to exhibit the peculiar character of the species until the time when it is pleased to die. Its height is about 2½ feet, though it is said rarely to attain more than 2 feet. The plant resembles an Echinocactus, and the flowering part produced on the summit consists of a dense cylindrical mass of woolly hairs and slender red spines, among which appear the small Mammillaria-like flowers; in this case it is more than a foot high. From a fancied resemblance it has earned for the plant the name of Turk's Cap. It is also known as Pope's Head and Englishman's Head, the latter presumably by way of compliment, it being known to the French as *tête-à-l'Anglais*. It grows in the arid districts of South America and the West Indies, where the mules conveniently quench their thirst by drinking the juice of the interior, after first removing the spines with their feet. If desired to cultivate, small plants should be obtained from a nurseryman, or they may be imported without soil in a box of any dry loose material that will preserve them from injuring one another. On arrival they should be placed on a dry surface in the full sun, or may be potted, but in either case must be kept dry until there is an inclination to grow. In winter a temperature of 50° is sufficient, but in summer they will not be the worse for the highest degree of heat convenient, with a proportionate amount of moisture. In the cultivation of Cacti many prefer potting to be done in June, as at that time a large proportion commence growth, a preference, of course, on the assumption that plants should not have fresh soil until the roots are ready to make active use of it, because of its getting out of condition. But as Cacti do not require water until growth commences, the rule does not apply with so much force, and there seems no reason, if more convenient, why potting should not be done from February onwards; indeed, by experiment it is found to answer.

Among the Orchids is a very interesting Dendrobium, D. tetragonum. It is chiefly remarkable from the long tetragonal pseudobulbs, which are pendulous and terminate in a pair of leaves. The flowers are not highly coloured, but yet from their number and peculiar form cannot be considered unattractive. The perianth segments are narrow, the two lateral segments curiously twisted. It is a native of Moreton Bay, Australia, and does well on a block in a cool house. Masdevallia attenuata, a charming though diminutive species, must also be mentioned. It was first described three years ago, then introduced by the Messrs. Veitch from Costa Rica. The height does not exceed 3 inches, and among the numerous leaves appear many sweetly-scented white flowers with orange-coloured tails. This plant is growing freely suspended in a basket, a position that is often convenient, as it insures safety from outrage by slugs.

DISEASE OF CUCUMBER ROOTS—VIBRIOS.

I am very glad to find that my observations on the presence of a parasitic Nematoid in the nodules which frequently occur in the roots of Cucumbers and Melons, and which have also been found in Gardenia, have attracted attention. I used the word Vibrio in the sense in which it was originally employed by Müller and Bauer, as more immediately intelligible than a new term to persons acquainted with Vibrio Tritici, which is now Tylenchus Tritici, *Bastian*. It is quite true that the term Vibrio is now applied to a different set of organisms. Those who wish for an account of the rather extensive family of Anguillulidæ may consult Dr. Bastian's paper in the "Transactions" of the Linnean Society, vol. xxv., p. 73, 1865. The species in question is not included in the paper, as I was well aware when I recorded its occurrence a second time under the old name of Vibrio.—M. J. Berkeley.

OUR BORDER ADONIS-FLOWERS.

We hail with pleasure the early flowers of our borders, and look upon them as the harbingers of spring in whatever garb they appear, and we bid them welcome, though of short duration.

The Adonis family is but a small one, comparatively speaking, but we treasure them in our memories as well as in our borders and spring gardens.

Adonis vernalis, called by some "The God of Love," is of easy culture, requiring a good loam mixed with limestone grit, well-rotted manure, leaf mould, and a little sandy peat, well drained, but watered when required. The soil in the border should be broken up to the depth of 18 or 20 inches, and the above particularised compost incorporated with it; the aspect should be sunny, and when planted they should be firmly

placed in the soil. They may be successfully grown in pots plunged in ashes in the reserve ground. When wanted for the spring garden they are best grown in pots, and plunged where they are wished to grow, for they are then easily removed when their bloom is past. While in bloom they are very gay for the cool greenhouse in early spring. They are rather impatient about being disturbed when they are once established. They may be increased by division, but I prefer raising them from seed.

I have sown the seed as soon as ripe, placed the seed pan in a cold pit, and the seedlings made their appearance in the following spring. When they have completed their first growth they may be potted, and placed in a cold pit, or plunged in the reserve ground until they are required for planting out.

I often wonder the Adonises are not more cultivated. Vernalis (yellow-fleshed) is the most desirable of the family for either rockwork or border. Adonis pyrenaica (yellow-flowered) is a very desirable plant, growing a little taller than vernalis, and is later in blooming; it does well on the rockery. A. sibirica (yellow-flowered), introduced nearly fifty years ago, is very rarely seen. A. apennina (yellow-flowered), ought to be in more general cultivation; being of dwarf compact habit, is very desirable for the rockery, border, or spring garden.

There is little difference in the colour of those I have enumerated, but being spring-flowering plants they ought to be more frequently met with; they cannot fail to repay any extra labour that may be bestowed upon them. We have an annual species known among many of our cottagers as the "Pheasant's-eye" (Adonis autumnalis), a very pretty crimson border flower. Some doubt is entertained about its being one of our own native plants.—VERITAS.

BUDDING.

"A. C." in the number of December 10th recommends the use of a quill in Rose-budding, and says, "One chief requisite of budding now is a bundle of toothpicks." Necessity compels me to carry a toothpick, but for the purpose its name denotes. Certainly not as an aid in the operation of budding.

I am equally successful with "A. C.," and should like to make known the method I adopt in separating the wood from the shield. I learnt it some years ago from a gardener who was in the habit of inserting a thousand buds a-day (at least so he told me), and it may account for his, to me, astonishing dexterity.

To begin with, then, disabuse your mind of the idea that the taking out of the wood is the most delicate part of the operation of budding, or, in fact, delicate at all. The way I shall attempt to describe may be rather characterised as "rough and ready." Insert the knife below the leafstalk in the ordinary way, but bring it out very obliquely, so as to leave a piece of the bark beyond the wood long enough to take between the finger and thumb, then take the end of the wood in the same way with the other hand and snatch the wood and shield asunder. Unless the wood is very green and tender the operation is ninety-nine times out of a hundred perfect, and if it should not be, then use your toothpick.

My instructor did not complete the severance of the bud from the stem with the knife, but pulled them asunder, tearing off some inches of bark with the bud, but this I found generally damaged the buds remaining on the wood.—HUBERT BENSTED, *Maidstone.*

ACACIA AFFINIS.

MANY of the New Holland Acacias are very beautiful and worthy of more extended cultivation, especially as they are so easily grown, bearing rougher treatment than most of the beautiful plants we get from that country, so rich in flowering shrubs.

I enclose with these notes a small branch with flowers of an Acacia we have under the above name. I am not quite certain if the name is correct, but it is one of the most beautiful of the Acacia family, and, what makes it doubly valuable here, it is perfectly hardy. The racemes with their many flowers, which I have sent, were taken from a plant growing on latticework of a verandah, where frost has free access on all sides.

A few years ago we had a large plant growing on the back wall of a greenhouse, where it used to bloom most profusely, and furnish us with thousands of its long bunches of golden flowers for cutting at this dull season, when there is but little but what we have from the forcing pit.

At that time I had a large plant that was of no use to us under glass. I was tempted to try it outside on a wall with south-east aspect, with very pleasing results; for it soon reached the top of the wall, which is about 14 feet high. Its very rapid growth I attribute to its roots having extended into a rich open Vine border—soil just suited to its wants. This plant, growing so well and so admired by everybody who saw it, I was induced to plant one on the verandah abovenamed, and with the like pleasing results.

The early flowering of the plant this season—having commenced to flower in December—is no doubt caused by the very dry summer, and consequent early ripening of the wood and development of flower buds. Since the plants have been out we have had on many occasions 12° and 16° of frost, but I have never known the unexpanded flower to be injured.

I would say to all lovers of beautiful wall plants who reside in the warmest parts of the British isles, Plant the above Acacia; and should it never favour you with a flower, its beautiful bipinnate, light-green, Fern-like leaves, differing from everything you have, and forming a pleasing contrast to all that is near, will be ample compensation for the trouble taken. —W. OSBORNE, *Co. Cork.*

[The specimen was of the species intended. The name Mr. Osborne has applied to this Acacia is one of the several synonyms of the plant now called by botanists Acacia dealbata. There is a portrait of it in the "Botanical Register" under the name of Acacia decurrens. It is a native of Van Diemen's Land, where it is called "The Green Wattle."—EDS.]

AMBURY OF CUCUMBER ROOTS.

I READ Mr. Platt's article on Cucumbers, and I suppose it is in the winter months when he is troubled with what we know as "ambury." The soil I consider is the chief point requiring attention, and the less complicated it is the better. I have found that "mixtures" generally encourage the ambury, especially when some kinds of leaf mould are added. What I find to answer is two parts of turfy loam chopped rough, one part of short litter fresh from the stables, with a sprinkling of half-inch bones. In planting I make a small mound, plant in the centre, and as the roots work through add a little fresh soil.

Has Mr. Platt grown Improved Sion House Cucumber? If not, I would strongly recommend it for winter work. For summer Blue Gown takes the lead with me. I hope he will give my method a trial, and be able to report favourably at some future time.—J. WILSON.

METEOROLOGY OF THE PAST YEAR, AND ITS EFFECTS ON VEGETATION.

TAKING water first for consideration, I will consider in what way the supply of 1874 met the wants of that year; but to do this we must begin at the beginning of the season, or rather we must go back to the last two months of 1873, as I consider the rain that falls then when taken in addition to that which falls the following three months to have an important effect on the sources from which our summer's supplies are drawn—in other words, the autumn and winter rainfall tell in the following spring and summer. Believing such to be the case, we are not surprised at the outcry for water in many places during the past summer for water for domestic uses, when we find that only a very trifle over 5½ inches of rain fell in the autumn and winter five months of November and December 1873, and the three first months of 1874, which was not increased to any useful extent by what fell in the following April, the total then barely reaching 7½ inches. But somehow the rainfall of the next two months sufficed to keep vegetation moving; so that, although there was a lack of water almost everywhere for almost all needful purposes, there have been seasons in which vegetation has suffered more than in 1874. The long period of dull deluging weather we had all through May and June, and up almost to the middle of July, rendered a heavy rainfall unnecessary—in fact I am not sure that it would not positively have been an injury; but as it was, the showers in these months were sufficient to prevent surface crops, as grass, &c., from suffering so much as we have known them to do in former years; so that, although the growth was restricted, it was hardly ever arrested entirely, and fields in general never had that burnt-up appearance we have often known. Garden crops in like manner being affected accordingly, established things struggling through tolerably well-but newly planted ones having more or less of a trial. The

absence of heat, which will be spoken of hereafter, having much to do with the growing period alluded to. But with August more warmth set in, and the following two months of September and October being both more fruitful in rain, a rapid growth in most vegetable substances was the result. The ground becoming heated by the bright sun of the latter part of July and the whole of August, all the Cabbage and kindred tribes of plants made rapid progress, and the same may be said of the bedding plants. Frost, however, intervened somewhat sooner than usual, to the injury of the latter, while a heavy rainfall towards the end of October was beneficial many ways. November as a whole was fine, the roads for a considerable time being all but dusty. And the early part of December was also on the whole fine until the 16th, when a rather heavy covering of snow fell on ground but slightly frozen over; and this being repeated the following day, gave us a fall of snow equivalent to about an inch of rain, and which lasted with very little diminution up to the end of the year, with frost every day sufficiently hard to enable skating to commence on 22nd and continue for ten days—an unusual thing with us. The severity of the frost, however, increased very much the last two days, the thermometer falling to 12° Fahr. on 31st, the lowest it has been since 1867. Fortunately, however, the ground was covered with snow, that the injury to crops will not, I expect, be so severe as on some former occasions; and the generally good condition things were in when it commenced will all tend to lessen the effects it might otherwise have produced.

Up to the end of April the season was on the whole an early one, and the prospects of fruit were good; but with the commencement of May the hopes of the fruit-grower became blighted. Frosts, at first moderate, culminated at length in a very severe one on 10th, which was by no means the last, as a repetition on 16th and 18th, and with one as late as June 13th, told a tale which resulted in many orchards being complete failures, while others braved it out. But these unusually late frosts with the accompanying cold weather gave such encouragement to the insect family of all kinds, that the Hop, which perhaps is more susceptible to attacks of that kind than most other plants, has been in many places a complete failure; and many other crops have also been indifferent. Even the hay crop was light in consequence of the cold ungenial weather at the time it ought to have been growing. And in gardening matters the bedding-out period was retarded very much. Perhaps the latter was fortunate rather than otherwise, as it not unusually happens that a fine early season tempts one to plant out before it ought to be done. As it was, however, the prospect at the end of June was the reverse to encouraging; but better weather setting in things improved, and in most cases the crops of fruit ripened-off well when there was any. Even those trees that were heavily laden—which many Plum trees were to the breaking-down point—in most places attained a fair average size, especially the late kinds. And the same may be said of Apples and Pears, while the Corn crop is reported everywhere as good; and what is also encouraging, the general appearance of fruit trees is good for another year—a matter that ought not to be lost sight of, as I consider a well-developed fruit blossom in embryo as more likely to withstand frost in spring than an indifferently formed one; in fact I do not know but 2° or 3° difference of temperature, &c., could be given in the one case and still have a better result. But as this has been alluded to before, we may in conclusion give a passing word on vegetables.

We have said that the dry sunny weather of the latter part of July, together with August and the greater part of September, had heated the ground so as to cause a rapid and vigorous growth to take place when the autumn rain fairly set in, which growth continued through October, notwithstanding the check of a rather sharp frost rather early in that month and more severe one on the 25th and 26th, the result being that most of the Broccoli and Cabbage tribe attained an undue height; and growth continuing on until late in November, they were in a great measure in a bad condition to resist the frosts that commenced early in December. But these frosts being moderate at first, we hope that all the dwarf varieties will have been gradually inured to it, and that they may escape; but we much fear for some plots of the taller kinds that the snow did not protect sufficiently, and which we accidentally omitted to lay down in time. We fear that many of them will be useless for this season, more especially if another severe frost follows, for which there is ample time yet; but on the whole the frost has not been so destructive as on many other occasions, as all vegetable crops covered with the snow have in general escaped. The rainfall of England in 1874 being about 3 inches, and that of 1873 2½ inches below the average, these shortcomings of our water supply in the past summer are in some measure accounted for; at the same time the rainfall of 1872 was far in excess of both these deficiencies.

TRUFFLE HUNTING IN ENGLAND.

As I was walking along the high road lately in the neighbourhood of the village of Micheldever, Hampshire, I came upon an old man with a couple of dogs, as I thought, ferreting by the roadside. On asking him what he was doing, he put his hand into a canvas bag which he had slung over his shoulder, and producing two or three small roots or bulbs said, "Hunting for these." On asking what they were he told me they were Truffles, that it was his regular business hunting for them, and that he sent them up to London.

The dogs were two very intelligent little creatures, both small, one smooth-coated with a very short pug nose, the other apparently something of a small Bedlington terrier. I watched them for a short time, and soon saw the short-nosed dog begin to scratch at the root of a Larch, when the man went up with a hoe and quickly dug out another Truffle about the size of a good walnut. We all know it is a practice to hunt for Truffles in France with dogs, but I thought so unusual a circumstance in England might be interesting to your readers.—T. C. Burnell.

NOTES AND GLEANINGS.

Royal Horticultural Society.—The Carter Cup and other prizes offered in the schedules of the Society by Messrs. James Carter & Co., for competition at the Society's Great Provincial Show, has now been arranged to take place on the 7th of July at the Society's Gardens, South Kensington.

—— It has been announced that Mr. Henry J. Elwes, F.Z.S., F.L.S., is about to issue a monograph on the genus Lilium, with plates drawn by Mr. W. H. Fitch, F.L.S. The work will be issued in parts, each containing eight plates, at the price of one guinea per part.

—— The ship "Tintern Abbey" has recently sailed for New Zealand, having on board no less than 1130 living birds—viz., blackbirds (Turdus merula), thrushes (Turdus musicus), starlings (Sturnus vulgaris), redpoles (Linota rufescens), of each one hundred; hedge-sparrows (Accentor modularis), 150; linnets (Linota cannabina), 140; goldfinches (Fringilla carduelis), 160; yellow-hammers (Emberiza citrinella), 170; and, lastly, partridges (Perdix cinerea), 110. When the birds arrive in New Zealand they will be let fly under proper authority. There is, we understand, a heavy penalty enforced against shooting at or injuring these birds in New Zealand, and it is hoped that they will do well at the Antipodes. The New Zealand farmers cannot get on without them, for they keep down the insects that ravage the crops. The Acclimatisation Society of Canterbury, New Zealand, we understand, have begun and are now persevering in this good public work. —(*Nature.*)

HARDWICKE HOUSE,

THE SEAT OF LADY CULLUM.

This pretty place is little more than a mile from Bury St. Edmunds. It is said to have been named "Herdwicke" from the flocks and herds which pastured on the heath or common, which, till within about fifty years since, almost ran up to the present mansion. A charter of King Edmund in 945 granted it to the Cellarer of the Monastery of St. Edmund's Bury. But of the Hardwicke of those olden times little is known; but the Hardwicke of to-day, with its numerous plantations and well-furnished parks, pleasure grounds, and gardens, may be said to have been the creation of the last fifty years.

The place has been in the Cullum family for nearly two

hundred years. Its history can readily be traced from the time of the dissolution of the monastery. It was then granted to Sir Thomas Darcy. During the reign of Queen Elizabeth it came into the possession of Sir Robert Bouthwell, Master of the Rolls. In 1610 it was purchased by Sir Robert Drury of Hawstead Place, where the family of the Drurys had resided for 250 years, and became extinct in the person of Sir Robert Drury, the purchaser of Hardwicke. The moat is nearly all that remains of this ancient seat of the Drurys, now the property of the Cullums. The way up to the place is still through an ancient and very lofty avenue of Limes, and there are three of the most magnificent Oriental Planes in the kingdom growing near to the old house, that are said to have been part of the first batch brought to England by Lord Bacon, and to be of the same age as others to be found at Gorhambury, St. Albans, Herts.

The second proprietor of Hardwicke of the Cullum family, Sir Dudley Cullum, was devoted to horticulture. He was fond of botanical pursuits, and was advised by Evelyn as to the collections, culture, and planting of rare exotics. He also adopted Evelyn's stove for the preservation of exotics, the excellence of which consisted in admitting fresh air into the greenhouse in winter, and in managing that air in such a manner as to keep up the fire to any degree of heat—a contrivance, says Sir Dudley, "that has more perfection than ever yet art was before master of, and which had highly obliged him and all lovers of this hortulane curiosity and recreation." Sir Dudley introduced into his garden at Hawstead Place, a situation well adapted for the purpose, most of the curious exotics then known in England. In 1694 Sir Dudley writes of his Orange trees as thriving in the most luxuriant manner. His greenhouse was 58 feet long, 14 feet wide, and 20 high, a large house for that time; and of its success he gave Mr. Evelyn an account that may be found in vol. xviii. of the "Philosophical Transactions."

Leaping over many years we arrive at the third Sir John Cullum, the author of the "History and Antiquities of Hawstead," and uncle of the late proprietor, Sir Thomas Gery Cullum. The two fine Cedars of Lebanon in the garden, only one of which is now standing, were planted in 1760. A very fine specimen of the Upright Cypress against the conservatory is probably of the same date.

The uncertainty and irregularity of the climate was carefully noted and recorded by Sir John Cullum. Here are a few facts of historical interest to horticulturists:—

DIFFERENCES IN DAYS IN THE FLOWERING OF DIFFERENT PLANTS IN THE YEARS 1779 and 1784.

				Difference in days.
Apricots	20th February, 1779	15th April, 1784		54
Wood Anemones..	9th March	„	16th April „	38
Apple	6th April	„	15th May „	39
White Thorn	15th April	„	22nd May „	37
Vine	14th June	„	23rd June „	9
Lime Tree	21st June	„	7th July „	16

The author remarks that the time was early in 1784, it being seldom in flower till near the end of June. He attributes this to the warmth of the preceding May. The greatest differences are in the early part of the spring.

Notwithstanding the love of planting, botany, and natural history that distinguished Sir John Cullum and his father, the Hardwicke of sixty years ago was as different as could well be to that of to-day. The late proprietor was said to have built the present house, and to have formed the present garden. Even less than thirty years ago Hardwicke was a quaint old place with its lawn, mixed garden, and Holly and other hedges, its large orchard and kitchen garden close to the house in the style common to Elizabethan mansions. About that time a new kitchen garden was formed quite away from the mansion, this old one swept away, and the present extensive flower garden laid out on its site. During his whole life, too, the late Sir Thomas Cullum was a zealous and skilful planter. He planted the park, pleasure grounds, lawns, and shrubberies; all the fine Cedars in the lawn and park were of his planting. He pushed back the arable land further and further year by year to make room for belts, park, and woods, and only finished planting when he died. He was fond of moving large trees, and was most successful in doing so at a time when the science and practice of transplantation were very imperfectly understood. He was almost as devoted to exotic as hardy plants, and the present range of glass, 300 yards in one range and other houses, were erected and furnished by him. He died twenty years ago; and his widow, the present Lady Cullum, has not only kept-up but very much enlarged and improved Hardwicke. Mr. Fish was engaged before the death of Sir Thomas, and arrived at Hardwicke a few weeks afterwards.

I will now proceed to describe Hardwicke as it is at present, but any description that can be given must fail to do it justice. The range of hothouses are very extensive, and fruits, flowers, and plants are well cultivated. The kitchen and fruit gardens are admirably managed, but the main attraction are the grounds, which are, and will be even more so in the future, a standing monument to the talents of Mr. Fish as a landscape gardener. I will therefore try to describe the grounds first. Commencing at the extreme west end of the flower garden, we follow a walk overhung with English Yews, which affords a cool and graceful promenade in summer. On the left-hand side of this walk is the Rose garden and herbaceous border. Let us step on to the velvety turf on which the Rose beds have been cut out. The position has been well selected—sheltered on the east side by the Yew walk, and on the south-west, from whence come the strongest gales of wind, by a belt of trees and shrubs, the latter forming a dense foreground, although they do not come out quite to the short grass, as winding round in front of them is the herbaceous border. The Rose beds are of a plain description—circles, ovals, and one or two irregularly-shaped beds. A geometrical garden would be out of place here. One thousand standard Roses have been used in planting the beds, but Mr. Fish informed me that Roses are not long-lived here, although, from the healthy growth made last season, they do fairly well for a time. There would be a heavy bill for Roses every three years did Mr. Fish not work a quantity annually in reserve grounds. Some of the best views of the surrounding country are obtained from this point. To the south-west, Ickworth, the seat of the Marquis of Bristol, is spread out, and a fine view is also to be obtained of Westling; indeed, the beautiful views of the surrounding country and of notable places constitute one of the charms of Hardwicke.

Following the Yew walk we reach the pinetum; but before entering this we cast our eyes down a splendid avenue of Lime trees, and one can but stand and admire the long unbroken view, extending as far as the old Abbey gates at Bury. The pinetum contains some noble examples of the choicest Coniferæ, and this class of tree succeeds splendidly at Hardwicke. Perhaps there is not such another large well-grown specimen of Pinus macrocarpa to be found in Britain. There are also grand specimens of P. excelsa and P. Sabiniana. The following are also fine:—Taxodium sempervirens, Picea pinsapo, Cedrus atlantica, and C. robusta. This is a very distinct and handsome tree. It resembles and may be a form of C. Deodara, but the branches have a more weeping character; the leaves are also longer and more glaucous.

Following a curving path through the pinetum we come to another of the distinctive features of Hardwicke, and this is the rock, root, or stump garden. The mounds and banks of earth have been formed at a vast expenditure of time, talent, and cash. If I had not been assured by Mr. Fish that it was not so, I should have thought that he had taken advantage of the natural irregularities of the ground. But it is during the spring months that this fairy spot must look its fairest and best, when thousands of Snowdrops peep out of every nook, while myriads of modest Violets scent the air, and Mr. Fish's favourite Myosotis dissitiflora, "the earliest of the year," adds its quota to the picture. In summer hundreds of luxuriant Ferns irresistibly remind one of the lines—

> "The calm retreat, the silent shade,
> With prayer and praise agree."

Leaving the rock garden by a hidden path you come upon a handsome Araucaria imbricata, a grand Wellingtonia gigantea, and yet another very large Abies Smithiana or Morinda. Behind the Wellingtonia is Abies Douglasii, probably over 100 feet in height. Not far from the rock garden is the kitchen garden, which we will come back to after finishing the dressed grounds, of which the Rhododendron grounds are the last; but before entering them, and in keeping with the surroundings, there are large spaces planted with Daffodils. When in flower they have been described by Mr. Fish as waving seas of Daffodils. There are some handsome specimens of trees and shrubs in the American garden, a striking specimen of the pyramidal Oak, grand English Yews, which are quite at home in the neighbourhood of Bury. Numerous vistas have been opened out by Mr. Fish through the plantations; and one seen from this point the largest and best, extending right over Bury, is appropriately named Vista Major.

The geometrical flower garden, of which the accompanying

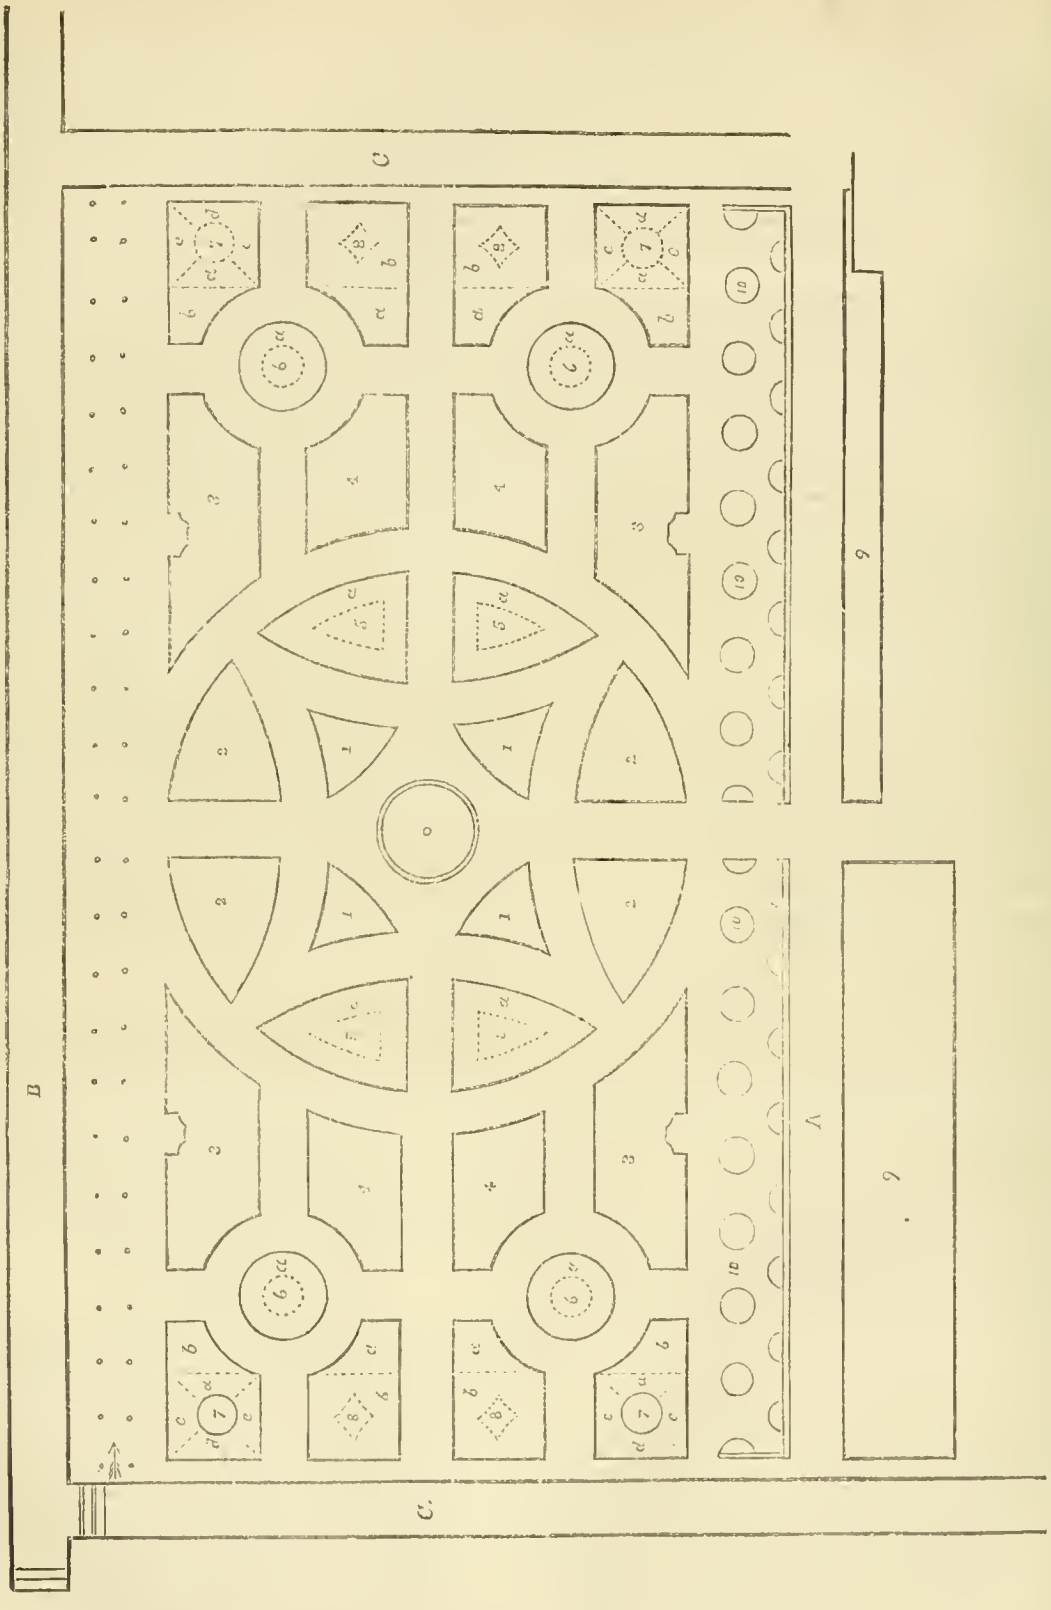

Fig. 12.—Plan of flower garden at Hardwicke House.

illustration (fig. 14) gives a good idea, adjoins the mansion. The view is taken from the walk in front of the conservatory. The large tree forming the background is a grand Wych Elm, and the smaller tree is a healthy specimen of the same; these are on the east side of the garden at the west side, but not included in the picture are some remarkable trees, and amongst them a Dutch Medlar. What! a Medlar in a flower garden? Yes, and one of the most remarkable in existence; the spread of the branches, which sweep the ground all round, have a circumference of 125 feet; a Copper Beech girths at 3 feet from the ground 15 feet 6 inches, with a circumference of branches of 207 feet; a Cedar of Lebanon girths round its massive trunk 20 feet, with a circumference of branches 270 feet; and an Evergreen Oak, the finest I have ever seen, has a circumference of its outer branches of 157 feet.

From a raised platform behind the long range of glass houses the whole extent of the flower garden is taken in at one view, and not only can one contemplate the floral beauty spread out beneath, but extensive views are obtained of the surrounding country, including four churches—viz., the tall spire of the beautiful church of St. John's, Bury; Ingham, of which the Rev. Mr. Chere had charge; Bradfield, and Rushbrook. Some handsome specimens of the English and Irish Yews are planted as isolated specimens in the flower garden, the English forming the best pyramids. No flower garden of considerable pretensions is passably praiseworthy without broad well-kept paths. The main walk here is at the outer side of the garden, and is 810 feet long by 14 feet wide; shorter walks of the same width run into this at each end of the garden. Roses are the favourite flowers at Hardwicke, so that a conspicuous place has

Fig. 14.—Geometrical flower garden at hardwicke house.

been found for them in the flower garden. The best of the Teas are planted against low walls, and inside the long walk a strong double trellis of wrought iron has been erected in the form of arches, which form a delightful promenade underneath, and can be used in hot dry weather, when walking on gravel paths is rendered unpleasant. A corresponding walk runs along the side of the garden nearest the houses, and more trellised Roses in single file. But I must close my description of this part of Hardwicke, reserving the houses and kitchen garden for another paper.—J. Douglas.

REFERENCE TO PLAN (FIG. 13).

1. Stella Pelargonium, edged with Ceraetium tomentosum.
2. Mangles' and Verbena venosa, edged with Golden Pyrethrum.
3. Chinese Roses and Amy Hogg, edged with Cerastium.
4. Dwarf Ageratum, edged with Ivy Pelargonium Duke of Edinburgh.
5. Single White Chrysanthemum. *5a.* Ribboned.
6. Raised beds supported by wooden piles. *6a.* Ribboned with Lady Cullum Pelargonium, dark Heliotrope, scarlet and Ivy-leaved Geraniums; the wooden piles densely draped with Lonicera aureo-reticulata.
7. White Perfection Pelargonium. *7a.* Cleopatra Pelargonium. *7b.* Lady Cullum. *7c.* Vesuvius Pelargonium. *7d.* Culford Pink Pelargonium. *7e.* Glow Pelargonium. Edging, Lobelia compacta.
8. Cybister Pelargonium. *8a.* Flower of Spring mixed with Lobelia speciosa. *8b.* Calceolaria Aurea floribunda. Edging, Cerastium tomentosum.

9, 9. Ribbon borders.

10. Round beds used as trial beds for new Pelargoniums.

A. Terrace walk, 286 feet long, 14 feet wide.

B. Long terrace with ornamental stone seats at each end, 810 feet long, 14 feet wide.

C. Gravel walks 14 feet wide at each end of flower garden. Centre circle is a fountain.

CONTENTS OF SMALL RIBBON BORDER.

Sedum glaucum.
Echeveria secunda glauca and Mesembryanthemum cordifolium variegatum.
Lobelia pumila flore-pleno.
L'Elegante Pelargonium.
Iresine Lindeni.
Flower of Spring Pelargonium.
Vesuvius Pelargonium.

CONTENTS OF LARGE RIBBON BORDER.

Sedum glaucum.
Echeveria secunda glauca and Mesembryanthemum cordifolium variegatum.
Lobelia compacta.
Lady Cullum.
Iresine Lindeni.
Imperial Dwarf Ageratum.
Crystal Palace Gem Pelargonium.
Spread Eagle Pelargonium.
Flower of Spring Pelargonium.
Perilla nankinensis laciniatus.
Cleopatra Pelargonium.
Cybister Pelargonium.
Dwarf white Dahlias.

NOTES ON VILLA AND SUBURBAN GARDENING.

Although the weather will very much influence operations in the garden this month, yet, whenever the opportunity occurs, the soil that has been trenched-up, say in November, for the purpose of carrying a crop of Onions, Parsnips, Carrots, and other root crops, such as Beetroot, Salsafy, &c., and more particularly if it has become firm on the surface, should immediately be turned up one spit deep, and left in a rough state to be further acted upon by the weather. There is such a material difference in the working of a soil that has been well prepared

and one that has not, but only been allowed to lie till the time for cropping comes and then dug up, and such an important influence has it in starting a crop on its season of growth, that it is necessary to make this special remark upon it. And again, the ease with which a soil can be worked reduces the labour of cropping fully one-half; and the seeds when deposited in it have a much better chance of vegetating with something like regularity, and the seedsman would escape the chance of being blamed for sending bad seeds. This working of the soil applies to every part of the garden, though, with the exception of flower beds and borders, it cannot be worked-up so deeply among shrubs and trees owing to the injury it would cause to the roots; but still the time has come when it is necessary for it to be done, as well for the benefit of the soil and the things growing in it, as it is for a neat and fresh appearance which it gives to the garden.

While talking of soil, it is just the time of year to prepare and place under cover the different sorts of soil likely to be required for potting and other purposes during the coming season. For instance, it is my custom at this time to mix up the soil for potting bedding plants, frequently turning it over until required for use, and then the work can be done expeditiously. The other soils, if laid up separately and in the dry as they ought to be, can easily be worked-up when wanted.

This reminds me that all the common sorts of bedding Geraniums, from Mrs. Pollock to Tom Thumb, that have been stored away as old plants thickly in boxes or pots, ought now to be brought out and placed in the frames or on the greenhouse shelves to induce them to break into growth. First of all the stems ought to be cut down to where there is life and health; and when they show signs of growing they should be divided and potted separately, and grown-on until they have established themselves. But when they are first cut down and until they break into growth very little water should be given to them, or the chances are, that instead of growing they will decay and die.

Again. It will be as well to see to the stock of plants that are intended to supply cuttings for propagation, such as Verbenas of sorts, Lobelias, Heliotropes, Fuchsias, and other things of which a greater stock is wanted, and place them in heat as soon as room can be made for them. It must be borne in mind, that if there is no convenience for propagation in the house it will be necessary to make up a bed for them. This may consist of a moderate beating bed of dung and leaves, and when quite ready cover the surface with old tan, ashes, or sawdust, or in the absence of these things a very light dry soil will answer; the object being to let the heat pass up through it readily, the pots to be plunged up to the rims when the bed is in a fit state and free from steam, which if allowed to prevail will cause many of the cuttings to go off.

Those who force bulbs or have the means of bringing them on in the greenhouse or conservatory should now introduce a few more pots of such as Tulips, Hyacinths, Narcissi, Jonquils, Lily of the Valley, Solomon's Seal, &c. First of all ascertain that the bulbs are firm in the soil and the drainage quite clear. It often happens that when the pot is small and the soil light the vigorous roots of the Hyacinth, from growing so fast in a cramped space, push the bulb almost out of the soil. Now, to make it again firm requires care. The roots are brittle and easily break. Instead of pushing the bulb into the soil it would be better to make it firm by adding soil to the top, or repot it into a larger one.

The pretty and useful forcing plant, Dielytra spectabilis, may be introduced into the greenhouse. It needs but a very mild heat to bring it into bloom; and although it may be grown into a very large specimen if the roots are maintained in a healthy state and the crowns formed of a good size, yet it is particularly handsome and attractive when grown in small pots for room or vase decoration. If Cinerarias are required larger the plants ought to be shifted at once, and let that be the last one; but if they are needed more for bloom small plants will be the most serviceable. And the same may be said of greenhouse Pelargoniums. Large plants for specimens need plenty of room and frequently turning about to get shapeable plants, so much so that they ought almost to have a house to themselves, as the staking and tying of the shoots is a frequent and necessary operation. Bring an old plant of each sort of Fuchsias into the warm part of the greenhouse in order to produce cuttings for plants for autumn blooming; and the stock of herbaceous Calceolarias should be examined, and those strong and healthy be shifted into larger pots. These plants should never be allowed to become pot-bound while they are increasing in size. It is, moreover, a plant very liable to throw its roots out on the surface of the soil; this peculiarity is partly encouraged by the large leaves, which generally lie flat upon the soil. These roots must be encouraged by top-dressings, especially when the plants are throwing up their flower stems.—T. Record.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

Allusion was made a week or two ago to forcing Sea-kale in pots. It is the best way to dig up the whole stock of roots, selecting all the large roots to pot, reserving all under a certain size to plant out as soon as convenient. Just as the crowns are starting is as good a time as any to plant them. Care must be taken not to get into the same muddle as we did this year. The plunging material used is generally cocoa-nut fibre refuse; any fermenting will in all probability cause the roots to rot, and the crowns will not start at all. In our case some decaying stable manure that had been used for another purpose was placed too close to the pots; this injured the roots, and our first crop was spoiled. The same result has happened when water has been applied to the pots after they were put into heat. The best way is to use sandy loam moderately moist when potting, and not to water the roots at all. It has been stated already that the pots are plunged out of doors, but in wet cold districts it may be desirable to throw some protection over them to ward off the rains.

Just a word also about forcing Asparagus. Our own experience would lead us to recommend heated pits, and the method of forcing in such structures was explained some weeks ago. Not everyone can command them, though, and perhaps hotbeds are more frequently used for this purpose; but more than once have we seen the roots damaged and the consequent failure of the crop from overheating. The bed should be formed of leaves and manure in equal proportions. The manure should not be fresh from the stable, but should be thrown in a heap for two weeks, and turned once or twice. In a week or so after the bed has been made-up it will be ready for the frame and lights, and when the heat has declined sufficiently the soil may be put in, and the roots planted thickly. We have made-up excellent beds with equal proportions of stable manure and coarse grass forked out of marsh land; the bottom heat from this was also very lasting. The roots ought not to be watered until the crowns are fairly started, and then it must be done carefully.

Many persons recommend autumn sowing for Peas. In some districts it answers very well. The crops sown in November have been earlier and equally good as regards crop with those sown in favourable weather in January. The experience gained in this neighbourhood is all in favour of spring sowing. The market gardeners, who must understand "cost and come to," sow in January and February for the first crop; but at whatever time the seed is deposited in the ground, much of success or failure is owing to the condition of the seed bed at the time. The ground ought not to be worked when it is wet if it is intended for any early crop. It is also quite necessary to watch for a favourable opportunity to sow the seeds. Our first crop was sown to-day (15th); the ground was in good order, and the day fine. Ample trial has been made of the best early Peas; and as we think two early varieties quite sufficient for our purpose, the selection has fallen upon Alpha and William I., both raised by Mr. Thomas Laxton of Stamford.

All the kitchen-garden ground is in excellent order for digging and trenching, and no time must be lost in getting it forwarded. We have finished the pruning, and will soon get through with tying and nailing.

FRUIT AND FORCING HOUSES.

Pineries.—We have a house of Queens, which were suckers in August; if the late autumn months had not been so mild, which made us keep the plants growing later than usual, we should like to have started them at once. Most of the plants are in 10-inch pots, which are well filled with roots. Our only difficulty is, that they have not rested enough, and when such is the case a large proportion of the plants commence to grow instead of throwing-up fruit. When a batch of good suckers can be taken off and potted in June, it is then easy to have a batch of plants ready for starting on New Year's-day. A large number will show fruit at once, others will start into growth and throw-up at intervals, which will be all the better, as a succession of fruit is thus obtained. Smooth-leaved Cayennes and Charlotte Rothschild are now usually grown for winter; but those who prefer flavour to size and appearance, will have a goodly proportion of Black Jamaica. The Queen is by far the best to start now, and the earliest fruit will be ripe in June. The stronger-growing sorts should not be grown with Queens, nor should the plants be quickened into active growth before the middle of February. Cayennes generally throw-up freely, while the more luxuriant Charlotte Rothschild will most likely start into growth. Many persons have recommended the cutting-over of the plants at the surface of the pot; this causes them to throw-up sometimes, but not invariably. We have cut over strong plants and potted them, to find that they did not fruit earlier than suckers put in at the same time. A house started now, or that was started on the first day of the year, should have a minimum temperature kept up of not less than 65°, bottom heat 90°. When the days are cloudy, as they are eleven out of every twelve, the temperature of the houses does not rise much higher by day than it does at night; the hot-water pipes must be kept about the same degree of heat, and a little air admitted from 9 A.M. to 3 P.M.

Orange Trees.—There are few gardens where the culture of dessert Oranges is practised to any extent; but the trees occupy very little room—indeed small plants in 6 and 8-inch pots, not

more than a foot or 18 inches in height, will bear as good fruit as old trees in tubs or planted-out. The fruit is very much superior to that imported from St. Michael's, and there is very great interest and pleasure in watching the development of the fruit from the flowering stage until it is quite ripe. The fruit when cut with the leaves has also a satisfactory appearance on the dessert table. The usual varieties of Oranges grown for the flowers are composed of thick skins, and a pithy substance inside; but we have the St. Michael's and Maltese Blood Oranges with the skins burst, through being too full. The fruit can also be had through the three winter months, when Grapes are scarce and the best Pears are over. Our earliest plants are now well advanced in flower, and the temperature of the house is about 60°.

Fig trees, where the buds are not started, are syringed every day; after the buds start the trees are only syringed on clear days. All ours are grown in pots, and they are repotted every year, as, if we only surface-dress them, the greatest difficulty is to know when the roots require water, as the rich surface always appears moist even when the roots are parched.

PEACH HOUSE.

The same treatment is requisite in this house as to dressing the branches and surfacing the borders as has been already detailed in the previous numbers for vineries. Watering is also the same; the only difference is, that Peaches will not bear forcing to the same extent that Vines will, especially early in the year. If the trees are in flower this month the greatest care is necessary to prevent the fruit from dropping off. The most frequent cause of this is overdryness at the roots or too much moisture in the atmosphere. The only moisture that is permitted at this time is obtained from sprinkling the paths and borders with water from a fine rose.

PLANT STOVE.

We do not approve of potting any plants that are not free growers before the middle of February, but some Ferns and foliage plants that are growing freely will be shifted into larger pots as soon as convenient. These have the pots in which they are growing quite full of roots. It is necessary to pot carefully at all seasons, but much more so at present. The pots are quite clean; the drainage is also free from any loose mould, and some fibrous material is sifted from the loam, to prevent the compost from mixing with the drainage. With a pointed stick we carefully disentangle the roots that are matted round the ball, and when the plant is placed in the centre of the pot the top of the ball should be about 1 inch below the rim. Orchids in the cool house require attention. Many of the Odontoglossums require repotting. The best time to do this is just as the young growths are starting. O. crispum, O. triumphans, O. odoratum, and other allied species require water all through the winter months; we never at any time allow them to be quite dry, so that they start at any time, and the best treatment is to repot when they require it. Quite a different course of treatment is necessary for the Mexican species. They do much better if allowed to become quite dry at the roots during the winter season, and only giving sufficient water to prevent the pseudobulbs from shrivelling. We have repeatedly counselled small shifts for all tender plants, but more especially for Orchids that require large supplies of water. All the New Grenadan species succeed best if sphagnum moss is kept growing on the surface of the pots; a large supply of atmospheric moisture is also essential to complete success.—J. Douglas.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

Secretaries will oblige us by informing us of the dates on which exhibitions are to be held.

TRADE CATALOGUES RECEIVED.

William Paul, Waltham Cross, London, N.—*Select Catalogue of Seeds.*

T. Bunyard & Sons, Maidstone.—*Catalogue of Vegetable, Flower, and other Seeds.*

Barr & Sugden, 12, King Street, Covent Garden.—*Descriptive Spring Catalogue of Choice Seeds.*

W. Cutbush & Son, Nurseries, Highgate, London.—*Vegetable and Flower Seeds, Azaleas, and other Shrubs, &c.*

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

Caraway Pippin (*A. Cheese*).—We believe it is a synonym of Caraway Russet. It can be obtained at any of the nurseries where fruit trees are specialities.

Glasgow Royal Botanic Garden (*B. G. G.*).—You have no just ground for complaint, and there is no question as to the legality of the treatment.

Apples and Strawberries for Light Soil (*Country*).—*Apples*—Lord Suffield, Rymer, Alfriston, Bedfordshire Foundling, Cox's Pomona, Warner's King, Blenheim Pippin, Dumelow's Seedling, Winter Majetiug, Norfolk Bearer, and Annie Elizabeth. We add for dessert—Red Astrachan, Cox's Orange Pippin, Reinette du Canada, Dutch Mignonne, King of the Pippins, and Scarlet Nonpareil. The first-named dozen are culinary kinds. All are good growers and free bearers. *Strawberries*—Sir Joseph Paxton and President.

Eucharis amazonica not Flowering (*J. C.*).—Your plants do not flower because they are kept constantly growing. They will now or soon be either throwing-up for flower or growing, or both. If they do not show for flower shift into larger pots, and encourage growth with a plentiful supply of water and moisture, and continue this treatment until the growth is complete, then cease watering so freely, only giving enough to keep from flagging, affording them a light airy position. After six to eight weeks of this resting process they will most likely, upon water and moisture being given, throw-up for flower, flowering in early summer; and after this they are to be encouraged with heat, moisture, and water to make a good growth; and after and in October up to about the new year, he kept dry and comparatively cool, and yet not so dry as to allow the leaves to flag. By the new year they will be throwing-up their flowers, and after it they should be potted, divided if stock is wanted, and grown on. Your treatment seems to be good, only you do not rest the plants.

Cinerarias and Calceolarias Suddenly Failing (*Jas. H.*).—The dying-off of these plants is not due to any grub or insect, but is usually a consequence of plants being irregularly watered, and allowing them to become pot-bound before shifting into larger pots, also watering upon the neck or collar of the plants. The fertile source of the evil is keeping in a dry atmosphere and warm, they delighting in a cool and moist one, but well ventilated and safe from frost. It is common to these plants and also to Humea elegans. The only culture we have found guarding against it is never allowing the plants to become dry, shifting into larger pots as those they are in fill with roots, keeping the neck or collar of the plants slightly raised in the centre of the pots so that the water will drain from, not to it, but covering the roots with soil without burying the neck or stem of the plants, and not watering upon the neck or centres of the plants, keeping moist, cool, or if warm having corresponding moisture, and good ventilation. Avoid making the soil sodden by too frequent watering, giving it when it is wanted—not before, but before the plants flag, and a thorough supply sufficient to show itself at the drainage.

Lime Water for Worms in Pots (*Idem*).—Lime water is not injurious to the roots of plants unless it be applied in too powerful doses. One pound of fresh lime is a sufficient quantity for three gallons of water, in which the lime should be put, stirred-up well, and let stand for two or three days, and then pour-off the clear water, leaving the lime sediment in the bottom, watering the plants with the clear lime water. We recommend the Vines after pruning to be stripped of any loose portions of bark, but not paring and scraping them, and then wash with a brush with clear water at a temperature of 120°, and after dress them with a composition of 1 lb. soft soap to a gallon of tobacco juice, with sufficient flowers of sulphur to bring it to the consistency of thin paint, and apply with a brush to the rods and every part, taking care not to dislocate or rub-off the eyes.

Mistletoe Cultivation (*W. W.*).—It is not a "fungus," nor a "plant," if having the roots deriving support from the soil is meant. It (Viscum album), is a genuine parasite, rooting beneath the bark of the trees on which it grows, and deriving from their juices the whole of its nutriment. It thrives best on the Thorn, Apple, Lime, and is very vigorous on Poplars, but does not take so freely upon them as the Thorn, Apple, and Lime. Seeds are the readiest means of propagation, and the best months for sowing it are February and March. Make two cuts on the under side of the branch of any of those trees and down to the wood of the branch, in the form of the letter V, raise the tongue of bark made by the cuts, but without breaking it, and into these squeeze one or two of the seeds from the berries, and let the tongue back into its place, where the seeds will be held between the bark and wood of the tree, and the seed being good the seedlings will soon appear, and remain attached to the branch. The seeds will vegetate placed upon the branches on a smooth part squeezed from the berries, and to which they adhere by their glutinous pulp, but unless protected from birds it is likely they will be eaten. At the under side of the branches, and under a tongue of bark, the seeds are more likely to escape the vigilant eyes of the feathered tribes.

Sheltering Apiary (*E. L.*).—The arrangement shown in your plan will answer very well, but we are not certain that the hedge and shrubs are to the north of the proposed apiary, and will afford them shelter from that point. If it be so, well, we have no other fear; only you say it is at the bottom of the garden. We hope it is not in a hollow, and that the Berberises are not large but low, if that be the south of the hives, as if large it would interfere with the bees' flight. The evergreens next the hedge and at the sides ought not to overhang the hives, and the front south space ought certainly to have nothing higher than the flight-board within 6 feet of the hives, and not higher than 4 feet at 12 feet distance from the hives. Place the hives with the entrances southwards, allowing 6 feet between the rows of hives.

Pruning Vines (*Vitis*).—The mode of pruning shown by your sketch is right, only we think you have miscalculated the eyes. Two are ample to leave upon each shoot; but we think you have not counted one at the bottom of each shoot, and which, though not so prominent as those higher up, ought to be calculated upon to give fruit. We may be wrong, but your sketch shows the eyes to be too distant from the base of the shoots, and this will give you in a short time very long spurs, which it is desirous to avoid. You will be able to see in a short time after the eyes break, the shoots being a few inches long, which are showing fruit, and then you may disbud. One of the shoots last year ought to have been removed, for you will crowd them with shoots, having the leaves ill exposed to light and air. We should not multiply them any more. Two shoots from a spur are ample, and the spurs should not be nearer each other along the rods than 15 to 18 inches on each side.

Avoid overcropping, which you are likely to have with two shoots to a spur. It is better to allow fruit upon only one than upon both. The extra foliage will do more good than harm, only it does not cause crowding.

Succulents.—"Having a desire to see other amateur growers of succulents come forward at the exhibitions this season, Mr. Peacock has determined not to compete during the year.—J. Croucher, *Gardener to J. T. Peacock, Esq.*"

Crown Imperials and other Bulbs in Greenhouse (*W. H. S.*).—The Crown Imperials will flower in pots, they being kept in the open ground until they appear above ground, but with protection in severe weather; or you may place them in a cool, light, and airy position in the greenhouse at once, watering them as required, moderately at first, increasing the supply with the growth, top-dressing them with rich compost when they show for flower. We should have preferred planting them in the open border to growing in pots, and would do so yet, affording them a good deep sandy soil, and covering about 3 inches deep. The bulbs of the Crown Imperials ought to have been covered with an inch of soil, and been that depth from the soil over them to the rim left free to allow for top-dressing. The other bulbs should be removed to the greenhouse. Amaryllis would not be destroyed by too low potting, but they ought not to be potted deeper than with the neck of the bulbs covered with soil, the neck being left clear and just level with the rim of the pots. It is sufficient if the soil be kept moist when they are at rest, and in February or March they should have the benefit of bottom heat for a time to insure rooting and free growth. There is no book specially treating on the cultivation of bulbs; but they are treated of in the "Cottage Gardeners's Dictionary" under their several names. Your Strawberries in pots we should introduce to the greenhouse the beginning of February, placing them on shelves near the glass, and where they will have abundance of air and light.

Pruning Old Apple Trees—Fowls' Dung for Vines (*J. C. N.*).—The best time to prune old Apple trees in an orchard is in early winter so soon as all the leaves are fallen, and through the winter in mild weather up to March. Early winter pruning is preferable to late spring, therefore have them pruned at once, but only in mild weather, ceasing therefrom if severe frost prevails. Fowls' dung is a good and powerful manure, and will answer for Vines, but it must only be applied in about one-third the quantity of farmyard or stable manure, applying to the surface, and pointing-in with a fork, but not so deep as to disturb the roots.

Artificial Manure (*D. W. W.*).—Your fresh land would be best dressed with phospho guano; and being poor, 3 cwt. per acre would not be too heavy a dressing, applying it broadcast over the whole of the surface after sowing the seeds or planting the Potatoes and before covering them up.

Black Currants for Damp Situation (*Idem*).—They will succeed better than anything else; and though it does not get sun in summer more than four or five hours a-day, they would ripen, but be, of course, later than those in a warmer position. The situation would be too much shaded for Plum trees, and the Black Currants would be more likely to pay without them. The best kind of Black Currant is Lee's Prolific, and next to it Black Naples.

Pruning Evergreen and Deciduous Shrubs (*M. N. O.*).—Now in mild weather up to when they commence swelling the buds is the best time to prune deciduous shrubs; before the swelling of the buds pruning ought to be completed, and it may be done in mild weather after the leaves fall through the winter until the buds swell. Evergreen shrubs are best pruned at the close of March, or early in April when they are beginning to grow, it being best done in mild weather and showery.

House for Figs (*Horace*).—In north Kent you will not succeed with Figs in the open ground as bushes. They would, however, succeed against a south wall with protection in winter for the branches and shoots. Every way a house would be the preferable thing to have, keeping the bushes in pots, increasing the size of the pots with the growth of the trees, and having the pots half plunged in the borders. Ultimately your two dozen bushes will require a good-sized house, as they will require to be, when they are in 14-inch to 18-inch pots, 4 feet 6 inches apart, and as much side and head-room. This will give you 52-feet length of house for two dozen trees, and 12 feet in width, having a walk up the centre 2 feet 6 inches wide, and a border on each side of the walk 4 feet 6 inches wide. The side walls may be 2 feet high above ground, and of glass 2 feet 6 inches, which will give the height of the sides 4 feet 6 inches; and in the centre over the walk the house may be 9 feet from the floor to the ridge. A span-roofed house, with the ends north and south. To make certain of two crops in a season it would be well to have the house heated by two 4-inch hot-water pipes along both sides and one end. Half the length of house would be sufficient for the trees for a couple of years.

Cherry Trees not Fruiting (*A Subscriber*).—Your soil is too light for the kind of Cherries you name, but you might do much to check their growth by making the soil firm after giving a dressing of lime to the surface, and pointing it in with a fork. A bushel of lime per rod (30¼ square yards) will be ample, and then make the soil very firm. Keep the shoots close-stopped through the summer, and manure by the surface, giving the trees a thorough watering when they are going out of flower. They will, we think, give you fruit; but if they do not in a year or two, root-prune, and make the soil about them very firm.

Substitute for Grafting Clay (*Idem*).—We do not know of any substitute for clay but grafting-wax, which is made in various ways; but we give two formulæ, one requiring to be applied warm—viz., Burgundy pitch, 1 lb.; black pitch, 4 ozs.; yellow wax, 2 ozs.; rosin, 2ozs.; mutton suet, 2 drachms, melting in an earthenware pot over a slow fire, and applied warm to the grafted part, but not so hot as to injure the bark of the stock and scion it comes into contact with. The following may be used cold:—Yellow wax, 1 lb.; turpentine, 1 lb.; Burgundy pitch, 8 ozs.; mutton suet, 4 ozs. Melt all together and mix thoroughly, leaving to cool, when the mass may be formed into small balls and used as required.

Iron Filings for Jointing Hot-water Pipes (*S. H. W.*).—Mix the filings with strong vinegar, making thoroughly moist, forming a sort of salve; or add sal ammoniac 1 oz. to 2½ lbs. of the iron filings, and half an ounce of flowers of sulphur. In either case the piping should not be used until the iron cement has become perfectly firm.

Apricot, Cherry, and Plum Trees Pruning (*A Constant Reader*).—The fruit of these is produced upon spurs principally, and the young shoots also fruit; but after the first year of the young shoots you will have to rely upon spurs for fruit of the Cherry and Plum, and mainly upon spurs of the Apricot, though the young shoots of the Apricot will fruit freely, and should be laid-in between the main branches, but not so as to crowd them. They may be laid-in 3 or 4 inches apart. The main branches or shoots ought for all the trees named to be 1-foot distance apart, and trained fan-shape; each shoot or branch intended to produce spurs be taken straight, and at such an angle that, when it is half the length it has to traverse, it will be 1 foot distant from the branch it originates. The long shoots we should not shorten, they being intended for branches, and the trees are properly furnished. If the trees are not furnished the shoots must be cut back to give you the requisite shoots, otherwise we should not shorten them, but train-in their full length. The side shoots of the Cherry and Plum should be cut-in to about an inch, or two eyes of their base, and the twiggy side shoots of the Apricots laid-in between the main branches, and not shortened; but any fore-right or front shoots are to be cut-in to two eyes. Any short stubby shoots of not more than an inch or so long should not be shortened, but left their full length; they are spurs, and will be clusters of fruit buds, with a wood bud at their points. We should not advise the lifting Peach and Nectarine trees which are now fruiting, although producing vigorous shoots 6 feet long. Leave well alone; only remove their points, say a third, the length of the shoots, and train-in from them bearing shoots at 1-foot distance apart.

Decayed Sawdust for Flower Beds (*J. K.*).—If reduced to "mould" it will answer well; but if it contains any woody matter, be likely to engender fungus, and in this case would be objectionable as a top-dressing.

Berberidopsis corallina for Wall (*Idem*).—It is a very pretty sub-scandent shrub with coral-like red flowers, evergreen, and is suitable for a wall, but requires one with a south or south-west aspect. Lobelia speciosa will suit as an edging to yellow Pansy.

Transplanting Rose Trees (*Bereaved*).—Take them up as soon as you can, and carefully preserving as much root as practicable; and as they are taken up cover the roots with mats to protect them from drying, and carefully pack the roots in dry straw, and secure with mats outside. They should have the heads neatly tied together—the plants, in fact, secured by mats in reasonable-sized bundles, and they should be carefully planted, the ground having been trenched and liberally manured. Pruning should be deferred until the beginning of March. Secure them against winds by suitable stakes and tying, watering at planting if the weather be dry, and in dry weather after growth syringing or watering overhead in the evening, so as to secure free growth. They should be pruned rather more severely than had they not been removed.

Names of Fruits (*Pierson*).—The Pear is Beurré Rance.

Names of Plants (*J. A.*).—It is impossible to identify plants from foliage only, it takes much time to do so even when flowers are with the leaves.

POULTRY, BEE, AND PIGEON CHRONICLE.

POULTRY EXPERIENCES IN 1874.

It may not be uninteresting to the readers of your Journal to hear the year's experiences of a poultry-keeper on a very small scale, and it may also be the means of encouraging others to attempt what is certainly a profitable as well as an amusing occupation. I have had built at the end of a long narrow kitchen garden a small poultry shed, which is entirely roofed-in, and a roosting and laying-house made according to the directions of the "Practical Poultry-Keeper." The yard is about 16 by 14 feet, and the house about 6 feet square, and in this space I have kept a cock and from eight to ten hens, and reared twenty-two chickens. The sort I keep are Light Brahmas, which I have found exceedingly satisfactory in every respect, being very hardy, and constant layers. I have had in the year 996 eggs, with five hens on an average laying at the same time, and the following is my table of profit and loss:—Expenses during the year for food and carpenter's work to the shed, &c., £7. Receipts, including value of stock, £11 12s., leaving a balance of £4 12s. as profit, and a supply for the table of rich eggs and first-rate chickens for eating.

I have bought the food entirely and of the very best quality, giving barleymeal and bran in the morning, wheat at night, and kitchen scraps with abundance of green food in the day. The young chickens were fed on Scotch oatmeal and bread soaked in milk mixed with fine chopped grass.

I have kept a Cochin hen and one or two Barndoor as well as Brahmas, so I have had opportunities of testing the superiority of the latter sort. I have found them far less broody than the Cochin, while they make quite as good mothers and lay a great many more eggs in the year than the Barndoor, and, while I lost two pullets of the latter sort, I reared every Brahma I had. They are also very handsome, and I was able to sell several sittings in the spring at 6*d.* an egg. I may add that I attend to them entirely myself, cleaning out the roosting house every morning, and I always let them have plenty of dry earth or lime riddlings as a dust bath, and pulverised oyster shells to peck when they like. They seem always perfectly happy though kept in close confinement.—A. H. Martin, *Evesham.*

THE BARB.

A fine Barb is a rare bird. The majority of the specimens we see are of the coarse coarsely, and with the Barb vulgarity is ruinous; for a large bird with a common wattled head (such as we see) is too suggestive of a Carrier with its beak razeed. It is a variety we would like to admire, but finding it impossible to obtain the very few fine birds met with in our travels, we have allowed the fancy for them to sleep until the present time, and nothing but an extra specimen (of our style) will induce us

to become enthusiastic in their favour. The fanciers of Barbs may be divided into two classes: one in favour of the coarse vulgar birds, of which there are many; the other favouring the small elegant birds, which are the antipodes of the Carriers, and of which there are so few. We are happy to state that the most refined fanciers are nearly all to be placed in the class advocating the small specimen. The extreme beauty of such birds is the determining cause, and a fancier who has once seen a good-headed creation of the small type will never be satisfied with a "razeed Carrier." Like all fancies for pictures, sculpture, horses, or what not, the pursuit tends to refinement and exclusion, and the man who begins with commons and common specimens is as sure to reach a higher taste for the rarest (among Pigeons) as he who tosses away chromos or plaster casts for Rembrandts or Angelos.

The reason Barbs have not heretofore caused a sensation is because they have never been properly bred. They have been kept too near the Carriers; there has not been enough distinction to make the keeping of the two varieties interesting; they have been playing second fiddles, and always will, as long as the difference in beaks is the only contrast observable to the ordinary looker-on in Pigeondom.

Few persons have devoted themselves entirely to Barb culture, and among the few we know there has been but one arrived at

Fig. 15.—The barb.

anything like success. He has produced one bird, which we shall bear in mind in giving the points we think most important to breed for. The others of our acquaintances have been contented to rear a large number of second-fiddles, resting satisfied with quantity instead of quality. We have had the pleasure of watching two fanciers, one of Carriers, the other of Barbs, and have derived much information as well as amusement from their conversations. The Carrier is striving for a long beak, just another quarter, with the head a little narrower; while the Barb says, "If I can only breed the beak a little shorter, and the head a little broader, all will be right." So they go, and neither pays attention to the bodies, and the result is two birds of nearly the same size, only distinguishable by examination of the beaks. We saw at a show a short time ago two such birds, which it would have been impossible to distinguish by merely feeling any part except the beaks.

The shape of the Barb should be different from all the other varieties. It should be small, compact, and stout in appearance, like the pug among dogs. The Almond Tumbler is small and light; the Barb should be small and stout, like a short, sturdy, broad-backed person, perfect in proportion, but proportions heavy according to size of individual—in other words, a little big Pigeon; the feet red, toes well spread and flat upon the ground; broad across the shoulders; flights and tail long. The neck rising full from the shoulders becomes thin and small at its connection with the head, presenting the appearance of the neck of the broad-headed snakes.

The head is considered the most important part, and most of the care has been bestowed upon its points; it should be broad across, and short from before backwards. The beak is short and broad at its base; it should be of the Hawk or Owl variety, set on in a line with the brow and head, thus presenting what is called a down face. Very little beak-wattle allowed, the less the better.

The eye is very important; it is pearl in all colours except the White, in which it is dark. It is surrounded by a wattle as large as that of the Carrier, and of the same soft material, feeling like velvet in the perfect birds. The wattle should be of the same width all around the eye. Most of the coarse birds are what they call pinched-eyed—that is, the cere becomes narrow at the back of the eye, and the perfect circle is incomplete. This is a fault that cannot be too carefully guarded against, and a bird with a narrower perfect cere is more valuable than a cere broad in front but pinched behind.

The colour of the Barb is black—that is the best; but Reds, Duns, Yellows, Blues, and Whites have been bred, and some of them are easier to obtain than the Black, but it is seldom they breed truly. A pair of Yellows may throw all Reds, and *vice versâ*—a great defect in any variety, as when a fancier buys birds for their colour he wants them to breed it—viz., to have the blood and not be mongrels. None of the Barbs we have owned breed truly, though the variety is one of the oldest. The Blacks are the most steadfast, that being the original colour. It will be gathered from the foregoing that the points we admire are the following:—1, Size, small; 2, Shape, stout; 3, Eye, pearl, well wattled; 4, Head, broad; 5, Beak, short and hooked; 6, Neck, thin at the setting-on of the head; 7, Colour, black.

There is a problem connected with Barbs and Carriers which we should attempt to solve if we should ever again be tempted into the wattled-bird fancy. It is, whether they have been derived from the same source? To us the question is decided in the affirmative by all the external marks of the varieties, and by our knowledge of what can be produced by the selection of specimens possessing certain points. We started to prove this side some years ago, and our experiments were satisfactory as far as they went, but were interfered with by a visit to Europe, where, from what we saw, we thoroughly convinced ourselves of the truth of the proposition.

Should we again attempt a solution of the question we should obtain a pair of barbed (wattled) Pigeons, and from their young select birds for two strains, keeping in view the long face (or beak) for a Carrier strain, and the short face (or beak) for a Barb strain, and by continuous selection and judicious matching of such individuals there would not be the slightest doubt of producing well-defined Carriers and Barbs. Patience is, of course, a necessity here as elsewhere, but it completeth a perfect work. To persons who have simply kept Pigeons such productions may seem impossible; but to those who seek knowledge beyond the limits of sight, and to those who have spent months and years in the lofts with mongrels, so shaping the course of Nature that she becomes the handmaid instead of the mistress, the production of Barbs or Carriers from the wattled Pigeons becomes as simple as the breeding Long and Short-faced Tumblers from the same strain, or the conversion of Turbits into Owls, &c.—Dr. W. P. Morgan, *Baltimore, Md.*—(*The American Pet-Stock Bulletin.*)

[The above article, like all by Dr. Morgan, is plessant reading, but the show Barbs of America must differ from those of England, the fault here being rather of getting them too Tumbler-shaped, and the longish form of the true Barb with rather long flights is being lost. It is, I hold, a mistake to breed all varieties down to weak delicate birds. I admire robustness in an English Owl, delicacy in an African Owl. Delicacy, again, is the very thing in an Almond Tumbler, but a Barb should be like a little cob, not a racing pony. Dr. Morgan's idea of being like a pug is not bad. I own I do not think that Carriers and Barbs are connected. An English authority tried the crossing of the two, and a perfect failure as to wattle was the result.

The Barb should be a little big Pigeon, like a cob horse, a resemblance I prefer to a pug, for, as the Birmingham Columbarian Society state, it should have "a rather heavy appearance," and pugs are now bred small. As Dr. Morgan's friend the Barb-fancier has only "produced one bird" up to the mark, what a pity he does not procure better birds from some of our great English breeders. But whatever American fanciers may be poor in, they are rich in a doctor-fancier. I only wish we possessed an M.D. or an M.R C.S. who, being a Pigeon-fancier, had the happy literary gifts of Dr. Morgan. Interesting writers as poultry or Pigeon writers are doubly valuable, as their articles attract the attention of non-fanciers, who, being attracted, become not unfrequently ardent fanciers; such a writer is Dr. Morgan.—Wiltshire Rector.]

BRAHMAS FOR EGG-PRODUCING.

I cannot help thinking that somebody steals a march on "Agricola," and gets first to the nest. His letter induces me to give my experience.

I bought four Brahma pullets at Stevens's on the 20th of last March. I had two eggs on that day, and 412 to November 30th. Three of them sat. I reared eighteen chickens: eight I cooked, the largest made a good Sunday's dinner for my family of eight, with 1 lb. of sausages; two the cats dined off, leaving eight pullets. My first two sittings were hatched on May 23rd. My first egg from the young birds was laid on December 5th, and I have averaged four eggs per day since. I now give two meals a-day—8 A.M., ground oats slaked with boiling water; 2 P.M., house scraps, potato peelings, &c., hot made up with whole corn mixture. I have not been one day without an egg since I commenced. I flatter myself no other breed would show better results. I do not keep a cock bird, buying what eggs I require for sitting. I must in justice add that I have kept fowls before, and gained most of my experience from our Journal.—Ealing.

WOLVERHAMPTON POULTRY SHOW.

This Show was held in the Agricultural Hall, on the 15th, 16th, and 18th inst. The awards were as follow:—

Brahmas —*Dark.—Cock.*—1, Newnham & Manby, Wolverhampton. 2 and *hc*, T. F. Ansdell, Cowley Mount. 3, J. Watts, King's Heath, Birmingham. *c*, F. J. Cotterell, Birmingham *Hen.*—1 and 2, W. H. Crabtree, Levenshulme, Manchester. 3, T. F. Ansdell. *hc*, W. Hargreaves, Bacup; F. Bennett, Shifnal; J. Walker, Newcastle. *c*, E. Pritchard, Wolverhampton; W. Birch, Barnacle; W. B. Etches, Whitchurch.

Brahmas —*Dark.—Cockerel*—1, R. P. Percival, Northenden, Manchester. 2 and 3, T. F. Ansdell. 4, E. Ryder, Hyde, Manchester. *hc*, F. Bennett. *c*, Newnham & Manby; G. E. Cartmel, Eden Mount, Kendal; W. Birch; W. B Etches. *Pullet.*—1, 2, and 4, Newnham & Manby. 3, White & Shuter. *hc*, E Pritchard. *c*, W. B. Etches; E. Pritchard; W. Birch.

Brahmas.—*Light —Cock.*—1, W. H. Crabtree. 2, T. A. Dean, Marden, Hereford. 3, J. Bloodworth, Cheltenham. *hc*, J. Birch, jun.; F. J. Cotterell. *c*, G. Walters, Worcester. *Hen.*—1, R. P. Percival. 2, W. H. Crabtree. 3, F. J. Cotterell. *hc*, T. A. Dean. *c*, G. Walters; R. Bird; G. M. Rolls, Monmouth; S Sambrooke, Chipping Campden.

Brahmas.—*Light.—Cockerel.*—1, R. Bird, Fulham, London. 2, J. Bloodworth, Cheltenham. 3, R. Horafall, Liverpool. 4, R P. Percival. *hc*, W. Storer, Brewood (3). *Pullet.*—1, H. C. While, Mancy, Sutton. 2, W. Tedd, Erdington. 3, T. A. Dean. 4, R. Bird *hc*, W H Haseler, Handsworth; Mrs. G. M. Rolls; W Tedd; C. Morris, Chester; C. Bloodworth. *c*, W. H. Haseler; R. Bird (2).

Dorkings.—*Coloured, except Silver-Grey.*—1, J. Copple, Prescot. 2 and 3, Countess of Dartmouth, Patshall, Abrighton. *hc*, W. H. Denison, Woburn Sands; Mrs. W. Chalmers, Hallyburton, Coupar Angna; J. Copple (2); Henry Lingwood, Needham Market.

Dorkings.—*Silver-Grey.*—1 and 3, W. Ruttidge, Northend, Kendal. 2, E. Wren, Lowestoft. *hc*, Mrs. H J. Bayley, Rosedale, Tenbury.

Dorkings.—*White.*—1, W. Morfitt, Goole. 2, Mrs. G. M. Rolls. 3, J. E. Pilgrim. Hinckley.

Dorkings.—*Cuckoo* —1, H. Allen, Wood Green. 2, Countess of Dartmouth. 3, W Messenger, Woncrsh, Guildford. *c*, H. Allen.

Cochin-China.—*Cinnamon and Buff.*—1, W. A. Taylor, Manchester. 2, J. Cattell, Birmingham. 3, S. R Harris, Onsgarne, St. Day. *hc*, H. Tomlinson, Birmingham. *c*, A. H. Jones, Larkhill, Liverpool.

Cochin-China.—*Cinnamon and Buff.—Cockerel.*—1, W. A. Taylor. 2, Mrs. A. Tindal, Aylesbury. 3, Henry Lingwood. *vhc*, R. P. Percival. *hc*, H. Goodfellow, Madeley, Newcastle; C. Bloodworth, Cheltenham. *c*, Mrs. H. Shutt, Stourbridge; J. T. Lees, Drayton.

Cochin-China.—*Cinnamon and Buff.—Pullet.*—1, A. Darby. 2, G. E. Cartmel. 3, Mrs. A. Tindal. *hc*, R. P. Percival; J. Cattell; W. A. Taylor. *c*, Mrs. E. Allsopp, Worcester; H. Dean.

Cochin-China.—*Brown and Partridge-feathered.*—1 and *hc*, W. A. Taylor. 2, Mrs. A Tindal. 3, T. Stretch, Ormskirk. *vhc*, E. Tudman, Whitchurch, Salop.

Cochin-China.—*Brown and Partridge-feathered. — Cockerel.* —1, Mrs. A. Tindal 2, W. A. Taylor. 3, R. P. Percival. *vhc*, T. Aspden. *hc*, E. Tudman.

Cochin-China.—*Brown and Partridge-feathered.—Pullet.*—1, R. P. Percival. 2, W. A. Taylor. 3, E. Tudman. *hc*, T. Aspden, Church; R. Jones, Neath; Mrs. A. Tindal. *c*, Mrs A. Tindal

Cochin-China.—*White*—1, C. Bloodworth. 2, R. S. S. Woodgate, Pembury, Tunbridge Wells. 3, W. Whitworth, jun., Longsight, Manchester. *hc*, T. Rogers, Walsall; S. R. Harris; W. R Bull, Newport Pagnell.

Cochin-China.—*Any other variety.*—1, W. Jehu, Bridgenorth. 2, G. Fortey, Shrewsbury. 3, A Darby, Shrewsbury. *hc*, T. Aspden *c*, H. Feast, Swansea.

Houdans.—*Cock.*—1, J. J. Scott, Llanstephan. 2, R. B. Wood, Uttoxeter. 3, W. Whitworth, jun. *vhc*, F Bennett. *hc*, G D. Harrison, Grange-over-Sands; G. Anderton, Accrington; W. Dring, Faversham. *Hen.*—1, W. Dring. 2, C. Morris. 3, W. Whitworth, jun. *hc*, G. D. Harrison; R. B. Wood (2); J. B. Rowland, Pillerton Vicarage, Warwick.

French.—*Any other variety.*—1, W. H. Crabtree. 2, Rev. G. B. Knight Biratwith Vicarage, Ripley. 3, Rev. W. J. Ridley, Newbury. *hc*, Mrs. J. Cross Brigg; F. Bennett.

Spanish.—*Cock* —1, E. Jackson, Finchfield, Wolverhampton. 2, J. Walker, Wolverhampton. 3, Mrs. E. Allsopp. *hc*, W. Smallwood, Wolverhampton; E. Jackson; J. Barry, Bristol. *Hen.*—1, Mrs. E. Allsopp. 2, J. Walker. 3, J. F. Silitoe, Wolverhamptoo.

Game.—*Black Red.—Cockerel.*—1, G. Bagnall, Stoke-on-Trent. 2, G. Newdigate, Shifnal. 3, S. Matthew, Stowmarket. *hc*, J. Mason, Worcester; A. Dyas, Madeley. *c*, J. Palmer, Wednesbury.

Game.—*Brown Red. — Cockerel.* — 1, S. Matthew. 2, T. Hassell, Market Drayton. 3, T. Burgess, Whitchurch, Salop. *hc*, W. Perrin; Miss Osborn (2); J. Forsyth; A. Dyas.

Game —*Excepting Brown and Black Reds. — Cockerel.* — 1, W. J. Cope, Barnesley. 2, J. Forsyth, Wolverhampton. 3, E. Winwood, Worcester. *hc*, J. Palmer; E. Bell. *c*, E. Bell.

Game.—*Any variety.—Cock.*—1, S. Matthew. 2, G. Lunt, Market Drayton. 3, J. Foreyth. *hc*, J. Palmer; C. Chaloner, Chesterfield. *Hen.*—1, A Cameron, Epworth. 2, S. Matthew. 3. J. P. Gardener, Rugeley. *vhc*, J. Forsyth; J. Palmer. *hc*, C. F. Barnett; Miss Osborn.

Polands —2, T. Webb, Sutton.

Hamburghs.—*Gold-spangled.* — 1, T. Blakeman, Wolverhampton. 2, H. Pickles, Earby, Skip on. 3, Duke of Sutherland. *hc*, I Davies; S. W. Hallam; W. May. *Silver-spangled.*—1 and 2, Duke of Sutherland. 3, H. Pickles. *vhc*, Ashton & Booth. *hc*, C. Parsons

Hamburghs.—*Gold-pencilled.*—1, H Pickles. 2, W. Dixon, jun., Darby. 3, S. W. Hallam, Leicester. *c*, J. Anderton. *Silver-pencilled.*—1, R. W. Bracewell, Earby, Skipton. 2, H. Pickles 3 and *hc*, Duke of Sutherland.

Bantams.—*Game.*—1, E. Bell, Burton-on-Trent. 2 and *hc*, Mrs. E. Hunter, Wolverhampton. 3, G. Roden, Wolverhampton. *Any other variety.*—1, H. B. Smith, Broughton. 2, Mrs. Wootton, Mapperley, Nottingham. 3, W. H. Shackleton, Bradford. 4, Mrs. E. Pritchard, Wolverhampton. *hc*, R. H. Ashton; Mrs. A. Tindal. *c*, Sir J. Morris; J. Bloodworth.

Any other Variety —1, W. Meanley, Handsworth, Birmingham (Black Hamburghs). 2, F. Sabin, Birmingham (Malay). 3. A. Ward. *hc*, Duke of Sutherland (Black Hamburgh); H. Yardley (Yokahamas); G Burnell (Malay); Rev. N. J. Ridley (Malay); H. Pickles (Black Hamburgh); T. Marples (Sultans) A. Ward.

Selling Class.—*Brahmas, Dorkings, and Cochins.—Cock.*—1, H. B. Morell Clyro (Dark Brahma). 2, S. Sambrooke (Buff Cochin). 3, F. J. Cotterell (Light Brahma). 4, J H. Jones, Handforth, Manchester (Partridge Cochin). *vhc*, R. P. Percival (White Cochin). *hc*, P. Ogilvie (Dark Brahma); G. F. Whitehouse (Dark Brahma); E. Pritchard (Dark Brahma); J. Pitt (Dark Brahma); W

Hargreaves; R. P. Percival (Dark Brahma); H. B. Morrell (Dark Brahma); H. Yardley (Dark Brahma); T. F. Ansdell (Dark Brahma); C. L. Boyce (Dark Brahma); T. Powner (Dark Brahma); T. Barker (Brahma); H. Chawner, jun. (Brahma); F. Bennet (Brahma); R. P. Percival (Light Brahma); E. J. Draper (Buff Cochin); H. Goodfellow (Buff Cochin); Mrs. H. Shutt (Buff Cochin); J. Cattell (Buff Cochin); F. Bennett (Buff Cochin); J. Alcock (Buff Cochin); H. Tomlinson (Buff Cochin); R. P. Percival (Partridge Cochin); G. Lamb (Partridge Cochin); J. H. Jones (Dark Brahma); J. Watts; H. Chawner, jun. (Brahma); F. J. Cotterell.

SELLING CLASS.—*Excepting Brahmas, Dorkings, or Cochins.—Cock.*—1, J. Pitt, Wolverhampton (Spanish). 2, G. Burnell, Rugeley (Black Red Game). 3, J. Walker (Spanish). 4, J. & E. Prince, Nantwich (Brown Red Game). *vhc*, C. L. Boyce (Black Hambargh); T. Boulton (Gold-spangled Bambargh); J. T. Parker (Spanish); J. Jarratt (Spanish). *hc*, Duke of Sutherland; Rev. H. Buckston (Silver-spangled Hamburgh); T. Hassell (Brown Red Game); F. A. Beck, Guilaford, Welshpool (Black Red Game); J. S. Rooth (Malay); H. C. While, Maney, Sutton.

SELLING CLASS.—*Brahmas, Dorkings, or Cochins.—Hens.*—1, R. P. Percival (Dark Brahma). 2, E. Shaw, Oswestry (Dorking). 3, E. Pritchard (Dark Brahma). 4, C. Morris (Light Brahma). *vhc*, T. Rogers (Dark Brahma); R. P. Percival (Light Brahma). *hc*, G. F. Whitehouse (Dark Brahma); H. B. Morell (Dark Brahma); Newnham & Manby (Dark Brahma); Mrs. Allsopp (Dark Brahma); H. Langman (Dark Brahma); W. Hargreaves; P. Ogilvie (Dark Brahma); H. Chawner, jun (Brahma); F. Bennett (Brahma); J. Watts (Brahma); W. H. Haseler (Light Brahma); J. Alcock (Buff Cochin); R. P. Percival (Buff and White Cochins); J. T. Lees, Drayton, Penkridge (Buff Cochins); C. Bloodworth (Buff Cochins); H. Tomlinson (Buff Cochins); J. J. Waller (Partridge Cochins).

SELLING CLASS.—*Excepting Brahmas, Dorkings or Cochins.—Hens.*—1, E Jackson (Spanish). 2, R. B. Wood (Crevè-Cœurs) 3, D. Lane, Hardwick, Gloucester (Houdans). 4, C. L. Boyce, Birmingham (Black Hamburghs). *hc*, R. Davis (Silver-spangled Hamburghs); J. Jarratt (Spanish); J. T. Parker (Spanish); W. B. Etches (Scotch Greys); J. Aldridge, jun. (Black Spanish); H. C. While.

TURKEYS.—1, W. Wykes, Wolvey, Hinckley. 2, P. Gill, Trewern, Oswestry. *hc*, Rev. N. J. Ridley; R. H. Masfen.

GEESE.—1 and 2, T. Kingsley, Tring.

DUCKS.—*Aylesbury.*—1, Mrs. Wootton. 2 and *hc*, T. Kingsley. *Rouen.*—1, —Gladstone, jun., Liverpool. 2, W. Evans, Prescot. *vhc*, W. Evans; W. Meanley. *hc*, J. Forsyth; W. B. Etches. *Any other variety.*—1, S. Burn, Whitby (Black East Indian). 2 and 3, Sir J. Morris, Wolverhampton (Pintail and Carolina). *vhc*, J. C. Smith (Brazilian); Mrs. G. M. Rolls; Mrs. H. J. Bailey (White Call). *hc*, R. Macalister (Muscovy); S. Burn (Carolina); H. B. Smith.

PIGEONS.

TUMBLERS.—1, 3, and *vhc*, H. Yardley, Birmingham. 2, J. Baker, Kew Bridge. *hc*, A. & W. H. Silvester, Sheffield.

FANTAILS.—1 and 2, E. A. Seal, Kilgobbin, Dublin. 3, H. Yardley.

CARRIERS.—1, H. Yardley. 2, J. Baker. 3, A. J. E. Swindell, Stourbridge.

DRAGOONS.—1, Rev. G. F. Hodson, North Petherton. 2, H. Yardley. 3, C. E. Chavasse, Sutton Coldfield. *hc*, F. Elkington, Wolverhampton; H. Yardley; J. Barker.

ANTWERPS.—1 and 3, W. Gamon, Chester. 2, J. F. Theobald, Lower Tooting, London. *hc*, H. Gough, Wolverhampton; E. Booth, Birmingham.

ANTWERPS.—*Working or Homing.*—1, J. J. Sparrow, Grosvenor Mews, London. 2 and *hc*, W. Ellis, Idle, Leeds. 3, W. Gamon.

NUNS.—1, R. J. Goodwin, Townsend, Stoke-on-Trent. 2, R. W. Richardson, Meaux Abbey, Beverley. 3, H. Yardley. *hc*, J. Watts; E. A. Seale.

OWLS.—1, J. Baker. 2, J. J. Sparrow. 3, H. Yardley. *hc*, J. W. Edge, Birmingham.

TURBITS.—1, S. Salter, Oxford. 2, J. Baker. 3, E. A. Seale. *hc*, W. Tedd; H. Mappleback, Birmingham; E. A. Seale.

JACOBINS.—1, E. A. Seale. 2 and 3, J. Thompson, Bingley. *vhc*, J. Baker; R. W. Richardson; W. T. Breeden.

BARBS.—1 and 3, H Yardley. 2, J. Baker.

POUTERS.—1 and 3, H. Pratt, Hampton-in-Arden. 2, H. Yardley. *hc*, Mrs. Ladd, Calne; J. Baker.

ANY OTHER VARIETY.—1, Wells & Sherwin, Ripon. 2, J. Watts. 3, W. Tedd.

SELLING CLASS.—1, H. Yardley. 2, J. Baker. 3, J. Thompson. *hc*, J. Watts; H. Yardley.

JUDGES.—Mr. R. Teebay, Fulwood, Preston; Mr. F. C. Esquilant, 4, Effra Road, Brixton, London; Mr. M. Leno, Dunstable; Mr. J. Dixon, North Park, Bradford.

FAKENHAM SHOW OF POULTRY, &c.

THE fifth annual Show of the Fakenham and West Norfolk Poultry Club was held on the 12th and 13th inst. in the Corn Hall, a building which, from the great abundance of light and its good size, is admirably adapted for the purpose of a poultry show.

The Coloured *Dorking* cocks were inferior to the hens, which included several very good birds. The cup hen was a very fine one. In Dorkings of any other variety Silver-Greys, Whites, and Cuckoos won the prizes. Buff *Cochin* cocks were a fair class; but Cochin cocks of any other colour were poor. Buffs took all the prizes amongst Cochin hens. The first Dark *Brahma* cock, which was a grand bird, succeeded in winning the Brahma cup and the champion cup for the best pen in the Show. He won his place fairly, and was a good step ahead of any others in the class. Hens were a nice class; and here Mr. Leno had to be content with a second prize, first being awarded to a beautifully-marked pullet belonging to the Rev. J. D. Peake. Both classes of Light Brahmas contained some very excellent birds, but some two or three good ones were very much out of festher. In Brown Red *Game* cocks Mr. Martin won the Prince of Wales's cup with one of his now well-known strain, a bird most excellent in colour, style, and shape. This was an excellent class. The Black Reds, although good, were by no means equal. In Game hens, Black or Brown Reds, the prizes went to some most beautiful birds of the latter variety, first besting the second chiefly in style. In Game cocks of any other colour some graud Duckwings were shown; and in hens two Duckwings and a Pile were the winners. In *Hamburghs* the cup was won by a psir of very good Golden-spangled, the best in their class. In Silvers the hens were, generally speaking, much better than the cocks; indeed, there were several pens containing good hens, but good cocks were rare. The Golden-pencilled were a fair class; and the Silver-pencilled contsiued some very nice birds. The first cock had a very nicely-marked tsil; the hen was also a good one. Blacks were about an aversge, and here the first-prize psir won the second county cnp. There were two classes for *Malays*, and amongst them were some capital specimens of both White and Coloured. *Spanish* were not numerous; the first-prize psir won the section cup. In *French* very fiue Crêves won first, La Flèche second, and Crêves again third. In the Variety class a fiue psir of Golden Polish won; second were nice Silver Polish, and third White Leghorns. The Black and Brown Red Game *Bantam* cock class contained some very nice Black Reds, and the other Coloured Game Bantam cocks contained some remarkably good Duckwings, also one or two fair Piles. Game Bantam hens were chiefly Black Reds, but a very good Brown Red was first. In Bantams of any other variety Silver-laced, Black, and White were respectively the winners. In Aylesbury and Rouen *Ducks* Rouens were first, and better than any of the others. The Variety Duck class contained a very pretty and interesting collection of various fancy Ducks. The Selling classes were numerously filled, and contained a few good and cheap birds.

In PIGEONS the first-prize Black *Carrier*, a cock, secured the section cup; he was a fine bird and in capital condition. The *Pouter* class contained a lot of excellent birds, more especially of Whites, first being a grand White, second and third capital Blues. In *Tumblers* some good birds were shown, bnt the competition was very limited. *Fantails* were fair. *Dragoons* were very good indeed, some very capitsl specimens of Blues and Yellows being the winners. The *Antwerp* class contained some few very nice birds; the first and second a Silver Dun and a Blue, being both very good in qusility. The *Jacobins* were a fair average; and in Any other variety all the prizes went to Black Barbs, and the first-prize peu won the section cup.

DORKINGS.—*Coloured.—Cock.*—1, 2, and County, Mrs. B. B. Sapwell, Norfolk. 3, J. Gee, Oxford. *Hen.*—Cup and 1, F. Parlett, Chelmsford. 2, H. Lingwood. 3, J. White, Northallerton. County and *c*, E. H. Willet, Norwich. *hc*, C. Speed, Oakham; J. Gee.

DORKINGS.—*Any other variety.*—1, L. Wren, Lowestoft. 2, C. Speed. 3, J. H. Putney, Dorking. County, T. & H. Heath, Norwich. *hc*, T. & H. Heath; C. Speed; W. Mortitt, Goole. *c*, J. Robinson, Garstang.

COCHINS.—*Cinnamon or Buff.—Cock.*—1, W. A. Burnell, Southwell. 2, E. Winwood, Worcester. 3 and County, W. Brunton, East Dereham. *hc*, H. Lingwood. *Any other variety.—Cock.*—1, T. J. Saltmarsh, Chelmsford. 2 and County, Major Bignold, Norwich. 3, G. G. Baldwin, East Dereham. *Any variety.—Hen.*—Cup and 1, M. Leno, Dunstable. County and 2, Major Bignold. 3, W. A. Burnell. *hc*, J. Everitt, Hadleigh; C. Speed; Mrs. C. Berners, Yoxford. *c*, G. Vincent.

BRAHMAS.—*Dark.—Cock.*—Champion and Section Cups and 1, Horace Lingwood. 2, T. F. Ansdell, Cowley. 3, R. P. Percival, Manchester. County, J. S. Pearson, Manchester. *vhc*, J. Watts, Birmingham. *hc*, J. S. Pearson; W. Brunton. *Hen.*—1, Rev. J. D. Peake, Laleham Vicarage, Chertsey. 2, M. Leno. 3, T. F. Ansdell. *hc*, W. Brunton; J. S. Pearson; Horace Lingwood; E. H. Willett. *c*, G. C. Livett, Soham; W. Brunton; T. F. Ansdell. County, J. S. Pearson.

BRAHMAS.—*Light.—Cock.*—1, P. Haines. 2, G. Walters, Worcester. 3, F. J. Cotterell, Beechfield, Birmingham. County, J. P. Case, Fakenham. *hc*, Mrs. F. Cheshire, Acton. *Hen.*—1 and 2, P. Haines, Palgrave, Diss. 3, F. J. Cotterell. County, J. P. Case. *vhc*, G. Walters. *hc*, J. P. Case; M. Leno; E. J. Bird.

GAME.—*Brown Red.—Cock*—Prince of Wales's Cup, Game Cup, County, and 1, H. E. Martin, Fakenham. 2, W. & H. Adams, Ipswich. 3, J. Cock, Worcester. *vhc*, C. Waney, Creake. *hc*, H. E. Martin; A. Wootton, Fakenham. *Black Red —Cock.*—1 and County, J. S. Pearson. 2, J. Paine. 3, J. F. Walton, Rawtenstall. *hc*, G. H. Fitz-Herbert, Sevenoaks; W. Wainwright, Rugby. *Black and Brown Red.—Hen.*—1, A. Cameron, Rotherham. 2, 3, and County, H. E. Martin. *hc*, A. Wootton; J. S. Pearson; J. P. Gardner, Rugeley; J. Chester.

GAME.—*Any other variety.—Cock.*—1, J. S. Pearson. 2, W. & H. Adams. 3, E. Winwood. County, H. E. Martin. *hc*, H. E. Martin; J. F. Walton. *Hen*—1, T. Whitaker, Melton Mowbray. 2 and *hc*, E. Winwood. County and 3, H. E. Martin.

HAMBURGHS.—*Golden spangled.*—1 and Cup, T. Blakeman, Wolverhampton. 2, W. K. Tickner, Ipswich. 3, B. Reynolds. County, H. K. Plattin, jun., Fakenham. *hc*, J. Robinson. *Golden-pencilled.*—1, W. K. Tickner. 2, J. Robinson. 3 and County, A. C. Chamberlin, Swaffham. *hc*, A. Silver, Long Melford; E. Walton.

HAMBURGHS.—*Silver-spangled.*—1, W. Barker, Mark Lane, London. 2, T. H. Turner, Sheffield. 3, J. Robinson. County, H. K. Plattin, jun. *Silver-pencilled.*—1, J. Robinson. 2, R. W. Bracewell, Earby. 3 and County, J. P. Case. *hc*, B. Norton, Town Malling; E. Walton.

HAMBURGHS.—*Black.*—County Cup, County Prize, and 1, J. P. Casc. 2, J. Long, Bromley Common. 3, J. Robinson. *hc*, T. A. Wright, Great Yarmouth; A. A. Boissier, Penshurst.

MALAYS.—*Cock.*—Cup, 1, and County, E. Branford, Swaffham. 2, S. B. Perry, Lymington. 3, J. G. Falle, Jersey. *hc*, S. Elliott, jun., Lakeard; J. G. Falle; E. Branford; J. Hinton, Warminster; A. Hawkins. *c*, Rev. N. Ridley, Hollington House, Newbury. *Hen.*—1, J. S. Rooth, Chesterfield. 2, County, and *hc*, E. Branford. 3, J. Hinton.

SPANISH.—Cup and 1, H. Wilkinson, Skipton. 2, J. F. Walton. County and 3, Major Ewen, Norwich. *c*, J. F. Dixon.

FRENCH.—1, C. H. Smith, Parkhelds, Derby (Crêve-Cœurs). 2, Mrs. Wicks, Brigg (Crève-Cœurs). 3, E. Walton. County, Mrs. Miller. *hc*, F. Barlow, Cambridge (Houdans); Mrs. Miller. *c*, W. Cutlack, jun., Littleport, Ely (Crève-Cœurs).

BRAHMA POOTRA.—1, H. Wyse, Rishopbriggs. 2, J. Angus, Muirkirk. 3, G. Willison, Kilmarnock. 4, J. Honeyman, Skelmorlie.

SCOTCH BREED.—1 and Special, H. B. Marshall, Glenlove, Airdrie. 2, W. Purdie Bothwell. 3, R. M'Lellan, Wallacetown, Ayr. 4, J. Clarke, Dalserf, by Carlnke.

HAMBURGHS.—*Golden-spangled.*—1, A. Begg, High Blantyre. 2, A. Friskin. 3, W. Crawford, Beith 4, A. Robertson, Kilmarnock. *Hens.*—1, J. Jardine, Kilmarnock. 2, A. Friskin. 3, A. Black, Kilpatrick. 4, A. Robertsen, Kilmarnock.

HAMBURGHS —*Golden-pencilled.*—1 and Special, J Graham, Largs. 2, H. Pickles, Earby, Skipton. 3 and 4, D. Gilmour, Kilmarnock. *Hens.*—1, R. M'Millan, Holly Bush 2, D. Ferrie, Rutherglen. 3, W. Linton, Selkirk, Slotharn Bank. 4, D. Langland.

HAMBURGHS.—*Silver-spangled.*—1, H. Pickles. 2 and Special, D. Lachland, Kilmaurs. 3, Scott & Boo'h, Bury. 4, R. Thomson. Alexandria. *Hens.*—1, A. Yendal, Galston. 2, H. Pickles. 3, A. Henderson, Barrhead. 4, J. Park, East Kilbride.

HAMBURGHS.—*Silver-pencilled.*—1 and Special, H. Pickles. 2, H. Smith, Keighley. 3, A. Angus, Galston. 4, J. Lochhead, Kilbarchan. *Hens.*—1, R. Borland, Kilbarchan. 2, R. Muir, Craigie. 3, T. Alexander, Bathgate. 4, J. Lochhead.

POLANDS.—*Topped.*—1, W. Good, Airdrie. 2 and 4, J. Laird. 3, J. Wylie, Johnstone.

GAME.—*Black-breasted and other Reds.*—1 and Special, J. Waddel, Airdrie. 2, J. & C. Sneddon, Tollcross. 3, D. Mackie, Stewarton. 4, G. Williamson, Johnstone. *Any other colour.*—1 and 3, R. Heys. 2, J. Waddel. 4, N. Forrest, Whiteinch. *Hens.*—1, R. Heys. 2, N. Neilson. 3, J. Ferguson, Dalmuir. 4, J. Clark.

ANY OTHER VARIETY.—1, J. C. Shaw, Barrhead. 2, H. Pickles. 3, D. Honeymoon, Larbert. 4, J. M. Wilson, Kilmarnock.

CROSS BREEDS.—1, 2, and 3, J. Pollock, Mearns, West Milton. 4, A. Brown, Neilston.

DUCKS.—*Aylesbury.*—1, 2, and Special, A. Robertson. 3, Z. H. Heys. 4, T. Adam, Renfrew. *Any other variety.*—1, Mrs. Alston, Craighead. 2, H. R. M'Millon, Blantyre. 3, J. Young, Neilston. 4, J. Pollock, Mearns.

GAME BANTAMS.—*Black-breasted Reds.*—1, J. Mather, Strathaven. 2, P. M'Quattie, Bonhill. 3, J. Taylor, Johnstone. 4, T. Barker, Burnley. *Any other variety.*—1, J. Campbell, Pollokshaws. 2, J. Scoular, Kilmarnock. 3, J. M'Laren, Kilmarnock. 4, Z. H. Heys. *hc*, T. Barker; Gow & Walker, Kilbarchan.

BANTAMS.—*Black.*—1, J Rouston, Rutherglen. 2, R. H. Ashton, Mottram, Manchester. 3 and 4, D. M Laren, Kilmarnock. *hc*, J. Currie, Kilmarnock. *c*, B. Brown, Bonhill. *Any other colour.*—1 and 2, W. Kerr, Beith. 3, A. Robertson. 4, J. Mitchell, Paisley. *hc* J. H. Law, Birmingham.

SELLING CLASS —1 and Special, Mrs Alston. 2, J. Waddell, Airdric. 3, R. Borland, Kilbarchan. 4, J. Ferguson, Dalmuir.

PIGEONS.

POUTERS.—*Black or Blue.*—*Cock.*—1 and Special, G. Wallace, Durnbank, Glasgow. 2, G. Andrews, Beith. 3, H. Thomaon, Glasgow. *Hen.*—1, G. Wallace. 2, H. Thomann. 3, G. Andrews.

POUTERS.—*Any other colour.*—*Cock.*—1, G. Wallace. 2, A. Dunleavy, Glasgow. 3, H. Thomson. *Hen.*—1, J. R. Renuards, Helensburgh. 2 and 3, G. Wallace.

TUMBLERS.—*Short-faced.*—1, 2, and 3, M. Stewart, Glasgow. *Any other variety.*—1, Miss A. Blair, Johnstone. 2, A. Gray, Kilbarchan. 3, J. Crawford.

CARRIERS.—1, 2, and Special, M. Stewart. 3, M. Gilmour, Inchmnan.

FANTAILS.—1, Miss A. Blair. 2, J. Galt, Kilbirnie. 3, W. Stevenson, Beith.

JACOBINS.—1, J. Lohore, Larkhall. 2, J. R. Renards, Helensburgh. 3, J. G. Orr, Beith.

NUNS.—1 and 2, A. Duthie, Montrose. 3, J. Gilmour, jun., Galston.

TURBITS.—1, J. G. Orr. 2, J. R. Renards. 3, M. Gilmour.

COMMON.—1, Cumming & Fleming, Beith. 2 and 3, D. Weddle, Gatesida, Beith.

ANY OTHER VARIETY.—1, A. Dunleavy. 2, J. F. Cunningham, Beith. 3, J. G. Orr.

SELLING CLASS. — 1, R. Raines, Stirling. 2, A. Dunleavy. 3, H. Davis, Kilbirnie.

CANARIES.

CLEAN.—*Pair.*—1 and Special, J. Hood, Kilbirnie. 2, W. Clark, Kilbarchan. 3, G. Grant, Glaagow. 4, T. Dalton, Ayr.

YELLOW.—*Cock.*—1 and Special, J. Thorpe, Dumfries. 2, G. Grant. 3, T. Scott, Carluke. 4, A. Kelly, Paisley. 5, J. Johnstone, Glasgow. *Hen.*—1 and Special, R. Byron, Dalry. 2, S. Brown, Glasgow. 3, P. Wilson, Douglas.

BUFF.—*Cock.*—1, N. M'Lean, Glasgow. 2, W. Paterson. 3, W. Stevenson, Inkermann. 4, G. Grant. 5, R. Ritchie, Renton. *Hen.*—1, W. Stevenson. 2, J. Graham, Kilmarnock. 3, G. Grant. 4, J. Kennedy, Paisley. Special, J. Grieve, Leith.

PIEBALDS.—*Pair.*—1 and Special, D. Gibb, Anchinheath. 2, W. Thom, Stevenson. 3, A. Kelly. 4, J. Gibson, Paisley.

PIEBALDS —*Yellow.*—*Cock.*—1, J. M'Cuthon, Airdrie. 2, W. Cochran, Glasgow. 3, T. Jamieson, Kilbarchan. 4, C. Aird. Kilmarnock. 5, W. White, Renfrew. *Hen.*—1 and Special, J. Pettigrew, Carluke. 2, M. Barr, Paisley. 3, J. Grieve. 4, C. Aird. 5, R. Houston, Kilbirnie.

PIEBALDS.—*Buff.*—*Cock.*—1 and Special, W. Hunter, Kilbirnie. 2, R. Stevenson, Galston. 3, T. Christie, Glaagow. 4, A. S. Barr, Glasgow. 5, N. M'Lean. *Hen.*—1, J. Brown, Paisley. 2, A. Kelly, Paisley. 3, J. Grieve. 4, J. Smith, Beith. 5, J. Mitchell, Perth.

FOCL.—1 and Special, W. Hunter. 2, D. Perric, Paisley. 3, J. Grieve.

GREEN.—1 and Special, W. Thom. 2, J. Barr, Glasgow. 3, W. Hampherson, Glasgow.

GOLDFINCH MULE.—1, A. A. Mauchan, Dumbarton. 2, J. M'Pherson, Paisley. 3, J. Thorpe, Dumfries.

GOLDFINCH.—1, T. Conn, Kilwinning. 2, T. Reive, Glasgow. 3, W. Arthur, Paisley.

HOME BIRDS.—1, W. Barrlas. Alexandria (Bullfinch). 2, Miss J. Neilson (Cock of the north). 3, J. Bryson, jun.. Paisley (Starling).

FOREIGN BIRDS.—1 and 2, Mrs. Wilson, Kilmarnock (Cockatoo and Parrot). 3, A. M'Phee, Paisley (Parrot).

We have received the following notes on the Pigeon classes:—*Pouters*, Black or Blue, cock.—All the placed birds were Blues. First-and-special good in limb; second longer in feather, but shorter in limb, and deficient in style; third we could not get to show. Pouter cocks, Any other colour.—First and second Whites; third Mealy, which deserved second place. Pouter hen, Black or Blue —First Black; second Blue, with very wide-set limbs; third bare of leg-feathering and bishop-winged. Ponter hen, any other colour.—First White, hardly deserved to be placed; second and third beat her hollow. The latter was a Red, but bad in colour. The Pouter class was altogether a very indifferent one, there being not a really good specimen in the lot; for the four classes there were only twenty-nine entries. Short-faced *Tumblers*, in pairs.—First and second Almonds; third Blacks. All very good in head properties, but we thought a little deficient in colour. *Tumblers*, any other colour.—First were very pretty Balds; second good Blacks; third very coarse Yellows. 54½ should have had third place. *Carriers.*—First Duns; second Blacks. These were magnificent specimens, and the only Pigeons in the Hall of special merit. The third were "duffers." *Fantails.*—First Whites; second Saddlebacks; third Whites. We liked pen 63 best, and would have placed them first. Second were right placed, and we should have substituted 72 for the third-prize pen. We could have bet onr hat (it is an old one) that several pens in this class were made up of hens, and some of these were among the winners. *Jacobins.*—First Yellows; second and third Reds. Pen 85 contained a good pair in bad condition. No. 80 also very good. *Nuns.*—All Blacks, and prize birds were placed. Lots of trimming, as usual. *Turbits.*—First good; second bad; third fair. No. 110 should have had second place. Common Pigeons.—The prize birds were all dapples, and we think the Judge did well in this. Any other variety and Selling classes contained nothiug worthy of notice, with the exception of a pair of White Foreign Owls, shown in wretched condition.

The prizes offered were 15*s.*, 10*s.*, and 5*s.*, with card for fourth prize, and should have brought together a great many more birds. There were only 167 entries in this department. We are accustomed to see considerably more birds, and as good in quality, at the village shows, where the prize money is less than one-third that offered here. Perhaps the names of the Judges not being advertised had something to do with this. We would like to see the Paisley Show well patronised by the fancy, as it well deserves to be, and we hope in future the Committee will leave no stone unturned to make it what it ought to be—second to none on their side the border. The birds were in dome-shaped wire pens, all fastened down, and they were particularly well cared for with food and water. They were arranged in double tiers; those in the lower were too dark, and those in the upper too high to be seen to advantage. The Judge, Mr. McLean, is a new hand; we hail his advent. He did his work well, and only requires experience to impart a little more confidence. We were sorry to see large stacks of hampers outside, and exposed

to the heavy rain. They must have got soaked, and birds going long distances in these are sure to be the worse for it.

JUDGES.—*Poultry:* Mr. A. Paterson, Airdrie; Mr. T. Struthers, Larkhall; Mr. J. Sharp, Johnstone; Mr. T. Raines, Bridge Hough, Stirling; Mr. C. M'Gechan, Hamilton; Mr. J. Paton, Stewarton; Mr. J. Stewart, Thistlebank, Helensburgh; Mr. J. Stewart, Barrhead. *Pigeons:* Mr. G. J. M'Lean, India Buildings, Edinburgh. *Cage Birds:* Mr. J. Fulton, Beith; Mr. T. Buchanan, Kinning Park, Glasgow; Mr. J. Graham, Kilmarnock; Mr. J. Lindsay, Hamilton; Mr. J. White, Paisley; Mr. W. Weir, Paisley; Mr. M. Barr, Paisley; Mr. R. White, Paisley.

SPALDING COLUMBARIAN SOCIETY'S SHOW.

THIS was held on the 14th inst. The following were the awards:—

POUTERS.—*Blue.—Cock.*—1 and Extra, H. B. Massey, Spalding. *Hen.*—1, H. B. Massey.
POUTERS.—*White.—Cock.*—1, — Simpson. *Hen.*—1, — Simpson.
POUTERS.—*Any other colour.—Cock.*—1, — Simpson. *Hen.*—1, — Simpson.
CARRIERS.—*Black.—Cock.*—1 and Extra, — Bulmer. Cup. H. B. Massey. 3, W. Massey. *Hen.*—1, H. B. Massey 2, — Bulmer. 3, W. Massey.
CARRIERS.—*Dun.—Cock.*—1, W. Massey. 2, — Bulmer. *Hen.*—1 and 2, — Bulmer. 3, W. Massey.
CARRIERS.—*Any other colour.—Cock.*—1, H. B. Massey. 2, W. Massey. *Hen.*—1 and 2, W. Massey. 3, H. B. Massey.
BARBS.—*Black or Dun.—Cock.*—1, Extra, and 2, H. B. Massey. 3, W. Massey. *Hen.*—1, Extra, and 3, W. Massey. 2, H. B. Massey.
BARBS.—*Any other colour.—Cock.*—1 and 2, W. Massey. 3, H. B. Massey. *Hen.*—1, W. Massey. 2, H. B. Massey. *Cock or Hen.*—1, — Simpson.
ANTWERPS.—1 and 2, — Shadford.
TUMBLERS.—*Almonds.*—2, H. B. Massey. *Any other colour.*—1 and Extra, H. B. Massey. 2 and 3, — Dows.
FANTAILS.—1, Extra, and 2, — Simpson.
OWLS.—3, — Dows.
JACOBINS.—*Reds*—1, Extra, and 2, — Royds. *Any other colour.*—1, 2, and 3, — Royds.
TRUMPETERS.—1 and 2. — Simpson.
RUNTS.—1, — Dows. 2 and 3, H. B. Massey.
ANY VARIETY.—1, H. B. Massey. 2 and 3, — Dows. *hc,* — Simpson; — Dows.

YOUNG BIRDS.

WHITE.—*Cock.*—1, — Simpson. *Hen.*—1, H. B. Massey. 2, — Simpson.
CARRIERS.—*Black.—Cock.*—1 and Extra, — Bulmer. 2, H. B. Massey. 3, W. Massey. *Hen.*—1, — Bulmer. 2 and 3, W. Massey. *hc,* — Simpson; — Bulmer.
CARRIERS.—*Dun.—Cock.*—1, W. Massey. 2, — Simpson. 3, — Buffham. *Hen.*—1 and 2, — Bulmer. 3, — Simpson. *hc,* W. Massey.
CARRIERS.—*Any other colour.—Cock.*—1, H. B. Massey. 2, W. Massey. *Hen.*—1 and 2, W. Massey.
BARBS.—*Black.—Cock.*—1 and Extra, H. B. Massey. 2, W. Massey. 3, — Buffham. *Black or Dun.—Hen.*—1 and 2, W. Massey. 3, H. B. Massey.
BARBS.—*Any other colour.—Cock.*—1, W. Massey. *Hen.*—1, W. Massey.
SELLING CLASS.—1 and Extra, H. B. Massey. 2, — Simpson. 3, — Buffham. *hc,* — Shadford. *Pair.*—1 and 3, — Simpson. 2, H. B. Massey.

RABBITS.

LOP.—*Buck or Doe.*—1 and Cup, — Boyle.
BELGIAN.—*Buck.*—1, W. Massey. 2, — Dows. *Doe.*—1 and 3, — Buffham. 2, — Boyle. *hc,* — Dows.
SILVER-GREY.—1 and 2, — Boyle. 3, —Dows. *c,* — Buffham.
HIMALAYAN.—1 and 3, — Boyle. 2, — Dows.
DUTCH.—1, — Boyle.
ANY VARIETY.—1, — Boyle. 2, — Buffham.
HEAVIEST.—1, — Buffham.

OPEN RABBIT CLASSES.

LOP-EARED.—1, Mrs. H. Pickworth, Spalding. 2, B. Greaves, Cleethorpe. 3 and *hc,* T. Schofield, jun., Cheetham. Extra 3, C. King. *vhc,* T. & E. J. Fell. *c,* J. Irving (2).
BELGIAN HARE.—1, G. E. Livett. 2, R. J. Foster. 3, J. Poole. Extra 3, A. Hudson. *hc,* J. T. Billett; W. Whipham. *c,* C. Kitchen.
SILVER-GREYS.—1, A. Hudson. 2, Miss Mortimer. 3, J. Hallas. Extra 3, H. W. Wright; A. Canty; J. Hallas. *hc,* Mrs. Pickworth; B. H. Glew. *c,* T. Schofield, jun.
DUTCH.—1, J. Martin. 2, J. Irving. 3, B. Greaves. Extra 3, A. Hudson. *hc,* H. C. Gilbert. *c,* Mrs. H. Pickworth; G. Biddis.
HIMALAYANS.—1, C. G. Mason. 2, Dr. Eames. 3, S. Ball; Mrs. Pickworth. *vhc,* T. Hinks; G. H. Riding. *hc,* G. E. Levitt. *c,* J. Hindley.
ANY OTHER VARIETY.—1, J. Martin (Angora). 2, Mrs. Pickworth. 3, J. Hallas.
HEAVIEST.—1, P. Booth. 2, — Jessop. 3, J. Brown.
SELLING CLASS.—1, J. Hallas. 2, C. King (Lop). 3, H. Hincks (Silver-Grey). Extra 3, J. T. Codling (Lop). *vhc,* G. H. Riding (Angora). *hc,* A. C. Wiseman (Lop). *c,* T. Schofield (Dutch); A. Canty (Lop).

JUDGES.—*Pigeons:* Mr. Tegetmeier. *Rabbits:* Messrs. Smith and Harrison.

CRYSTAL PALACE POULTRY SHOW.—This will take place about November 22nd to 24th. No foundation exists for the report that Messrs. Howard and Nichols will not be the Secretaries.

BAILDON ORNITHOLOGICAL SHOW.

THE entries of Pigeons were very good in most of the classes. The pens were on Turner's principle and showed the birds well, although the light was not the best, the day being very dull. The birds were well fed and watered, and so far all was well; but in other respects the management was bad, for each class commenced with No. 1, and this made it most difficult to get through the classes without innumerable mistakes. But what was worst of all was that the classes were not arranged so as to follow each other, but were placed one at one end and the next perhaps in some other wing of the building; and we would suggest that in future some one be engaged to arrange and manage this section, for the Show having assumed good proportions, it is but a duty owed to the visitors and exhibitors.

Jacobins were first, and were a good lot, a Yellow hen being placed first, and Red second and third, and there was a grand Blue also. Of *Pouters*, first was White and second Black, while the third went to a Blue. *Fantails* were good, and the awards well made, the style and carriage of the winners being of high merit. English *Owls*, cock or hen, were a heavy class, and the first and second winners Blue. Mr. Binns's birds as usual not putting in appearance. *Antwerps* were in great force, no less than 112 birds being shown. In Short-faced cock or hen, the first award was made to Red Chequer hen which for form and head is most perfect, and a bird of last season. Second was a Silver Dun cock, but this was a mistake, for if the bird has not an actual frill, the breast feathers overlap each other. Third, a Blue Chequer cock, was a good bird. *Antwerps*, Long-faced, the first and second were Red Chequers, and capital birds, but some were left out which ought to have been in the list, notably Mr. Ellis's grand-headed bird, but the light was so bad here that there is little wonder he was not seen. In hens were some very good birds, both as regards head, style, and feather, and we think had these two classes been seen by our friends in the south it would become a recognised fact with them that the standard must have been settled for the Long-faced variety long before they took leave of their babyhood. Medium-faces were a grand lot, and as usual produced many perfect birds, the first being a Silver Dun with good black beak; and the cup for Antwerps was awarded here. All the winners were cocks. The second and third Red Chequers. In *Tumblers*, Long-faced, the first was a Red Mottle, rather dun in tail; second to a Black Mottle, and third to a Black Bald, Mr. Dye showing a real good Black Beard. *Carriers* were a fair lot, but Mr. Horner's champion Dun cock, though winning first, was in a most woebegone plight; second and third were Blacks. *Dragoons*, though a large class, were not good with a few exceptions. *Turbits* were a fair lot, and the winners Yellow, Red, and Yellow. Only the winners in *Barbs* were of any note; but Mr. Mawson's Black cock, which stood first, was really grand, not one of the broadest, however, but one of the most perfect in all points. Second was a good Black, but younger, and third a Black almost worn out. In the Variety class Mr. Hawley won with an exquisite Black Mottle Tumbler; the second going to a Pigmy Pouter, and third to a Red Letz. There was some sharp work in the Selling class, some capital birds being shown, and quickly snapped up even before the Show was open, although after the time advertised for opening.

"AN EYE WITNESS" writes—The *Canaries* numbered 246 entries, and it would be a difficult matter to award the palm to any particular breed of birds, the representatives in each class mostly consisting of birds which have won prizes at previous shows. The competition having been close greater care had to be brought into play, but at about half-past two o'clock the last of the cards of distinction was attached to the cages. The morning was anything but good for judging. The Executive, Messrs. Longbottom (President), Pemberton (Vice-President), Fawcett, jun. (Treasurer), and Myers Mann (Hon.-Sec.), worked with a determination to make the Baildon Show of 1875 worthy of the promoters. We saw a few of the "fancy," not only in the show-room but at host Winterburn's, and had a good opportunity of judging of their enthusiasm in the cause of Canaries and Pigeons. Those who have visited Baildon of course knew more about the place than I did prior to the Bird Show. When I emerged from Shipley station I sought a "cabby," who happened to be there, and who conveyed me the better part of the way to my destination. After slowly ascending hill after hill for about two miles, he suddenly came to a dead stop, and refused to proceed an inch further. The last hill going into Baildon was a poser for "cabby," and the offer of another shilling would not tempt him to further proceed. However, I groped my way in the dark, through mud occasionally, until I got on to a pathway skirted by a lowish stone wall, overlooking a chasm about 15 or 20 yards deep, at the bottom of which water was flowing, as I could tell from the glare of a lamp shining upon the surface. A few minutes brought me to my roosting quarters—the "Malt Shovel," where I refreshed the inner man with the good things provided by a very pleasant landlady. Baildon by daylight gave a very different impression to the one I had the evening previous. From the various summits splendid views of the Yorkshire hills and valleys may be obtained, but the foggy atmosphere debarred me of that treat, which, perhaps, may be enjoyed the next time I may chance to visit the place. I filled up my time in another way—admiring the birds. It must have been the departure of the severe frost that caused the temperature in the bird room to be more genial to one's feelings. It could not possibly have been the fiery-coloured Norwich birds. It is not the first occasion I have seen such, but with all that there were other birds in the room, consisting of the Belgian, Manchester Coppy, Lizard, Yorkshire, Cinnamon, and the various Mule breeds, fit to grace the cages of the best of fanciers. In the competition for the "specials." Messrs. Hutton & Thackray (with thirty-one) took away the silver cup offered to the winner of most points; Mr. Adams winning the cruet, he being next up in points (twenty-eight). Messrs. Cleminson & Ellerton, Hawman, Bunting, Mackley, Belk, Cox, and Horme, were

amongst the most successful prizetakers. Messrs. Huttou and Thackray also won a special prize, a set of knives and forks, for the best bird in class 12 (Yorkshire Yellow). The bird was one of the best I ever saw, being in tip-top trim.

PIGEONS.

JACOBINS.—*Cock or Hen.*—1, T. Holt, Bradford. 2, W. Smallpage, jun., Colne. 3, S. Lawson, Preston. *vhc*, S. Lawson; W. T. Swallow, Northampton. *hc*, J. Thomson, Bingley; E. Horner, Harewood, Leeds. *c*, W. F. Jennings, Bradford; E. Horner; T. Holt; Ingham & Helliwell, Halifax.

POUTERS.—*Cock or Hen.*—1 and 3, J. Hawley, Girlington, Bradford. *vhc*, E. Horner.

FANTAILS.—*Cock or Hen* —1, Ingham & Helliwell. 2, J. Walker, Newark. 3, J. F. Loversidge, Newark. *hc*, J. F. Loversidge (2); J. Walker; J. Hawley. *c*, E. Horner.

OWLS.—*English.—Cock or Hen.*—1, J. Thresh, Bradford. 2, E. Rhodes, Great Horton. 3, W. Fawcett, Baildon. *vhc*, Ward & Rhodes, Otley; W. Ellis, Idle. *hc*, Ward & Rhodes; E. Mounsey, Low Moor; S. Lawson; H. Jennings, Allerton; Ingham & Helliwell. *c*, Cockett & Sunderland, Great Horton, Bradford; W. Wilkinson, Great Horton; A. McKenzie, Liverpool; E. Rhodes; H. Jenoings.

ANTWERPS.—*Short-faced.—Cock or Hen.*—1 and 2, J. Lister, Keighley. 3, W. Slater, Gravelly Hill, Birmingham. *vhc*, W. Ellis; H. Jennings. *hc*, E. Cootes, Burnley; E. Mawson, Leeds; Tordoff & Wilkinson, Wibsey, Bradford; J. Lister; W. Ellis (2); E. Horner; H. Jennings. *c*, E. Horner.

ANTWERPS.—*Long-faced.—Cock* —1, J. Lister. 3, D. Riddiough, jun., Bradford. *hc*, T. Hutton, Baildon; W. Ellis (2); J. Whitaker, Baildon; R. W. Pratt, Oxford. *c*, T. Bottomley, Great Horton. *Hen.*—1, W. Ellis. 2, H. Jennings. 3, E. Cordley, Idle. *vhc*, Cockott & Sunderland; Tordoff & Wilkinson; J. Bastow, Keighley; H. Jenoings. *hc*, W. Illingworth, Wilsden; E. Mounsey. *c*, Cockett & Sunderland; T. Bottomley; W. Illingworth.

ANTWERPS.—*Medium-faced.—Cock or Hen.*—1, H. Jenoings. 2, J. Hawley. 3, Tordoff & Wilkinson *vhc*, J. Lister. *hc*, J. Barnett, Baildon; Cockett and Sunderland; Clayton & Bairstow, Girlington; W. Ellis; J. Dyson, Guiseley. *c*, J. Rushworth, Keighley; W. Wilkinson, Great Horton; W. Ellis (2); T. Foster, Bingley; J. Dye, Hexham.

CARRIERS.—*Cock or Hen.*—1 and 2, E. Horner. 3, J. Thompson. *hc*, Miss F. Seanor, Leeds; E. Mawson, Leeds; J. Hawley; J. Holden, Bradford; Clayton and Bairstow. *c*, J. Holden; A. McKenzie.

DRAGOONS.—*Cock or Hen.*—1, E. Horner. 2, J. Rushworth. 3, T. Smith, Keighley. *vhc*, Ward & Rhodes; A. Holt, Bingley; R. Woods, Mansfield (2). *hc*, Ward & Rhodes; T. Smith; Cox & Robinson, Baildon; W. Whitaker, Cowling, Crosshills; Miss F. Seanor; R. Woods. *c*, Clayton & Bairstow; J. Wade, Silsden; J. Thompson.

TURBITS.—*Cock or Hen.*—1, E. Rhodes. 2, W. Wilkinson. 3, G. H. Poole, Bradford. *hc*, H. Wescoe, Harrogate; J. Thompson; J. Dye. *c*, Cockett and Sunderland; G. H. Poole; E. Horner; T. Foster.

TUMBLERS.—*Long-faced.—Cock or Hen.*—1, J. Hawley. 2, J. Dye. 3, W. F. Jennings *vhc*, D. Riddiough, jun. *hc*, D. Riddiough, jun. (2); E. Horner. *c*, J. Bastow, Keighley; J. Dye.

BARBS.—*Cock or Hen.*—1, E. Mawson. 2, J. Thresh, Bradford. 3, E. Horner. *hc*, Miss F. Seanor; J. Thresh. *c*, H. Wescoe.

ANY OTHER VARIETY.—1, W. G. Holloway, Shipley. 2, Miss F. Seanor.

SELLING CLASS.—*Pair or Single.*—1, D. Riddiough, jun. 2, Ward & Rhodes. 3, Clayton & Bairstow. *vhc*, T. Hartley, Keighley; J. Bastow; W. Fawcett, Baildon; W. Ellis (2); J. Thompsoo *hc*, J. Rushworth; J. A. Barnes, Gloncester (2); J. Lancaster, Baildon; T. Holt, Bradford. *c*, H. Crosley, Sale; J. Holden; J. Hutton, Baildon.

CANARIES.

BELGIAN.—*Clear Yellow or Ticked.*—1, Reed & Wilkinson, Great Horton. 2, R. Barrett, Crosshills. 3, Hutton & Thackray, Baildon. *vhc*, Reed & Wilkinson; E. G. Rossell, Brierley Hill. *hc*, W. Watmough, Otley Gill, Guiseley (2). *Clear Buff or Ticked.*—1, E. G. Russell. 2, Reed & Wilkinson. 3, T. Jobling, Middlesborough.

PARROTS, OR ANY OTHER VARIETY OF FOREIGN BIRDS.—1, S. Bunting.

LOCAL CLASS.—1, 2, and 3, W. Wray, Westgate, Baildon. *vhc*, E. Goodall, Baildon.

JUDGES.—*Pigeons :* Mr. Cannan, Bradford. *Cage Birds :* Mr. Barnesby, Derby.

NATIONAL PERISTERONIC SOCIETY.—The annual Show of this Society will take place at the Crystal Palace on Tuesday next. The members have greatly increased during the last year, and a great show is anticipated.

RABBIT HUTCHES.

IN my opinion all systems of drainage, slanting floors, holes in the backs of hutches, grooves, and so forth are ineffectual. Sooner or later the floors become foul and unhealthy. The most ingeniously arranged canals for conducting away the refuse from the hutches are always liable to become choked up, and as a matter of fact very frequently do. Why not have the floors of the hutches made of stout galvanised wires half an inch apart, on the same principle as that adopted in parrot cages? With a liberal allowance of litter there would be no fear of "sore hocks," and no harbour would be given for damp or vermin. Below the floor should be placed a zinc tray the exact size of the hutch, to collect the droppings. The principle is old enough. Cowper in the management of his three immortalised Hares, says (I quote from memory), "The floors were so arranged as to allow all ordure to pass through," and a floor of wooden bars has been recommended by more than one writer on the subject; but the superior cleanliness and efficiency of galvanised wire must be apparent. The labour, too, of cleaning under this system would be reduced to a minimum. All that is required is to "shake the bed" well every morning, add a wisp of fresh litter, empty the tray, sprinkle a little disinfecting powder upon it, and replace it under the hutch; or a few seconds more would suffice to thoroughly sluice it with water, and dry with a cloth, which would bring about a better and more business-like result. A few handfuls of sawdust placed in the tray each day would, I fancy, be an improvement.

Thus, where several hutches are in use, what would be under the old system a dirty half-hour's work would be accomplished in five minutes without so much as soiling the fingers. Indeed, the daintiest of damsels need not shrink from attending to her pets herself under such circumstances. It would be advisable, though, to retain the boarded floor in the doe's private retiring room, as everyone who has kept Rabbits knows that, however self-abnegatory and thoroughly she may have "feathered her nest," her obstinate family are sure to pertinaciously work their blankets up into a wall all round them, and contentedly repose on the bare boards. A well-behaved doe also is generally careful not to defile her nursery.

I have not tried this plan, but I intend to do so some day. It is a theory, but one born of very unpleasant memories of hutches with all sorts of complicated drainage works. Simplicity carries the day in greater undertakings than Rabbit-keeping.

I do not keep Rabbits now, but I hope to resume the pursuit when circumstauces will permit, in addition to poultry and Pigeons. I have drawn out plans for a combined establishment to fit the end of a back garden, which is quite a multum-in-parvo in its way, and I intend forwarding them to this Journal, in the hope that they may originate a hint or two to those who, like myself, find that this "wicked Journal," with its numerous departments, makes them wish for a practical interest in each, but who have only a small space in which to "have their fling."

Can anyone enlighten me as to the advisability or otherwise of using dried fern (common bracken) as a litter for Rabbits? It would be everything that could be desired as regards softness, but would it injure them if (as of course they would) they were to eat it? They are tolerably omnivorous—*e.g.*, I very distinctly remember an old buck Rabbit of mine, who on different occasions in an eventful life made apparently satisfactory meals of sawdust, a piece of pewter, and some putty. The same animal was also a critical judge of cigars. I can collect any quantity of fern here (near Epping Forest) in the autumn, and if suitable as a substitute for straw, it would effect a considerable saving.—SCIOLIST.

HOW TO DISPOSE OF OUR HONEY.

HONEY—luscious honey—is generally a treat to our little ones for their breakfast, tea, or supper, in place of butter, and nice and wholesome it is too, as well as an agreeable change; but, unlike bread and butter, they soon tire of it, so it is only as a treat that it can be consumed in that way. To the buyer of 10 lbs. or 20 lbs. this does not matter, but were we to keep our own bees, and our little friends supply us with the delicious commodity

by the hundredweight, then an important question arises—How to dispose of our honey? Naturally the answers comes—Sell it. Very good, but first a customer must be found, and we do not all like to turn hawkers without a license; so now I suggest we should take a lesson from our neighbours of the continent, who have many ways of using honey to please all palates. Almost contemporaneous with our Crystal Palace Exhibition were held at Paris and Copenhagen gatherings of a similar character, and, in addition to most of the exhibits that were shown here, appeared a long list of eatables and drinkables made wholly or partly with honey, which would be very welcome on the tables of our own land. Taking the Paris catalogue I see here were shown honey bread, spiced bread, fruits preserved in honey, jellies, sweetmeats, cakes, bonbons, pastiles, and chocolates; whilst for eau de vie we need not leave old England, seeing it is to be made both from honey and wax! Then we have hydromel or metheglyn, champagne, red and white wines, liqueurs, fruit syrups, vinegar, and fruit cordials. There is a pretty list of delicacies for our housewives to exercise their ingenuity and skill upon! and I trust the result will be, I shall be able to see and taste many of the above at our next British Bee-keepers' Show, and the prizes will be offered for such classes. I think last year they must have been clean forgotten, but notwithstanding which a half-dozen bottles of metheglyn made their appearance, which were generally distributed amongst the Committee, and one having fallen to my share I can truly say it was fine; and my friends say the only fault about it is, you cannot drink much of it—perhaps that is lucky.

Regretfully I say I have no instructions how to make these good things, but perhaps among the multitude of our readers others are more fortunate. If so, by all means let us have the recipes in good time to utilise for our next Exhibition.—JOHN HUNTER, 5, *Eaton Rise, Ealing.*

ECONOMICAL HIVING.

I AM only a cottager, but very fond of bees. Mr. Pettigrew is a great advocate for his large straw hives. I quite agree with him that a large hive is better than a small one. I have now seventeen stocks of bees—ten in straw hives and seven in boxes, four of which are in tea chests, two in boxes made by a carpenter, and one in a rough box which will hold three pecks, or nearly a bushel. They were so heavy at the close of the honey season one could scarcely lift them, but I must say that the box, being rather a rough and large one, adds more to the weight. Now as to the tea chest: I keep all my bees in bee houses, and three of those in tea chests are well wrapped-up with hay, and one with old carpet and wadding. My boxes and tea chest have (all but one) three holes on the top covered with perforated zinc, one or two of which I leave open for ventilation, with a glass or small straw hive over.

In the Journal of November 5th, page 416, "R. S." says that he has a hive or box, or packing case (as he calls it) in his apiary which he has had in constant use for ten years, and made from wood only half an inch thick, and answers very well. Now, if this box answers well which is made from wood half an inch thick, I feel that the tea chest will answer quite as well. The wood is very hard, they can be bought for 3*d.* or 4*d.* each, which would be a great advantage to the poor man. I do not say they will do for outdoors, but in a house I think they will answer very well with care in the winter. I have two in tea chests which have stood two winters and are all right up to the present time. I put some bands on the edge of my tea chest of thin iron hooping to keep them together in case the nails should give way.—T. G.

DR. SANDFORD *versus* SECRETARIES OF CRYSTAL PALACE.—Dr. Sandford sued the Secretaries of the Crystal Palace Poultry Show for return of entries and expenses. This was heard on Tuesday last at the Westminster County Court, and resulted in a verdict for the defendants with costs. Particulars will be given in our next number.

TO OUR READERS.

ALTHOUGH we have a double Supplement we are obliged to omit several prize-lists and communications, although in type.

OUR LETTER BOX.

SEBRIGHT BANTAMS FOR SCOTLAND (*R. McG.*).—Sebright Bantams will stand any climate in the British Islands. The Golden are easier to breed than the Silver. Both are equally hardy. The difficulty in breeding them is, that many of the cocks are at fault, and for the same reason it is seldom satisfactory to buy eggs.

POULTRY ACCOUNT BOOK (*Fly-catcher*).—There was such a book published but we suppose it was given up, as it is not advertised.

CALL DUCKS FOR EXHIBITING (*Call Duck*).—We know few birds more attractive or more admired than good Brown Call Ducks, and they are seldom overlooked. They breed better and pay better than the strictly fancy birds that have little but their beauty to recommend them. Brown are preferred to White always. They must have water enough to swim in.

CANARIES IN AN ENCLOSED SPACE OVER A SHOP DOOR (*Groundsel, Ireland*).—The place wherein you keep your birds is certainly a very nice and cheerful position both for the birds and your pleasure. Desiring to enjoy an uninterrupted view of the ways and doings of your Canaries during the breeding season, you need not labour under any misapprehension that the birds will not breed if the cages are entirely taken away from the small room over the doorway. A couple of pairs of Canaries would amply suffice for the 4-feet space in length by 18 inches wide. Divide the place either with a sheet of glass or a skeleton wire partition, keeping each pair of birds apart during incubation, or there might, perchance, be a row in the house. The seven Canaries would be too thick upon the ground. When the proper season comes the birds will no doubt very readily pair, although they are in company together at the present time. The hens will of necessity take to their former holes or cavities in the walls (more especially if neither nest box nor basket be supplied), although the cages you mention may be removed. There is at all times a chance of birds quarrelling if kept together, whether in or out of cages, and we would rather the quarrel take place in an open space than in close quarters. There is every probability of some of the birds successfully pairing and breeding. The state of happiness you say they are now enjoying, accompanied with buoyant health, are signs that harmony will continue to reign in their household. Song will be a matter of secondary consideration. It is much too soon for the hens to begin breeding, therefore do not supply them with building materials until March. By all means keep the cock Robin apart from the Canaries during the breeding season. If you require Mule birds pair a cock Goldfinch to a hen Canary; but do not indiscriminately mix up a male and female Goldfinch with your Canaries during breeding time. Goldfinches are generally very mischievous with nests and eggs; of course there are exceptions. A three-year-old Goldfinch hen will more likely breed with a cock Canary than the cock Goldfinch (caught last harvest) will with a hen Canary. Get a two or three-year-old Finch if you wish to be successful in Mule-breeding.

BOOKS (*J. D. W.*).—A new edition of Mr. Pettigrew's book on bees will be shortly published by Blackwood & Sons.

REMOVING STOCKS (*Unfortunate*).—There will be no difficulty found in the removal of your hives from their present position to the other on the south side of the Thames. No danger at this time of the year from suffocation or overheating. Their doors should be closed (ventilation is not necessary in winter), and the hives well secured to the boards by string or nails. Put them separately on a light cart (or one with springs), or into a railway carriage, and they will travel safely any distance. If the two positions are close to the river, and nearly opposite each other, the hives may be taken across by a boat, using a hand-barrow on either side. If they have to go round by London send them by railway.

REMARKS.

13th.—Warm but damp and dark all day.

14th.—Showery during the whole day; very warm at night.

15th.—Another dull morning, but soon clearing off, was fine from 10 A.M. till noon; rainy and dull afternoon; but a fine night.

16th.—Showery till noon, then fine for four or five hours, when rain again fell, making the evening very damp.

17th.—Fine till about 1 P.M.; showery afternoon; but fair in the evening.

18th.—Rainy morning, and more or less rainy all day, in fact a regularly dark, damp, disagreeable day.

19th.—Very windy during the past night, and rather so all day, but much lighter and finer than the day or two preceding it. A little rain at night. Heavy gale commencing about midnight.

A dark damp week, the mean 9 A.M temperature 13° higher than the week before last. Ground saturated by continual slight rain, and damp atmosphere. —G. J. SYMONS.

COVENT GARDEN MARKET.—JANUARY 20.

WE have nothing fresh to report, supply and demand being about balanced. The provincial markets remaining quiet, very few orders being on hand.

From observations taken near London during forty-three years, the average day temperature of the week is 45.0°; and its night temperature 31.3°.

PEACH FORCING.

IT must be said, though it were superfluous to repeat what everybody knows, the Nectarine requires the same treatment as the Peach, and in no way that I know of do the two differ, except that the Peach has a downy skin and the Nectarine a smooth one, yet the flesh and flavour are dissimilar. Peaches diverge occasionally into Nectarines—*i.e.*, a Peach tree produces fruit with downy and smooth skin, or Peaches and Nectarines; but an instance of a Nectarine producing fruit with downy skin is not, I think, recorded. From the stone of a Nectarine a tree has arisen producing Peaches, but this does not throw any light upon the origin of the Nectarine, which I consider only a variety, as pointed out in Dr. Hogg's "Vegetable Kingdom," page 299, "distinguished," says the author, "by the name of Amygdalus persica lævis; . . . and there can be no doubt that it originated in a mere freak of nature, as we have seen instances of Nectarines being produced on the branch of a Peach tree without having been budded." It is clearly a variety due to culture, and one, like those of most other fruits which in variety of the originals have the saccharine juice most highly developed, are smaller in size. Peaches attain to 12 inches in circumference, but it is a magnificent Nectarine of which the girth is 10 inches. I have an Early Alfred Peach which the past three seasons has borne only Nectarines some 10½ inches in circumference. Can it be that the Plum stock exerts an influence over the Peach scion, causing the fruit to partake partly of the nature of the Plum and partly of the Peach, resulting from working upon a foreign stock? When was the Plum first used as a stock for the Peach? Were they first introduced upon their own roots, the Almond, or Plum?

In forcing the Peach the house is a consideration of no mean importance. For early forcing there is nothing surpassing the old lean-to with a good substantial back wall. The wall, whatever may be said against its expense, is a great absorber of heat and moisture, and reservoir of the two. The wall absorbs heat when it is colder, and moisture when it is drier than the atmosphere it is presented to, and gives them out again when the atmosphere is colder and drier. It also catches the sunbeams, and when not them, light whenever there is any, for the foliage of trees rarely is so dense as to obscure the back wall from the sun's influence; and the rays of light by the wall are reflected back into the house, just as the angle of incidence shall determine. The lean-to, at least its back wall, is not nearly so sudden in its changes from cold to heat, or the contrary, as glass, which is the best of all for allowing a heated atmosphere to be cooled by external cold. The back wall will not be of any use for Peach trees, as the roof will be occupied by trees planted in front, and though they grow, will not fruit satisfactorily. A house of about 9 feet width over all, and 12 feet of back wall, will answer, and give about 10 feet of trellis in height. This kind of house (fig. 16) wastes 2 feet of the back wall (upper part), as we have only 10 feet of trellis, but 12 feet of wall. "The trees might as well be against the back wall," I have no doubt some may suggest, "and have the front fitted with shelves—not so high as to obstruct the light to the trees on the wall—for Strawberries, &c. It is only reasonable!" But it ain't. Forced Peaches, forced anything wanted to flower and

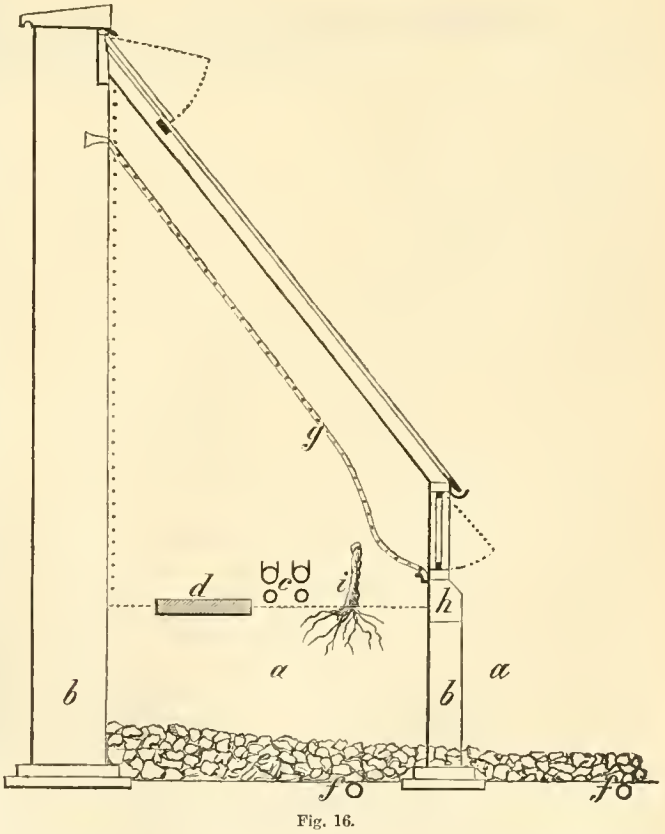

Fig. 16.

fruit, does not want to be 6 feet or more from the glass, but as near thereto as is consistent with the prevention of the leaves scorching and the avoidance of chills. If too near the glass the leaves are liable to be blistered or scorched when the sun's rays are powerful and the leaves wet; and there is danger of chills when the trellis is

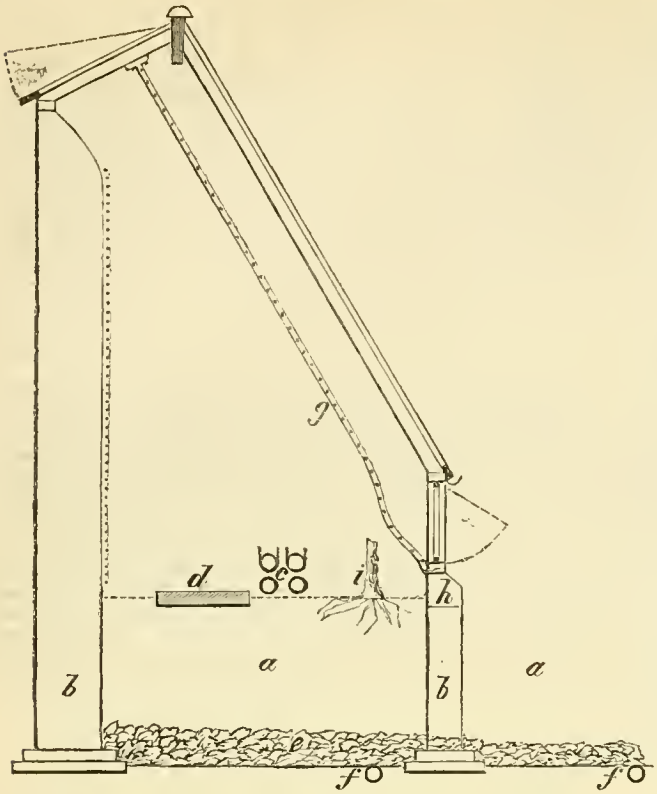

Fig. 17.

near the glass in case of sudden frost, with danger also from condensed moisture during the flowering period. Experience prompts my naming 15 inches from the glass as the best distance for early forcing, and for crops which are not expected to be ripe before July any distance from 15 inches to 3 feet is suitable, but at a greater distance than 3 feet they answer for later crops; the main thing is to afford the foliage unobstructed light, and they then do well at a greater distance, and when but little artificial heat is employed; but for early work the growths require to be made near the glass, for when made at a distance from it the shoots are liable to be drawn, and the foliage thin in texture, which results in single instead of triple buds, and those formed being very liable to drop.

The best material for the trellis is iron, having guiding bars of flat bar iron—one to each rafter, and pierced with holes 6 inches apart for the wires to pass through, with angle iron at the ends, and also pierced with holes for the wires, the ends of the wires threaded, and the wires tightened with brass thumb-screw nuts. The angle iron may be 1¼ inch each way and three-sixteenths of an inch thick, and the bars three-quarters by a quarter inch thick; when practicable secured to the woodwork of the house, as they may in front trellises to the wall plates and rafters; whilst the back-wall trellis stage may be let into the wall, and secured by cement. The curved trellises may have the stays let into stones on pillars, and cemented-up. The best kind of wire is the annealed; galvanised does not answer so well as the plain, and this does not appear injurious. Were better-finished iron employed for galvanising it is likely any objection would disappear; but in its present rough state minute particles sticking up along its surface, and causing gum or canker in every shoot pierced by those particles, it is not to be recommended. The drawn annealed wire is much more evenly finished, and is stronger than rolled wire, which from its cheapness is most commonly used. Drawn annealed wire is best for trellises under glass, and for a Peach trellis No. 8 gauge, which is about 509 yards per hundredweight, and this should be thoroughly painted, three coats at least, of white-lead paint, as well as the other ironwork of the trellis.

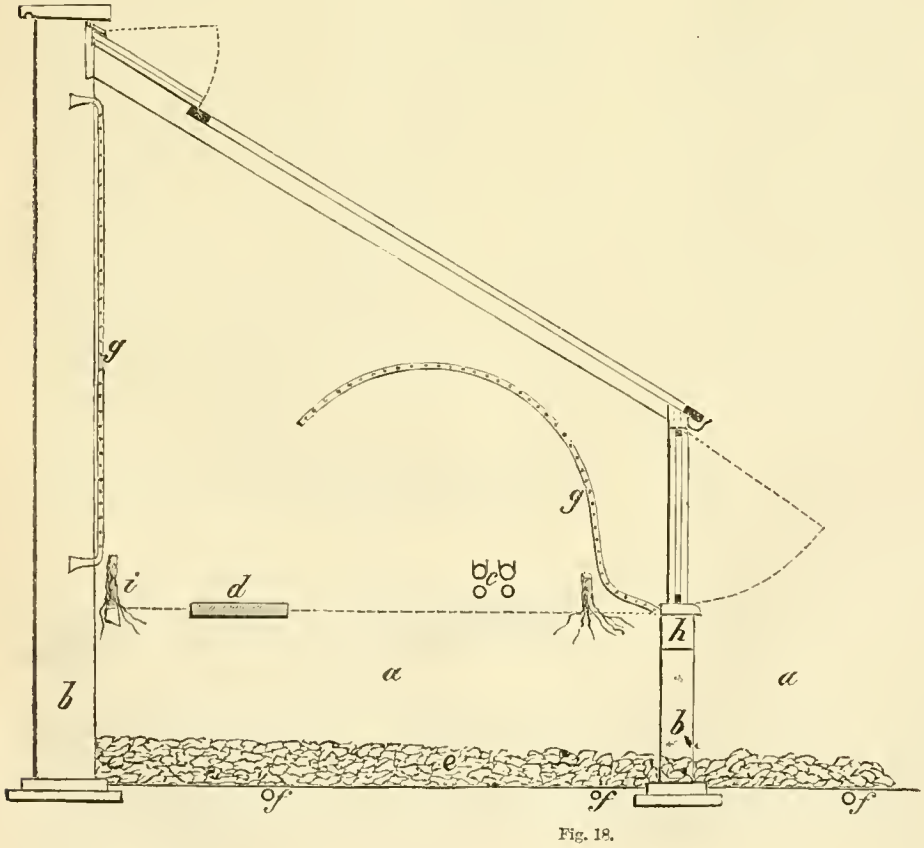

Fig. 18.

There is nothing better for constructing the house than wood. To sound well-seasoned red deal there is no objection, and this we advise for the woodwork. Lights, especially moveable ones, are going out of date. It is, however, a mistake for Peach houses to dispense with them. All the glass portion of the roof should be moveable except the ventilation part and front lights, so that the trees may when at rest be fully exposed to the weather, and especially those houses which are calculated to give ripe fruit in April up to July. Great benefit accrues from the exposure of the trees to the weather, particularly those ripening their fruit off at an early season. The exposure is a great destructive of red spider and complete annihilator of brown scale; besides,

the borders and trees are much benefited by the autumn rains, and trees so subjected appear to thoroughly enjoy the process, as their buds do not drop, and are so bright and plump. Besides, when the house is closed the trees seem to be more readily excited, and so good is the treatment that I advise its practice.

In the matter of glass, 21-oz. sheet, thirds quality, answers, and in large squares, but not wider than 15 inches, and having narrow laps so as to prevent water getting between the glass at the laps. We have squares 30 to 40 inches long and 15 inches wide of 26-oz. glass, thirds, on the roof of Peach houses, with 3-16th laps, which have not had a square broken by frost in four years. The thicker the glass the greater certainty of maintaining a more equable temperature, as thick glass does not allow of the atmosphere being cooled so quickly as thin. Cheap thin glass is false economy.

The front walls of Peach houses should be constructed so as to admit of the roots passing outside, affording them an inside and an outside border. This may be effected by having the front walls built on pillars 14 by 9 inches, with 2 feet or 2 feet 6 inches clear space between. The spaces for affording support to the wall-plates may be arched over if the wall is to be taken up in brickwork, but if stone is procurable a stone head is preferable; it may be 10 inches deep and the thickness of the wall, and in length so as to reach midway of each pillar. A stone heading allows of the roots passing outside at less depth than the arches, and the spaces are greater.

A brief allusion to the sections may now be made. Fig. 17 differs little from fig. 16, but has a sort of span roof, which admits of a higher trellis. The dotted lines against the back wall show the usual position of trees in such houses, and to which there may be no objection if the trees are not required for early forcing.

Fig. 18 is also a lean-to and wider than figs. 16 and 17, with a trellis against the back wall and one in front of the house, and curved, so that the foliage of the front trees may not obstruct the light to the trees against the back wall. This house being wider, having a flatter roof than figs. 16 and 17, and less piping, is not suitable for very early forcing. The trellises being at greater distance from the glass, is a disadvantage for early work; but the fruit may be ripened very satisfactorily in such houses in early June.

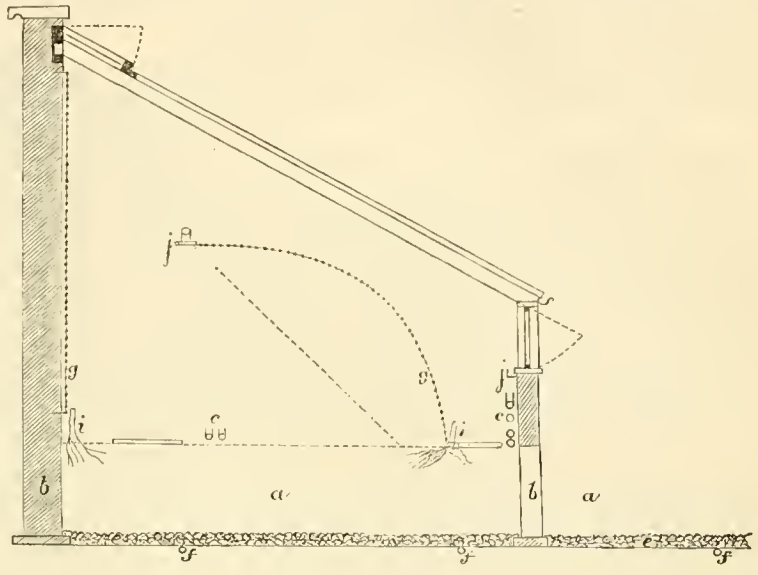

Fig. 19.

Fig. 19, also a lean-to, but considerably wider than the three preceding, having a walk back and front, two trellises, a front one and the other against the back wall—arrangements admitting of ready access to the trees. A curved front trellis is shown, but sometimes a flat one is employed, as indicated by the dotted lines under the curved one, which is only space wasted, besides causing the foliage to be a greater distance from the glass. It is shown heated by six rows of 4-inch pipes, which are desirable to have fruit ripe in June, but, if not wanted ripe before July, four rows will be sufficient.

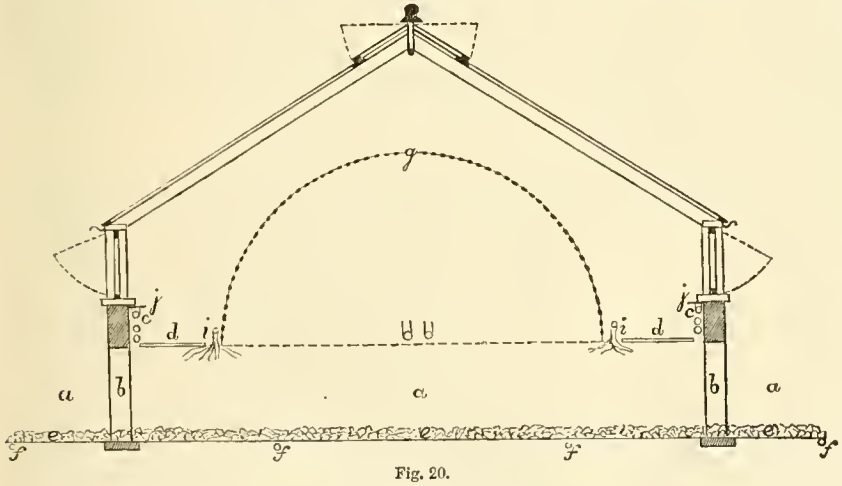

Fig. 20.

REFERENCES TO ALL THE FIGURES.

a, Border 3 feet deep, and both inside and outside the house.
b, Back and front or side walls.
c, Hot-water pipes, the two upper troughed for holding water for evaporation.
d, Pathway of laths, or flags, or iron gratings.
e, Drainage.
f, Drains, which require proper fall and outlet.
g, Trellis of annealed wire, and well painted. No. 8 is most suitable.
h, Stone head crossing the pillars, and spaces admitting of the roots passing outside.
i, Indicates where the trees are planted.
j, Shelf for Strawberries.

The scale of figs. 16, 17, and 18 is quarter-inch to 1 foot, and figs. 19 and 20, 8 feet to 1 inch.

Fig. 20 is a span-roof, and about 24 feet wide, with curved trellis, a pathway along both sides, and it is heated by eight rows of 4-inch pipes, so as to give fruit in June.

These houses have all top and front ventilation, than which Peaches can hardly have too much provided for, and the upper pipes are fitted with evaporation troughs. The borders are shown efficiently drained, and are selected as most suitable for their purpose. Others there may be equally good, probably better, of which I should be glad to hear, but I have a decided objection to those which have shelves in every conceivable place for accommodating Strawberries, though I have shown them in figs. 19 and 20. Strawberries are very acceptable no doubt, and if they can be had without incommoding the Peach trees the objection ceases; but they happen to flower and ripen their fruit when we want to syringe the Peach trees, and they are rarely introduced without bringing-in red spider, and do not go out without leaving it behind, for it is hard to tell which the red spider is most partial to, the Strawberry or Peach.—G. Abbey.

Climbing Roses.—Your contributor, "Tucker," writing on

climbing Roses, says that he has given up growing climbing Devoniensis and climbing Victor Verdier, two of the best climbing and pillar Roses we possess. The former covers the larger part of the front of my house (not ten miles from London), and the beauty of its chaste cream-coloured blossoms before full expansion baffles description, to say nothing of its handsome foliage, so generally healthy and free from blight. Again, why does your correspondent omit Cloth of Gold from his indoor climbers? It is absolutely without a rival in a Rose house. If he wants crimson flowers, let him procure Messrs. Veitch's charming new Tea Rose Duchess of Edinburgh.—H. K. M.

VERONICA SERPYLLIFOLIA A SUBSTITUTE FOR LAWN GRASS.

A REALLY good substitute for grass would certainly be a great boon to many, especially to amateurs with small grass plots closely studded, as these often are, with flower beds.

Some fifteen or sixteen years ago the days of the "dewy grass" were thought to be numbered, and Spergula pilifera was to reign in its stead. In some nurseries it was cultivated almost by the acre, and immense quantities of it sold, but now the nasty weed is seldom seen. At that time I was in a large garden near Edinburgh, where it was tried in various ways, and we were kept dibbling, watering, and weeding Spergula until it became a settled conviction with us youths that our worthy chief had spurrey on the brain; but nothing came of it, or rather the grass came, and the scythe and the mowing machine went on as before.

In small nooks and corners grass is doubtless sometimes very troublesome, and unless these be kept equally as well as the more accessible parts, the neatness and beauty of the whole is considerably marred, and for such places I would strongly recommend a trial on a small scale of Veronica serpyllifolia.

This little plant is said to be a native, although I do not know it as such, and it may not be so well known to all but that a short description of it may be acceptable. It is a low, spreading, dense-growing plant with leaves, as its name implies, very much resembling those of the common wild Thyme, Thymus Serpyllum, only of a brighter fresher green, and much more closely set upon the stems. On light soil in a common herbaceous border it seldom grows higher than about an inch, its creeping stems rooting at every joint, and a patch of it the size of a crown planted in spring will cover a square foot of ground by the end of the season. In May and June it is thickly covered with white flowers faintly tinged with pale blue, which scarcely rise half an inch above the plant. Were its season of blooming not so very brief it would long ago have won itself a name among the best of carpet bedders. It bears treading and rolling well, though certainly not to the same extent as grass. Except on rockwork I have not seen it suffer from drought, but it does best on a moderately damp soil.—R. D. TAYLOR.

HARDINESS OF CORDYLINE INDIVISA.

Is it generally known that Cordyline (Dracæna) indivisa is a hardy out-of-door plant?

I saw last summer in Messrs. Jackmans' nurseries at Woking several plants standing in a row, and was told they had been there without protection for six or eight years. I was struck by their beauty, luxuriance, and tropical appearance. As a decorative plant for standing in isolation on lawns I cannot imagine a better. A few days since I drove to Messrs. Jackmans', and was told that the Dracæna was unharmed by the severe frosts we have lately experienced.

My interest lies greatly in the beautifying of grounds, &c. I am anxious to rake up any hardy ornamental plants and shrubs suitable for conspicuous positions, of which Dracæna indivisa is certainly one.—HENRY W. COOPER, F.R.H.S.

CULVERWELL'S PROLIFIC MARROW PEA.—My object in writing is not to write-up the above Pea, but to advise those who intend to grow it to try it for general use, as I see it is advertised in your columns merely as a late Pea. Having had the opportunity of seeing it growing last season I can recommend it as the Pea for everyday use, particularly to those who have a large supply to produce from a limited space. It is just the Pea to take the place of the well-known Champion of England. These thoughts must have suggested themselves to many other garden visitors to Thorpe Perrow as well as to myself as they looked down the magnificent rows of this Pea grown by Mr. Culverwell, who grows it not only as a late Pea, but as the Pea for everyday use. The photograph shows its bearing qualities, the pods being large and well filled with monster peas—in fact, to my mind it is a giant Veitch's Perfection.—THOMAS KEETLEY, *The Gardens, Newton House.*

TRANSPLANTING VINES.

MR. WRIGHT expressed a desire to hear the result of my experiment as regards the fruiting of the Vines, the transplanting of which was described in the numbers of your periodical of October 9th and 16th, 1873.

Last season (1874) the Vines were all that could be desired, making vigorous growth, and producing a sufficient number of moderate-sized bunches, with berries as large as I have ever seen in a cold vinery (such as mine), and scarcely to be surpassed in colouring, bloom, and condition.

I am not ambitious of cultivating the "sensational bunches for exhibition purposes" of which Mr. Wright speaks, but I should thank him much if he would fulfil a hope which he gave us some reason to entertain, by giving directions for the formation of his *beau ideal* border, such as would produce at least sensational berries, say of the size of an Orleans Plum; but probably the two things go together. Mr. Wright's system of incorporating charred vegetable matter with the border is, I am sure, excellent. The virtues of that dressing are proved in an early number of the *Cottage Gardener* by Mr. Barnes of the Bicton Gardens. I had not such materials at hand, or I should gladly have used them. Liquid manure has a powerful effect. In the better days of guano I tried it with potted Vines; the growth, marked on the wall, was sometimes 1½ inch in twenty-four hours, if not more.

Mr. Wright's recommendation regarding fire heat is good. The ripening of the wood has always been a great point with me. I hope this year to introduce hot-water pipes into my vineries, which have hitherto been without them.

Lastly, I mentioned the failure of my Grapes in the house before the Vines were transplanted. The chief cause, I have no doubt, was that the roots were inside the house, and that the watering of these, especially if followed by sunshine, made the berries crack, and covered them with oïdium before they even changed colour. Since the Vines have been planted outside not a single berry has cracked or failed to ripen well.—ROBERT BLACKBURN.

OUR BORDER FLOWERS—THE FRITILLARY.

WE have not among all our border flowers a more pleasing family than the Fritillarias when well grown. What is more attractive in the spring time than Fritillaria imperialis, or "Crown Imperial," as some choose to name it? It is often seen to the greatest advantage in some cottager's garden. Fritillaries are a rather numerous family, requiring liberal treatment, especially the Imperialis section. They should have the border broken up to the depth of 2 feet, and enriched by well-rotted manure two or three years old, or leaf mould well decomposed, a little sandy peat with a sprinkling of coarse sand well incorporated together, and have thorough drainage. The bulbs should be planted 4 or 5 inches deep. They sometimes grow themselves out of the soil, if they are not taken up and replanted. They should be replanted every second or third year after being divided. They are readily increased by division.

They do well in a moderately sheltered situation, but should be secured from being blown about. If the spring be dry they will be the better for being mulched with decayed stable manure.

The double varieties are very handsome and ought to be far more extensively cultivated than they are as spring-blooming plants. The variegated varieties are handsome either for pots, borders, or spring-garden decoration. They perfect their growth and may be removed in time for summer bedding. For this purpose the bulbs may be dried and stored away in a cool moist place. The yellow-flowered varieties make a bright display either grown by themselves or mixed with the red, but I prefer them in their separate colours.

Fritillaria meleagris, one of our native plants, ought to be in all herbaceous borders or in the shrubbery. Its beautiful bell-shaped blooms and pendant habit, with its curious-coloured flowers, called by some of our country cousins "Weeping Widow," will thrive in most situations. F. meleagris alba, a

lovely flower, of more slender habit than the last-named, deserves extensive cultivation. F. meleagris plena should not be overlooked. F. persica ought to be in all collections. This section will do well in any ordinary garden soil, though they prefer a rather tenacious loam, moderately moist but well-drained. Their marbled flowers are admired by all who see them.—Veritas.

Budding.—"A. C." and all other brother amatours, may save themselves much time and trouble as well as loss of buds, by not attempting to take the wood ont of the shield, but put the shield in the usual way with the wood remaining in. I fonnd this ont many years ago, after reading an article on the circulation of the sap, and have practised it in my small way ever since. It is the sap returning from the upper end of the stock, which flows through the bark of the shield where the cross-cut is made, which makes the junction between bud and stock.—H. C., *South Hants*.

THE CYCLAMEN.

Cyclamen persicum was introduced, according to our dictionary, from Cyprus in 1731, and to point to the merit or beanty of this plant is almost superfinous; but a few words may not be out of place, as its long period of blooming and in the dull season, together with its delicious fragrance, combine to ensure it a welcome. The fragrance and style of blossom secure it a place in the neatest bonquet. There is no wonder that it is so extensively cultivated for the supply of our London market.

The Persian Cyclamen is readily produced from seed—but although the seed is saved from highly scented kinds, not all the produce will be equally fragrant. Immediately after flowering the seed-stalk withdraws itself from public gaze and lies half coiled ronnd the crown. In a few weeks the seed-vessel will burst and shed the seeds if not watched closely. When the seed-vessels are about to burst they must be picked, and the seed sown; they do not require keeping longer than a few days, in order that they may burst their bonds by a natural process. The seed will be ripe usually in April or May. A seed-pan should be carefully prepared for them, as the seedlings will not benefit by transplanting during the first summer. The compost for them to be fibrous and sandy heath soil well chopped, two parts leaf mould, with a little well-decayed cow mannre, one part light sandy turf loam, and a little silver sand, the whole pressed down firm, and the soil being rather dry bears pressing close to the seeds, so as to put them just ont of sight; then cover the surface with moss, to supersede the necessity of much watering. Place the pan in a warm corner, and it will only require light sprinkling twice a-week.

The yonng plants will begin to appear in about five weeks, and the moss must be at once removed; nothing more is required during the first summer's growth but to grow them clean and water regularly. Pot lightly in the following February. The seedlings will go to rest about November, and may be put on a cool shelf, and kept moderately dry until the following February. About this period the bulbs must be again potted—singly, in 3-inch pots. Towards May, when they are filled with roots, they will require a shift into 5-inch pots. Place the newly-potted seedlings on some shelf close to the glass in a cool greenhouse. By the ensuing autumn they will be strong bulbs, possessing seven or ten strong leaves. Abont September they will require a partial rest, so again withhold water for a while. Towards the middle of February, or sooner, these two-year-old bulbs will show flower-buds, and then a slight increase both of heat and moisture must be given.

I now revert to the management of the two-year-old plants. The plants being past blooming, the leaves somewhat sere, abont the middle of April a bed should be prepared in one of warmest parts of the kitchen garden on a dry bottom, a few inches of half-rotten leaves and heath soil dug-in and thoroughly mixed. In this the Cyclamen should be planted with their balls of earth entire, the soil being pressed firmly to them sideways. After this they are merely to be kept free from weeds and watered when dry, and by the end of August these stont bulbs would begin to form scores of blossom-buds. At this period they must be potted, and, if they have flonrished, wide-mouthed pots will be requisite. A well-grown Cyclamen, like a well-grown cluster of Achimenes, requires a pan, or, as we generally call it, a seed-pan.

I never could discover why our potters do not supply pans for the Cyclamen, since it does so well in them. A pan for a very strong specimen should be barely 6½ inches deep by nearly 8 in diameter. Nothing looks worse than to see a plant wide and tufty in character stuck in a tall and narrow pot.

Henceforth the plants will require to stand on a cool greenhouse shelf near the glass, regular watering, moderate at first, and increased with the increase of foliage. By November they will be in blossom, and continue so through the winter. If a long succession is required some may be kept back in a cool frame, for they will endure 7° or 8° of frost tolerably well if hardened previously.—J. H., *Gardener to Lady C. Legges*.

Dickson's Favourite Cucumber.—I can testify to all Mr. W. Taylor says of his Cucumber. It is a first-rate variety for general purposes; one that does not require much heat to grow it to perfection. We have grown it three seasons with equal success. Last year we planted, the latter end of March, three plants in a three-light box, in a mixture of chopped turf and leaf mould, on a dung bed with a moderate heat. The first fruit was cut April 28th, and from that date to May 28th sixty-six were cut, fine fruit 15 to 16 inches long. Our last plants were put out in the latter part of June in some pits that had contained bedding stuff, and previous early Potatoes, so that they had not much bottom heat and no top heat; they grew luxuriantly, and continued in good bearing till November.—G. P., jun.

Two Useful Hints.—Very often a screw-hole gets so worn that the screw will not stay in. Where glue is handy, the regular carpenter makes the hole larger and glues in a larger plug, making a nest for an entirely new hole. But this is not always the case, and people without tools and in an emergency often have to fix the thing at once. Generally leather is used, but this is so hard that it does not hold well. The best of all things is to cut narrow strips of cork and fill the hole completely, then force the screw in. This will make as tight a job as if driven into an entirely new hole.

Another hint of a similar character may be useful. One often desires to put a staple into a block of stone. The hole is made, the staple inserted, and lead melted and run in. But unless the hole is made with the bottom larger than the top, the lead will in time work out if there is much jar or side strain on the iron. Besides, the lead itself is liable to some compression, which admits of looseness, especially after being subjected to very hot fires. A much better article is sulphur. If this be melted and poured-in around the staple instead of lead, it makes a much more durable job. Besides, it is often more easy to procure sulphur than lead, as every store keeps it that deals in general variety.—(*American Builder.*)

AMERICAN APPLES.

[The following communication was received with a collection of Apples by Messrs. Stuart & Mein of Kelso, N.B.]

This collection of Apples was grown at Kalamazos in the State of Michigan in the United States of America. The specimens in this collection are a few of the most approved sorts that are cultivated in the western States. The variety that I would most especially recommend for cultivation in Scotland and England, even as a standard tree, is the Waggner. This Apple, while possessing every requisite for the table, has fine flavonr, beauty and symmetry of form, is also remarkable in its habit of growth. It may be said to be rather of a dwarf, thickset, upright habit, forming a tree of the finest symmetry. The buds on the young wood being prominent and thickly set, it comes very soon into bearing, so much so that I have frequently seen the trees in the nursery row of three and four years' standing bearing large quantities of fine specimens of fruit; and in this case, when the trees are set out in the orchard and thickly set with fruit, it is absolutely necessary to thin-off the fruit to a proper distance, so that it may not only grow large, but that the tree may be so strengthened as to bear a full crop every season, which it will not fail to do if this is properly attended to.

There are several other varieties in this collection which, I have no doubt, might to a certain extent succeed as standard trees in this country, and it is very likely that the greater number of them have been already tested; but there is no doubt that all of them would succeed much better in producing far finer specimens of fruit when cultivated on the wall, or even as

espaliers. For this, especially, I should suppose that that large Apple The Tompkins County King would require a wall, and would be an astonishing production for the size and beauty; so also would the Northern Spy, the Baldwin, the Belmon, and all of them.

There is no doubt but the difference in climate exercises a wonderful influence in the flavour and appearance of the same variety of fruit. A very striking instance of this came under my own observation the first or second year after I came to America. The Ribston Pippin, which I had been in the habit of cultivating in Scotland on the wall to the greatest perfection, and was generally esteemed as the most superior in flavour to all others—I found a single tree of this variety growing in a large orchard of ten acres, and I asked the owner if he knew the name of that Apple, and what he thought of the quality. He said it was known by several names in this country, but he had understood that it was the Ribston Pippin; but as to its quality, it was considered only second or third-rate. I mentioned that with us in Scotland it was considered as our No. 1 first-class. He immediately drew his conclusion, and was not slow in asserting that we must have a very poor stock of Apples in Scotland. I tasted the fruit, and found it ripe and mellow, but in no way flavoured as I used to grow it. I drew the conclusion at once that it was too highly ripened in our hot climate, and I found the next year by an experiment that in this I was perfectly correct. I therefore the next season watched the tree, and before the fruit was fully ripened (with a rich yellow, as it does here), I took off a quantity of the fruit—the very same as has to be done with many of our finest Pears—and I was very much pleased to find that I had got these Ribston Pippin Apples nearly as fine as ever I had them in Scotland; and therefore I drew the conclusion that this process, and the reverse of it according to the different circumstances of two climates, would be absolutely necessary in order to bring out the same fruit with full perfection.

I have a quantity of the scions and a few of the one-year graft, with roots of several of these specimens. If you consider them of any importance, I shall be happy to send you a few to experiment upon.—George Taylor, *Kalamazos, State of Michigan.*

Nectarine.—*Welbeck Seedling.*—A seedling raised by Mr. Tillery. "The specimens of this fine Nectarine which Mr. Tillery sent were not only exceedingly beautiful in appearance, but were also most excellent in quality. Leaves crenated; glands reniform; flowers small. Fruit as large as those of Balgowan, in some cases roundish-ovate, in others rather depressed, with a well-defined suture. Skin almost wholly covered with dark red, the shaded parts showing a little watery or pale green ground colour, while the most exposed parts are of a very deep purple-red, sometimes slightly speckled. Flesh greenish-white, red at the stone, full-flavoured, very juicy, rich, and sugary. The flavour is brisk yet luscious, and altogether it is one of the very best Nectarines we have ever tasted."—(*Florist and Pomologist*, 3 s., viii., 13.)

MR. THOMAS WEAVER.

"On the 21st inst. Thomas Weaver, gardener during forty years to the late and present Wardens of Winchester College, aged seventy-one years."

The above was the brief notice we received, and little did the sender think that it announced the death of one of the earliest and worthiest of our gardening friends—little did the sender think that he would cause to us deep sorrow by the announcement; but so it was, and we turned to our desk to pay a heartfelt tribute, when there we found the following:—

IN MEMORIAM.

In the past week there has gone to his rest one who deserves a notice in the Journal to which he has so often been a contributor in former years, though we have not seen much from his pen of late—I mean Mr. Weaver, gardener to the late and the present Wardens of Winchester College, who was found dead in the potting-shed of the garden which he loved so well and had tended so carefully for more than forty years.

He began his gardening life in the botanical gardens at Oxford, and I well remember his telling me how he used to get young Mr. Baxter to set him "copies" after gardening hours to teach him to write. When the late Warden of Winchester was appointed he applied to Mr. Baxter for a gardener. He at once recommended Thomas Weaver. How good the choice was no one who has ever seen the garden under his care can doubt for a moment. For years he managed the garden entirely alone—a thoroughly "working gardener" indeed. When the Diocesan Training College was established at Wolvesey Mr. Weaver was asked to give botanical lectures to the pupils, which he gladly undertook with his master's leave. I say his "master," for Weaver was never ashamed to use this word, though there are no such things now! About this time the Warden suggested to him that he should have someone to help him in the garden, an offer which he gladly accepted. At the end of the week, when his book was brought in, the Warden observed that the extra man was not charged. "No, sir," was the reply, "you allow me to lecture at the Training College, which I think a great honour. I cannot think of letting you pay the man who does my work. I am only thankful to you for allowing me to have him." He has, in fact, been "single-handed" in the management of that large garden, and surely no garden was ever better kept; no garden ever supplied a more unfailing succession of flowers and vegetables of the very first order. Who that has ever seen them can forget his Asparagus and his Strawberry beds? Who has ever gone round the garden with him without gaining many useful cultural hints? Who has failed to learn from him a lesson of unswerving duty and faithfulness? for this was indeed his characteristic. His contempt for what he called "six o'clock men" was quite amusing.

His death was in keeping with his life. He had gone to the garden on Thursday to shut-up his houses, and it is supposed that feeling unwell he went to the pot-shed to sit down. He was found with his head on his hand quite dead. Dear old man! may we, when our time comes, be found to have been as faithful in the discharge of our duty as he was—aye, "faithful unto the end."—H. G. M., *Michelmarsh Rectory.*

The next letter we opened was this:—

"I feel it to be my painful duty to write and tell you of the death of my dear father, who passed away sitting on a wheelbarrow in a little shed in the dear old garden he loved so well on Thursday afternoon, the 21st. He was quite well and in good spirits when home to his dinner at 1 P.M. He sat reading your Journal until about quarter-past two, when he left home to go into the High Street to pay a little bill, &c., and returned a little past three through the Warden's house, where he spoke to the cook in a pleasant joking way as he passed through into the garden, and told where he had been. He went briskly on and opened his little 'sanctum,' as he called one of the little sheds, to take off his coat and hat for work, but instead of that must have felt a pain or giddiness in the head, as he sat down on this old wheelbarrow, leaned his head against the wall, and fell asleep—so sweetly, so peacefully, with a smile which still remains and seems to say, 'I know all that you're doing, but I'm not going to wake up.' We cannot yet realise the thought that he is gone.

"Feeling it would be his wish that we should write and let you know the circumstances, I have thus taken the liberty."

Can we add without bathos anything to those testimonies? Yes. This extract from a note to us by the Warden:—"I am sure you will condole with me on the loss of my old gardener, Weaver, who was found dead in the garden which he loved like one of his own children."

Thus friend, family, and employer in unison bear testimony to the worth of our old supporter. In all that they say, in all that they feel, we fully coincide. Weaver was a thoroughly honest man, and we use the epithet in its broadest sense; he was true to his family, true to his friends, and true to his employer.

HARDWICKE HOUSE.—No. 2.

THE SEAT OF LADY CULLUM.

All the glass houses at Hardwicke are easy of access from the mansion, and in such positions that the proprietor can walk from the drawing-room to the conservatory, and from thence to the ranges of vineries, Peach houses, ferneries, &c., without passing into the open air, with the exception that the stove and another house, used for miscellaneous subjects in winter and for Cucumbers and Melons in summer, is isolated. The present notice will begin with the stove, a span-roofed structure 15 feet by 47 feet. Until recently it was a wood erection entirely, but portion of it has been converted by Mr. Beard of Bury St. Edmunds into their new patent system of metallic bars and patent glazing without putty, and so far as

I could see it answers admirably. Mr. Fish has at the same time had all the internal fittings of wood removed and substituted them with stone, slate, and iron, so that no woodwork is exposed to the wet and heat of a stove temperature, which in a very few seasons make sad havoc with the best pine wood. The occupants of the house are of the usual description of well-furnished stoves. Euphorbia jacquiniæflora is grown extensively, its small bunches of brilliant flowers are of great value at this season. Adiantum concinnum was very pretty, and Platycerium grande, the best of the Stag's-horn Ferns, was also in fine condition. Marantas, of which by far the finest was M. Veitchii. Monstera deliciosa fruiting freely. Some of the best and most useful of Palms and Cycads are also grown. There is also a fine plant of Quisqualis indica planted out: this is a very useful evergreen stove climber, which was introduced to our hothouses from Iowa in the Waterloo year; it is of easy culture, and is admired for the brilliancy of its sweetly-scented orange-red flowers.

The next house is of corresponding size, and is now cool. It contains amongst many other fine things a number of very healthy plants of Daphne indica on their own roots, a mode of culture Mr. Fish prefers to grafting them, as they are usually done, on the D. Mezereum. My own experience coincides with his in this respect. I find the plant is readily propsgated by cuttings, they make bushy plants, and flower at every point. The plants stand on slate platforms, on which in summer the soil is placed to grow the Cucumbers and Melons. The house I could see was well adapted structurally for them, but Mr. Fish also informed me that they did well with only about 4 inches of monld being placed on the slates. I had always been accustomed to grow Hoya bella and Allamanda in a high temperature in winter, but they are both wintered in this cool

Fig. 21.—Hardwicke.

house, and I was informed after their long rest flowered very freely. The first vinery entered was in use as a forcing house, and what of the Vines meanwhile? They are tied-down near the base of the top lights, and by a simple arrangement of the front sashes are speedily turned outside. It is done in this way: A shelf 18 inches wide is fixed at the base of the rafters, another of corresponding width level with the wall-plate. The Vine rods are tied between the two shelves, and the sashes are brought in from the front to the back of the shelves, where they are fixed until the time comes round for the Vines to start into growth. There is a bed of leaves in the house, so that any quantity of spring-flowering shrubs, such as Lilacs, Deutzias, &c., may be forced. On the back wall are trained Fig trees, which very seldom feel the pruning-knife. Mr. Fish believes that the trees fruit much more freely if they are allowed to grow freely; the growths are trained one over the other, so that the branches are three and four deep. I could see plenty of fruit-bearing wood, and have no doubt that abundant crops are produced. Mr. Fish showed me a number of Fig trees trained on the walls and roofs of some out-buildings near the garden. The growths of these were tied loosely in the same manner, and the crops are enormous. I believe the knife had been seldom or never used on the trees. On one of the vinery walls was a large seedling Loquat; it flowers annually, and sometimes produces fruit.

On the back wall of the Muscat house are trained plants of Lapageria rosea and the more recent variety L. alba. The Vines in this house are planted both inside and outside, but they have not given satisfaction in either position, a fact which is doubtless traceable to the character of the soil, as no pains have been spared in making borders for them. The soil does not seem to be heavy, and the subsoil is chalk.

Passing through a small house filled with Camellias well set with flower buds, we enter a Peach house. It is a lean-to, and both planting and training have the mark of originality about them. On the back wall Figs are planted. Over the path at intervals arches have been placed of very stout iron rods. Between the path and front of the house is the border for Peaches and Nectarines. The trees are planted in a single row about 6 feet apart in the centre of the border, each tree being provided with a trellis formed of wires strained horizontally from the front to the path at the back. The trees can be readily got at by the man who has to prune and train them, and they annually produce good crops of fruit. In the next house, a small one, Passiflora edulis is cultivated for its fruit, which is here esteemed useful for dessert. The next house to this in the same range has Peach trees planted out and trained to the back wall. Stanwick, a very uncertain variety, does well on this wall; the fruit ripens without cracking, and the flavour is excellent. The house is also used for

wintering bedding plants and a large collection of Fuchsias. Most of the latter were large plants trained as pyramids, and, perhaps, half a score years old. The branches are roughly cut-back in the winter. Under this treatment they flower profusely, much more so than young plants. The internal arrangement of the house we enter next is unique; the stages are composed of rockwork, and the "clinkers" that are obtained from brickfields cemented together. The house is a lean-to, and one terrace rises above another from the front path to the back wall, the artificial rockwork being clothed with Lycopodium, Isolepis, &c., the occupants of the stages being well-grown specimens of the finer species of Ferns. There were very handsome specimens of the magnificent Adiantum Farleyense. A characteristic of this variety, which others as well as Mr. Fish have noted is, that large plants die-off suddenly without any apparent cause. A plant under Mr. Fish's care, 5 feet through, went in this way. A. tenerum is a charming species, so is A. colpodes, and the most useful and easiest grown of all is A. cuneatum. The finest plant of Platycerium alcicorne I had ever seen was suspended in a basket in this house. Trained overhead in wild profusion are Passion-Flowers, represented by Passiflora princeps, P. alata, P. quadrangularis, and P. edorata. Trained against the wall of the passage leading to the conservatory was a grand specimen of Heliotrope, which must be useful to cut from all the year round. The brilliant Tacsonia Van-Volxemii is trained to the roof, and in contrast to it is a noble specimen of Mandevilla suaveolens. Its snow-white flowers are deliciously scented. It succeeds best planted out; if the roots are confined to a pot the leaves become a prey to red spider. Plumbago capensis, also planted out, was in good health, and produced its pretty pale blue flowers in abundance. In another house are great tree-like specimens of Brugmansia suaveolens and B. atro-purpurea, and when covered with hundreds of the large trumpet-shaped flowers the sight is sufficiently striking to be remembered during the years of an ordinary life. Brugmansias do not thrive well in pots, they are gross feeders, the roots will not bear restriction. There are in the same house some specimens of Australian tree Ferns that would delight the heart of a London exhibitor.

The kitchen and fruit garden is removed some distance from the house. It is surrounded by a wall, which is furnished with well-trained Peach, Nectarine, and Apricot trees. The blossoms are protected from frosts by an ample glass coping. The sheets of glass are only used when the trees are in flower; they are placed upon a framework of iron, which is permanently fixed to the wall. The trees are trained to stout iron wires strained perpendicularly, and not in the usual horizontal manner. Apricots do pretty well for a time, but the trees are short-lived, and frequently require renewal. Plums will not thrive as standards, but do well trained as cordons; the trees are trained to single wires fixed in a horizontal position about a foot from the surface of the ground. Apples also do well under the same treatment, but they must be worked upon the French Paradise stock, and not upon our own English Paradise, which causes the trees to grow too strongly. Another system of cordon training, which may be called diamond cordon, answers well for Apples. The trees are about 3, or they may be 4 feet apart, and are trained to stout wires fixed obliquely in the ground. The first wire leans to the right, the next to the left, and so on to right and left alternately; the trees thus cross each other, and form a row of diamonds. Fruit trees have little tendency to make wood here, all the branches being studded with fruit buds. The bush and pyramidal-trained Apple and Pear trees have a remarkable appearance, as almost every bud seems to be a fruit bud. In the garden are specimens of Beard's glass walls; these hasten the blossoming of the trees, consequently they require protection both from frosts and the proverbial early birds which eat the early blossoms.

Mr. Fish is well known as one of the foremost writers on all matters horticultural, and the arrangement of the beautiful grounds at Hardwicke show that if his precepts are good his example is better; and I can only conclude by thanking him for the kind manner in which I was received and shown over the beautiful gardens under his charge.—J. Douglas.

Deaths.—William Port Ayres died on the 14th inst. His father was a gardener, and the son, after completing his professional education at Chiswick, became gardener to J. Cook, Esq., Blackheath. He did not succeed as a nurseryman at that place, and thence went to Nottingham. He wrote on the cultivation of the Cucumber, and was one of the editors of the "Gardener's Magazine of Botany," which failed as it deserved, because started by its publisher in spiteful opposition to "Paxton's Flower Garden." Mr. Ayres suggested a form of hothouse, the manufacture of which we believe he was pursuing at the time of his decease.

Archibald Turnbull died on the 19th inst., aged eighty-five. He was of the firm of Dickson & Turnbull, nurserymen, Perth, and is a great loss to the locality.

METEOROLOGICAL REPORT FOR 1874.

Ticehurst, Sussex.

WHITE HARICOTS.

Among the little-known vegetables on this side of the channel, perhaps the least known of all is the Haricot Vert, or Green Haricot, which is highly esteemed in Paris, but seldom seen save upon the tables of the rich, where it ranks as a luxury even greater than early Green Peas. As a dried vegetable Haricot Blanc, or White Haricot, is much more widely known in France, where it forms a portion of the daily food of the people; ever since the Potato famine it has been, but unfortunately not extensively, used in England.

The difference between our Scarlet Runner and the Haricot is that we eat the whole of the former while young—that is to say, the whole of the pod and its contents, cut up, while with the Haricot Bean the entire pod, which is lined with a tough skin, is discarded, and the seeds or green beans alone eaten being shelled like Peas. There is no reason why Haricots should not be grown in this country, at any rate to be eaten, young; when required as a part of the supply of winter vegetables, doubtless they can be imported at a much lower price than we could produce them here; rent of land and price of labour almost preclude the growing of ripened seeds in England.

There is a widespread but erroneous idea that our climate is not suitable for the growth of many vegetables extensively cultivated by our continental neighbours; the truth being, however, that we could grow them as well, or even better, but not so cheaply. Yet the outlay in their production need not be so great as to preclude a profitable return on their sale.

The imported White Haricots, such as we buy for culinary purposes, are also excellent for sowing; we have taken the Beans haphazard for this purpose from a sack, and found that every seed germinated and bore a large crop of sweet, delicately-flavoured, nutritious food. The bine of this variety grows as rapidly and quite as luxuriantly as our common Runner Bean, to which, at the season of blooming, it forms a pretty contrast in the colour of the flowers, the pure white-winged blossoms of the one adding intensity of colour to the brilliant scarlet of the other. The Haricot is as long in the pod, but neither so wide nor so coarse in texture as that of its compeer. The cultivation is exactly similar, where the one will grow well the other will likewise flourish. Both descriptions being half-hardy annuals, the seed should not be sown in the open ground until the end of April or beginning of May. When the plants have attained a sufficient height to cover the sticks up which they are trained they should be topped; this tends to make them throw out side shoots and bear a heavier crop of beans. Haricots may be grown dwarf in a manner similar to that pursued with Scarlet Runners, but the yield will be nothing like so great. The young green Haricot Beans will

be ready for gathering about the end of August or beginning of September, according to the season. The plants while growing should never be allowed to droop for want of moisture, and occasional watering with liquid manure during dry weather is beneficial in producing rapid growth and early maturity. The beans should be gathered and shelled when they have attained almost their full size, but while they are still of a pale green colour; they should be thrown into boiling water with a little salt, and boiled for about twenty minutes, when they should be served hot, with a lump of butter in the centre of the beans. —(*National Food Reformer.*)

DRESSING VINES.

I HAVE been reading with great interest Mr. J. Wright's very able articles on the "Vine Pruning and Winter Dressing," in No. 717, page 559 and 560, and I am very happy to see that he does not advocate peeling or scraping off the loose bark; but still, I am embarrassed when reading in No. 719, page 4, a piece signed "H.," denouncing not only peeling off loose bark, but also the use of paints made of sulphur, soot, soft soap, clay, &c., and substituting clean water for all. Now, I wish he would tell how I could apply clean water to clean and clear my Vines of red spider and mealy bug, which were so plentiful the year before I got charge that they gummed the Grapes all over and made them unfit for use; and I may safely say it was only by the use of "H.'s" obnoxious mixture I was enabled to have a crop, and now the Vines are almost clean by close watching and close painting with "H.'s" obnoxions mixture. Nevertheless, I would dispense with the painting if I were advised to something better and not obnoxious.—B. G.

FORCING STRAWBERRIES.

RECENT articles on Strawberries have been very interesting; but I have not seen a word from any correspondent in favour of Viscountess Héricart de Thury as an early kind for forcing in pots. I have a few of this Strawberry now fit to send to table from runners early in last June, which were laid in large 60-sized pots, and plunged to the rim the second week in July. They were well rooted in the pots, and then cut from the old plants, and the 1st of August potted into 48-sized pots and placed in full sunshine. At the end of August a frame was put over them, and the plants kept dry through September. The lights were drawn-off all day when fine weather, and put on at night. At the end of September the plants were watered, the frame shut-up early in the afternoon, and the plants soon began to make new growth and throw-up flowers. At the end of October the plants were placed on a back shelf in a warm greenhouse near the glass, and I have picked some ripe fruit for dessert to-day (January 18th), and have the promise of a fair crop.—G. S., *Hadlow, Kent.*

PACKING GRAPES.

SOMETIMES a great fuss is made about the packing of Grapes, such as wrapping them up in tissue paper and cotton wool all round them—treatment which only removes the bloom more effectually, which is the great disfigurement to avoid.

I have a great quantity of Grapes to pack and send off every year, and the arrangement I find to answer the best are square baskets with a handle and a lid. I first line with fine shavings, or in the absence of them a little soft hay; this lining I cover with paper, and the baskets are then ready for the Grapes. I take the basket to the vinery and place it on its end in a sloping position, cut the bunch from the Vine, and remove any decayed or defective berries, place the bunch at the end of the basket stalk uppermost, and so on until the basket is full; I then take the basket by the handle and give it a gentle shake, and the operation is complete. The Grapes will travel safely and unpack with very little loss of bloom.

The bunches must be cut from the Vines and placed at once in the basket in which they are to travel. Our baskets hold about 20 lbs. of Grapes, and so packed I never hear any complaints, which would very soon be made by the fruiterers if the Grapes were the least damaged.—J. ANDERSON, *Hill Grove Gardens.*

MARIE BAUMANN ROSE.—I am astonished at the Rev. Mr. Radclyffe not being able to recommend Marie Baumann. Here, with a wretched climate, a rainfall nearly equal to that of Kendal, and the atmosphere full of smoke, there is no Rose like it for perfume, colour, beauty of shape, and profuseness of blooming. Its only faults are, that it is a weak grower on the Manetti, but not so on Mr. Prince's cultivated seedling Briar; and then it hangs its head like a young maiden blushing at her own loveliness, but thus hanging only in windy weather or after a shower of rain.—T. WATSON, *Manchester.*

NOTES ON VILLA AND SUBURBAN GARDENING.

The Amateur's Vinery.—Undoubtedly this is one of the most useful and interesting houses that can be attached to a suburban residence—that is, if it is constructed internally with a view to its being used for other purposes besides that of growing Grapes. There ought to be either a stage or a brick pit under the roof; but the question is, which of the two would be the handiest or most useful during the season? If to economise space as well as allow convenience for other things, I should say a stage, because not only might the stage be used for bringing plants into bloom at this time of the year, but it also affords more space for storing plants during the winter; and again, the room under it might be used either for storing plants when dried off, or for the bringing-on of such things as Rhubarb, Sea-kale, and Asparagus—at this time of the year, therefore, a great saving of labour in making-up separate beds elsewhere, and the heat which is necessary to bring on the Vines serves for the other things also. The pit would, in one sense, be more useful just now and for a few weeks to come, because it would be more beneficial to the Vines if filled with heating material, and in which plants to be forced into bloom might be plunged, and would no doubt do better than in the dry heat on a stage; and again, part of it would be required on which to place a hand-light or two for propagating bedding and other plants, unless if the pipes run round the front of the house and a portion of one end of them bricked-up, with lights on the top, so as to form a small heated frame, then propagation might be carried on there. If this were done it would be another reason why a pit would not be so useful as a stage, because there would be no need to use it for propagating purposes, and a pit takes up much room that cannot be so serviceable when not wanted for particular purposes. February is upon us with its increased daylight, and I hope plenty of sun, and those who have such a house as I describe may put it into working order and start the things in a gentle heat at first; but as the season is advancing they may reasonably expect these things to do fairly without very much additional labour, but they must be attended to at all times, or it is better not to attempt anything at all, but just let the Vines and plants come on naturally.

Now let us see what the house is to be filled with. As I have mentioned above, Rhubarb, Sea-kale, and Asparagus are the principal things to occupy the space under the stage. The former must be dug-up from the open ground as whole as possible, and placed on a bed of earth prepared for it in the house, the roots and crowns just covered with earth and watered to settle it about them; and the same for Asparagus—I may say done in exactly the same way; but when the Sea-kale is taken-up from the open ground it should be put thickly into pots and covered over with another one so as to blanch it properly, or the roots may be planted in a bed of earth the same as for Rhubarb, and then covered over with hoops and mats so as to be in total darkness. On the back stage may have the tallest of the plants to be forced, such as Azaleas, Begonias, Roses, Lilacs, Deutzias, Spiræas, Fuchsias, Rhododendrons, Kalmias, Weigela rosea, Acacias, Forsythia viridissima, and the other tall-growing things; while the front stage ought to be taken-up with the dwarfer-growing, such as the Dielytra spectabilis, Richardia ethiopica, some of the strongest and most advanced of the Cinerarias, dwarf-growing Ferns and Lycopods, then come the different sorts of Dutch bulbs, all of which if they have been well prepared as before advised, will have their pots full of roots and will force well. Some of the best-ripened bulbs of Amaryllis, and a few pots of Achimenes, Gloxinias, and Gesneras, as well as Lily of the Valley, must not be omitted. At the same time as occasion requires, a few pots of Verbenas, Heliotropes, Lobelias, and most other sorts of softwooded bedding plants to produce cuttings for propagation. Indeed such a house as I have described, if worked very carefully and filled with the above-named plants, will not only afford a grand show during the spring for the conservatory, but it will be the groundwork of all the decoration to be done by plants, both bedding and otherwise, during the whole season that is before us.

All plants for forcing should have a season's good preparation beforehand. I allude particularly to hardwooded plants, which should be in a good state at the roots, have made a good growth with plenty of buds, and the whole well ripened before they are fit for the ordeal of pruning. Those plants that need it should have a top-dressing of the same sort of soil mostly used for their growth the year previous, and the drainage of every plant so established should be examined, and if necessary renewed, so as to leave a free escape for the water. The house with its occu-

pants should not be started at a high temperature at first, as the days are lengthening—say 50° at night and 10° higher in the day, with sun heat, and have air admitted to them when likely to go beyond that. The Vines, as well as the plants, ought to be syringed twice or thrice a-day, and be shut up early in the afternoon, say by two o'clock, and syringed at that time; this gives the whole a time for growth in the afternoon, and the atmosphere is then most suitable for it. It should be borne in mind that as it is found necessary to increase the heat the moisture must also be increased, which not only advances the rooting power of the plants but keeps away the red spider.—THOMAS RECORD.

THE GOLDEN CHAMPION GRAPE.

IN reply to Mr. Thomson I write to say that the foliage of the shoot or lateral upon the Trebbiano Vine which bore the bunch in question differed slightly from the foliage of the other shoots, and became yellow and ripe much earlier, but was not, I think, quite so large as the foliage of the Golden Champion usually is; the wood or bark of the shoot which bore the bunch in question was also a shade darker than the others. I think I may confidently assure Mr. Thomson that there cannot possibly be any mistake in the matter, as so many people not only saw the bunch but tasted the fruit and minutely examined the same, including Dr. Hogg, whose eye it caught nearly as soon as he entered the house without having it pointed out, and before he was even aware that such a thing existed. There were four eyes or buds upon the shoot, and I have inserted them all a week or two since. I hope I may succeed in getting them to grow; and should only two of them do so I shall have pleasure in sending one of them to Mr. Thomson.

A gentleman in writing to me upon the subject has asked me to take particular care of the bud opposite to the bunch; but it so happens that no bud formed there, or at most a defective one, as the bunch was produced near to the end of the shoot, and the four buds I have secured were formed under the bunch—that is, between the bunch and the rod.

As Mr. Thomson justly observes, the subject is certainly interesting. I have stated all particulars as far as I know. I can offer no explanation, but can only hope that modern science may be able to throw light upon the matter.—P. GRIEVE, *Culford, Bury St. Edmunds.*

EARLY ENGLISH WRITERS ON GARDENING.

No. 2.

LEONARD MASCALL.

THE Mascalls are a Sussex family of long standing, and their name seemingly a corruption of the Norman Marescal.

Fig. 22.

The founder of the family in Sussex probably came over with William the Conqueror, members of the family being its Sheriff in the reigns of Richard Cœur de Lion and John. At the Heralds' College their arms are recorded as Sable, six fleur-de-lis or, three, two, and one, with a bordure engrailed, argent. East Mascalls, a residence in the parish of Lindfield, belonged to them; but the chief mansion of the family was Plumpton Place, in the parish of the same name, about five miles from Lewes. It is a five-gabelled house, the three centre gables being smaller than the two outer, which advance as the ends of the wings. Mr. Lamb, an architect who published an illustrated volume on "Ancient Domestic Architecture," gives a view of the place, and concludes his slightly adverse criticism by saying, "The design is chiefly commendable for its simplicity of form and its harmony of details, and for the absence of all architectural impropriety in the architectural features." He also remarks that it has the appearance of being different tenements, which agrees with its present occupants, who are families of cottagers. It was surrounded by a wide moat, and a drawbridge over in front of the mansion—three sides of the moat remain. It now belongs to the Earl of Chichester.

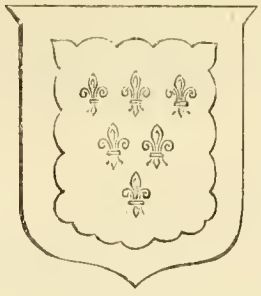

Fig. 23.—Shield.

The Mascalls were not lords of the manor of Plumpton, but were its Crown tenants. Leonard Mascall, the especial subject of my notice, was the owner of Plumpton Place. Of the dates of his birth or death I have not been able to obtain particulars, but he certainly lived throughout the reign of Elizabeth and some part of that of James I. Fuller asserts that he introduced carp and Pippins "from over the sea;" but he attributes to him the first introduction of that fish, a merit to which he certainly was not entitled. He may, as has been stated, have introduced carp from the Danube and bred them in the moat of Plumpton Place; but in an earlier part of the century Dame Juliana Berners in her "Boke of St. Albans" says, "The carpe is a dayntevous fyshe; but there hen but fewe in Englande, and therefore I wryte the lesse of hym." These facts testify that Mascall lived at and strove to add to the attractions of his mansion. They justify the conclusion that he travelled on the continent, and it is certain that he was acquainted with both the French and Dutch languages, and many of the details of grafting and planting are stated by him to have been translated by himself out of those languages.

Fuller's statement is—"Leonard Mascall being much delighted in gardening, man's original vocation, was the first who brought over into England from beyond the seas carps and Pippins; the one well cooked delicious, the other cordial and restorative. For the proof hereof we have his own word and witness in his book of Fishing, Fowling, and Planting; and did it, it seems, about the fifth year of the reign of King Henry VIII., anno Domini 1514. The time of his death is to me unknown."—(*Fuller's Worthies—Sussex.*) The volume Fuller quoted from is entitled, "A Booke of fishing with hooke and line and of all other instruments thereunto belonging. Another of sundrie engines and trappes to take Polcats, Buzards, Rattes, Mice, and all other kindes of vermine and beasts whatsoever. Made by L. M. 1590." Mascall refers to himself in this passage—"The carpe is a strannge and daintie fish to take. The first bringer of them into England (as I have been credibly enformed) was maister Mascoll of Plumsted in Sussex, who also brought first the planting of the Pippin in England." The mis-spelling of the names both of the author and his residence may be the printer's errors, but the name of Mascall in those days of phonetic and unfixed spelling occurs in various forms, even as "Mastall." Then as to Plumpton being called Plumsted in the sixteenth century, the change to the modern form may have arisen as the houses and population increased. In Oxfordshire is Stead-ham-ton, literally "the village become a town." There is no mention in the sentence in Mascall's book that the introduction of carp and Pippins was so remote as 1514, and that date is more applicable to Dame Berners' time.

In 1572 Mascall published his first work—"A Booke of the Art and Manner how to graff and plant all sortes of trees, how to set stones and sow Pepins to make wild trees to graff on, as also remedies and medecines, with other new practices, by one of the Abbey of the St. Vincent in France, with the addition of certain Dutch practices, set forth and Englished by L. M."

In the library of the British Museum are other editions published in 1575, 1580, 1582, 1592, 1652, and 1656. In 1640 was published, "The Countryman's Recreation," which contains this book of Mascall's, bound up with Reynold Scot's "Perfect Platforme of a Hoppe Garden," and De Sercy's "The Expert Gardener." This seems to have been a publisher's compound.

"The Art and Manner how to graff and plant," though a translation, has the merit of being largely original, the record of his own practice and observation, and all his works are entitled to the same credit. At the commencement of the volume is an address in rhyme from "The Booke to the Reader," and the following verse extracted from it testifies that Mascall was not a mere copier of other men's experience—

"Weigh well my wordes, and thou shalt finde
All true that I doe tell;
Myne auethour doeth not write by geese,
Practise made hym excell."

One statement he makes either refers to a lost art or is a mere recital of Roman writers' fables. It is that "in the scutcheon ye may graft of divers kinds, as on Peares, Apricocks, and Plums together, and of others also." He writes as if relating his own experience, adding, "I have not knowne or found of any others," and rejects others as "but jests."

This (fig. 24) is one of the illustrations of the volume and if it correctly represents the gardener's costume shows that "the blue apron" had not then been introduced. The "trauses" (birth-name of our trowsers) were hose fitting the limbs closely; over these were the trunk-breeches, stuffed with wool or other soft material, and to so ridiculous an excess that in the Parliament-house the members had rails to sit upon! The sleeved doublet resembled somewhat the stableman's waistcoat of our time. In the gardener's belt were stuck, as occasion required, the implements for grafting, pruning, or training.

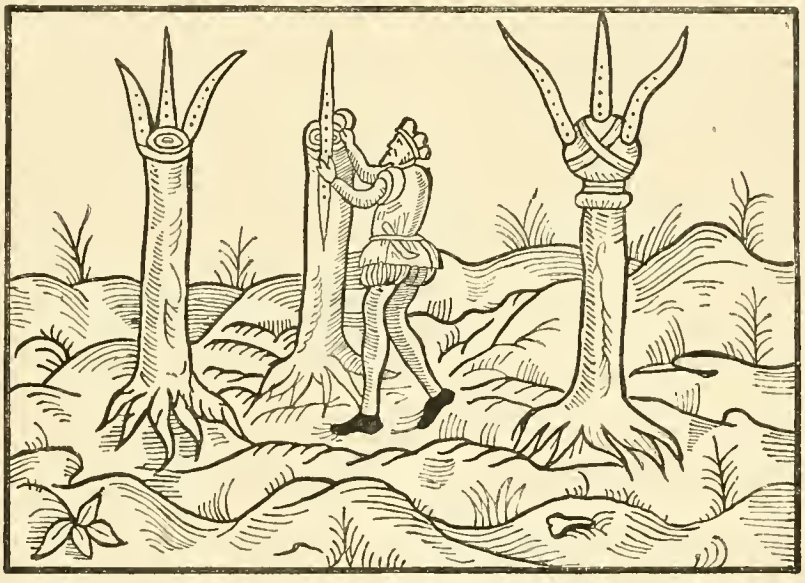

Fig. 24.

Mascall was the earliest writer in English on poultry-keeping. His work is entitled:—"The Husbandye, Ordring, and Governmente of Poultrie. Practised by the learnedste, and suche as have bene knowne skilfullest in that arte and in our tyme." This little duodecimo volume of about 150 pages was published in 1581, and the dedication is headed, "To Mistresse Katherine Woodforde wife to Maister James Woodforde Esquier and cheefe clarke of the kitching to the Queene's Majestie Leonarde Mastall wisheth a prosperous estate in health long to continue;" and he goes on to state that she had "a desired minde how to use and govern Poulterie to profit for maintenance of her housekeeping," and this, and having known her at "Brestall" (Bristol), he dedicates the volume to her. He says it is translated out of Columella and Stephanus, but that there were added many practices known to "all good householders." I have not examined what are these additions, but was disappointed by not finding any description of the fowls then cultivated, for as he lived in the Sussex district, now celebrated for poultry-breeding, I hoped to find some particulars to prove or disprove that the Sussex variety of the Dorking are descendants from those bred in the sixteenth century.

In 1600 Mascall published "The Government of Cattel, Divided into three Books. First of Oxen, Kine, and Calves, and how to use Bulls and other cattle to the yoke or fell. Second, government of Horses with approved Medicenes. Third, Sheep, Goats, Hogs, and Dogs with remedies. Also perfect instructions for taking of Moals; monthly husbanding of Grounds." Other editions were published in 1605, 1620, 1633, and 1662. "The Countryman's Jewel, or the Government of Cattel. Inlarged by Richard Ruscam," which came out in 1680, is an edition of Mascall's work. Mascall at the beginning of his volume says—

"For want of knowledge and good skill,
Oftimes it may so fall,
A man that is full rich in beasts,
He may soon lose them all."

And the volume certainly comprises a large amount of the practical knowledge of the author's period. It evidently attracted the attention of Government, for within three years he was appointed to an appropriate office, a later edition stating it was "Gathered by Leonard Mascal, Chief Farrier to King James." The farrier of the Stuart period was in social position on a level with the veterinary surgeon of the present day, and the chief farrier of the Royal establishment was a man of education and acquainted with the relative sciences as then known. Thus Snape, Charles II.'s farrier, published a volume on the anatomy of the horse.

Aided courteously by the Rev. Mr. Woodward, Rector of Plumpton, its registers have been searched for some record of Leonard Mascall, but in vain; and similarly fruitless has been a search obligingly made by E. C. Currey, Esq., of the wills in the registry of Eastern Sussex.

The registers in Somerset House have been equally unproductive. We can therefore only surmise approximations to the dates of Mascall's birth and death. His portrait prefixed to these notes, published in 1596, represents him as about fifty years of age, and therefore his birth at about 1546. This is not inconsistent with the publication of his first work in 1572, for he would then be twenty-six. His death may be fairly concluded to have occurred between the years 1605 and 1620. The first-named year is the date of the last edition of his "Government of Cattle," which has stated on its title-page, "Gathered and *set forth* by Leonard Mascall." On all subsequent editions it is merely stated to have been "gathered" by him. In "The Countreyman's Jewel, or the Government of Cattel," published in 1680—on the title-page it is stated, "Gathered at first by Leonard Mascal, but much inlarged by Rich. Ruscam, gent." Ruscam speaks of him as "that judicious and fortunate Mascal, chief farrier to King James."

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

Last week it was stated that our nailing was nearly finished. We do not have much to do, as the orchard house supplies us with all the finer fruits required; but the greatest number of gardens are not furnished with orchard houses, and, as a rule, in the United Kingdom the finer fruits must be grown on walls. There should be no delay in finishing off all pruning, and tying, or nailing the trees. In our apprentice days it was the rule not to nail or even prune Apricot and Peach trees until the blossoms were very nearly at the point of opening, and this was just at the time that the greatest pressure required to be put upon the men in every department; whereas, if the nailing had been attended to in favourable weather during the winter months, it could have been done in a less hurried manner. Where well-trained wall trees are a prominent feature much time is taken

up with tying or nailing, and one reason why time should be taken by the forelock is, that it is not possible to do it either in wet or cold weather. Men cannot stand on a ladder or at the base of a wall and drive nails if they are shivering with cold; they should in cold weather have digging or trenching to go to before breakfast in the morning or towards dusk in the evening. We have known men nailing Morello Cherries behind a north wall, and cut their fingers nearly to the bone, and not know of the accident until they saw the blood streaming from the wound. We are now getting more into summer pruning for fruit trees, and there is no reason if time can be spared why much of the nailing should not be done in the autumn. It is simply bad management to lay-in a large quantity of young wood in the summer months, to cut it out in winter; if no more young wood is laid-in than is required for the purposes of fruit-bearing (and not a single shoot more ought to be laid-in than, with a system of summer pruning carried out as it ought to be), the labour required now would be a mere tithe of what is in too many instances required.

Peach trees ought to be taken down from the walls every year, and if necessary the branches should be washed, and if the old nails are used again they ought to be roasted first. New shreds should be used, and it is very often necessary to cut out a few of the lowest branches and bring down some of the others in their place. A tree is generally furnished with five or seven main branches; these ought to be nailed-in first, the smaller and fruit-bearing branches being regularly disposed between. Plum, Apricot, and Cherry trees are usually trained in the same way, but it is not at all necessary to undo the fastenings of them. We have seen Pear trees trained in many different ways; but where there is a fancy for variety, the best is the oblique cordon single or double. If single, the trees to be planted 18 inches apart; if double, 3 feet, trained at an angle of 45°. For high walls and large gardens where a supply of first-class fruit is the main object, plant your trees 20 or 24 feet apart, one main branch to be trained vertically, side branches being trained 9 inches apart; the side growths will not start exactly opposite to each other, but they must be brought opposite before taking a horizontal position. The severe weather early in the month prevented planting; all ours was finished last week. The trees had been carefully lifted in the nursery, and were a mass of healthy fibrous roots, the main roots not having received any injury. The trees were selected in the nursery, not because they were the best-looking trees, but because they had been transplanted the previous season. Handsome healthy-looking trees might have been purchased at a cheaper rate, but when sent home the roots would have presented a very different appearance. If large trees are bought, stipulate that they have been transplanted the previous season. Each tree had a barrowful of decayed fibrous loam placed round the roots.

Just a word about planting wall trees. The main stem should not be quite close to the wall, but about 3 inches from it. Do not nail or prune the tree until the buds are unmistakeably swelling.

FORCING HOUSES.

Early Vineries.—The first house has broken regularly, and the shoots are very strong. The night temperature is now 65°. Our plan is to water the borders thoroughly about four or five times. The second watering has been given, about as much having been applied as would cover the ground to the depth of 2 inches. The young shoots are being pinched two leaves beyond the fruit and carefully tied-down to the wires. The tying must be done with great care, as it is always the strongest and best growths that are most likely to snap. Such a variety as Golden Champion can only be trusted in the most careful hands. One growth only should be trained from each spur, and the spurs should not be closer to each other than 15 inches, so that it is frequently necessary to thin the buds out on young wood, but managing so that the growths are as nearly opposite to each other as possible. We shut-up early, and admit air at the apex of the roof the first thing in the morning in fine weather.

Cucumber House.—Half of the plants failed entirely this winter, the other portion planted with Blue Gown is now doing well. During the last four or five years the same stock has been kept true by striking cuttings, but in time the constitution fails and must be re-invigorated by raising seedlings. The plants from seeds sown in December have been grown-on in pots near the glass, and have been planted-out in good condition. The variety is Tender and True. The night temperature is kept at 65°, but a margin is allowed of 3° or 4° either way according to the weather. Sowed Melons, Tomatoes, and Capsicums in bottom heat in the Cucumber house.

ORCHARD HOUSE.

The Peach and Nectarine trees have been removed into the house. They have been plunged over the rims of the pots out of doors since early in October. The fruit buds are very prominent and thickly studded over the young wood. We have always advocated removing the trees out of doors; and as a proof that they receive no injury thereby but are benefited by it, the roots work up into the rich top-dressing, and if not taken out of the material before March they form a network of roots in the fibre over the pot. Other growers in this district leave their trees out later—in fact till just before the blossoms open: this is to keep the trees as late as possible, so that the flowers may not be injured by spring frosts. We are not very particular about this, as the house is heated, and, the pipes being connected to a boiler that is always at work, the expense for fuel is a mere trifle. We have also found that brown scale does not like exposure to the winter frosts, and that the trees are comparatively free from insect pests under the treatment. The trees have now to be looked over and any dead or superfluous branches cut off. The pots do not require water for ten days or so after being brought in, and afterwards water must be carefully applied until the trees start into growth. Strawberries on the shelves require but little water; looking over them once in a week is sufficient. As we do not wish the trees to flower early, all the ventilators are opened in the daytime but shut at night, as, even though there may be no signs of frost at dusk, a change sometimes occurs in the night, as it did on Tuesday, when a sudden change caused the thermometer to fall to 29°.

GREENHOUSE AND CONSERVATORY.

The question was put to us by an ardent amateur, "How must I do to have my Camellias in flower early?" He had been forcing them in heat, and the result was that the buds, instead of swelling more rapidly as he very naturally expected, began to drop off. Now, to have Camellias in flower before Christmas the plants must be placed in heat, say in April, to make their wood, and kept there until the buds are set, when they may again be removed to the greenhouse. The most useful plants to continue the supply of flowers at this time are Cyclamens, Cinerarias, and Chinese Primroses (Primula sinensis). They will continue to flower all through the winter months. The Cyclamens must be carefully attended to, as damp affects the leaves and flowers in all sorts of weather. Damp round the necks of Primulas must be checked with lime dust as soon as perceived. Our Cinerarias are grown for decorative purposes only. Those who are cultivating for exhibition must now be very attentive to their plants. Every alternate watering should be with weak liquid-manure water. The plants must be close to the glass where the air from the ventilators plays freely amongst the leaves. The shoots must be carefully tied out to a wire fastened to the rim of the pot, or to neat sticks. As our forced flowers have not come in yet, the above with the perpetual-flowering Carnations are exceedingly useful. Of course Epacrises and winter-flowering Heaths furnish their quota.—J. Douglas.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

Secretaries will oblige us by informing us of the dates on which exhibitions are to be held.

TRADE CATALOGUES RECEIVED.

Little & Ballantyne, Carlisle.—*Spring Seed Guide.*

Dicksons & Co., 1, Waterloo Place, Edinburgh.—*Descriptive Catalogue of Select Fruit Trees, &c.*

W. Barron & Sons, 16, Market Street, Nottingham.—*Vegetable, Agricultural, and Flower Seeds, &c.*

Brunning & Co., 1, Market Place, Great Yarmouth.—*Illustrative and Descriptive Seed Catalogue.*

G. C. Short, Market Place, Stokesley.—*Descriptive Catalogue of Choice Seeds.*

B. R. Davis, Middle Street, Yeovil.—*Illustrated Catalogue of Vegetable and other Seeds.*

E. P. Dixon, 57, Queen Street, Hull.—*Descriptive Catalogue of Seeds.*

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Books (*A. C. Swain*).—There is no publication on Auriculas with coloured plates. The gentleman you name has not published any work on floriculture. (*F. J.*).—"The Handy-book of the Flower Garden" is published by Messrs. Blackwood. (*Amateur*).—For common flowers, vegetables, &c., "The Garden Manual." If you enclose twenty post-office stamps with your address you can have it post free from our office. (*E. S. D.*).—Lindley's "Flora Medica" gives such information as you need. Longman & Co. are the publishers. Price 18s.

Apple Trees Cankered (*T. Williams*).—The roots of your young trees have reached the red sandy ironstone subsoil, and the soil above being heavy is retentive of water—both circumstances productive of canker. Cut away the roots that have descended, and slightly top-dress the surface over the roots with manure every spring to induce the roots to keep near the surface.

Price of Pears (*A Constant Subscriber*).—Huge specimens were in a fruitist's window in Covent Garden Market marked one guinea each, but whether they were sold at that price is not known to us. They were Uvedale's St. Germain.

Wild Ginger (——).—Sir S. Baker's plant cannot be the Asarum canadense. The characteristics are different.

Orcharding (*Beta*).—We are sorry we cannot give you the names of either of the Apples of which you have sent us only portions and rind. In all probability they are local varieties, of which you have abundance in Worcestershire. The "Fruit Manual" is far advanced towards completion, the printers having got as far as "Plums;" but the additions to the work have been so numerous, the time taken to produce it has been longer than was anticipated. The best guide we can offer you in your present need is Canon Lee's "Small Farms," published at this office, and sent free by post for 6½*d.* in stamps. It is by the Vicar of St. Peter's, Droitwich, and being in your own district will be applicable to your case. It is a very practical book, and will show you how and what fruit to grow profitably.

Sarracenia purpurea (*A Subscriber, Cambridge*).—The price is about 2*s.* 6*d.* Write to Messrs. Cutbush, Nurseries, Highgate, London, for information.

Tree-boring Caterpillar (*J. Green*).—It is the caterpillar of the Goat Moth, Cossus ligniperda. We published a full account of it with engravings on page 354 of our twenty-sixth volume.

Hyacinths Planting (*Hyacinths*).—In "planting Hyacinths" in pots the bulb should not be more than about half covered with soil, not pressing them into the soil, but placing them upon it, and filling with soil around the bulbs to the required height, pressing it firmly around the bulbs. The soil being in a moist state when the Hyacinths are potted, they should not be watered after potting prior to plunging in and covering with ashes. The soil must be made moist before plunging the pots if it be dry, but it is better to pot in moist soil. The bulbs usually require to be covered about six weeks, or until they have made good roots, and have grown at the top about an inch. When this extent of top-growth is made, and before it is 2 inches long, the pots should be removed from the ashes.

Heading-down Briar Offshoots (*Jane*).—We presume the offshoots have no roots, in which case the earlier they are cut back the better, and if they were rooted when planted they should be cut as soon as possible, and in either case it would have been better done prior to planting.

Late-cooking Apples (*Idem*).—Bedfordshire Foundling, November to March; Dumelow's Seedling, November to March; Brabant Bellefleur, November to April; Lord Raglan, January to June; Norfolk Bearer, November to January; Norfolk Beefing, December to June; Rymer, October to March; Northern Greening, November to April; Striped Beefing, November to May; Winter Majetting, November to March; and Annie Elizabeth will keep often until July.

Santolina and Alternantheras Culture (*Old Subscriber*).—Santolina is a hardy plant in well-drained soil, but in a wet one requires the protection of a frame or pit. It is propagated by cuttings, which root freely in summer in sandy soil in a close-shaded frame, or in spring in a frame in gentle heat. The young plants may be wintered in a warm situation out of doors, planting them about 2 inches apart, or if the soil be a heavy and wet one winter in a frame in the cutting pans, hardening well off in spring, and putting out in light rich soil in April in a warm position, shading for a few days and keeping moist, removing to the beds at planting time. It is a remarkably neat edging plant for beds, and for lines in carpet bedding. The foliage is white or silver. Alternantheras are propagated by cuttings, which root freely in sandy loam in gentle heat, kept moist and shaded, and when well rooted potted off singly and grown-on in heat; or they may be planted out in a pit about 2 inches apart, and grown on so as to have them strong by planting-out time, and well hardened off. In winter they require a temperature of 55°, and to be kept moist. To strike freely they require a bottom heat of 70°, and top heat corresponding. We do not think you will be able to obtain seed of either.

Caladium Culture (*I. H.*).—Pot them about three tubers in a pot, or five if small, allowing the same distance between the tubers as they are in diameter, and the same from them all around to the sides of the pots, potting so that the tubers will be covered about three-quarters of an inch deep. Give free drainage, and a compost of three parts turfy loam, one part leaf soil, half a part sandy peat, and half a part old cow dung or well-rotted manure, and one-sixth of silver sand, the whole well mixed, chopped up rather fine, but not sifted. Place in a house with a temperature of 65° at night, and 70° to 75° by day, keeping moist, and only so until they are growing freely, then water also freely, increasing the supply with the growth. The pots being full of roots shift into pots 2 inches larger in diameter, and when they are established in these, water twice a-week with weak liquid manure. They, revelling in moisture during growth, should be very copiously watered and have a moist atmosphere. Slight shade from bright sun is necessary.

Conifer Seed Sowing—Adiantums Potting, &c. (*W. L.*).—The best time to sow seeds of Conifers is in March or early April, choice kinds in pans in a cold frame to have air abundantly when the seedlings are up; the commoner varieties in open but sheltered positions out of doors. The best time to fill-up bare places on lawn by sowing grass seeds is early in April in showery weather. Adiantums in greenhouse will require to be potted in March, be moderately supplied with water until they are growing freely, and then water requires to be given copiously, never allowing them to want for water without giving it, and at the same time the soil must not be made sodden by needless applications. The plants are benefited by a light syringing morning and evening, and should have shade from bright sun.

Dracæna Propagation (*A Subscriber*).—The plants may be cut off at a few inches above the soil, the upper part or crown formed into a cutting and struck in gentle bottom heat, and the stem may be cut into lengths of about 2 inches, and laid flat on sandy soil in a pan filled to within an inch of the rim with soil, gently pressing them in the soil, and covering three-quarters to an inch deep with soil. Place the pan in a hotbed of about 75° to 80°, and keep moist. Instead of cutting the stems into lengths we lay them in the plunging material of the bed in the stove, and covered an inch or two deep; and when young plants appear about 3 inches high the stem is hared and the plants detached close to it with a knife, potting singly in small pots, and placing in a house with a brisk moist heat, where they soon become established, until which they require shade from bright sun, after which they should be kept near the glass, and have light to secure good colour.

Sea-kale Culture, &c. (*W. P.*).—We presume you intend to blanch it upon the ground with pots placed over the stools, and covered with leaves or litter, or both. The plants should be planted in patches 2 feet apart, and 2 feet 6 inches distance between the rows. The plants should be three in a patch in the form of a triangle, and 6 inches from crown to crown. The best time to plant is in March or beginning of April. Pyramid fruit trees we should plant 9 feet apart in the borders along the walk of the kitchen garden. The middle of February will not be too early to commence with Cucumbers with a bed 4 feet high at back and 3 feet in front, and Melons the middle of March.

Constructing Propagating Pit (*H. K. Q.*).—For a propagating pit there is no need of light in front nor at the ends, in which case you will only require a glass roof, with a 3-feet light in the centre at the highest part; you will have sufficient ventilation for propagating: but as you will desire to use the house for other purposes—Melons or Cucumbers in summer and plants in winter—we should have the whole of the upper part of the roof and 3 feet down the roof to open—sliding lights, or they may be hinged and raised by a lever. The middle wall ought to be 9 inches thick, also the back or shed wall, and the front wall until clear of the ground should be 9 inches, and may then be taken up 4½ inches, the height required. The pathway will need to be sunk about a foot to give head-room. For heating so small a house have a stove boiler in the shed, for which you will need a hole sunk to give the necessary level to the pipes. Two pipes will be required for bottom heat to the front border, and these we should surround with rubble, covering them about 3 inches deep with the same, and then have about 6 inches of plunging material for the pots. For top heat you will require four pipes, the pipes 2 inches diameter Six pipes the length of the house and across the ends.

Pteris tricolor Culture (*W. T. F. M. J.*).—It requires a good heat—55° to 65° in winter, and 65° to 75° in summer, with a rise from sun heat and a uniform moist atmosphere, careful watering, and always moist at the roots, but not syringed or watered over the foliage. Young plants are best; after three years they do not thrive well.

Potting Geraniums (*F. J.*).—The plants having filled the pots with roots, pot them before placing in the bottom heat; but if the plants have not good roots place them in the bottom heat before potting, and when well rooted shift into a larger size and return to bottom heat.

Fancy Geraniums Drawn—Chrysanthemum Culture (*A. G.*).—You may cut the plants back and keep cooler, but they will not bloom until late. Do it to the least extent consistent with the forming of compact plants. The stems of the Chrysanthemums ought to be cut off at the bottom. From the base of the stems cut away will be new shoots or suckers coming up; these are what you must depend upon for flowering this year. They should be taken off when about 3 inches long, and potted singly, or three in a small pot, and struck either in a cold frame or a gentle hotbed. Grown-on they will make splendid plants for autumn and early winter flowering. The temperature, 50° to 60°, is not sufficient to have these in good condition during the winter, but if kept rather dry they will grow none the worse in spring. A temperature of 60° to 65° is most suitable. For bulbs the temperature you name could not be better, but they would bloom finer in a temperature of 45° to 50°, but come on more slowly and be later. The Sparaxis will flower in due course, but not for some time yet. Do not bring them on too rapidly.

Wasps (*C. R.*).—We know nothing of the "Asphyxiator." If it suffocates wasps we should think it would similarly destroy rabbits in their burrows.

Twelve Superior Gladioluses (*T. Watson*).—Belle Gabrielle, Charles Dickens, Eurydice, Fulton, Horace, Le Titien, Lord Byron, Madame Fartado, Madame Vilmorin, Norma, Sir J. Paxton, and Milton.

Canon Hall Muscat Grape as a Stock (*Oxon*).—We would not think of working any sort of Grape Vine on this stock, unless by way of experiment. Black Hamburgh would be most likely to succeed on it.

Apples Sweating (*B. G.*).—It is not usual to go over the Apples and rub them with cloth after they are stored on the fruit-room shelves. It is necessary to look over them occasionally and to remove all decaying fruit to prevent it from tainting the sound ones.

Plants in Greenhouse not Thriving (*J. H. F. C. G.*).—The plants, we think, are suffering from some noxious vapour. It may be that of the newly painted house, which a little air left on for a time day and night would soon rectify; but a more likely cause is an escape of gas. The gas boiler has, we presume, a funnel communicating with the external air to carry off the consumed gas fumes. Or there may be an escape at lighting; or there may be a draught down the consumed-gas funnel, bringing down the fumes into the house. It is certain the atmosphere is very impure, and that you will not have any improvement until that is rectified. The floor would be a source of damp, but not of injury to the plants where due regard is had to giving air, and having a gentle heat in dull weather to cause a circulation of air. You may have the floor cemented without injury to the plants.

Zinc Sashbars (*A. A. M.*).—There would not be any emanation from zinc sashbars injurious to plants; at least we have not observed any, and we have to do with both copper and zinc, but they were painted.

Stove for Heating Greenhouse (*Idem*).—You are going from good to bad in seeking to have a stove in place of heating by hot-water pipes. We should keep to the pipes at any rate, and have a stove boiler, which you may have within the house, and with a funnel or smoke-pipe to convey to the external air the noxious products of combustion. Any of those advertising in our columns would supply you with what you require.

Grass for Poultry Run (*A. H. U.*).—As you want a speedy rather than a permanent result, we recommend Pacey's Perennial Rye-Grass alone, which sown early in April will be ready for the fowls in about six weeks. It might be sown earlier, but the growth is not generally good; though, if the spring were mild, you might by sowing early in March use the run in April.

Growing Fruit for Sale (*A Constant Reader*).—It would not do to be over-particular as to locality, though you will need to have regard to a good soil, a pure atmosphere, good supply of water, ready means of obtaining fuel, manure, and direct communication by rail with the places the produce is to be delivered at. Fruit always commands a ready sale in most large towns. For a supply to the northern markets you will need to be south; though you may, if the produce is not to be sent far, need not to be in a warmer part than the market; and if you grow under glass it does not much signify either way, only early and late fruit, especially of Grapes, pay the best. It is probably best for a beginner to take to a place for some time in hand by a fruit-grower, but success depends more upon individual effort, enterprise, and skill than upon any advice and instruction.

Holly Leaves Falling (*E. M.*).—The leaves are probably falling from the trees being injured by the late severe frosts, or they may have sustained injury from being near a smoky town, as we presume you are.

Double Geraniums Leggy, &c. (*J. W. L.*).—The best and only plan to have them dwarf and compact will be to cut them down, making cuttings of the tops, and in future keep them dwarf by stopping and growing near the glass. Some kinds are of strong erect habit, but are not more inclined to grow up tall than the Zonal and Nosegay kinds usually are. Tomtits are, we presume, the blue titmouse, which is very troublesome very often in Pea-growing, which we know of no way to hinder only by a close-meshed net. We have them by the score, and they do not interfere with the Pea crops. In one instance only were we obliged to destroy the birds, and this proved to be an old one taking the green peas to its young. The Celery is probably rotted at the heart by wet, the stalk not being close together, or it may have been occasioned by the slugs eating the stalks and causing decay.

Mushroom-growing Successfully (*A. J. D.*).—After the Mushrooms appear it is not good policy to cover the bed with hay or any kind of covering. Yours probably die or damp-off from being too heavily watered and overhead, also with warmer water than that of the house, which is a prolific source of dying. Mushrooms require an equable temperature and regularly moist atmosphere, as also regular moisture of the beds. With two beds only we command a supply of Mushrooms from October to July, and every day after Christmas, about which time the second bed comes in. Sometimes the beds require to be renewed. You will find an excellent article on Mushroom culture in vol. xxvi., page 288.

Names of Plants (*J. E. S.*).—The specimens were dried up and smashed. (*P. W.*).—Pothos sp.; perhaps a var. of P. scandens. (*W., Langport*).—The creeper is Bousingaultia basilloides; the fruit that of the Black Hickory, Juglans nigra. (*T. S.*).—Eupatorium Weinmannianum, *Regel*; E. populifolium, *D.C.* (*W. C.*).—1 and 2, Davallia canariensis; 3, D. tenuifolia; 4, Adiantum sp.; 5, Asplenium bulbiferum; 6, Phlebodium aureum. We do not name more than six specimens at once. (*T. W.*).—1, Pteris longifolia; 2, Blechnum occidentale; 3, Polystichum aculeatum; 4, Adiantum hispidulum.

Names of Fruits (*An Old Subscriber, Framfield*).—The small Pear is Broompark, and the larger one Prince Albert. (*Junior Carlton*).—No. 1, Cobham or Pope's Apple; 2, Reinette Verte.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 6.

BY T. C. BURNELL.

Dorking chickens grow and mature faster than any other known variety, and it is for this reason that they are always kept where there is a regular large demand for early chickens of the finest quality. Hamburghs will excel them as layers, but it is very doubtful whether the large size of the Dorking egg does not more than compensate for any deficiency in numbers; and in this as in all other breeds hens vary as layers, but average Dorking hens lay eighty or ninety eggs in the year, besides hatching and rearing a couple of broods of chickens in the most exemplary manner, and notwithstanding all the tall talk to the contrary, I very much doubt if any other breed will do any better. I have heard several complaints this unusually severe winter of people being without eggs; but although I only keep a small number of hens, I have not known what it is to be without them. However, it is on their merits as chickens for the table that Dorkings must rise or fall, and to this I will now confine my remarks.

With prize stock, as with poultry, the desideratum is to produce as large as possible a quantity of the best meat in the shortest possible time—that is, to combine excellence of flesh with early maturity.

What the Shorthorn is to cattle the Dorking is to poultry—that is, not only will this fowl come to maturity sooner than any other, but when matured the principal portion of the meat will be found in the most desirable places—viz., on the breast, wings, and merrythought, instead of on the legs, as is generally the case with Cochins and Brahmas. The advantage this peculiarity gives to the Dorking is very great, and it is for this reason, independently of their white flesh, that they are so much sought after by higglers and dealers; the only fowl which can compete with them in this respect being the French Dorking, the Houdan, but as this variety is a non-sitter it is not generally suited for domestic purposes.

If it is only desired to rear chickens for the table we cannot well hatch them too early in the year, provided they can be kept out of the wet and damp, as the earlier they are the more valuable they will be. But if we hatch out a brood of Dorkings with the hope of finding some prize birds among them, it is very doubtful if anything is gained by beginning too soon.

I never hatch any chickens till February, and often not then. The early birds if not stunted by the cold will doubtless win at the summer shows, and it is for this reason people are so anxious to get them out; but the March and April birds, which have the whole summer to grow in without a check, always make the finest in the end, and it is a common thing to see an April-hatched Dorking winning in November against January and February birds. But not so with Asiatics: it is well known they take nine or ten months to mature, while a Dorking, if pure bred, will be as far advanced at six or seven.

The careful breeder will always like to be certain of having his chickens bred from certain cocks and certain hens, in order to supply on the one side what is wanting on the other, for perfect birds are hardly ever seen except in poultry books. To make sure of this the sexes must be separated in the winter, and the desired birds mated-up again at least a month before we think of setting their eggs.

It is commonly supposed that the strongest chickens are obtained from a cockerel mated with hens, or an old cock mated with pullets. But owing to Dorkings maturing so much earlier than any other breed, this rule I think hardly applies to them. I have certainly bred some of my finest chickens from cockerels and pullets running together, and if the latter are early-hatched birds of the previous year they will be at least ten months old and fully matured, and I cannot see that any harm will ensue. It is not advisable to sit the first few eggs of a pullet, as such, besides being small, seldom hatch; but a March or April pullet will, if well fed, be nearly sure to lay in the autumn, and will thus be to all intents and purposes a hen in February or March, and her eggs may be safely trusted.

I have laid great stress on the Dorking maturing so early, but we must also bear in mind that early maturity means early decay. Dorkings are not long-lived birds, the large show cocks seldom get over their fourth winter. I know several birds in a neighbouring farmyard which are for certain twice that age. However, I am not now speaking about the common barndoor Dorking but the larger bird of the show pen, and I am justified in saying they are short-lived compared with some breeds, as I can hear of no instance of a well-known show cock lasting more than three seasons, while Cochins and Brahmas frequently hold out to five and six. The hens do better, though, and I now know a Dark Dorking hen which has twice won the cup at the Crystal Palace Show, and which is still flourishing and winning, though certainly over eight years old.

It is for this reason—their comparatively short life, that fanciers will not be justified in giving the extraordinarily high prices for Dorkings which Cochins and Brahmas sometimes fetch. We may reasonably expect to have several years' service and many shows out of these latter; but anyone who gives a high price for a Dorking cock, thinking to exhibit and win with him through the season, as is often done in some breeds, will find he is reckoning erroneously, as no Dorking, however carefully attended to, can stand knocking about from show to show, and certainly not for two or three seasons running.

To return to the mating of our birds. If we have an old cock which has not been overshown, and which we desire to use for stock purposes, put him with three or four pullets; but if we have only a nine-months cockerel there will not be the least reason to doubt the probable excellence of his chickens, even though mated with pullets. Besides, we are often compelled to breed from the latter, as it is seldom we can get the old hens to lay soon enough for their eggs to be sat for early chickens. In April and May seven or eight hens may be allowed to one cock, but in the early months it will be better not to allow more than four. When the birds have once been mated-up they should not be separated, as it is hopeless to expect to rear prize chickens if we keep on knocking the parents about from show to show. I should like to see the great winter shows end with December, when we could exhibit our best birds two or three times and afterwards breed from them, but I am afraid there is but very little chance of this coming to pass.

The eggs for sitting should be collected every afternoon, and if they have to be kept should be stored in chaff or bran, and turned every day. I do not believe there is any advantage to be derived from storing the eggs large or small end up, and most certainly a hen if she steals her nest does not do so, but eggs cannot be left for three or four days in one position with impunity. I should not care to sit eggs more than ten days old, and if they have to go a journey they should certainly not be more than two or three. If we wish the chickens to hatch out together the eggs should be as nearly as possible of the same age, as the staler the eggs are the longer will the chickens be in coming out. Dorking eggs are generally very large, and ten or eleven are quite enough for any hen to cover; in fact, nine will be better in the winter months.

The nests may be made either on the ground, in a manger, or in any other convenient place which the hen may select. But if we desire to rear a large number of chickens it will be found more convenient to set the hens in boxes or hampers with lids to each, and to take the hens off, and to put them on again every day after feeding—the plan which is generally adopted by keepers, as by this means we shall avoid disapointment caused by the stupidity of the hens in getting on the wrong nests.

CANTERBURY POULTRY EXHIBITION.

As a visitor and exhibitor at the late Show, I can fully corroborate the evidence of your reporter respecting the delay of auction, and the late hour of affixing many of the prize cards. When the hour of sale is distinctly stated in the schedules, one reasonably expects such to take place at the stated hour; and as many of us are, from distance and want of time, unable to be present the second day, it is certainly a disappointment. However, I feel certain the Committee and Secretary will take the hint in a friendly spirit, and endeavour in future to avoid delays, unpleasant to all parties.

But while commenting upon the failings of this Society, allow

me to do them the justice due in other respects. The birds were sent home in really good condition. White birds remarkably clean, considering they were in pairs. I must also acknowledge the special prize cards and honorary mentions posted a few days after the Show to successful exhibitors. This, I think, is most courteous and businesslike on the part of the Committtee. Other societies would do well to make a note of this, for it is seldom one gets the prize cards, and when they do happen to be put in the baskets, they are generally so soiled before they reach their destination that one has no pleasure in showing them to a friend. The prize money was also paid a few days after the Show. So, considering the Canterbury Exhibition of 1874 as a whole, I think exhibitors have much to be thankful for, and I for one offer the Committee and Secretary my most sincere thanks, and in conclusion, say, as a suggestion, Keep the entries still confined to the four counties. One thousand entries is surely large enough, and much too large for the Corn Exchange, and, as a contemporary justly remarks, it would in many cases be better for all parties that more of our exhibitions were local, or confined to a few counties. In our large exhibitions I maintain that some of the classes are simply a monopoly for a few exhibitors. Why not introduce champion classes, as at dog shows? This would certainly create more fanciers, and offer some hope for many who have a true heart but a slender purse. Encourage all, but give some encouragement, nay, special encouragement, to the artisan and mechanic. Many of us must have some hobby; encourage all. It is better to spend a few spare shillings in this way than in the gin palace or beer shop, and I can conceive nothing more interesting, and may say even profitable than chickens.—Brahma.

SANDFORD *v.* HOWARD AND NICHOLS.

On Tuesday, the 19th, Dr. Sandford sued Messrs. Howard and Nichols, the Secretaries of the Great National Poultry Show, for £2 5*s*., the amount he had paid as entry fees at the last Crystal Palace Show, and for 10*s*. expenses of carriage. The case was heard in the Westminster County Court. Dr. Sandford stated that he arrived at the Crystal Palace on the Saturday evening prior to the Show, that in the first instance he was greeted not very civilly by one of the officials, but this was afterwards explained, and having been informed that some exhibitors had been allowed to enter the building for the purpose of penning their birds, he inquired for one of the Secretaries for the same purpose. He saw Mr. Howard, who after some hesitation refused to allow him to enter, and eventually said he would neither admit him nor his birds. In cross-examination Dr. Sandford admitted that he had told Mr. Howard that he had told a falsehood, and that in reply to that, Mr. Howard stated that after such an insult he should hold no further conversation with him. Dr. Sandford called a witness, who corroborated some portion of his evidence, but differed with him with regard to Mr. Howard's replies.

On the other hand Mr. Howard stated that Dr. Sandford had complained to him in the first instance with regard to the incivility of the servant, and that he had apologised to Dr. Sandford and told him he thought it was one of the workmen; that he then asked him to be allowed to see his birds penned; that he explained to Dr. Sandford that he could not allow any exhibitor to enter for the purpose except under the supervision of one of the officers, and that it was so late, it being nearly ten o'clock, it would be almost impossible; that Dr. Sandford had accused him of telling a falsehood, and that he then declined to speak to Dr. Sandford again. He denied that he had refused to admit Dr. Sandford's birds, or that in answer to Dr. Sandford's threat that he would summon him he replied that "he could stand all that." Mr. Wilson corroborated Mr. Howard's statement. Several other witnesses were in attendance, but the Judge decided that it was unnecessary to go any further, and dismissed the summons with costs against Dr. Sandford.

UNDIGESTED FOOD IN FOWL'S CROP.

It may interest some of your readers who keep poultry to hear how I operated on a couple of birds which were suffering from an accumulation of food in their crops, caused either by general debility or local disorder, but I do not pretend to state the cause.

The birds were in a most pitiable condition, with crops very large and hard. My man securely held the first bird, which was a young Spanish cockerel; I made an incision with a sharp penknife through the outer and inner skins of the crop about 1 inch long, and with a blunt pointed stick probed out the undigested corn and maize, which was about a cupful. After sponging the wound with warm water I proceeded to sew up, first the under membranons skin, and lastly the outer.

"Young Tom" stood the knife very well, and so did the next patient, a middle-age hen, which, by-the-by, was very weak, having had the attack longer than the other.

A fortnight has now elapsed and they are both doing remarkably well. We feed them on soft food, a little bread and milk occasionally. Perhaps some of your readers can give me further information, and if there is a less radical remedy, which I must say they stand remarkably well, and appear greatly relieved after the operation.—R. G. P., *St. Peter's*.

[Hard crop is believed to arise from debility of the organ and we have known it removed by pouring a tablespoonful of gin down the fowl's throat.—Eds.]

MAIDSTONE POULTRY SHOW.

This was held on the 13th and 14th inst. We gave the prize list last week. The quality of the birds was certainly very good indeed, quite surpassing all previous shows in this town. The birds were well fed and attended to, and kept very clean; the Show was well arranged, and the place looked bright and fresh. We saw on many of the pens placards stating the birds were fed and reared on Spratt's patent food. Well, this is all very well now and then, but it is growing quite a nuisance. The fronts of the pens are none too large, and these cards placed in the central part of them hide to a great extent their inmates. We hardly attend a show now but we see these cards placed on nearly every pen. They seem to be put up in the most haphazard way. It would seem as if the party who goes about with them had a list of the names of all those who have at any time purchased this food, and then on all the pens exhibited by these purchasers the cards are placed. To our own knowledge these cards were placed both here and at Bristol on pens which had never tasted a crumb of this food in their lives. We only mention this *en passant*, in no way depreciating the food, for we find it indeed most valuable, but simply because the cards do help to prevent the birds being seen, apart from the untruth which they sometimes point to.

Coloured *Dorkings* came first, and a wonderfully good class they were. The first and second were fine large-bodied birds, and well shown. Third also good. 2 (Stratford) contained a beautiful cockerel, the bird which won fourth at Oxford, but he is rather small. 9 (Greenhill) contained a splendidly-coloured hen. Silver-Greys were a fair lot, and the winners well placed, one exhibitor sweeping off all three prizes. White Dorkings were also admirable. The first were an easy win, the cockerel being especially good. The second hen was large and neat in comb; third a nice hen with good feet. Buff *Cochins* brought seventeen pens. The first-prize pen had a charming pullet, large and good in shape; but we liked the second-prize cockerel best. They were, however, both good pens. Third were smaller, but good in colour. 37 (Dowker), a fine-coloured pullet. 40 (Hawkine), a small good-shaped pullet, but which will never make a large hen. In the next Cochin class, the Whites which won first won the £10 10*s*. champion cup for the best pen of any breed in the Show. The cock was very large and good in colour and shape, and the hen well feathered. Mr. Woodgate's other pen in this class (53) was empty, as the pair entered were claimed at Bristol for £40. The second and third prizes went to good Partridges. 48 (Watchnrst), a fine White cock, but horribly yellow. *Spanish* were not much save the winners. The first hen was a beauty, as good as any we have seen out this season. The second cockerel was a fine bird. 58 (Francis), a good pullet. *Brahmas* had two cups, one for Dark and one for Light. The majority of the pens seemed badly matched, and many looked quite seedy. The cup Darks were good, the cock of good shape and carriage, but the hens a dirty brown, though well pencilled. Second nice chickens. Third cock capital carriage, but a little too straw-coloured on his back. 69 (Lake), a fine pullet. Lights were also good, a good pair of chickens winning first, but a little too small. Third very good old birds. 94 (Boissier), much quality, but wanted washing. 97 (Stevens), a fine pullet, and 103 (Hawkins), a well-shown old cock and a smart pullet. In *Game*, Black-breasted and other Reds, Brown Reds won first and second, and Black Reds third. The cockerels were all better than their fair companions. The first especially was more worthy of a better hen. 111 (Warde), a good cockerel. 122 (Foster), a fine Brown Red cockerel. In the next class Duckwings won all the three prizes. The first cockerel very smart and stylish, with a beautifully coloured hen; second also very good. 128 (Foster), a fine pair of Piles of beautiful colour, but the cock very badly dubbed. Single Game cocks were pretty good. First a good Black Red cockerel, and cheap at catalogue price of £4 4*s*.; second a smart Brown Red; third a middling Black Red. *Hamburghs* were good classes on the whole. Mr. Long walked off with four of the five prizes. The first Golden-spangles were very rich in colour and markings; second a nice pen too; third only fair. In Silver-spangles the first only were up to the mark, though the third pullet was well marked. The winning Golden-pencils were good and well placed; the first cockerel very smart. The Silver-pencils were capital. First won from condition, the second cockerel having caught a slight cold *en route*; third a nice pair, with pullet very evenly marked. *Houdans* a most splendid class. The first were very large and heavy and good in colour, a pair which look as good for the breeding as the show pen; second nice large birds; and third a fine old cock, but a little

unsteady on his legs. 166 (Mansel), a pair of well-grown chickens. 169 (Lake), a good hen. In the Variety class Black Hamburghs won first, Crêves second and third. We think almost the second should have been first, they were so immense in size and grand in shape and colour, though the first Black Hamburghs were very smart and good. Third, Crêves, fine chickens. 185 (Kitchin), very well-coloured Brown Leghorns in good condition. 188 (Nott), dirty but large Guinea Fowls. Game *Bantams*, only the winners were good. The first, Duckwings, were smart chickens; and the second, Black Red cockerel, a beautiful bird. In the Variety Bantam class good White-booted won first, the cock of exquisite colour, but the pullet a little too big. Second fair Sebrights; third nice Japanese. 220 (Ware), good Blacks. 221 (Stickings), a nice Black pullet; 226, fair Blacks, cheap at entered price, 30s.

Aylesbury *Ducks* were very good, but only four pens entered. Rouen Ducks were capital, the first being grand in colour and of very fair size. Pens 232 and 233 (Harvey), two capital pens. In the Variety Duck class Carolinas won first, a very nice pair; second, dirty White Muscovies; third, very small White Calls, but the Duck had one tiny black mark on her beak. *Geese* were good, the winning Toulouse being large and weighty, the first winning their place well. 248 (Stratford), very beautiful White Chinese. *Turkeys* were wonderful. We never saw six better pens. The first won easily, but the second, third, and pen 253 (Warde) were very near each other. The third contained a smaller hen, but the cock's colour was something quite exquisite.

The Selling classes contained many good and cheap pens. The winners in cocks were Game, Light Brahmas, and White Cochins; in hens, Dark Brahmas, White Cochins, and Partridge Cochins; and in cock and hen, Spanish, Crêves, and Houdans. We believe the sales were very few, and hardly any birds changed hands. The first Buff Cochins, however, were speedily claimed for £8, the hen alone being worth the money.

The poultry awards gave the greatest satisfaction, Mr. Teebay picking-out the winners so deservedly that even the vanquished were obliged to hold their peace. We were much pleased to see this most worthy north-countryman down so far in the southern counties.

TUNBRIDGE WELLS POULTRY SHOW.

This Show was held on the 21st, 22nd, and 23rd inst. in the Riding School. The entries were more than could have been expected, and the building hardly large enough for their accommodation; still the arrangement was generally so good, the alleys between the pens so broad, and the building so well lighted from above, that in spite of the pens being arranged three tiers high one could get a fair view of the majority of them. The quality of the birds was in most classes very good, and we have seldom seen so large an attendance of visitors at any show.

First on the list came Coloured *Dorkings*, a splendid class of sixteen pens. First prize and cup for the best pen of Dorkings justly went to Mr. Parlett's magnificent pair, model Dorkings all over, and birds which we have before admired. The second-prize birds were by no means equal to the first, the cock a good dark bird, but white in earlobe. Third, a fine sprightly old cock, but the hen very light in breast-colour. Mr. Lingwood's commended pen was fine; we suppose the cock's defective face pulled them down. Pen 2 (Trist) contained an immense cock, but strangely dark and with a Minorca look. Whites were few but good. Mr. Cresswell's first-prize pen contained a very young and promising cockerel. The cock in the second-prize pen was remarkable for handsome comb and tail. The class for Any other variety Dorkings was not a success. First were Silver Greys; second small but pretty Cuckoos. *Cochins*.—Buffs were the largest class, Whites the best. In size the Buffs were good, but there were a large number of badly-coloured birds. First were a fine and good cock, a well-shaped fine hen, but not sound in colour. The second cock was broad and well-feathered, but slipped in wing, and with neck-hackle rough and frizzly. On the whole we liked the third-prize pen the best; the hen showed a patch of light feathers on the back, which must, we suppose, have pulled them down. In the class for Partridge or Black all the prizes went to the former variety. The first and second cocks were good in colour, but under-feathered; the third looked to us the best shaped bird, but he was mated with a pale indistinctly marked hen. The Blacks were all poor: one pen contained a cockerel with admirable pea comb; we wonder how Brahma enthusiasts would account for this phenomenon in an otherwise correct Cochin. Mr. Woodgate's first and second-prize White, to the former of which the cup for the best pen of Cochins was awarded, were marvellously fine birds; the first cock a perfect though symmetrical giant. The third-prize pen contained a nice hen. Dark *Brahmas* filled twelve pens. Mr. Lingwood's pair which won the cup were almost faultless, the hen perhaps a little brown on the back, but beautifully pencilled on the breast. Mr. Ansdell's two pairs arrived late; one of them would undoubtedly have figured in the prize list had they been in time, though they did not come near the cup pen. In Lights Mr. Lingwood was again first with an excellent pair. In the second-prize pen was a very yellow cock, bad in comb, but mated with a fine and broad hen. In the third-prize pen, too, the cock was tinged with yellow, but another excellent partner brought them into the prize list. The class was large, and as a rule the hens were better than the cocks. In *Spanish* the winners were good, the first pen particularly so, which took the cup for the best birds in four classes. Second also nice birds. In the third pen was a cock with magnificent face, but nearly blind from its development. *Houdans* were only fair. The first-prize pair were well placed. In the second-prize pen were a tall thoroughly French cock, and a hen with miserable tuft. Third were too dark for our fancy. *Crêves* were a small class; the first and second-prize pair magnificent; the third only fair. *Hamburghs* were good throughout. It is seldom that such a collection is seen in the south of England. We fancy that southerners are beginning to appreciate these lovely birds. The first pair of Golden-spangled were super-excellent, and carried off the cup for best pen of Hamburghs. The first Silver-spangled were also good, and the prize birds all well placed, though we thought the highly commended pair quite as good as the third-prize. Golden-pencilled numbered nine pens. Mr. Cresswell's first-prize cockerel was a superb bird. Mr. Pickles' second-prize pullet, though pale in colour, was finely barred. Silver-pencilled were hardly so good. We admired the first-prize cockerel and the second-prize pullet much. The third-prize pen of Blacks were good, the rest of the class poor.

Game had four classes. The gems of the collection were Mr. Pope's Black Red—faultless birds, combining the richest colour of the old-fashioned birds with the elegance of the modern type. They obtained the cup for the best pen of Game in the Show, and the hen also won the piece of plate for the best Game hens; the first Duckwings were also remarkable birds. *Polish* were a singularly good class. Mr. Edwards's first and third-prize White-crested Blacks were such birds as one seldom sees; the first cock by far the best, but we thought the third hen rather the best of the two. Second were Silvers; the hen a grand bird, very superior to her partner. We thought much of Messrs. Silvesters' unnoticed Golden; we suppose the quantity of white in the hens' tuft went against them. Pen 193 (Reeves), highly commended, were also good Golden. In the Variety class first went to a grand pair of Malays, second to lovely Silkies; we thought them as good as any we have ever seen; third nice Black Minorcas. There were six Selling classes for large breeds, including many excellent birds, for which there seemed unfortunately but few purchasers. Amongst them we specially noticed Mr. Woodgate's first-prize pair of White Cochins, a nice pair of Dark Brahma hens shown by Mr. Lawther, and a grand Dorking cock shown by Mr. Cheesman, a cross apparently between the Silver-Grey and Dark varieties. *Bantams* had five classes, three for Game. These were fairly filled, but hardly by birds of the highest type. The Black Bantams were excellent; the first-prize pair brilliant in colour, but the cockerel had his tail too much thrown back. In the class for Any other variety exquisite Silver Sebrights were first, and took cup for the best pen of Bantams; Golden Sebrights second; fair White-booted third. The Local class were put in so elevated a position that we could not attempt to examine them.

Aylesbury *Ducks* were not remarkable. Rouens an immense class, the noticed pens all good. Messrs. Sainsbury and Kellaway divided the prizes in Black East Indians. Carolinas, Mandarins, and tiny White Call Ducks were in the third-prize pens in the Variety class. The class for *Geese* was interesting, as containing several of the rarer varieties—viz., Sebastopol, Grey, and White Chinese. Mr. Warde's first and second-prize *Turkeys* were magnificent, the cocks showing the gorgeous hues of the American variety.

Pigeons.—The majority of the Pigeon classes were well filled. As a rule, the winners were excellent, but there were, of course, some poor specimens among the unnoticed. *Pouters* were fair, Mr. Gill taking three out of the four prizes. In *Carrier* cocks the winners were both Black, and splendid birds; we much admired Col. Hassard's first-prize Dun hen. In *Tumblers* Mr. Ford took first with an Almond and second with an Agate, both pretty birds. Mrs. Lee sent two Blue Beards instead of one; good birds, but of course put out by the mistake. In *Barbs* the first-prize bird was the only remarkable one. The *Jacobin* class was well filled. First went to a White, we presume for its colours' sake, for the second, a Red, was far better in hood, form, and size. The first *Fan* was a sweet little bird. A good Blue *Turbit* took first in a class of eleven, a rich Yellow second. We almost preferred Mr. Cresswell's highly-commended Red to his second winner. *Owls* were a large class, English and foreign being mixed. First was a neat White African, second an English Silver. The first Long-faced *Antwerp*, a Silver Dun, was a very well-coloured bird. In the Any variety class a Black Trumpeter was first, and a Blue-spangled Fairy second, an excellent Archangel being unnoticed.

We were glad to see so large a staff of Judges. The awards seemed to give almost universal satisfaction, which we think would be more generally the case if judges always had a practicable amount of work allotted to them. No man can satisfactorily make awards when he knows that he must hurry through the work to get it over by a given time. We congratulate the energetic Secretary on the great success of his first attempt, and upon the prompt way in which the awards were posted up and the prize list brought out.

DORKINGS.—*Coloured.*—1 and Cup, F. Parlett, Great Baddow, Chelmsford. 2, R. Cheesman. 3, T. Brown. *hc*, H. L. Trist. *c*, H. L. Trist; L. G. W. Stratford; H. Humphrey; G. W. Greenhill; Henry Lingwood, Barking, Needham Market.

DORKINGS.—*White.*—1, O. E. Cresswell, Feltham. 2, L. G. W. Stratford. 3, J. Harris.

DORKINGS.—*Any other variety.*—1, Mrs. Lee. 2, J. H. Putney.

COCHINS.—*Cinnamon or Buff*—1, Mrs. A. Christy. 2, E. Winwood. 3, A. Darby. *hc*, W. White; Henry Lingwood.

COCHINS.—*Partridge or Black.*—1, T. W. Anns. 2, Capt. F. G. Coleridge. 3, J. A. Sleep.

COCHINS.—*White.*—1, Cup, and 2, R. S. S. Woodgate, Tunbridge Wells. 3, Mrs. Wild.

BRAHMAS.—*Dark.*—1 and Cup, Horace Lingwood, Creeting, Needham Market. 2, F. G. Cotterell. 3, J. Watts, King's Heath, Birmingham. *c*, Dr. G. Angier; J. W. Trowbridge.

BRAHMAS.—*Light.*—1, H. Lingwood. 2, F. G. Cotterell. 3, P. Hainss. *hc*, Rev. M. Rice; H. M. Maynard; F. Cheshire; Capt. W. Saville. *c*, H. Steed; S. Pitt; H. Stephens (3).

SPANISH.—1 and Cup, Miss E. Brown. 2, J. Francis. 3, H. Brown. *c*, P. Roffey.

HOUDANS.—1 and 3, W. Dring, Faversham. 2, J. W. Moyle. *hc*, M. Sandford. *c*, R. A. Boissier.

CRÈVE-CŒURS.—1 and 2, W. Dring. 3, T. Ledger.

HAMBURGHS.—*Golden spangled.*—1 and Cup, T. P. Carver. 2, H. Pickles, Earby, Skipton. 3, J. Long. *Silver-spangled.*—1, H. Pickles. 2, J. Long. 3, Miss E. Kingsnorth. *hc*, N. Barter.

HAMBURGHS.—*Golden-pencilled.*—1, O. E. Cresswell. 2, H. Pickles. 3, H. M. Maynard. *hc*, J. Long. *Silver-pencilled.*—1 and *hc*, B. Norton. 2, J. Long. 3, H. Pickles *c*, N. Barter.

HAMBURGHS.—*Black.*—1 and 2, J. Long. 3, — Pickles. *hc*, H. Thomas; R. A. Boissier.

GAME.—*Black Red.*—Cup and 1, W. J. Pope. 2, W. H. Stagg. 3, J. Jekan. *hc*, W. Foster; J. Mason. *Brown Red.*—1, W. Foster. 2, J. Jekin. 3, H. Ritchie. *vhc*, T. Mason. *hc*, F. Warde (2). *c*, J. Cock. *Duckwing.*—1, J. Mason. 2, T. Whitaker. 3, E. Winwood. *hc*, J. Chittenden. *Any variety.*—1 and *c*, G. H. Fitz-Herbert. 2, W. Foster. 3, H. Ritchie. *hc*, J. Croote, jun.

POLISH.—1 and 3, T. P. Edwards. 2 and *c*, G. T. Lenny. *hc*, J. Long; E. T. Reeves.

ANY OTHER VARIETY.—1, S. Elliott, jun. 2, R. S. S. Woodgate. 3, J. Croote. *hc*, — Tample; Rev. N. J. Ridley.

ANY BREED.—1, A. Arnold. 2, J. Harris. *c*, G. Ware; J. Harris; J. K. Pain (2).

SELLING CLASS.—*Dorkings, Brahmas, and Cochins.*—1, R. Cheesman. 2, J. K. Lawther. 3 and *vhc*, S. Pitt. 4, G. W. Greenhill. *hc*, L. G. W. Stratford; A. Arnold; R. Cheesman; Mrs. Dressing; H. Mills; E. Haywood (2). *c*, R. A. Boissier; J. F. Bates.

SELLING CLASS.—*Dorkings, Cochins, and Brahmas.*—1, R. S. S. Woodgate. 2, H. Humphrey. 3, E. Haywood. 4, J. Harris. *vhc*, A. Arnold; H. Mills; G. W. Petter; E. Haywood. *hc*, L. G. W. Stratford; C. S. Chantler; H. Stephens; W. Vidler; R. Cheesman; W. J. Russell; E. Haywood; G. J. Lenny. *c*, H. Steed.

SELLING CLASS.—*Bantams.*—1, W. S. Marsh. 2, A. J. Radford. 3, Mrs. J. Longe. 4, J. Boney. *hc*, Mrs. W. N. Lister; R. S. S. Woodgate.

SELLING CLASS.—*Any other variety except Bantams.*—1, E. Haywood. 2, J. Francis. 3, J. Cock. 4, J. Chittenden. *hc*, R. J. Foster; D. W. J. Thomas; N. Edghill.

SELLING CLASS.—*Any other variety except Bantams.*—1, W. Dring. 2, H. Stevens. 3, J. Honey. 4, J. T. Parker. *hc*, E. Heywood.

SELLING CLASS.—*Any other variety except Bantams.*—1, J. K. Lawther. 2, Miss E. Brown. 3, W. Dring. 4, R. S. S. Woodgate. *hc*, Miss E. Mansell; D. W. J. Thomas; W. Foster; E. Haywood *c*, Miss E. Mansell; T. H. Smith.

GAME BANTAMS.—*Black Red.*—1, E. Payne. 2, W. S. Marsh. 3, T. Randall, jun. *Brown Red.*—1, S. & J. J. Stephens. 2 and 3, V. Sandford. *Any other variety.*—1, A. J. Radford. 2, W. White. 3, M. V. Sandford. *c*, J. Windle; G. H. Nutt.

BANTAMS.—*Black or White Clean-legged.*—1, C. W. Gedney. 2, J. Watts. 3, G. Vigers. *hc*, G. Ladd; C. Reed. *c*, G. Ladd. *Any other variety.*—1 and Cup, Mrs. Lee. 2, J. K. Lawther. 3, W. S. Marsh. *hc*, A. A. Vander Meersch. *c*, R. S. S. Woodgate; Mrs. J. Longe; G. Ramsden; C. Judson.

LOCAL CLASS.—Cup and *vhc*, R. Ritchie. 2, J. Francis. 3, H. Stephens. Extra 3, J. K. Lawther. *hc*, H. Stephens (2); R. Sheppard. *c*, J. W. Robinson; N. Edghill.

DUCKS.—*Aylesbury.*—1, N. Edghill. 2, F. E. Arter. 3, G. Ware. *hc*, Mrs. W. Dombrain. *c*, J. Merriman. *Rouen.*—1, F. Parlett. 2, F. Warde. 3, G. Ware. *hc*, Earl of Abergavenny; F. E. Arter. *Black.*—1 and 3, J. W. Kellaway. 2 and *hc*, G. S. Sainsbury. *Any other variety.*—1, R. Wilkinson. 2, W. Boutcher. 3, R. S. S. Woodgate.

DUCKS.—1, G. Ware. 2, A. Arnold.

GEESE.—1 and 2, G. Ware.

GEESE.—1 and 2, G. Field. 3, G. H. Fitz-Herbert. *hc*, J. R. Thomson (3).

TURKEYS.—1 and 2, F. Warde. 3, Mrs. A. Mayhew. *vhc*, Rev. N. J. Ridley. *hc*, Earl of Abergavenny; Marchioness Camden.

PIGEONS.

POUTERS.—1, 2, and *hc*, M. H. Gill.

POUTERS.—1, M. H. Gill. 2, F. Winser. *c*, A. Arnold; M. H. Gill.

CARRIERS.—1, H. M. Maynard. 2, Col. F. Hassard. *hc*, M. H. Gill. *c*, J. Ford; G. H. Nutt.

CARRIERS.—1, Col. F. Hassard. 2 and *hc*, M. H. Gill. *vhc*, H. M. Maynard. *c*, J. Ford.

DRAGOONS.—1 and 2, L. Whitehead. *hc*, H. W. Webb; W. V. & J. M. Longe. *c*, E. Durrant; T. Marsh.

DRAGOONS.—1, E. Durrant. 2, J. Chandler.

TUMBLERS.—1 and 2, J. Ford. *vhc* and *hc*, Mrs. Gill. *c*, E. W. Bunney; Mrs. Gill; J. S. Simpson.

BARBS.—1, H. M. Maynard. 2, L. Allen.

JACOBINS.—1, A. A. Vander Meersch, Tooting. 2, O. E. Cresswell. *hc*, H. W. Webb; G. H. Nutt.

FANTAILS.—1 and 2, O. E. Cresswell. *hc*, J. F. Loversidge, Newark; H. M. Maynard. *c*, J. F. Loversidge.

TURBITS.—1 and 2, O. E. Cresswell. *hc*, — Gregory; O. E. Cresswell. *c*, C. A. Crafer; A. G. Avenell.

OWLS.—1 and 2, T. G. Spruntt. *vhc*, — Gregory. *hc*, J. S. Simpson; C. Blunden. *c*, L. Allen; W. V. & J. M. Longe.

ANTWERPS.—*Short-faced.*—1, E. F. Wilson. 2, W. S. Marsh. *hc*, E. F. Wilson; J. T. Theobald.

ANTWERPS.—*Long-faced.*—1, E. F. Wilson. 2, C. Mills. *hc*, W. S. Marsh; J. T. Theobald; J. B. Russell. *c*, F. G. Moore.

ANTWERPS.—*Homing.*—Cup, F. G. Moore. 2, G. H. Nutt. 3, T. G. Ledger. *vhc*, J. F. Bates. *hc*, P. J. Cheffins; A. Heath (2); S. Le Blanc Smith; H. S. Strange; G. H. Nutt. *c*, Col. F. Hassard.

ANTWERPS.—*Four Working Homing.*—1, J. Theobald. 2, E. F. Wilson. *hc*, J. W. Barker; Capt. G. Edwards; A. Farndon; E. F. Wilson; G. F. Lenney; G. H. Nutt.

ANY OTHER VARIETY.—1, A. A. Vander Meersch. 2, G. H. Nutt. *hc*, H. W. Webb; L. Allen (2); G. H. Nutt (2).

SELLING CLASS.—1, A. G. Avenell. 2, A. A. Vander Meersch. *vhc*, J. Ford. *hc*, G. T. P. Pointer (2); E. Durrant; C. Blunden; H. M. Maynard; A. G. Avenell; E. A. H. Alderson (2).

SELLING CLASS.—1, J. Ford. 2, A. G. Avenell. *hc*, G. T. P. Pointer; A. T. Nye; A. A. Vander Meersch; H. M. Maynard.

ANY BREED.—1, G. Ware. 2, J. Harris.

CAGE BIRDS.

NORWICH.—*Clear Yellow.*—1, J. Adams. 2, T. Willsher. *hc*, J. Caplin; J. Adams; G. H. Nutt. *c*, W. Smith. *Clear Buff.*—1, J. Caplin. 2, J. Adams. *hc*, J. Adams; W. Smith. *c*, J. Caplin. *Any variety.*—1, J. Caplin. 2, G. H. Nutt. *vhc*, J. Caplin; G. H. Nutt. *hc*, J. Adams; W. Smith.

BELGIAN.—1 and *hc*, J. Caplin. 2, G. H. Nutt. *c*, J. Pyman.

MULE.—1, J. Caplin. 2, E. W. Lulham. *hc*, T. Willsher; J. Adams; W. Smith; J. Moore.

LINNET OR FINCH.—1, T. Willsher. 2, Knight & Spencer. *hc*, G. Farmer. G. & J. Mackley; E. W. Lulham.

BRITISH BIRDS.—*Any other variety.*—1, G. Crack. 2, *hc*, and *c*, G. H. Nutt. Extra 2 and *vhc*, T. Willsher.

FOREIGN BIRD.—*Any variety.*—1, G. H. Nutt. 2, J. F. Bates.

SELLING CLASS.—1, J. Caplin. 2, Knight & Spencer. *hc*, J. Caplin; G. H. Nutt (2); W. Smith. *c*, G. & J. Mackley (2); J. Adams; G. H. Nutt (2); W. Smith.

PARROTS.—1, Mrs. E. Durrant. 2, W. Marsh. Extra 2, Mrs. Jocylyn. *hc*, L. Allen.

RABBITS.

LOP-EARED.—1, J. Cranch. 2 and 3, A. Stedman. *vhc*, A. J. Corder. *hc*, H. Soper; E. Frost; G. H. Nutt. *c*, G. H. Nutt.

HIMALAYAN.—1, E. W. Bunney. 2 and 3, G. H. Nutt. *hc*, J. Hallas.

SILVER-GREY.—1, C. King. 2, J. Hallas. 3, J. Ellis. *hc*, A. Dickson. *c*, A. Dickson; J. Ellis.

ANY OTHER VARIETY.—1, R. J. Foster. 2, B. Greaves. 3, R. A. Boissier. *hc*, J. T. Billet, jun.; A. Stedman; G. H. Nutt. *c*, A. Stedman; W. Batchelor; A. Adderley.

ANY VARIETY.—1, C. King. 2, A. Stedman. 3, E. Haywood. *hc*, W. Miller. A. Stedman; C. King.

CATS.

TABBY OR TABBY AND WHITE.—*Short Hair.*—1, E. Baxter. 2, T. Avenell. 3, R. Weekes. *hc*, R. Weekes; W. Spink. *c*, J. Green.

TORTOISESHELL OR TORTOISESHELL AND WHITE.—*Short Hair.*—1, G. W. Kent. 2, Mrs. E. Durrant. 3, W. Elers.

ANY OTHER COLOUR.—*Short Hair.*—1, Mrs. S. Smith. 2, Mrs. Shuckhard. 3, H. Cramp. *vhc*, R. Weekes. *c*, G. Burnell; E. Durrant; W. L. Faulknor.

ANY VARIETY OR COLOUR.—*Long Hair.*—1 and 2, A. Adderley. 3, E. Durrant. *hc*, Miss C. E. Harris. *c*, E. Durrant; G. Collingwood.

LITTER OF KITTENS.—1, E. Durrant. 2, Mrs. Lee.

TORTOISESHELL OR TORTOISESHELL AND WHITE.—1, E. Durrant.

LOCAL CLASS.—*Any colour or variety.*—1 and *c*, Mrs. E. Durrant. 2, Mrs. T. Durrant.

LOWESTOFT SHOW OF POULTRY, &c.

THIS Show was held in the Public Hall on the 20th and 21st inst. This building is remarkably well suited to such a purpose as regards light, &c., but unfortunately is, like all other places at the command of the Committee, far too small for the purpose; and the consequence was, that while the fowls were placed in the best position, the Pigeons were too high for easy inspection, except a few which were placed on the platform, but the cage birds were allotted a snug anteroom on the left-hand of the entrance. The pens were the substantial wooden ones (with bar-iron fronts and slide doors) of the Society, and as well arranged as the room would allow. The feeding, general attendance, and indefatigable exertions of Messrs. Wren, Stringfield, and other gentlemen of the Committee was exemplary, and such as merited better entries than was the result in poultry, which section (with a great increase of classes and cups) was not much in excess in numbers of previous years.

Dorkings.—The winners in both classes good Dark birds, and the whole pretty even. In *Cochins* the first was a great mistake, the second, a cock, being in all respects superior; both were Buff. In hens the first was an immense bird with extraordinary fluff and cushion, but not as heavy on the foot-feathering; but we thought the cup would have been much better placed here. Second a good light Buff, and there were some good local birds in the class. Dark *Brahma* cocks were well placed, and in all a fair lot. In hens Mr. Leno's exquisitely pencilled pullet was first, but we preferred the second, a grand hen by Lingwood, as nearer perfect, the first being sadly out of feather. Pen 45 (Lady Gwydyr) was passed unnoticed, but why we could not tell, for she appeared almost equal to the first in pencilling and colour, and quite as good in other points. With the above exception the whole of the awards were well made. In Light Brahmas Mr. Haines won all with two exceptions, taking the cup also with some capital birds. In *Game* the winners were all Brown Reds, the cup going to a cock of that colour. *Spanish* were very good in both classes, and plainly showed the great care bestowed upon them, but the best birds (Boulton) were too late for competition. *Hamburghs.*—Pencilled were moderate in quality, Mr. Tickner's cup pen of Gold winning easily. Spangles were better, and almost all noticed; and the winners in *French* were all Crêve-Cœurs. In the Variety class Messrs. Silvester won with a capital pen of Gold Polands, securing also the cup. The hen is a wonder. The Selling classes were large, and many capital lots were shown, some of which changed hands. Game *Bantams* were not as good as we usually find them here, and but few pens were

noticed. There were some moderate Blacks, but the hens were superior to the cocks, and there were some very good White pullets shown. In the next class Mr. Leno secured four of the six prizes, as also the cup. Mr. Stringfield showing some of the best Golden Sebrights we have seen for some time, and which might have had a place. *Ducks* were better than we have generally found them in the eastern counties.

Pigeons were a very large entry—nearly double, in fact, of those of any previous year, and the tone of quality of a high order. Carrier cocks were first, and one of the four cups was awarded to a well-developed bird in this class, a Black, and such a bird as, if in some hands, would sharply become the figure-head of the fancy. The second and third were made to Duns, much younger but of good properties; one bird that would otherwise have won was sadly over-trimmed. Hens were good, the winners all Black of good style of head, the awards being made in proportion to the make-up, most of these being noticed. Young Carriers were a very heavy entry, and the whole class noticed, there being scarcely a bird but that had excellent points. The winners all cocks. In old Barbs the first and third were Blacks, but this was not one of the best classes. Reds won in all cases in young Barbs, and they were moderately good. Dragoons were immense classes, which caused no little difficulty for the Judge, there being no less than forty-six entries, and most were marked in some form or other. First came Blue and Silver, in which a Blue hen was first, a black-barred Silver hen second, and a Blue cock third; many others coming very close. The next was an interesting class, almost every shade of colour and style of head being shown, the Horseman style coming out most forcibly in the grand-coloured Grizzles, which as regards colour are in our opinion a sadly neglected variety. The first and second were Yellows; the first a young bird of great merit, and the third a Red of grand colour. In Balds and Beards, first was a neat Bald, second a Blue Beard, and third a Blue Bald Long-face, very perfect in all points. Tumblers, any other variety, were all Almonds, as regards the winners the first being far a-head of the rest. Pouters were a very good class, the first award being made to a Black Pied of very sound colour, long in feather and limb; second was a White cock, very stylish and slim-built; and third a Blue, a little thick but in grand show, and good in all other points. Mrs. Ladd's birds were too late, but several other birds came very close to the winners in quality. Fantails were not a good class, though there were some very good; first and second White, and third Blue. Antwerps with a few exceptions were very poor, but a good Silver Dun Short-face attained the first position. Any other variety was a real good class, first being a Red Magpie of very diminutive proportions, second a Grey Frillback, and third a Blondinette. The Selling class was not large, but good Yellow Dragoons won first and second, Dun Carriers coming third.

Cage Birds were not an extensive show, some of the exhibitors seeming to be afraid of the Messrs. Mackley, but the show was very select as regards quality, and Messrs. Mackley carried off the lion's share; nearly all the specimens were of the hot variety, and most were noticed. In the first four classes the extra prize was given to a four-pointed Jonque Norwich, a very good Crested Norwich receiving another, and the remaining one was given to a pure white Goldfinch Mule of good size and in fine condition. Parrots and Paroquets were all noticed, and were a very interesting class, and in the next was a good Golden Lizard and Zebra Finch as first and second.

The catalogues and prizes attached were got out in excellent style, and were ready within a very few minutes of the Exhibition being completed. The extras for birds will be found in our list though not in the catalogue, owing to a mistake.

DORKINGS.—*Cock.*—1 and Cup, Henry Lingwood, Barking, Needham Market. 2, Miss Crowfoot, Keasingland. 3, F. Parlett, Great Baddow, Chelmsford. *Hen.*—1, Henry Lingwood. 2, F. Parlett.

COCHINS.—*Cock.*—1 and Cup, Henry Lingwood. 1 Local and 2 Local. W. P. Matthews, Gorleston. 2, Lady Gwydyr, Stoke Park, Ipswich. 3, H. Thring, Tamworth. *Hen.*—1, Lady Gwydyr. 1 Local, W. Saunders, Normanstone. 2, M. Leno, Markyate Street, Dunstable. 2 Local, W. P. Matthews. 3, Mrs. C. Bereare, Yoxford.

BRAHMAS.—*Dark.*—*Cock.*—1 and Cup, Horace Lingwood, Creeting, Needham Market. 1 Local, C. Denton, Keighley. 2, Mrs. H. E. Buxton, Flixton. 3, G. S. Pearson, Yarmouth. *hc* and *c*, J. Holmes, Whitecotes. *Hen.*—1, M. Leno. 1 Local, G. S. Pearson. 2, Horace Lingwood. 2 Local, Mrs. H. E. Buxton, Flixton. 3, C. Denton. *hc*, E. Pritchard, Tettenhall; G. S. Pearson; J. Holmes (2).

BRAHMAS.—*Light.*—*Cock.*—Cup, 3, and *c*, P. Haines, Palgrave, Diss. 2, Horace Lingwood. *hc*, P. Haines (3); F. J. Cotterell, Birmingham. *Hen.*—1, Cup, 2, and *c*, P. Haines. 3, F. J. Cotterell. *hc*, P. Haines (2); E. J. Bird, Cawston.

GAME.—*Cock.*—1 and Cup, S. Matthew, Stowmarket. 1 Local, G. Copling, Lowestoft. 2, H. E. Martin, Scalthorpe. 2 Local, J. Jones, Lowestoft. 3, H. Reynolde, Lowestoft. *Hen.*—1, S. Matthew. 1 Local and 3, H. Reynolde. 2, H. E. Martin. 2 Local, J. Jones.

SPANISH.—*Cock.*—1 and Cup, T. Boulter, Clerkenwell, London. 1 Local, W. White, Lowestoft. 2, R. Newbitt, Epworth. 3, E. Brown, Sheffield. *vhc*, J. Leamiog, Broughton. *Hen.*—1, J. Leamiog. 2, E. Brown. 3, W. White. *hc*, E. Holmes; R. Newbitt.

HAMBURGHS.—*Gold-pencilled*—1 and Cup, W. K. Tickner, Ipswich. 1 Local, J. Taylor, Lowestoft. 2, G. & J. Duckworth, Church, Accrington. 2 Local, S. Moore, Lowestoft. 3, J. Long, Bromley Common, Kent. *hc*, A. C. Chamberlain, Swaffham. *Silver-pencilled.*—1, F. Steward, Lowestoft. 2, J. Robinson, Garstang. 3, T. Cropper, Bacup.

HAMBURGHS.—*Gold-spangled.*—1 and Cup, T. Dean, Keighley. 1 Local and 2 Local, H. Reynolds. 2, G. & J. Duckworth. 3, W. A. Hyde, Thurst. *vhc*, J. Robinson. *hc*, W. K. Tickner; H. Reynolds. *Silver-spangled.*—1, J. Long. 1 Local, F. Steward. 2, Ashton & Booth, Broadbottom, Mottram. 2 Local, W. Blanch, Mutford. 3, T. E. Thirtle, Lowestoft. *hc*, J. Robinson; H. Stanworth, Worsthorn. *c*, H. R. Plattin, jun., Fakenham.

FRENCH.—1, Mrs. Wicks, Brigg. 3, H. Feast, Swansea. 3 and *hc*, W. Cutlack, jun., Littleport. *vhc*, Rev. M. H. Beghie, Farnham Rectory, Bury St. Edmunds.

ANY OTHER VARIETY.—1 and Cup, A. & W. H. Silvester, Sheffield. 1 Local, J. Miles, jun., Lowestoft (Andalusians). 2, J. Robinson. 2 Local, W. Knight, Lowestoft (Black Hamburgh). 3, A. Ward, London (Leghorns). *hc*, T. A. Wright, Yarmouth (Black Hamburghs); J. Miles, jun. (Andalusians); J. Robinson; W. Knights (Black Hamburgh); T. L. Nash, Sproughton (Silkies); Miss E. A. Eeles, Southwold (Sultans); T. Dean (Polands). *c*, J. Wilkinson, Shaoforth (Black Hamburghs); Rev. W. C. Safford, Attleborough Rectory.

SELLING CLASS.—*Cock.*—1, W. Carter, Lowestoft (Spanish). 1 Local, W. White (Spanish) 2, W. Knights (Black Hamburghs). 2 Local, T. E. Thirtle (Gold-pencilled Hamburghs). 3 and *c*, H. W. Thirtle (Brahma). *vhc*, W. White (Spanish); T. E. Thirtle (Gold-pencilled Hamburghs). *hc*, W. Brunton, East Dereham (Brahma); Mrs. C. Bernera (Dorking); J. S. Dew, Gamlingay Mills; T. M. Derry, Gedney.

SELLING CLASS.—*Hen.*—1, Miss E. A. Eeles (White crested Poland). 1 Local and *vhc*, G. S. Pearson (Brahma). 2, J. B. Bly, Wisbeach (Silver-spangled Hamburghs). 2 Local, S. Moore (Gold-pencilled Hamburghs). 3, W. White (Spanish). *hc*, C. J. Watson, Norwich (Light Brahmas); W. Brunton (Dark Brahmas); J. B. Bly (Silver-spangled Hamburghs). *c*, T. L. Nash (Brahma).

GAME BANTAMS.—*Cock.*—1 and Cup, W. Adams, Ipswich. 1 Local, W. Robbins, Lowestoft. 2, Capt. F. Wetherall, Doddington, Kettering. 3, R. Newbitt. *hc*, E. Harris, Islington, London; W. Robbins; W. B. Jeffries, Ipswich; R. Newbitt. *Hen.*—1, J. S. Pearson, Great Melton. 1 Local and *hc*, W. Robbins. 2, W. Adams. 2 Local, W. Wood, Lowestoft. 3, R. Newbitt.

BANTAMS.—*Black or White, Clean-legged.*—*Cock.*—1 and Cup, G. B. Francis, Romford. 1 Local and 3, T. E. Thirtle. 2, Milner & Beanland, Keighley. *vhc*, Rev. F. Tearle, Gazeley Vicarage, Newmarket. *hc*, W. H. Robinson, Keighley; R. H. Ashton, Manchester. *Hen.*—1, Wells & Sherwin, Ripon. 1 Local, 2, and 2 Local, T. E. Thirtle. 3, Milner & Beanland. *hc*, T. E. Thirtle; J. Wilkinson; J. H. Law, Birmingham; R. H. Ashton; Rev. F. Tearle.

BANTAMS.—*Any other variety.*—*Cock.*—1 and 2, M. Leno. 3, Miss F. E. Somes, Yarmouth. *hc*, G. Holloway, jun, Stroud. *Hen.*—1, Cup, and 2, M. Leno. 1 and 2 Local and *hc*, W. Stringfield. 3, Rev. F. Tearle.

DUCKS.—*Aylesbury.*—1 and 2, Mrs. C. Berners. 1 Local and 3, F. B. Potts, Wangford. *Rouen.*—1, Rev. W. C. Safford. 2 and 3, F. Parlett. *Any other variety.*—1 and 2, M. Leno. 1 Local, W. H. Norton, Pakefield. 3, E. W. Southwood, Fakenham.

PIGEONS.

CARRIERS.—*Cock.*—1 and Cup, E. Walker, Leicester. 2, W. Sefton, Blackburn. 3, W. G. Hammock. *vhc*, G. Kempton, Islington, London. *hc*, H. Yardley, Birmingham; W. Sefton. *c*, F. Hodgson, Driffield. *Hen.*—1, W. G. Hammock, Ilford. 2, E. Walker. 3 and *c*, G. Kemptoo. *vhc*, J. Stanley, Blackburn. *hc*, H. Yardley; W. G. Hammock; W. Sefton (3).

CARRIERS.—*Young Cock or Hen* —1, W. Sefton. 2, A. Billyeald, Nottingham. 3, E. Walker. *vhc*, E. Walker; C. H. Clarke, Nottingham. *hc*, C. H. Clarke.

BARBS.—*Single Bird.*—1, C. Norman. 1 Local, D. Bedford, Kirkley. 2, Miss F. Seanor. 3, H. Vardley. *vhc*, W. Loveday, Leicester. *c*, A. P. Byford, Ipswich. *Young Single Bird.*—1, J. Stanley. 1 Local, D. Bedford. 2 and *c*, C. G. Cave, Spalding. 3, W. Nottage. *hc*, W. Loveday.

DRAGOONS.—*Blue or Silver.*—*Single Bird.*—1, Cup, and 3, W. Sefton. 2, F. Graham, Birkenhead. *vhc*, A. McKenzie, Liverpool; F. Graham; J. Stanley. *hc*, H. Yardley (2); A. McKenzie; F. Graham (2); J. Stanley; A. Boots, Crewe; W. Sefton. *c*, A. McKenzie; F. Graham; A. Boots.

DRAGOONS.—*Any other colour.*—*Single Bird.*—1, F. Graham. 1 Local, 2 Local, and *c*, A. W. Wren, Lowestoft. 2, L. Whitehead, Drury Lane, London. 3, W. Sefton. *vhc*, A. W. Wren; A. McKenzie; F. Graham (4); A. Preston, Spalding. *hc*, W. Loveday; H. Yardley; L. Whitehead; J. Stanley; A. Preston; W. Sefton (3).

TUMBLERS.—*Balds or Beards.*—*Single Bird.*—1, Cup, and 2, W. Woodhouse, King's Heath. 1 Local, 2 Local, and *vhc*, G. & W. Banna, Lowestoft. 3, A. and W. H. Silvester. *c*, G. S. Farman, Lowestoft; A. A. Vander Meersch, Tooting, London, S.W.; G. & W. Banne.

TUMBLERS.—*Any other variety.*—*Single Bird.*—1, H. Yardley. 1 Local and 2 Local, C. Cowles, Lowestoft. 2, W. G. Hammock. 3, G. Holloway, jun. *hc*, W. Nottage, Northampton; A. & W. H. Silvester (2).

POUTERS.—*Single Bird.*—1, Cup, and 3, H. Pratt, Hampton-in-Arden. 2, H. Thurlow. *vhc*, W. Nottage; H. Pratt. *hc*, H. Yardley; P. R. Spencer; L. Watkin, Northampton; C. H. Byford. *c*, M. G. Hale, Lime Street, London; G. Holloway, jun.

FANTAILS.—*Single Bird.*—1, J. Walker, Newark. 1 Local and 2 Local, W. Wood. 2, J. F. Loversidge. 3, P. R. Spencer. *hc*, J. F. Loversidge (2); F. Aldis, Fakenham; P. R. Spencer. *c*, F. Aldis; J. Walker; Miss E. A. Eeles.

ANTWERPS.—*Single Bird.*—1 and 3, J. Stanley. 1 Local and 2 Local, D. Bedford. 2, F. G. Russell, Blackheath. *hc*, H. Yardley; Miss F. Seanor; A. Bentley, Clement's Lane, London; D. Bedford.

ANY OTHER VARIETY.—*Single Bird.*—1, Miss F. Seanor. 1 Local, G. Cooper, Blundeston. 2, H. W. Webb, Lower Sydenham (Frillbacks). 2 Local, Miss F. E. Somes (Danish). 3, H. Yardley. *vhc*, Miss F. Seanor (2); A. & W. H. Silvester. *hc*, Miss A. E. Eeles (Pigmy Pouters); A. & W. H. Silvester. *c*, C. T. Townsend, Ipswich; T. Cropper (Swallow).

SELLING CLASS.—1, A. W. Wren (Yellow Dragoons). 1 Local, C. Cowles (Blue Balds). 2, G. Lee (Yellow Dragoons). 3, H. Thurlow. *vhc*, A. & W. H. Silvester. *hc*, A. A. Vander Meersch; J. Walker; P. R. Spencer, Hereford; L. Watkin (White Pouters); T. Crooper (Turbits). *c*, J. F. Loversidge, Newark; C. Cowles.

CAGE BIRDS.

CLEAR.—*Yellow.*—1, Provart & Willis, Norwich. 2 and *hc*, G. & J. Muckley, Norwich. Local, W. Haverson, Lowestoft. *Buff.*—1 and 2, G. & J. Mackley. Local, W. Haverson. *hc*, Provart & Willis, Norwich.

VARIEGATED.—*Yellow.*—Extra 1 and 2, G. & J. Mackley. Local, W. Haverson. *Buff.*—1, Provart & Willis. 2 and *vhc*, G. & J. Mackley. *hc*, R. Poole, Maldon; Provart & Willis. Local, W. Haverson.

CRESTED.—Extra 1 and 2, G. & J. Mackley. Local, W. Haverson.

CINNAMON.—1 and 2, G. & J. Mackley. Local, W. Carter. *hc*, R. Poole.

MULE.—Extra 1, G. & J. Mackley. 2 and *c*, M. Flynn. *hc*, R. Poole; G. & J. Mackley.

PARROT OR PARAKEET —1 and *vhc*, Miss A. E. Eeles. 2, Mrs. Wran, Lowestoft. Local, A. Page, jun, Lowestoft. *hc*, T. Roll, Lowestoft (2); Miss F. E. Somes; T. E. Thirtle.

ANY OTHER VARIETY OF BRITISH OR FOREIGN.—1, R. Bishop, King's Lynn (Golden Lizard). 2 and *vhc*, Miss E. A. Eeles (Zebra Finch and Diamond Sparrow). Local, Miss F. E. Somes (Bullfinch). *hc*, Miss F. E. Somes (Bullfinch and Cockatoo); G. & J. Mackley (Goldfinch); Miss E. A. Eeles (Coral-nucck Sparrow and Bengalese Blanc).

SELLING CLASS.—*Single Bird.*—1, Provart & Willis (Ticked Buff). 2, R. Poole (Cinnamoo). Local, W. Haverson (Ticked Yellow). *vhc*, Provart and Willis (Yellow); G. & J. Mackley (Clear Yellow Norwich) *hc*, W. Haverson (Clear Buff); Miss E. A. Eeles (Crested Bronzewing); R. Bishop (Golden Lizard). *c*, A. Boatwright, Bungay (Mulelook); W. Haverson (Ticked Yellow).

JUDGES.—*Poultry:* Mr. R. Teebay, and Rev. T. L. Fellowes *Pigeons:* Mr. E. Hutton. *Cage Birds:* Mr. H. Thurlow, and Mr. E. Hutton.

WHITE DORKING CLASSES AT BRISTOL.—The subscriptions to these were:—Miss E. Williams, £1 1s.; Alfred Darby, Esq.,

£1 1s.; Mrs. Hayne, 10s.; O. E. Cresawell, £1 1s. It may be a satisfaction to the subscribers to know that in my opinion the classes were the best which have been seen for a long time.—O. E. Cresswell.

ASPATRIA (CUMBERLAND) POULTRY AND CAT SHOW.

(*From our own Correspondent.*)

This Exhibition was held at Aspatria on the 20th and 21st inst., and showed considerable improvement over its predecessor of 1874. It elicited entries from noted local and other exhibitors, and some first-class birds were exhibited. The display of *Pigeons* was a very fine one, as also *Canaries* and those useful household pets yclept *Cats*. Amongst the latter a pure white Japanese Cat, the property of Miss Lawson of Brayton Hall, elicited much admiration, and its fair mistress some envy in being the favoured possessor.

Mr. Pickering of Warwick Bridge undertook the responsible onus of judging throughout, a most arduous undertaking, but which he performed very successfully. The following is a list of his awards:—

Game.—*Black-breasted.*—1, J. W. Brockbank, Kirkesanton. 2, J. Rauthmell, Kendal. *Brown-breasted.*—1, J. Brough, Carlisle. 2, W. Barnes, Blennerhassett. *Any other variety.*—1, J. Mackreth, Holborn Hill. 2, J. Langcake, Aspatria. *Any variety*—1, J. Nelson. 2, Chartere & Irving.

Brahmas.—*Any variety.*—1, A. Dickinson, Distington. 2, H. Beldon.

Cochins.—*Any variety.*—1, Capt. G. F. Lyon, Kirkmichael, Dumfries. 2, Mrs. H. Beldon.

Dorkings.—*Any variety.*—1, J. Robinson, Garetang. 2, Miss Knowles, The Priory, St. Bees.

Spanish.—*Any variety.*—1, H. Beldon. 2, H. Wilkinson.

Hamburghs.—*Golden-spangled or Pencilled.*—1, J. Robinson. 2, H. Beldon. *Silver-spangled or Pencilled.*—1, H. Beldon. 2, J. Robinson.

French.—1, Bouch & Armstrong, Aspatria. 2, R. J. Robinson, Ulverston.

Polands.—1 and 2, H. Beldon.

Any other distinct variety (except Bantams).—1 and 2, H. Beldon.

Bantams.—*Game, Black-breasted.*—1, W. Grice, Bootle. 2, J. Hine, Kendal. *Game, Brown-breasted.*—1, W. Atkinson, Kendal. 2, J. Nelson. *Any other variety.*—1, W. Higgin, Ulverston. 2, H Beldon.

Ducks.—*Rouen*—1, J. W. Brockbank. 2, J. Nelson. *Aylesbury.*—1 and special prize, W. Brockbank. 2, Capt G. F. Lyon. *Any variety.*—1, Miss H. Robinson, Wigton. 2, J. Langcake, Aspatria.

Geese.—1, W. Mann. 2, W. F. Wilson.

Selling Class.—1, J. W. Brockbank. 2, H. Beldon. 3, J. Brough, Carlisle.

Local Classes. — *Game.* — Prize, W. Barnes, Blennerhasset. *Dorkings.*—Prize, W. Huggin, Westnewtown. *Spanish.*—Prize, Bouch & Armstrong. *French.*—Prize, Bouch & Armstrong.

PIGEONS.

Carriers.—1, J. & W. Towerson. 2, J. Lowrey, Cleator.

Pouters.—1 and 2, J. & W. Towerson.

Fantails.—2, J. Tremble, Aspatria.

Jacobins.—1, J. & W Towerson. 2, J. Cooke, Egremont.

Tumblers.—1, W. Brydone. 2, J. & W. Oddie.

Nuns.—1, W. Brydone. 2, J. Langcake.

Gwle.—1, W. Brydone. 2, J. & W. Oddie.

Barbs.—1, W. Brydone. 2, E. McKie.

Any other Distinct Variety.—1, J. & W. Towerson. 2, W. Brydone.

Selling Class.—1, W. Mann. 2, W. Brydone.

Cage Birds.—*Canaries.*—*Yellow or Buff.*—1, R. Walton, Silloth. 2, W. Hutton, Longtown. *Marked.*—1 and 2, H. Hodgson, Silloth. *British.*—1, W. Hutton. 2, W. Richardson. *Foreign.*—1, T. Benson. 2, Mrs. J. G. Nelson.

Cats.—*Any variety, to compete for piece of plate.*—1, H. A. Clark, Aspatria. 2, Master T. Graham. *Any variety.*—1 and Special, Miss L. P. Mulcaster, Leicester. 2, J. Ferguson.

NENTHEAD POULTRY SHOW.

That a show of poultry can be found among these wild Cumberland hills is something to be surprised at; but to find birds of the so-called most delicate varieties in the finest condition and bloom, as were the Silver-pencilled Hamburghs bred 1800 feet above the level of the sea, is sufficient to make one take leave of the term "delicate" as applied to at least one variety of poultry; and if this Society has not yet been able to achieve any great feat as regards entries on account of its isolation and distance from the rails, it has at least gone far to prove the possibility of cultivating high-class fowls in the coldest and most barren parts of the country.

As hinted above, the entries in poultry were small, and some pens were empty, Mr. Wilkinson's birds not arriving at Alston, five miles away, till after the awards were made, but the station-master kindly fed the birds with soaked tea cakes and returned them. *Game* were fair in quality in both classes, but the Gold-spangled *Hamburghs* very poor; while the Gold-pencils, which were locally bred, except as regards the second-prize pen, were a nice lot; the second, however, were too dark in colour. Only the Silver-spangles in first-prize pen were what they should be, but the Silver-pencils, as before hinted, were a good lot. In the Variety class the first were Black Polands, and second Partridge Cochins; and in pairs of hens, first was a handsome pair of Silver-pencilled pulleta, and second White-crested Black Polands. *Ducks* are never good here.

The *Cage Birds* mustered well, and made a rare show. First came the Belgians with only four entries; the first was, however, a real good bird—good in style, carriage, and condition, with a capital back, the second failing only in that respect; both were Buffs. In Yellow and Buff classes, which mean Norwich of course, the pepper scheme seems to have reached even here, and the winners were mostly of that kind, the same remark applying also to the marked birds, where some good four-pointed birds were shown. Green Canaries are generally good here, and this was no exception, and the Duns were a fair lot. In pairs of Canaries, first was a handsome pair of Belgians, and second Marked Norwich. The rest of the classes contained some good specimens.

Game.—*Black-breasted and other Reds.*—1, W. Armstrong, Low Row. 2, W. Walton, Cocklake. 3, T. Brown, Nenthead. *hc*, T. Brown; W. Walton. *c*, J. Stephenson. *Any other variety.*—1 and 3, W. Walton. 2, T. Brown.

Hamburghs.—*Golden-spangled.*—1 and 3, Rev. H. Robinson, Nenthead. 2, P. Swindle, Nentebury. *Golden-pencilled.*—1 and *c*, J. J. Millican, Nenthead. 2, T. Dickinson, Brampton. 3, J. Cousin. *Silver-spangled.*—1, E. White, Alston. 2, J. J. Millican. 3, W. Graham, Nenthead; G. Dodd, Clows, Gillholme. *hc*, W. Graham. *Silver-pencilled.*—1, 2, and 3, J. Stephenson.

Dorkings.—1, J. Armstrong, Ashgill.

Spanish.—1, T. Storey, Alston. 2, J. Goodburn, Nenthead.

Brahma Pootras.—1, W. Nattrass. 2, J. Goodburn. 3 and *hc*, W. Teasdale, Hudgill.

Bantams.—1, R. Irving, Kirkhouse. 2, M. Coatos, Nenthead.

Any other Variety.—1, J. Goodburn. 2, Miss Snowden, Melmerby. 3, J. Dickinson, Nenthead. *hc*, J. J. Millican. *c*, W. Nattrass; E. Thomason, Ashgill; Dr. Horder.

Any Variety.—*Hens.*—1, J. Stephenson. 2, J. Goodburn. 3, J. Walton. *hc*, J. J. Millican. *c*, T. Brown.

Ducks.—1, J. Kindred, Bayles. 2, J. Richardson. *c*, R. Walton.

Pigeons.—1 and 2, W. Graham.

CAGE BIRDS.

Canaries.—*Couple.*—1, T. Brown. 2, M. Stelling. *hc*, P. Swindle, Nentebury; J. Dickinson, Nenthead. *c*, J. Percival, Nenthead; W. Thompson.

Belgian.—1, T. Brown, Nenthead. 2 and *hc*, M. Stelling, Wellington.

Yellow.—1, 2, and *hc*, M. Stelling.

Buff.—1, M. Stelling. *hc*, W. Thompson, Nenthead. *c*, J. Graham; W. Thompson.

Marked.—*Yellow.*—1 and 2, T. Brown. *vhc*, T. Brown; M. Stelling. *hc*, M. Stelling; J. Stephenson. *Buff.*—1 and *hc*, T. Brown. 2, G. Moore. *vhc*, M. Stelling.

Green.—1, J. Richardson. 2, R. Doyle, Nenthead. *hc*, H. Doyle; M. Stelling.

Dun.—1, T. Brown. 2 and *vhc*, M. Stelling.

Goldfinch.—1, M. Stelling. 2, T. Brown. 3, W. Rutherford, Dykeheads.

Mule.—1 and 2, M. Stelling.

Any other Variety.—1, J. Stephenson. 2, T. Liddle, Nenthead. 3, T. Brown.

The Judge was Mr. E. Hutton, Pudsey.

CARNOUSTIE ORNITHOLOGICAL SOCIETY'S SHOW.

This Exhibition of poultry and Pigeons was held on the 23rd inst., and was the most successful Show ever held by the Carnoustie Society. The quality in most cases was very good, and in some exceedingly so.

Game were a large and good class, first a good pen of Brown Red; second a fair cock, but wretched hen; third a pen of grand Black Reds; 7 contained a good hen. *Dorkings* were very fine, the first a really grand pen, the cock a Palace winner. There was not a bad bird in the class. *Cochins* were good, first going to a pen containing a grand hen mated with a fair cock; second good Buffs; third White; fourth Buff, a large cock. *Brahmas* were numerous and the quality excellent, first a grand cock, with a large and well-shaped but not too well-coloured hen. They were undoubtedly the best pen, and won in addition the cup given to the best pen shown by a member. Golden-spangled *Hamburghs* were few, but Silver-spangled mustered pretty well. We did not here agree with the Judge; the best pen was not noticed, being that belonging to Mr. McAndrew. The first were next; while second contained a bad hen, with a cock whose comb had been lately trimmed, the scars being most noticeable. Pencilled were a fine class. *Spanish* were also good, the first-prize pen stood out easy winners; second and third also good. *Houdans* were, wonderful to say, well represented, and the quality good, though some of the pens would have been farther forward had they been better matched. The Variety class was headed by a splendid pair of Black Hamburghs, second good Crêves, third Golden Polish. There were also good Scotch Greys, Silver Polish, and Silkies in the class. The extra prizes for the best cock in the Show was taken by the first-prize Game cock, belonging to Mr. R. Stewart; while that for the best hen went to Mr. Paton's Cochin hen. Game *Bantams* were both plentiful and of nice quality, first a pair of good Black Reds; second, the same colour, we did not like so well as the very highly commended pen, which should have stood second; third and fourth went to Piles and Duckwings. In the Any other variety class first were nice Sebrights; second Black; third White. *Ducks* were not very numerous, though the prize birds were of good size; first Rouens; second and third Aylesbury.

The *Pigeons* numbered about forty entries. Pouters were poor; but Fantails were good, as were also Tumblers; first a pair of nice Reds, second Almonds, third small Agates. In the Variety class first were a pair of fine Black Carriers, second good Yellow Magpies, third Blue Turbits.

Game.—1 and Cup, R. Stewart, Blair Adam. 2, R. J. Nicoll, Carnoustie. 3, J. Morrison, Forfar. 4, Miss R. Frew, Sinclairtown, Kirkcaldy.

DORKINGS.—1, D. Gellatly, Meigle. 2, J. Symon, Errol. 3, Mrs. W. Chalmers, Hallyburton, Coupar-Angus. 4, J. Sharp, Errol.

COCHIN-CHINA.—1 and Cup, W. M. J Paton, Broughty Ferry. 2, W. Nicoll, East Newport. 3, Mrs. G. Armitstead, Isobmartine. 4, Mrs. A. G. Duncan, Broughty Ferry.

BRAHMA POOTRA.—1 and Cup, J. Smart, Carnoustie. 2, F. C. Parker, Dundee. 3, H. Greenhill, Carnoustie. 4, W. G. Duncan, Dundee.

HAMBURGHS.—*Gold-spangled.*—1 and 3, G Low, Carnoustie. 2, J. Milne, Maryton, Montrose. 4, T. Hepburn, Carnoustie. *Silver-spangled.*—1, C. J. Wilson, Carnoustie. 2, Mrs. C. B. Taylor, Montrose. 3, G. Low. 4, W. Gibson, jun., Carnoustie *Gold and Silver-pencilled.*—1 and 2, G. Caithness, Carnoustie. 3, W. Milne, Forfar. 4, J. Taylor, Montrose.

SPANISH.—1, J. Norval, Alloa. 2, Mrs. W. Steven, Montrose. 3, D. Kidd, Carnoustie. 4, P. Symon, Errol.

HOUDANS.—1, A. Robertson, Carnoustie. 2 and 4, J. Smart. 3, Mrs. Stuart, Arbroath.

ANY OTHER VARIETY.—I and 4, G. Caithness (Black Hamburghs and Scotch Greys). 2, J. Smart. 3, J. Taylor, Montrose (Golden Polands).

BANTAMS.—*Game.*—I, J. D. Donald, Montrose. 2, P. Symon. 3, Miss J. M. Frew, Kirkcaldy 4, Mrs. Frew, Kirkcaldy. *Any other variety*—1, R. Frew, Kirkcaldy. 2, Miss B. P. Frew, Kirkcaldy. 4, J. Taylor, Montrose.

SELLING CLASS.—*Cock or Two Hens.*—1, P. Symon. 2, A. Bowie, Carnoustie. 3, F. Bell, Carnoustie (Buff Cochin).

DUCKS.—1, J. Fowler, Scotscraig, Tayport. 2 and 3, A. Bowie.

PIGEONS.

POUTERS.—*Pair.*—1, J. Cowe, Aberdeen. 2, J. F. Macdonald, Dundee. 3, Miss J. M. Frew

FANTAILS.—*Pair.*—1, A. Smith, Broughty Ferry. 2, Mrs. A. G. Duncan, Broughty Ferry. 3, W. Guild, Bayfield, Broughty Ferry.

TUMBLERS.—*Pair.*—1 and 3, J. Smart, Montrose. 2, D. Kennedy, Forfar.

ANY OTHER VARIETY.—*Pair.*—1, A. Smith (Carriers). 2, Miss R. C. Frew. 3, R. J. Wilson, Durn, Perth (Turbits).

JUDGES.—*Poultry:* Mr. T. Raines, Stirling. *Pigeons:* Mr. J. E. Spence, Broughty Ferry.

PENRITH (WESTMORELAND) ORNITHOLOGICAL SOCIETY.

(*From our own Correspondent.*)

THE Penrith Ornithological Society is now one of the institutions of the town, the Committee having on the 15th and 16th inst. at the first Exhibition received such a measure of support as will, we think, encourage them to make the Show annual. The following are the awards:—

MEMBERS' CLASSES.

BELGIAN.—*Clear Yellow.*—1, J. Turner, Penrith. 2, J. Deanwood, Penrith. *Clear Buff Belgian.*—1, J. Carruthers, Penrith. 2, E. Shaul, Penrith. *Marked Yellow or Buff Belgian* —1 and 2, J. Carruthers. *Clear Yellow Canary.*—1 and 2, J. Ostel, Penrith. *Clear Buff Canary.*—1 and 2, J. Sisson, Penrith *Marked Yellow or Buff Canary* —1, J. Sisson. 2, F. Moor, Penrith. *Even-marked.*—1, J. Turner. 2 and 3, J. Pickering, Penrith. *Glasgow* —1, G. Allinson, Penrith. 2 and 3, J. Carruthers. *Norwich.*—1, J. Turner. *Any other variety of Canary.* —1, J. Turner. 2, E. Shaul.

OPEN CLASSES.

BELGIAN.—*Clear or Ticked Yellow.*—1, J. Rutter, Sunderland. 2, Reid and Wilkinson, Halifax. *Clear or Ticked Buff Belgian.*—1, J. Rutter. 2, Reid and Wilkinson. *Clear Jonque Norwich.*—1, Atherauch & Son, Coventry. *Clear Buff Norwich.*—1 and 2, Athersuch & Son *Even-marked Yellow or Buff Norwich.* —1, Athersuch & Son. 2, J. Adams. *Ticked or Uneven-marked Yellow or Buff Norwich* —1, Athersuch & Son. 2, J. Adams. *Golden-spangled Lizard* —1, Clemінson & Ellerton. 2, S. Banting, Derby. *silver spangled Lizard* —1, Reid and Wilkinson. 2, T. W. W Fairbrass. *Clear Yellow Yorkshire.* 1, Reid and Wilkinson. 2, Fawcett & Anderton, Baildon. *Clear Buff Yorkshire.*—1, Reid and Wilkinson. 2, J. Deanwood. *Even-marked Yellow or Buff Yorkshire.*—1 and 2, Reid & Wilkinson. *Ticked or Uneven-marked Yellow or Buff Yorkshire.* —1, Fawcett & Anderton 2, Reid & Wilkinson. *Clear Yellow Glasgow.*—1, J. Turner. 2, R. Bryden, Lochmaben. *Clear Buff Glasgow.*—1, R. Bryden. 2, W. Clark, Langholm. *Flecked Glasgow.*—1, A. A. Manchan, Dumbarton. 2, R. Bryden. *Any variety of Crested Canary.*—1, J Baxter, Newcastle-on-Tyne. 2, R. Hawman, Middlesborough. *Any other variety of Canary.*—1, J. Adams. 2, Clemінson & Ellerton. *Selling Class.*—1, A. Palmer. 2, G. Cox. *Goldfinch and Canary Mule, Clear or Variegated.*—1, G. Stephenson, Gateshead. 2, J. Baxter. *Goldfinch and Canary Mule, Dark.*—1, R. Hawman. 2, G. & J. Mackley, Norwich. *Any other variety of Mule.*—1, J. Speece, South Shields. 2, R. Hawman. *Goldfinch.*—1, J. C. Bamber, Preston. 2, Clemінson & Ellerton. *Brown Linnet.*—1, Clemінson & Ellerton. 2, Baxter & Percival. *Any other variety of British Bird.*—1 and 2, R. Pearson, Whitby. *Any variety of Foreign Bird.*—1, S. Bunting 2, T Barrrow, Monkwearmouth.

PENRITH CLASS.—*Singing Bird, showing no Belgian Properties.*—I, Miss M. Watson, Penrith. 2, J. Ostle, Penrith.

SPECIAL PRIZES.

Silver Cup for the best bird in the Members' classes.—J. Turner, Penrith. Silver Cup to the winner of the most points in Classes 11 and 12.—J. Rutter, Sunderland Silver Cup to the winner of the most points in Classes 13, 14, 15, and 16, Athersach & Son, Coventry. Silver Cup to the winner of the most points in Classes 17 and 18.—Clemінson & Ellerton, Darlington. Timepiece to the winner of the most points in Classes 19, 20, 21, and 22.—Reid & Wilkinson, Halifax. Silver Cup to the winner of the most points in Classes 23, 24, and 25.—R. Bryden, Lochmaben, Dumfriesshire. Silver Cup to the winner of the most points in Classes 30, 31 and 32.—R. Hawman, Middlesborough. Silver Cup for the best bird in the Open Classes, J. Spence, South Shields.

JUDGES.—*For English Birds:* Mr. P. Rawnsley, Bradford; and Mr. W. Watson, Darlington. *For Scotch Birds:* Mr. James Thorpe, Dumfries.

ALLOA POULTRY SHOW.

THE above Show was held in the Corn Exchange, Alloa, on January 15th and 16th. There was a fair display of poultry, and Pigeons were a fine lot. *Dorkings* were very numerous, especially Silvers, and the prizewinners deservedly placed. *Spanish* were good; first a very nice pen, which we think we have seen win several times this season. *Hamburghs* were numerous and the quality good, especially the Golden-pencils. Golden-spangled were entirely absent, but Silver-spangled made up for the deficiency. *Brahmas* were a good though small lot, the first-prize birds in this class winning the cup for the best pen in the Show. *Cochins* were not numerous, nor were *Game*, which, however, were of fine quality. Game *Bantams* were a large lot. First were Black Red, a grand hen, but the cock too squirrelled in the tail; second fair Piles. Any other variety Bantams.—First Black, which should, however, have been not higher than third. Second good Silver Sabrights; second better Blacks than first. Any other variety.—First, good Black Hamburghs; second, Houdans; third, Crêves.

Pigeons were headed by White Pouters, which were a good lot and well judged. Red or Yellow came next. First a grand pen of Reds: the hen in this pen won the cup for the best Pigeon in the Show. Second was a mistake; 188, Yellow, unnoticed, was far before them in all respects. Blues were a fine class well judged, as was the Any-other-colour class; first here Mealy, a really magnificent hen and good cock. Tumblers were numerous: the best pen of the lot was the first Kites in the Any-other-colour class. Fans were, we think, a mistake; first going to great coarse birds of English type, all tail, no motion. Any other variety.—First, Red Barbs; second, Carriers, a fine pair; third, Dun Barbs.

JUDGES.—*Poultry:* Mr. Jardine, Kilmarnock; *Pigeons:* Mr. A. Frame, Larkhall.

DRAGOONS VERSUS HORSEMEN.

I HAVE read with much pleasure the communications of Mr. Staunton and Mr. Henry upon this subject, and I may add that I have had private letters from some who, though they decline coming forward in print, yet as heartily agree with my view as the two above-named gentlemen. Now, I think that Pigeon fanciers—I mean true fanciers—and much as I delight in shows, yet the prizes do slightly interfere with genuine Pigeon love, for a number of men exhibit for prizes who but for prizes would not keep Pigeons. I say that true Pigeon-fanciers have a great regard for the opinions, especially the recorded opinions, of fanciers of a former day; that they do not regard the fancy as merely a thing of the present, but as an old taste and regulated by old rules; that a hundred years ago a Pouter was a Pouter as now, a Carrier a Carrier, and that a Dragoon ought to be a Dragoon; and I add that true fanciers are jealous of any changes of name or nature, and only welcome changes which all fanciers agree to as being improvements. Returning to the subject of genuine fanciers and shows, I quote with much pleasure the words of a grand old fancier of Pouters, Mr. Ure of Dundee. Speaking of the days of his youth he says, "In those days I should think no one but a genuine fancier kept Pigeons. They had no open shows, as we have now almost every week, so there was nothing to induce the spurious or mere 'showing' fancier to go into them. They had their private clubs, where they met to exhibit their old 'cracks' or the young coming 'wonders' that were to knock the old ones off their perches; and I am not sure but these were the right sort of shows after all." It is, then, genuine fanciers, who free from prize-bias (not but that many who take prizes are very genuine fanciers), to take care that the laws of the fancy be not improperly altered, and that a bird of one variety be not foisted on to the world as a bird of another—*e.g.*, that a bad Carrier or a good Horseman be not panned with Dragoons and pass by their name.

In this matter let us go back to our forefathers and hear what they have to say, and what sort of a bird they call a Dragoon Pigeon. Old Moore, A.D. 1735, gives a longish account of the Horseman, a bird then thought much of, and even painted in oils by Bogdani, an eminent painter of the reign of Queen Anne, and several of whose works that Queen had in her palaces, where they hang to this day. These birds are described minutely as to head, &c., and colour; and these very birds I hold are now highly esteemed, but called "Dragoons, London Style." In the Treatise, A.D. 1765, we have a little more about the Dragoon; but we have nothing added by Girton; and until the modern writers, Brent, and Easton, and others, nothing save one remarkable exception. In the work published by Longman, first edition, I fancy about 1830, we have a good engraving of a Dragoon's head, just like the one pictured by Mr. Ludlow; and accompanying the engraving these additional words of description—"One of the principal beauties of the Dragoon is the straightness of the top of its skull and that of its beak, which ought almost to make a horizontal line with each other." Then goes on a remark saying that the cut is from a fine living bird. But in the words I have quoted lies the pith of the whole matter—straightness of skull and of beak; and in the book quoted, "the lightness and smallness" of the Dragoon is spoken of in contradistinction to the heaviness of the Horseman.

Now, such was the Dragoon, and such is the true historical fancy Pigeon rightly called a Dragoon, so named from the small light cavalry soldier called a Dragoon, who is a small man and rides a small horse, while the Horseman Pigeon corresponds to the heavy horse soldier. I have had the opportunity of seeing a group of true Dragoons drawn by Mr. Ludlow, which when published will delight the fanciers of the genuine bird. Much as I like some fanciers, though their knowledge is almost limited to Pigeons, yet those who know something of English literature as well as Pigeons should have a voice in this matter.

I have not seen one argument in favour of Horseman-Dra-

goons. All that is stated is Mr. This-person's opinion or Mr. That's. Argument based on the history of the fancy has not been attempted; and the men who accept the Horseman as a Dragoon know and will own that their birds are often not Dragoon-bred. That the old variety, called properly the Horseman, should be an exhibition bird is my wish. In this fight of truth against prizetaking I see the especial value of Pigeon periodicals; for a judge even is apt to say, "Well, I shall only give a prize to the Pigeon I approve;" but Pigeon-writers are too strong for even prejudiced judges. I wait anxiously for arguments, and not merely for the opinions of this fancier or that keeper of Pigeons. As the matter now stands the writers in favour of the bastard-bred young Carriers, or true Horsemen, are—to adopt an old phrase and putting to it a new signification —"utterly routed, horse, foot, and Dragoons."—Wiltshire Rector.

STANDARD OF DRAGOON.

I am very glad this question is getting somewhat nearer settlement. I observe an article upon this subject in another periodical by Mr. South, who has, I believe, bred some of the winning birds at various exhibitions, and therefore ought to know something about the birds in question, and with the concluding part of his statement I must say I agree, though we have begun at the wrong end; but no doubt we shall in due time, if we go on, arrive safely to the head of the bird. Mr. South says that the tail of the Dragoon ought not to touch the ground. I presume he means when the bird stands quite or perfectly upright. I then with my rule or straightedge referred to the bird and article by "Wiltshire Rector," in this Journal, and on placing the straightedge level with the sole of the feet found that the bird did carry the tail well off the ground. With this I agree as being one of the true points of a Dragoon, and that no Judge ought to give a prize or even a commendation to a bird, however good it may be in other points, if the tail does touch the ground, as a Dragoon ought not to be a long-feathered bird.

As to the pink eye, I have always seen it in a true-bred Dragoon, but if it can be bred-out as an improvement I have nothing to say against it. Mr. South also says, to settle the question let there be chosen (I say by ballot), two members out of each society. I suppose he means a London and a country society. Now, I would propose that there be twelve chosen by ballot to settle this question, say two from London, two from Birmingham, two from Manchester, and the other six from the different parts of the United Kingdom, not forgetting Mr. Ludlow with his pencil, that he may draw a true likeness of the bird chosen by the said twelve, as being the most perfect specimen. Let all the gentlemen send their names to you that are willing to act, then let a printed form be sent to all Dragoon fanciers, and let them place their mark X opposite the name they wish to act. I will give one guinea towards the expenses with pleasure.—W. Woodhouse, *King's Lynn.*

BEE-KEEPING IN 1875.

The new year dawns upon us hopefully in regard to the prospects of bee-keepers. Frosts and snow, of which we have had a fair share already, and at a very seasonable time, are an excellent preparation for a good and plentiful honey harvest. Here in the south-west of England, living as we do very near the seacoast, frosts of any severity are rare. As it is, I doubt if we have had more than 12° of frost, and that for only two or three days' duration; and it is now several years since we had frost enough to skate anywhere about us for more than a few hours at a time. Now, I have often observed that our best honey seasons—and they are of rare occurrence here—have followed our coldest winters. Therefore I augur hopefully for the summer before us. It is now (Jan. 16th) so warm, and has been so for some days, that a fire might have been dispensed with. At this moment I am sitting with my window wide open facing north, and my bees have been busy pollen-gathering. I noticed this pleasant sight for the first time on the 12th, but I have no doubt they were at it some days before during my absence from home. All my hives, eleven in number, seem to be in good health, and well supplied with provisions.

It is a good thing when the weather is open, as at present, to clear away as many dead bees as can be got at within the hive without breaking away the hive from its board. This can frequently be done by inserting a piece of wire with a curve at one end, and hooking out the dead on the floorboard. The effluvium arising from a mass of corrupting bodies is often very great, and after a long period of cold weather there is sure to be a considerable quantity of such dead bodies lying about the floorboard inside. The bees ordinarily remove their dead themselves from day to day when they can get out; but it helps them much to assist them in this labour, besides adding to their health and comfort. Where wooden hives are used no harm can accrue from breaking-up the hive from its board in any case where these fit accurately. It is in the case of straw hives, which rarely do sit ovenly on the board, that it is perilous to remove these boards in winter. Sometimes I have known the dead accumulate so thickly about the entrances inside as to choke them up entirely, in which case, there being no exit for the bees, the hive perishes inevitably. Let all bee-keepers watch against eventualities like these, as well as against long-continued accumulations of snow outside on the entrance-boards.

These hints are not untimely, as we shall doubtless ere long be visited by a sharp increase of cold, all the more severe for the present extraordinary warmth of temperature.

Since writing the above I have been examining my hives, and found ten out of the eleven pollen-gathering, some of them quite vigorously. One hive, active and strong, on inspection by a window at the back seemed to have a large number of dead scattered below the combs. So being a "good divine that follows his own instruction," I quickly heaved-up the hive by means of a screwdriver, and with a thin stick swept off right and left about thirty dead bees, whose fragrance was certainly not of the sweetest. *Sat verbum sapienti; experto crede.*—B. & W.

ONWARDS.

Apiarians as well as farmers and gardeners look forwards to spring with uplifting hopes. Spring flowers, generally speaking, afford more pleasure than autumn ones. All lovers of nature admire and welcome spring. It is budding-time in many senses, and with many persons and things. The enthusiasm of many seems to swell with the buds of the trees. The resolve is, that this year will be one of greater enjoyment and greater success. Apiarians were never so enlightened as they are now, speaking generally, and some of every school of management are hoping for a year of sunshine. We sincerely hope that 1875 may be a year of encouragement and success to all bee-keepers. Their motto is "Forward and onwards," not "Rest and be thankful." As soon as spring commences our "busy bees" will be abroad foraging. The crocuses, willows, and species of tussilago are amongst our earliest flowers, and these yield both pollen and honey.

In the south of England breeding commences early in February, when bees may be seen sipping and carrying-in water. All hives should be examined now, and have their boards well cleaned. If any of them have mouldy combs these should be cut out to save the bees the time and trouble of doing it themselves. Some combs, not mouldy, may have perished (lost their adhesive power), and crumble when touched by human hands. Damp hives from any cause will destroy the nature or adhesive power of combs not covered by bees in winter. Hence it is advisable to carefully examine all stocks at the present time with a view to remove all impurities and hindrances out of the way of the bees. If there be nothing to remove, there may be always something learned by an examination of hives internally. Small contracted doors and warm outer coverings are of great importance in the months of February and March. Then bees need all their natural warmth to assist in hatching brood.

It is yet rather too soon to begin artificial feeding. When this is begun it is well to continue it in unfavourable weather, whether hives really need it or not. A check to the prosperity of a hive during the spring months may be a very serious affair. A continuation of cold weather, together with the prospect of hard times, often puts an end, for the time being, to breeding in a hive. The bees instinctively decline to set eggs in times of threatened starvation. Hence the importance of feeding in unfavourable weather. Feeding at such times keeps-up the hum of health in our hives, and causes the inmates to move upwards and onwards.

The parent hive that (with its swarms) rose in weight to 373 lbs. last year, "got a quarter of a pound of sugar with an equal weight of water daily, from the 20th of April till the field honey came in." This happened in the north of Scotland. In most parts of England, and Scotland too, in ordinary seasons artificial feeding may be commenced earlier than the middle of April. Spring feeding is resorted to simply to stimulate and keep alive our liliputian communities.—A. Pettigrew.

METHEGLIN.

Now that bee-farming is assuming such proportions, and the sale of honey in many districts is so limited, what is to be done with the hundredweights of surplus honey? At present cus omers are exceedingly scarce. Chemists will offer 8*d.* or 9*d* per lb. for pure run honey, which is worth at least 1*s.*

The suggestion of Mr. Hunter is a very good one, that of manufactnring honey into honey bread, bonbons, pastils, chocolates, &c. If our confectioners would take a leason from our French neighbours, there would probably soon be a greater demand for the delicious article.

I do not know of anyone who can give a recipe for any of the eatables mentioned by Mr. Hunter, but I can furnish a

recipe for metheglin if you think it worth the space in the Journal. Perhaps some of your numerous correspondents will be able to give recipes for a few if not all the other good things in Mr. Hunter's catalogue. And here I may state that the metheglin which fell to that gentleman's share at the Crystal Palace Show was prepared from the same recipe.

When the comb has been drained of its honey, put it in a large vessel, then pour in sufficient lukewarm water to swim it nicely. Let it stand two days, stir it occasionally, then strain it. Skim the scum from the liquor carefully, filter the sediment through a flannel bag, then boil one hour. To 3 gallons:—2 lbs. raisins, 1 oz. of ground ginger, and seven or eight laurel leaves, then cool. Add a little of brewer's barm, let it stand part of a day, then barrel it, leaving the barrel open for two or three days, then bung it up, and let it remain untouched for six months, then bottle it. I daresay some who try their hands at making this honey-drink will be anxious to taste before the expiration of the six months, but the longer it is kept the better it will be. If an egg will float on the liquor it will be about the right strength.

Metheglin may of course be made from run honey, but by soaking the combs in water we utilise the honey which would otherwise be lost. A little lump sugar put in each bottle will make it as fine as brandy.

The above recipe was given me by Mr. J. Green, an old bee-keeper, whose aunt has been famous for honey-drinks for many years.—J. Oliver, *Hartington, Derbyshire.*

SALE OF HONEY.

It has been suggested that a sale of honey should take place on the next occasion of the Crystal Palace Bee and Honey Show in a more systematic manner than was the case last autumn. This is a matter which is of great interest to all bee-keepers, as we know by long experience how difficult it is to find a good market for our surplus honey, whereas if such market were found there would, we feel sure, be no lack of buyers at very remunerative prices. Good honey cannot be bought in London for less than 2*s.* or 2*s.* 6*d.* per pound. It is rare in the country to find purchasers at 1*s.*; add 6*d.* per lb. to this, and buyers would largely increase to the great advantage of the whole community, to none more than to the rustic bee-keeper.

There are difficultiea in the way of connecting such sale of honey with the Show, especially in the case of competing supers. To break up these for sale, except at the close of the Exhibition, would be to spoil the Show for every day but the first. We fear this cannot be thought of, and exhibitors who compete for prizes must be content to price their supers for sale *en bloc*, to be carried off or sent off afterwards; of course at the close of the Show there might be opened a retail market for their contents, of which due notice would be given.

But there might be a continuous sale all through the Exhibition of small boxes of tin or earthenware, containing from five to ten or more pounds, equally pure and excellent, from the stores of the bee-master at home, prepared beforehand in convenient baskets ready to carry away. Very cheap baskets could be made expressly for the purpose, with tins exactly fitting. In this way almost any quantity of honey could be sold, also of run honey in jars. I do hope something of the sort may be tried. Any bee-master with a large and productive apiary would surely find it to his interest to prepare his honey for sale in some such way. Let only one enterprising person pioneer the way, and he would in time have a large following, but at first all to himself, a heavy purse. I throw this out for the consideration of Mr. Hunter and the Committee of the Bee-keeper's Association.

As it is now, honey is often a great nuisance, and, beyond the quantity required for home consumption, quite too much of a good thing. A neighbour of mine makes his friends welcome to his surplus hives after he has taken what he wants for his own needs and for medicinal purposes among the poor. I have preferred to increase my stock by swarming of late years, and to sell the surplus of my hives in the spring, when the demand begins to develope itself after the losses of winter. In this way I have sometimes made more money than by keeping the bees for honey, and have been spared a great deal of trouble.—B. & W.

Crystal Palace Exhibition of Canaries and British and Foreign Cage Birds.—The entries close on February 3rd, after which date all post entries will be charged 25 per cent. in addition to the fixed entry. Post entries will close on February 6th. Besides the classes of former exhibitions are the following:—An extra £1 for the winner of most points in certain Norwich birds not of high colour; classes for Evenly-marked Crested Yellow and Buff Norwich, Silver-spangled Lizards with broken caps; silver cup for greatest winner in Goldfinch Mules; and prizes for Chaffinches, and the cage best combining cheapness with excellence.

OUR LETTER BOX.

Egg-layers (*Quizzical*).—Our answers to correspondents depend much on the circumstances under which the queries are made. We cannot advise the same to two fanciers, one possessing a run 20 feet by 9, and the other (happy man!) unlimited acres. We still like Brahmas, and do not find them either large eaters or tiresome sitters. We have been tormented by went of sitters for the last month, and yet we have four hundred Brahmas of all ages. Hamburghs lay many eggs, but small. Spanish lay large eggs; they are tiresome moulters. Crève-Cœurs lay large egge, and a great many. Houdane lay well, and are very hardy; their egge are not as large as the Crève-Cœurs'. These are the best layers. We advise either Crève-Cœurs or Houdane. Our advertising columns will show where they can be had.

Poultry Food (*J. E. M.*).—We do not consider locust meal good poultry feed. Few people have had as much experience as we have in poultry-feeding, and few have kept or do keep larger stocks. We have long ceased to believe that you can buy three-shillings' worth of food for 1*s.* 6*d.*, and we have proved most things, only to confirm us in our experience—the best food is the cheapest, and the plainest is the best. We pin our faith to three meals per day; morning and evening barleymeal or ground oats sleked, some whole corn, maize, or barley at midday, and occasionally some table or household scrape.

Manchester and Bristol Poultry Shows.—The first prizes for Roee-combed White Dorkings at both Showe were won by J. Robinson, Vale House, Garstang.

Crushing Mill (*C. T. S.*).—Write for information to some of the iron manufacturers who advertise in our columns. There is no doubt that crushed grain is more easily digested than whole grain. We never need dare.

Mealy Pouters (*J. E. S.*).—It is quite certain that Messrs. Hnie and Ure advocated the clase at the North British Columbarian Society years before our contemporary was thought of, and they may continue their advocacy long after our contemporary is forgotten.

Crystal Palace Canary Show (*M. G.*).—It is fixed for February 13th, and from 15th to 18th.

Combs Black (*Jane*).—The black combs in your hives have been too long in use, and have become black from age. You ask how they can be cut out without destroying the bees. To cut them out now would put the bees to a great disadvantage, and probably destroy them, for the blackest of the combs are in the centres of the hives, where the bees are sitting and where eggs will soon be set. It would be bad policy to cut out the combs just now. If there are parts of them rotten, cut them off with a table knife, but let all the rest, however black, remain till about three weeks after you obtain first swarms from them; then drive all the bees from your old hives into empty ones, and take their honey. In this way you will renew your stock and increase it without sacrifice; and seldom let your stocks be older than two years, and never more than three.

Fire Extinguishing (*J. L. T.*).—Not having any experience we cannot advise. Write to all the advertisers of extincteurs, &c. They will send you testimonials, &c.

REMARKS.

20th.—Windy all the past night, rather less so after 3 A.M.; fine day, but rain in the evening. A slight aurora.

21st.—Fine morning, and till noon, then dull; wet evening and fine night.

22nd.—Bright frosty morning, rather less bright in the after part of the day.

23rd.—Wet from 4 A.M.; fine for a short time about noon, dull afterwards.

24th.—Wind very high all night, but going down about 9 A.M., though slightly windy all day; occasionally very bright, but a sharp shower about 4 P.M.; fine evening. [at times.

25th.—Stormy night and morning; bright but windy forenoon; heavy showers

26th.—Dull early, but soon cleared off, and was very fine in the middle of the day; but rather dull afternoon and evening.

Mean temperature in shade about 7° below last week. Occasional hot sun, frequent rain, and heavy gales.—G. J. Symons.

COVENT GARDEN MARKET.—January 27.

We have experienced rather more demand with the improvement in the weather; but the supply has kept pace with it, so that little or no change has taken place in prices. Heavy arrivals of St. Michael Pines are in the river, reported in fine condition. The Oranges also are better. Among rough produce we notice very large arrivals of Broccoli from Penzance. Some good early frame Potatoes are also to hand from Jersey, making 1*s.* to 2*s.* per pound.

From observations taken near London during forty-three years, the average day temperature of the week is 45.7°; and its night temperature 32.2°.

CATCHING SUNBEAMS.

WHO can tell the value of an hour's sunshine in January to the gardener who has to keep up a perpetual supply of choice fruit, flowers, and vegetables? the demands for which always seem to increase in proportion as the weather gets worse. Fourteen hand-barrowloads of plants in flower (fine-foliage and Ferns count for nothing here), all through the dullest months of winter to be kept principally in dark dry passages heated with hot-air flues, which produce anything but a genial atmosphere, according to my notions of geniality, varied now and then by an icy draught from wide-open windows early in the morning when the weather is bright (and bracing to the hardier members of the animal world), take no small amount of scheming and forethought.

But all this is play compared with supplying choice vegetables to M. le Chef, who expects his demands for *Concombre*, *Tomate*, &c., to be supplied as easily as his order to Messrs. Barto Valle for maccaroni. Let a thing be known to be scarce, it is supposed to be *recherché*, and the demand increases accordingly. I have sometimes found the following little bit of stratagem successful, but I am afraid it will not serve me much longer. When a thing is likely to run short, gather all that can be laid hold of, of good, bad, and indifferent quality, and cause all to be placed before *le Chef* at once, who will then say it is not *recherché*, it is too common, and you may, perhaps, get a respite for a week. This, of course, is not honest practice, and an hour's sunshine made the most of will often do much to remove all difficulties.

We have now had several weeks of very dull, almost dark days, with not ten minutes' sunshine in a week, and, strangely enough, frequently as soon as the sun had fairly gone down the sky cleared, and the moon shone brightly. I suspect it would take a lot of moonshine to produce a pennyworth of chlorophyll. Now to-day, this 22nd of January, after a little frost, we have actually had a whole day's sunshine—glorious sunshine! a blessing not to be lightly esteemed. I was a little timid in the morning, anxious to make the most of every ray of light, but half afraid that tender Vine leaves, which had never seen real daylight before, would not bear such an abundance of it. Peaches, too, with flowers fully expanded under very adverse circumstances, would they bear it? Cucumbers with strong vigorous shoots, but with scarcely so dark a green colour as they should have, and some of the little fruits damping at the end, barely keeping pace with the daily demand for salad, and affording none for culinary purposes, if they could be induced to stand three or four hours of this heavenly sunshine would never look back again. Strawberries with their crowns just opening, Roses with shoots an inch long and just coming into leaf, Asparagus is *Asperge blanche* when we would rather have it *Asperge verte*. Everything, excepting, perhaps, French Beans, shows a want of daylight. Now it is come, will they be able to bear it? Fortunately at sunrise there is no house with a higher temperature than 57°. Peaches, Strawberries, and Roses have a lower temperature than this. Drops of moisture hang like beads round the edges of the leaves, and when the sun shines through the roof it feels inside the houses as nearly like a fine morning in May as anything I can imagine. There is no time to stop long in a place; there is much running backward and forward, just putting the least bit of air on one house and then running on to the next. There is not even time to look at the thermometers, temperature now is immaterial. The all-absorbing question is, Will the foliage, which is comparately thin in texture and short of chlorophyll, bear the sunlight?

Very little air must be admitted at once. It is still a frosty air. A leaf must not be seen to move, nor a breath of cold air felt. All the air must be admitted at the top, not the least bit anywhere else, or a draught will be the consequence. The sun still shines and the sky looks clear, another run round, another chink of air on the Peach house. The trellis is touched, and the pollen is seen floating about in the sunlight. The petals look strong and healthy, and some fall off still perfect. Some few buds here fell off when commencing to swell, but I think all are safe now, and the first opportunity will see seven-eighths of them picked off. Other houses, however, want looking to now, and this time it is a question whether the amount of ventilation now on will be sufficient for that part of the day when the sun, supposing it to keep out, will be the most powerful. It is now about 9.30, and there is not a cloud visible. The temperature has not yet risen more than 5° in any of the houses, but it is gradually rising in all; not a leaf is drooping, and there is now every prospect of the plants being able to stand the glorious sunlight. Fires, of course, were stopped long ago, and the pipes are already cooling; it will soon be nothing but Nature's own genial atmosphere. A day like this does more for the gardener than weeks of hard firing. No more air is given after 9.30. The temperature in most of the houses rises to about 75° by 10.30, and as the plants seem to be enjoying it, it is time at twelve o'clock to consider how to make the most of the remaining sun heat. The Cucumber house is now entirely closed, and the temperature rapidly rises to 82°, all natural heat. The pipes, with the exception of those for supplying bottom heat, are now nearly cold. Not a leaf is drooping here; the growth by this time after three hours' bright sunshine must be considerably consolidated, and I shall expect by to-morrow morning to have a visible difference in both leaves and fruits. Other houses now have the ventilation reduced, and all, excepting the Peach house are entirely closed soon after one o'clock. Were the Peaches a little forwarder, and fairly commenced swelling, they would be closed up too; but probably all the flowers are not yet fertilised, and during the process of fertilisation a close atmosphere is not good for them.

Peaches and Apricots outside are fast swelling their buds: I would rather the sunlight did not reach them just yet. I have had limewash in which a little sulphur

was dissolved syringed over them—in fact, over the entire walls, for the purpose of killing insects, and I expect this, as it dries perfectly white, to keep the flowers back a little. This limewash is also applied to Gooseberries, Currants, Plums, &c., to keep the birds from destroying their buds. If made properly with freshly-burned lime, no amount of rain will wash it off. There is still some remaining on standard Plum trees which was applied last winter; and as I find it rids the trees of moss and lichen, and, with the addition of dissolved sulphur, of all insect pests, I mean to use it much more extensively than hitherto. It is very glaring and unsightly, but I must have fruit. Those who object to having it white may add soot or some other innocent colouring matter, and it will still be effectual for all the purposes named, excepting for retarding the blossoms.—William Taylor.

NOTES FROM MY GARDEN IN 1874.—No. 2.

Did I not know how very great is the difference that soil makes in the success or failure of many things I should have wondered very much more than I do at the statements which are made on the subject of Potatoes. When I hear so good an authority as my friend Mr. Kinghorn saying that he has found Climax an excellent one, or I see others writing that they can make nothing of Suttons' Red-skin Flourball, I can only say it puzzles me, and pass on. I have mentioned, as far as my own culture is concerned, that I have some early sorts in my garden, and the remainder in a field where the soil is of a very light sandy nature. In the former I planted small quantities of the following sorts—Brownell's Beauty, Extra Early Vermont, Snowflake, Lee's Kidney, Myatt's Prolific, and Rector of Woodstock. Of these the first was about as ugly and bad a Potato as I ever care to see; it was at once condemned, and will never again find a place in my garden. Extra Early Vermont seemed to me in no way distinguishable from Early Rose, of which it seems to be a selected strain. Snowflake I regard as the very best we have had from America—the only one, in fact, that I should care to grow; it is very white, of good flavour, and apparently prolific. Lee's Kidney I received from my neighbour Mr. Woodford, and found it to bear out all that had been said of it; it is akin to Myatt's Prolific, but earlier, and an excellent cropper. I have saved a good quantity of seed, and think I shall quite discard Myatt's Prolific for it. I find by the Messrs. Suttons' catalogue that the entire crop has been purchased by them from Messrs. Lee. Rector of Woodstock is a handsome round second early Potato of Mr. Fenn's raising; it is very floury, and I shall grow it again this year. My only doubt about it is whether it does not lack flavour, for while a Potato ought not to have any earthy taste, it ought certainly to have some more flavour than a lump of flour in the mouth.

The varieties that I grew in my field piece were Lapstone, Yorkshire Hero, Victoria, Suttons' Red-skin Flourball, Hundredfold Fluke, Waterloo, and Suttons' Exhibition Kidney. I this year altered my plan of proceeding. My first Potatoes were planted on February 2nd, and the whole were finished by February 21st, and all were dug out by August 10th; and the result is so favourable that I mean in future to adopt the same course. The season was, as we know (while trying so far as the largeness of the crop was concerned) an excellent one as far as freedom from disease went, and I do not think that I have had, either at the taking-up or since, a gallon of diseased Potatoes; but then I found that my neighbours who left their Potatoes in the ground until September have complained, not merely that many of them were diseased at the lifting, but that they have lost a good many since. One thing I was doubtful of: Some of the later sorts, such as Victoria, were green in the haulm when they were lifted, and many of them rubbed in the skin. I do not find, however, that this affects their keeping qualities, and therefore the advice Mr. Luckhurst gave me not to mind the skin not being set was sound. Possibly it might have been better to have left them another fortnight, but in harvest time it is difficult with us to get hands, and so I must either have dug them or left them until after harvest; and I am quite satisfied with the result obtained by digging early. I cannot understand why my very good friend Mr. Laxton should have planted as late as he did, and do not wonder that the results in so many cases were disappointing; and while I do not see the advantage of planting so very early as Mr. Radclyffe does, I am persuaded that early planting and early lifting are the two surest preventives of the disease.

With regard to varieties I still cling to my often-expressed opinion, that the Lapstone is the best Potato grown for eating. It is not so heavy a cropper as some, but its flavour is excellent. Yorkshire Hero is very similar to it, but somewhat later, and of the same good character for eating. I believe that for the cottager, who looks for productiveness, there is nothing to exceed Suttons' Red-skin Flourball. It is a late Potato, but I lifted it at the same time as the others. It is one of those large-growing Potatoes that are unsuitable generally for garden culture; and as I have more than once said, the proper way to use it is baking. What are we to say to our Potato culture? I have just read that in America a codified statement of trials has been given, and that 1 lb. of Brownell's Beauty produced 1018 lbs. Surely we must be all wrong in our method of culture when 60 or 70 lbs. from 1 lb. of seed is considered a large crop.

My experience in Cucumber-growing is but small, nor can I say much as to sorts. I had Pearson's Long Gun last year, and found it good; but I believe the two best out are Douglas's Tender and True and Suttons' Duke of Connaught, the former black spine and the latter white spine. The first I believe better fitted for a house, the latter excellent for a frame, where I am going to try it this year.

In the same way I can only say with regard to Melons, that I am quite satisfied that for the small amateur, who like myself can only use a pit that has been devoted to other objects, there is nothing to be compared to Munro's Little Heath Melon. It gives so readily a nice little crop of fair flavour, that I do not think it is possible to substitute any other equally good for it.

Another excellent little novelty is The Queen Onion. It comes in so quickly, makes such pretty little bulbs, and stands the winter so well, that it deserves a place in every amateur's garden—not to take the place of such sorts as Nuneham Park, Improved Reading, and James's Long-keeping, but for early use, and for sowing in the autumn for early spring use.

I have not entered on the subject of Broccolis, &c., for in truth I know not what to say. I have been disappointed in finding, that although I planted so as to get as I hoped a good succession, I have found them all coming in of a heap. It may have been my fault, but it is none the less so.

Such are my experiences of vegetables in 1874. I must repeat that I do not intend to disparage other varieties by speaking favourably of these, but I can only say that in my own cultivation I have found them as I have stated.—D., *Deal.*

WHITE-EDGED GERANIUM LITTLE TROT.

Among the large number of new bedding Geraniums that are annually introduced, varieties of sterling merit occasionally present themselves, and which quickly obtain a place in every garden, not from any puffing or startling announcement upon the part of the raisers, but from that genuine excellence and intrinsic merit which, however much neglected in other things, certainly makes its way among plants. Foremost among such was the famous Tom Thumb, still quoted as an example in habit of growth of what a bedding Geranium should be. Stella, again, was another "standard kind;" so was, and still is, Waltham Seedling; so was Mrs. Pollock, and such is Little Trot.

The white or silver-edged section of Geraniums has never been a very extensive one, nor has it comprised many really meritorious kinds. Alma, Bijou, Flower of the Day, and Perfection were once grown by tens of thousands, but it was solely for the beauty of their foliage; in every other point they were found wanting. Flower of Spring in its bushy habit was a considerable advance upon all those kinds, as were May Queen and Miss Kingsbury; but none of these or others of later date can at all approach Little Trot in any way. Its growth is spreading, dense, compact, and very dwarf—all points of merit in a bedding plant, and in all of which plants of this section have hitherto been lamentably deficient; but it is in the striking and chaste effect of its broad white leaf-margin that it shines so conspicuous and is so superior to other kinds. It particularly attracted my attention in the trial beds at Chiswick last autumn. One was drawn to it involuntarily, precisely as to the glorious masses of Viola Perfection which were there, and conviction came to one's mind with the sight of each that the raisers had not only succeeded in making a "hit," but had conferred a real boon upon all who love flowers.

I was about to add that I had no particular interest in my

advocacy of this plant, but surely that would have been false. The raiser and distributor of a good plant are interested in a pecuniary sense; but there are other kinds of interest, and mine is most undoubtedly to tell to the readers of the Journal whatever facts may be worth knowing about this or other things worthy of their attention.—Edward Luckhurst.

ERANTHIS HYEMALIS, or WINTER ACONITE.

As early spring flowers seem now-a-days to be sought after as earnestly as new or choice bedding plants were a few years ago, it is singular that this old favourite should have received so little attention, having been seldom mentioned as occupying a position in those gardens where "spring bedding," as gardeners will term it, is most patronised; certainly its neglect cannot arise from its want of hardihood, for I do not know of one more capable of preserving itself. In regard to its earliness I am inclined to place it as the very first, if we make the 1st of January our starting point. True, some of the Primroses may be in flower before that time, and so, also, may some of the Hellebores, but they seem rather to belong to the class of autumn or winter-flowering plants than to early spring, of which this beautiful little plant is the type; for I do not recollect at any time ever seeing it bloom before the beginning of the new year, and but seldom is there any token of the plant being present until after that time; still its bright yellow flowers are presented to our view in most cases ere January is out, and very often before it is far advanced; and taking the present winter as an example, it is almost needless to point to December, 1874, as being a very cold and wintry month—frost with us on twenty-seven days, and the ground covered rather deeply with snow for the last sixteen days and for three days at least in January, 1875, while some of the snow remained three or four days more, and when it disappeared there did not seem a trace of this early harbinger of the new year, but its flowers nevertheless presented themselves fully expanded on the 14th in considerable numbers, and I believe a few did so a day or two before that; the Buttercup-like brightness of their petals contrasting favourably with the dark-coloured ground through which they had thrust their way; while their shining-green leaves added by their freshness an additional charm to their welcome appearance. It must be remembered, too, that the plants alluded to did not occupy any favoured spot likely to hasten them on, they being quite in the open ground—being, in fact, an edging to some Rose beds, and not humoured in any way, yet there they are flowering, and their bright numerous flowers visible at a great distance, the dark-coloured soil as well as the turf by which they are bounded alike adding to the contrast, and giving a cheerful aspect to the beds they margin. It happened that the white Primrose I have so often depended on for furnishing a nice display at Christmas, has this season disappointed me; the long period of severe weather before that time prevented them coming on, and the Snowdrops are not yet out, so the palm of earliness this season must in the fullest sense be accorded to the useful little bulbs.

This little plant, which when fully expanded is seldom more than 3 inches high, seems to have been known in this country for nearly three centuries, is more often met with in old neglected gardens than in fashionable new ones. In the former position it will often be found growing at the base of some large timber trees or amongst shrubs that have not been disturbed for many years, and very often struggling for an existence amongst things of much more robust growth, and maintaining the struggle. Many years ago I had a large patch that had originally occupied the spaces between old Fuchsia plants in a bed on which the encroaching branches of a Cedar of Lebanon were making advances. The place not being of importance, the Cedar of Lebanon, the Fuchsia a hardy one (I believe the old F. gracilis), and the little Winter Aconite were all allowed to take their chance, and do for themselves; the result being the Fuchsias were the first to give way, and little Winter Aconite successfully maintained its own against the weeds and other plants that usurped the space for some time, that it was only when the Cedar branches had so completely overshadowed it, and the common Ivy had occupied the ground some time, that the little spring favourite eventually succumbed. I have seen it struggle on some years amongst grass in a dry situation, and its seeds when allowed to shed themselves on the turf generally come up in great abundance, more especially, I believe, when the soil is of a chalky or limestone character. I am not sure that it is limited to soils of that kind; on the contrary, I think it will grow on most ordinary soils, provided it be not too wet, and perhaps a too stiff clay is also pernicious to it. But I believe one of its greatest enemies is the spade; for coming up, as it does, in January, and as usually its foliage is ripened off and also its seeds during May, there is all the rest of the year wherein no outward vestige of it is seen, and consequently, either from design or accident, it gets disturbed, and is rarely put back again so well as it is taken up that it gets lost. Still it clings to life tenaciously, and is often met with coming up where least expected; but it is best when left alone.

If it be advisable to multiply it, we very often do so when it is in flower, as it can be the more easily seen, and lines or edgings of it are easily made then; and as an edging for clumps of shrubs I need not say anything in its favour; while Roses and other things in beds may in like manner be also the better for its presence, and even patches of it in the herbaceous border are very beautiful coming up where there is nothing else. Care ought, however, to be taken to mark it with a stick, so that during the summer it be not meddled with. Tufts also in the rockery are charming; and even on the narrow border adjoining most dwelling houses, where creepers are cultivated, a few plants of this peeping up in middle of January, and cheering by their richly coloured petals that dull period of the year, are a source of attraction which after-objects, coming when other things are plentiful, fail to do. That and many more reasons combined give this plant a claim on our attention on which it would seem needless to enlarge further than to say that it is propagated freely from seed, which I believe is best sown immediately it is gathered; but even then it does not come up until the following spring, whereas if kept till then it is not at all certain of coming up that year. The seeds when ripe are not small, and the young plants do not seem miffy; on the contrary, we often meet with self-sown plants growing in the most unpromising places, the gravel walks being as often occupied by them as anywhere. And perhaps the best advice towards its management is to let it alone.—J. Robson.

HARDINESS OF CORDYLINE (DRACÆNA) INDIVISA.

Referring to the notice of this plant in your last issue, permit me to observe, that in the rock garden at Messrs. J. Backhouse & Son of York it has now been fully exposed to all the vicissitudes of our northern clime for the last three years, and it is quite fresh and green. It is growing on the side of a bank, elevated about 4 feet above the walk, in a dry and poor soil fully exposed to midday sun; in fact, it must from the position in which it is planted be an extremely dry and hot situation for the plant during the summer months. In such a position the foliage will be thoroughly well ripened before the wet and cold set in. It may possibly be owing to this circumstance that this Dracæna has so far borne our winters, including the last severe frost, without sustaining the slightest injury. At the same time the plant is without doubt perfectly hardy, or it would have succumbed to 30° of frost, and is therefore a most valuable acquisition to our hardy ornamental plants.

It will, I doubt not, prove to be a handsome object for planting on lawns, or in vases placed in such a position as to be seen easily from the window, or for cultivating in pots and used for table decoration, or for standing in an entrance-hall, and for any similar purposes. As it may be cultivated with perfect success in a cold frame, or where there is a glass house, without artificial heat, it would be perfectly at home there, and would be in such a position a most useful and valuable plant.

The habit is that of a narrow-leaved Yucca. The leaves I measured (those in the centre which are erect) are from 12 to 15 inches in length; the older ones are from 18 to 25 inches in length and are only half an inch in width. Many of these are recurved towards the outer half of the leaf, which gives the plant a graceful appearance. Midrib of the leaf prominent on the under surface, and is of a yellowish colour. Veins conspicuous and semi-transparent when held towards the light, and extremely tough. The leaves are so arranged as to cause the whole plant to form a circular plume.

There is a variety with red midribs, which is, I believe, named D. indivisa var. lineata.—R. P.

Nectarines on Peach Trees.—With reference to the singular fact mentioned by Mr. Abbey, page 69, I would remark that

the Early Alfred Peach was raised from a stone of Hunt's Tawny Nectarine.—G. S.

LAXTON'S CONNOISSEUR AND OTHER PEAS.

As "R. H. D." has called attention to my Pea Connoisseur (see Journal January 21st), and wishes for its history, I need have no hesitation in giving its origin, as I make no secrets of the pedigrees of my seedlings. Connoisseur was obtained by crossing Ne Plus Ultra with Evergreen, also a seedling of mine; that variety being the result of crossing a deep green-seeded selection from Prizetaker with Advancer, the offspring, *inter alia*, being a rich-flavoured, late, green-seeded Pea.

As a rule these green-seeded Peas, although advantageous for keeping their colour even when cooked quite old, are not prolific; this, however, is not a fault of Connoisseur, as it is very prolific, and lasts long without being subject to mildew. But the truth must be told, it will never be a seedsman's Pea, as the seeds being so sugary do not usually harden or ripen well, and consequently fail to give the usual proportion of growing seed. The dry seeds when cooked have almost the flavour of young green Peas, and may, perhaps, suit the vendors of "green Peas all the year round." I am not without hope that from Connoisseur a race of Peas may be obtained having in its ripe seed the rich green-pea flavour fully and permanently preserved—a point not yet attained, as evidenced by the good-looking but insipid-tasting canned green Peas, often palmed off on the unsuspicious guests at hotels as fresh green Peas.

The seed of Connoisseur is almost devoid of farina, and would, I think, grind with difficulty. All these sugary and high-flavoured wrinkled Peas, including Dr. Hogg, require some care in harvesting, and the seed should be carefully picked, as otherwise those seeds which contain the most farina and the least of the rich marrow flavour will predominate in the struggle.

All heavy-seeded Peas, such as Supreme, Superlative, and the green Marrow, and round Peas generally, should be cooked young, and before their sugar is converted into starch, as only then is their flavour first-rate. People often keep Peas, and especially new sorts, for eating until they are fat-podded and fit for show, whereas they are then only fit to convert into pork. This treatment affected the character of my Prolific Longpod, Supreme, and Superlative, and accounts for the extremely varying reports respecting them which one reads and is sometimes obliged to smile at. Those who had them cooked young describe the flavour as excellent; those who cooked them when fit for show execrating them. Connoisseur is a remarkable Pea, but I do not value it so much as Dr. Hogg, Unique, or Supplanter—the three certificated Peas sent out for me by Messrs. Hurst this season; and in this, as in most instances, my own experiments correspond with the results of the trials by the Royal Horticultural Society.—Thomas Laxton, *Stamford*.

FLOWERS CHANGING COLOUR.

In your Journal of January 14th you speak of flowers which change colour. I have been long wishing to learn how to avoid it in one particular instance—namely, in the common blue Cornflower. About five years ago I purchased a pot in full bloom. I carefully saved the seed therefrom, and the following year I had double the quantity, and still a lovely blue; again I reserved the seed, and sowed in the spring, but my pretty blue flower had changed into pink, dark violet, mauve, white—indeed, any colour but the blue which I wished for so much, as in making-up a bouquet it is so useful. The most provoking part of the whole is, too, that I cannot purchase the seed anywhere. When I inquire everyone says, "Oh, yes! I know what you mean—it is a very common wild flower—we don't keep it." And every year now crops up the aforenamed pink-violet imitation Cornflower, mocking me as it seems. I have given orders to my gardener to exterminate it this year if possible. Can you tell me where I can buy this common (?) blue Cornflower, such a little gem as it is?—A Little Savage.

Leeds Professional Gardeners' Friendly Benefit Society.—To meet a want that had been long felt by gardeners in the neighbourhood of Leeds, about nine years ago it was determined to establish a Society where, under its auspices, all could meet together to impart and receive aid and instruction, and also to cultivate good fellowship. Great success has hitherto attended the Society, which no doubt is in some measure owing to the praiseworthy efforts of some of the principal officers, and more especially to the indefatigable Secretary, Mr. W. Tunley. Their dinner on the 13th of January was very successful.

NOVELTIES IN THE ROYAL GARDENS, KEW.

In the Palm house a new and undescribed species of Dracæna is in flower for the first time. It is African almost without doubt, and will shortly be figured, when a name will be given. A single stem supports a large crown of green leaves; they are narrow and about 3 feet long, with a pale yellow midrib prominent on the under surface. The flowers are small, of a pale yellow colour, borne in several axillary panicles. Their smell is not agreeable, but at a short distance it is not perceptible. D. fragrans will soon be in flower. It is a native of Guinea and Sierra Leone, and is the most nearly allied species to the above, though the panicles are all terminal. Under this name D. latifolia is often cultivated. In this house also Jonesia Asoca is producing a brilliant mass of orange-red flowers on some of the branches. It is not often cultivated, but would doubtless repay attention. The leaves and habit remind one of Brownea, but the flowers are different, and besides are of a structure unusual in the order Leguminosæ. They are without petals, though on that account of no less beauty, as the calyces assume their appearance; are tubular with a four-divided limb, like the corolla of Ixora. From the ornamental character of this tree it is largely planted throughout India, where it is a native, and in the Mauritius. Ushoka is the name given by the Bengalese. It may either be struck from cuttings or grown from imported seeds. The latter should be sown in pots with a bottom heat of about 85°. Seeds of large size when sown under glass should not be placed at a depth in proportion to their size; perhaps the nearer the surface the better, provided that the covering is sufficient to keep them moist.

In the stove a large male plant of the rare Cycad Stangeria paradoxa has a fine cone, which is very richly scented. It was first named as a Fern by an eminent botanist, who called it Lomaria eriopus, thus showing how difficult it is to name peculiar and little-known plants from imperfect material. When the cones were first seen its true character was at once evident. This was for a long time the only known species; but Dr. Regel has recently published as distinct his S. Katzeri. A kind supposed to differ by having the pinnæ more irregularly toothed was imported some time ago, and called S. schizodon. The character mentioned would seem to be of slight value, leaves being found to differ widely on the same plant.

TEMPERATURES FOR WINTER CUCUMBERS.

Seeing so many interesting articles in the Journal lately on winter Cucumbers, and such difference of opinion with regard to temperature and mode of treatment, I will briefly state the mode of treatment adopted here where Cucumber-growing is carried on extensively.

The two houses for winter work are span-roof, 64 by 24 feet, with eight rows of 4-inch pipes, in one of which Pines are grown, planted out in beds without any bottom heat, from which good fruit are cut averaging from 2 to 2½ lbs. The Cucumber seed is sown in a glass hoop about 4 inches wide, on a slate or tile, and covered with a square of glass and placed on the pipes. The seedlings are up in a day or two, and are then potted-off, one or two in a 3-inch pot, and placed in bottom heat till fresh roots are formed; they are then placed as near the glass as possible. The temperature is from 65° to 75° by day, and stands about 60° to 65° in the morning. We have had the glass as low as 48° in the morning, and the plants have not in the least suffered. Provided the bottom heat is all right, a low night temperature suits them best.

We are much troubled with a small white grub, which eats away the extremity of the stalk of the plant, in consequence of which the plants so affected die quite suddenly. Several of our plants have gone off in this manner. Can anyone tell me what the grub is likely to be and how to get rid of it?—A Market Gardener, *Liverpool*.

Early Flowers.—We have Aconite fully out since the 16th of January, and now (29th), have also Snowdrops, Primroses, Crocuses, and Hepaticas. The latter open enough to see the

colour. I think this is very fair for Cheshire. [So it is.—Eds.] Christmas Roses still glorious.—A Lady in Cheshire.

THE WAY TO GROW FERNS.

Some years ago I commenced growing Ferns, and having consulted all the books on the subject that I could meet with, came to the conclusion that my gardener's ideas were correct.

The Ferns were potted in a mixture of leaf mould, peat, and sand; drainage in the ordinary way was carefully attended to. The pots were placed on stone shelves in a house heated with hot-water pipes, and the Ferns grew very much to his satisfaction, but not to mine, for they were no better than my neighbours'; so by degrees I altered my plan, and, as many of your readers would grow Ferns if they could do so without any difficulty, I send you my mode of procedure.

The hole in the bottom of the pot being broken out very much larger than the maker leaves it, I put in three or four pieces of broken pot, then some rich soil and old manure, just what should be used for Cucumbers, no peat, no sand; then I put in the Fern, and very gently fill the pot with good garden soil intermixed with a few small bits of soft brick as large as peas. The pot is placed on soil or ashes, perhaps partially plunged, perhaps surrounded with Lycopodium. In any case the soil is always kept quite wet—in fact muddy, and the Ferns grow as I never saw Ferns grow before.

The whole secret is in keeping them wet and warm, partially plunged, and thoroughly drained. You may take a pot-bound Fern, pull roughly the drainage from the roots, break off the fibres anyhow, repot it in wet soil instead of dry, and it will grow and flourish as it never would with ordinary treatment. I planted less than two years ago a little bit of Adiantum Farleyense root without a frond on it, and it now measures 10 feet 6 inches round.—H. L.

JOINING HOT-WATER PIPES.

I see (page 60 of the present volume) directions for making joints in hot-water pipes with iron filings. To these directions I should take exception.

In the first place, the admixture of sulphur has long been discontinued by the best hothouse builders as quite unnecessary and very dangerous, often cracking the joints; but I think it is quite time iron joints were discontinued altogether in the case of hot-water pipes. Where the pressure of steam has to be resisted it is quite another thing, but for hot water it appears very stupid to make a joint which is so difficult to undo again that it is easier to cut the pipe in two than get the pipes separated at the joints.

Pipes joined properly with Portland cement are just as good as those fastened with iron filings, they are put together four or five times as quickly, and are very easily separated again if it is required. I have hundreds of feet so joined; one of my houses, 100 feet long by 30 feet wide, has all cement joints; and all Mr. W. Thomson's pipes, some of them 200 feet in length, are put together in this manner. In saying these pipes are all joined with cement, I except, of course, expansion joints. In long lengths of piping, however the joints are made, two in 100 feet ought to be put in with indiarubber rings only, to allow of expansion. Before knowing this I had several pipes broken where the joints were made of iron filings. Of course the joints could not give way, and as pipes expand, say half an inch nearly when hot in 100 feet, and contract again to the same extent when cold, nothing is more probable than a breakage. If these pipes had been put together with cement it is probable one of the joints might have broken instead of cracking the pipes, and I should very likely have blamed the Portland cement, not knowing it had saved me a cracked pipe. How can we expect a long 4-inch pipe full of water to elongate and contract at every change of temperature without something giving way in time? An indiarubber ring here and there removes all danger.

But as in all other operations, however simple, there is a right way and a wrong one of making a cement joint, I will describe the right one. First of all it must be roped as in making a joint with iron filings, then filled with cement mixed as for laying bricks, then roped again, and finished with cement. Thus made a joint will neither break nor leak, whilst if roped once it is liable to do both. Pipes so joined will be ready to fill with water in twenty-four hours, are just as good as those made with filings, and can be cut out much easier if any alteration is required. The few pipes joined with indiarubber rings are in time very difficult to pull asunder, and almost impossible to cut, but are soon burnt out by flat chisels made red hot. Having proved the advantages of this system of joining hot-water pipes, I have no patience in watching men hammer, hammer, hammering at making iron joints which I know will take three times as long getting to pieces again if ever it is necessary.—J. R. Pearson, *Chilwell*.

JOTTINGS ON LAST YEAR'S GARDENING.—No. 2.

Artichokes.—Never was this vegetable so much in request or so fine as in 1874. It delights in an open rich vegetable soil, abundant manuring, and even sewage in dry hot weather poured around the plants, not upon them, in heat and moisture. By planting strong well-rooted suckers annually in April, they produce heads later than is afforded by established plants. The first heads were cut June 15th (remember, we are high and cold), and the last November 15th. It has been questioned whether the usual protection of litter is necessary in severe winters. I have not found the plants destroyed, but those protected produced heads much earlier in the season than the unprotected. The Purple and Green Globe varieties are cultivated. The Purple is the earliest, but is not so good as the Green.

Asparagus started and grew strongly, the supply being checked by the cold of late May and early June. The first heads were cut April 4th, earlier by seventeen days than in 1873; the last heads being cut June 29th, whilst the last heads in 1873 were cut July 23rd. This vegetable requires a rich, deep, light, vegetable soil, the alluvial deposits suiting it remarkably well, and though revelling in moisture is injured by water stagnant in the subsoil. It can hardly have too much liquid support after May, but the soil must be well drained. I have the ordinary kind of Asparagus—Giant or Battersea, and other aliases, growing side by side with Connover's Colossal, and of the same age, and can see no difference, only the head of Colossal is more knob-like, and is more round in the stem. Seed sown in April, 1872, had a few heads fit to cut in 1874. Some plants of the old kind (and the difference is slight), from seed sown where to remain, gave heads fit to cut when the same age as the Colossal. I have some hundreds of two-year plants of both varieties and in beds side by side, so that any difference is readily apparent.

Broad Beans.—The first crops were very good, but the sowings after the middle of May very inferior in productiveness. Early Longpods were fine. Early Mazagan and Beck's Dwarf Green Gem are too small and not earlier than Early Longpod, which gives double the crop. Seville Longpod I shall have this season, and it must give pods longer than 7 to 8 inches, or it will not beat the old Early Longpod, which grows fully those lengths in good rich soil. The Early Longpod or Seville are chiefly recommendable for their earliness and length of pods; Monarch Longpod for second and main crops, it being very productive and having very long pods, and Broad Windsor good; Improved Broad Windsor (Suttons'), being a great improvement upon the old kind, having as many sometimes as five beans of very large size in a pod, it is strong in growth and prolific of pods. Broad Beans were first had July 3rd.

French or Dwarf Kidney Beans.—Never finer. Osborn's New Forcing is good alike for forcing and outdoor, of dwarf and compact growth, with pods narrower and longer than Sir Joseph Paxton, and very prolific. It is unquestionably the best of dwarf kinds for forcing and early crops outdoors. Canadian Wonder as usual had the longest and largest pods, and was remarkably prolific; as also was Negro Long-podded, very fine and hardiest of all. The first dish gathered July 23rd; in 1873, July 24th.

Runner Beans.—Scarlet Champion had very much larger pods, and as many or more of them than the old Scarlet, which I have struck out. Though no white seeds were sown, some pods on some plants produced white ripe seeds. Why this freak of Nature? The first dish gathered August 18th; in 1873, August 17th. Wax Runner Beans were too unproductive in 1873, and were so little esteemed that it was considered our limited space could be better employed. Premier Runners will have a place this season. Maybe they will be superior to the Chinese Runners I had through the Editors in 1872, with pods long and narrow, and purple-streaked externally like a Negro Long-podded, dwarf, and ripe seed about twice the size of Osborn's Forcing, of the same colour as the ripe seed of that variety. Premier Runners remind me of the

variety above named, which I should have noted sooner only it offered no advantages over runners or dwarfs, though very prolific. In flavour it was a French Bean, but the pods too soon became old and stringy.

Beet.—The Chelsea is a flat-topped kind, the leaves lying almost flat upon the ground, has a medium-sized and fine-shaped root entirely below ground; in colour very deep crimson, free from whitish streaks in the flesh, and has no stringiness, the flavour being very fine and distinct. Those wanting uniform fine flavour will find it in this Beet. Dewar's Dwarf Red is the earliest, its roots attaining to a useable size by the middle of July, so that Beet may be had the year round. Whyte's Black is deeper in colour and larger than most, and when not sown too early—not before the middle of May nor later—is not subject to grow coarse, and is then a good kind. Those were all good the last season, Dell's Crimson losing none of its grand foliage-colouring from the drought, and it is a kind that has never yet run to seed with me the first season. Its roots, as also those of Pine-Apple Short-top, keep long into summer, but neither grow sufficiently large-rooted with me to be profitable. They may need more warmth.

Borecole or Kale.—These are not in request, only the Dwarf Curled (Veitch's) variety, and Cottager's are grown, both very hardy, the former having very fine, large, fleshy leaves, grand crowns, strong side shoots, and stand a long time before running to seed. Of Cottager's Kale the Green variety gives the best sprouts, and is most tender and pleasing. Variegated or Garnishing is very beautiful about Easter, the colour being so variable, and neatly curled. Prejudice, I suppose, hinders it finding favour for garnishing, and how desirable it is we should have easement from Parsley in early spring! The Borecoles are chiefly useful as affording greens in very severe weather, and a supply of their tender sprouts in spring. In cold parts they require to be planted-out early, so as to have them strong before winter.

Broccoli.—Snow's Winter is every season destroyed by frosts—*i.e.*, the spring frosts, and has been so four seasons consecutively. On warm borders it fares no better. The only way to have them here is to take up when the size of a teacup and lay-in in frames. It is as tender as a Cauliflower, and not far removed from one. Backhouse's Winter comes in after it, is hardier, and the leaves protect the head better. Veitch's Spring White has a nice close head, white, and delicious flavour, heading in March or early April. Cooling's Matchless comes in about the same time, the heads well protected, large and white. Mammoth I like for its dwarf growth, large and compact heads; but the leaves not covering the head it is high-coloured, and the flavour strong. Cattell's Eclipse has large compact heads, as have also Carter's Champion, but Lauder's Late White Goshen yields to no late variety in largeness, compactness, whiteness and flavour of head, and I have cut them on June 6th. The latest Broccoli of all is, perhaps, Late Queen (Suttons'), of very dwarf compact growth, and good compact heads. Perfection sent out by the same firm is of strong, self-protecting growth, having large compact heads, white, and good flavour. It is in season about April. Broccoli the past three seasons have done indifferently. This season they are on ground which has known no Brassica crop, and the result is not likely to be good. The first heads were cut March 2nd; in 1873, April 3rd, and the last June 11th; in 1873, June 5th.

Brussels Sprouts were miserable this season. The plants grew wretchedly before as well as after planting out, and the produce has been corresponding. In 1873 they were remarkably good. The difference is to be accounted for in their being put out in fresh soil and poor, coupled with the drought. The first were had November 15th; in 1873, October 13th; and the last March 30th, 1874. The kinds are Imported, and Scrymger's Giant.

Cabbage very good, and came in quickly in spring, and in autumn were fine from spring-sown seed. Hill's Dwarf Incomparable is hardy, early, and hearts quickly as well as firmly. Cattell's Reliance, also early and good; Wheeler's Imperial very fine and early, these being followed by Enfield Market and Nonpareil Improved, having fine hearts, very tender and good. Red Dutch is grown for pickling, and for autumn and early winter Hill's Incomparable, Nonpareil, and St. John's Day Drumhead, and Early Drumhead (Suttons'), the last two being valuable for their earliness and hardiness, not being so soon acted upon injuriously by frost as other sorts. Early Dwarf York is also a good sort for sowing in April for heading in autumn, being very sweet. Cabbage was first cut May 4th, and ever since up to the present. In 1873 the first were cut May 7th, and last November 21st.

Carrot.—Early Horn and Early Nantes, which is a capital second early, having a very small heart or yellow core, very tender. James's Intermediate Scarlet and Red Surrey are the sorts grown, the two first for summer, and two last for autumn and winter. The earlier become very maggotty after August, and the others did not escape. The first were drawn June 22nd; in 1873, July 14th. The best for frames, French Forcing.

Cauliflowers.—Except a few running to seed of the autumn crop prematurely this vegetable was very good, and yet our soil is light but full of "muck." Dwarf Erfurt Mammoth is a fine dwarf grower, early with fine close heads. Early London, early, and more tall, but very good; Walcheren being unsurpassed; King of Cauliflowers had very fine large close heads, as had also Large Asiatic and Stadtholder; Veitch's Autumn Giant under hand-lights disappointed, but for autumn and for taking up for protecting in frames is magnificent. The first heads were cut June 11th, the last December 29th. In 1873 the first were cut June 30th, and last, March 5th, 1874.

Celery.—Sulham Prize Pink (Suttons'), a capital sort, of moderate size; Williams's Matchless Red, stiff growth, very good, and keeps well; Major Clarke's Red, medium size, excellent; Sandringham Dwarf White, stout in growth and very good; Veitch's Silver White failed, bolting to a great extent, in 1873 this variety was good. The leaflets are very much serrated. Leicester Red need not be named, the difference between it and Major Clarke's Red, if any, is slight. The Turnip-rooted, or Celeriac, turned out a white sort with no root at all, and it came from Vienna, about a pound weight! So much for foreign seed nomenclature. It is a good white kind, not unlike Seeley's Leviathan. We use Celery only for soups before October; the last we had in 1874, April 24th, and last 1873, April 21st.

Chicory.—This sown early in April in rows a foot apart and thinned to 6 inches in the rows gives in autumn good roots, which are cut off about an inch above the root and stored in sand along with other roots in November, and as wanted at intervals of about a fortnight are placed in soil kept moist to the crown, burying the whole of the root part in a Mushroom house, and there give leaves in a fortnight equal to any Endive for salad. Any dark place will do if there is a gentle heat. The Large-rooted is the best, having broad fleshy leaves, and nothing near so bitter as the narrow scalloped purplish-midrib kind, which is only a slight remove from Dandelion. Chicory helps well in midwinter to fill the salad bowl. December 21st, it was first used last year; in 1873 the same time, and up to April.

Chervil and Cress.—I shall only remark that these are always expected to be at command winter and summer. A sowing of Chervil in early April and August will suffice, and if a hard winter it may be sown in pans or boxes, and grown in any light airy house where forcing is going on. Cress and Mustard should be sown every week from April to October outdoors, and the other half of the year under glass. Curled Chervil and Curled Cress are best.

Cucumbers.—Cox's Volunteer and Blue Gown were both good, preferably Blue Gown. Marquis of Lorne was also grown. It is a large and fine kind, but too large for everyday use. Tender and True has been added, also Duke of Edinburgh (Munro's) for this year; Ridge kinds do no good here.—G. Abbey.

(To be continued.)

RAINFALL IN 1874.

Osmington Lodge, Weymouth, Dorset. — January, 2.94 inches; February, 2.42; March, 0.66; April, 2.26; May, 0.61; June, 1.50; July, 0.98; August, 2.80; September, 3.74; October, 5.81; November, 3.38; December, 4.16. Total, 31.26.—C. T. Hall.

Effects of the Frost.—We are now beginning to see some of the effects of the late winter, especially among the winter greens. Though partly covered with snow Savoys, Cabbages, Brussels Sprouts, Curled Kale, and Broccoli have suffered severely, and are emitting a not very pleasant odour. Lettuces and Endive, though covered, have come in for a share of injury. Laurels with us have put on quite a brown appearance, and will not look themselves again until they have shed their leaves. Variegated Hollies have suffered much, and many of the common Hollies are shedding their leaves. Ever-

green Privet has also suffered, and many other hardy evergreens. Tender Roses are much injured. Potatoes in pits in some places have been frozen; heating apparatuses in many places have been tested during the late storm, and in some places have come to grief.—H., *Yorkshire*.

THE INFLUENCE OF HORTICULTURAL SHOWS.

COTTAGERS' GARDEN PRODUCE.

Amongst the many things deservedly receiving public patronage at the present time are horticultural shows; and apart from those provincial shows which claim to attract exhibitors from the greater portion of the county they are held in, others on a less extensive scale rise up in all directions, some of them limiting the exhibitors to such as reside within a given distance of the place where the show is held. Others are open to all comers, or offer prizes for certain classes free to all.

There can be no question but these horticultural shows are the best of all stimulants to amateur gardening, and a prize awarded to someone heretofore careless in such matters very often makes an enthusiast of him and stimulates him to further exertion; besides which, horticultural shows afford opportunities for that intermixture of classes which tends so much to enable one man to fully comprehend others, and removes many of those false ideas which all are liable to entertain, and a juster and better feeling is the result.

The number of such shows is certainly increasing, and with it the number of exhibitors. Gentlemen of position, having a laudable wish to encourage gardening among their cottager neighbours, start a cottagers' horticultural show on their own grounds, and in many instances give the prizes out of their own pockets, and invite their neighbours and others to come and see the show; and the show appears so satisfactory that next year it is determined to offer prizes for productions from gentlemen's gardeners apart from those offered for cottagers, and by this means a class of exhibitors is brought out that never contemplated exhibiting at all for competition. Now and then progress is marred by what all outdoor entertainments are liable to—a wet day; but even that does not always bring on bankruptcy, if other things be promising. Some good-hearted well-disposed individuals step in with assistance, and the next year greater exertions are made and the debt wiped off.

It has often been remarked that horticultural shows are now more numerous than desirable, and the object for which they started, which was the encouragement of good general cultivation, is diverted into a channel widely different to what its promoters intended. A certain number of good articles are prepared for the show, and the other things neglected. This view of the matter is carried too far, but it is very often true to some extent, and somehow or other those who give their whole attention to such matters get by degrees into the knack of so retarding certain things and forwarding others, that at the show day they can put in a better appearance than their neighbours, whose garden produce, if exhibited, or rather inspected, as a whole, would stand before them a long way. This is one of the incidental and unavoidable results of showing, and it cannot well be remedied even if it was desirable to do so, which is questionable, for the sight-seeing public, which are by far the most important patrons, would not be satisfied by anything short of first-rate quality, no matter how obtained; and consequently the honourable hard-working cottager, who has taken no more pains to secure exhibition articles than he has done to secure good crops and good quality in the whole of his garden, is but seldom rewarded with a prize. I heard one of the class remark in a tone of regret, "Ah! showing is a trade, and an honest man has no chance with the professional." This doubtless was taking a rather spiteful view of the matter, but to those who have witnessed the prize sheet of a cottagers' exhibition will find nearly the same list of names year after year. A remedy for this is difficult to contrive, for there is really no harm, but, on the contrary, merit in the cottager encouraging the growth, by all extra means he has in his power, of the articles he intends to exhibit, and if he wins a number of years in succession by fair and just means so much the more credit to him; but at the same time there is no question that it reduces the number of exhibitors.—J. Robson.

Vine-painting.—For "B. G.'s" information (page 77), if I had Vines infested with mealy bug I should at once, after pruning, construct a trough the length of my Vines and lay them in it, and with pure water drown the bugs. Should any remain I would repeat the operation, and with a brush, similar to a spoke-brush, brush off the remainder until rid of the pest, and then by pure air and pure water I would try to hold the pests at bay.—H.

POTATO-GROWING EXTRAORDINARY.

Towards the end of 1873 we gave a brief notice of the extraordinary yields of Potatoes obtained in the United States under the stimulus of the prizes offered by Messrs. Bliss of New York. In that year the conditions were that the prize of $100 should be awarded to that cultivator who obtained the greatest yield from 1 lb. of seed Potatoes. There were two first prizes—one for each of two varieties of the tuber, and minor prizes for the second, third, and fourth in each class. The greatest yield from 1 lb. of seed was 609 lbs., a quantity very justly regarded as extraordinary, and no doubt looked upon by gardeners and others in this country as a bit of Cousin Jonathan's "huncome." However unjust may have been the incredulity of the "blue aprons" as to the 609 lbs., we can but acknowledge that, when they read the report of the competition in 1874, they will be justified in refusing credence to the statements made until further details are forthcoming. Nevertheless, it seems from the abstract of the report published by the *Tribune*, that the competition has been fairly conducted; and referring to the names of the Committee who were entrusted with the awarding of the prizes, we must confess that we see no reason to doubt their *bona fides*, or the affidavits of the competitors. The results are, however, fairly astonishing, and can only be accounted for—if they can be accounted for at all—by one of three propositions—either the Potatoes grown must be wonderfully prolific, the soil in which they were grown exuberantly productive, or some method of cultivation unknown out of the States must have been adopted. Possibly, however, the effect is the joint result of the three causes combined in one happy man with the soil and the tuber.

The prizes offered last spring by Messrs. Bliss were open to the world, and amounted in the aggregate to $1500. Six prizes, varying in amount from $10 to $100, were apportioned to each of three varieties of Potatoes—the Early Vermont, Compton's Surprise, and Brownell's Beauty; the conditions being that the largest yield from 1 lb. of seed of each sort, grown without any resort to forcing or any unusual method of multiplication, should receive the first prize of $100. There were prizes also for the largest yield obtained from a quarter of an acre, the same varieties of the Potato being used. The entry for the competition comprised many hundreds of farmers and gardeners, nearly every State and territory of the Union, and some of the neighbouring provinces being represented. The competitors were compelled to find witnesses as to the truth of their statements, and also to verify them by affidavit. These statements were duly and promptly made, but owing to the illness of one of the Committee the report has been delayed. We can only afford space for the names of the winners in each class. For Extra Early Vermont, Mr. Alfred K. Titus of Wilmington, Vermont, is first with 708 lbs.; for Compton's Surprise, Mr. P. C. Wood of Esther, Illinois, wins with 900 lbs.; and for Brownell's Beauty, Mr. H. C. Pearson of Pitcairn, New York, is first with 1018 lbs.—a yield of more than a thousandfold! Besides the States mentioned above, prizewinners came from Minnesota, Kansas, Pennsylvania, and one from Nova Scotia, with the not insignificant yield of 615½ lbs., so that this extraordinary Potato-growing is not confined to any special locality in the North American continent. This astonishing productiveness, however, is not borne out by the results of the quarter-acre competition, for which there were so few entries that each was entitled to a prize, though from information which has reached the Committee there were many larger yields from quarter acres obtained by non-competitors. For Extra Early Vermont grown on a quarter acre the first prize was awarded to Mr. D. Steck, of Hughesville, Pennsylvania, for 6247 lbs.; the second and third prizes being awarded respectively to yields of 2642 lbs. and 2584 lbs. The first prize for Compton's Surprise was obtained by Mrs. M. A. Royce, of Home, E. Tennessee, for 7350 lbs.; and Mr. A. Rose, of Pen Yan, New York, carried off the first for Brownell's Beauty with 8899 lbs. Taking the last figures as a basis for a short calculation, it will be seen that they represent the very respectable yield of nearly 16 tons an acre, and although this amount has fre-

quently been surpassed in this country, especially with certain sorts, it is, we believe above the average of the regular Potato cultivators. It is unfortunate that more results on the larger scale are not forthcoming, for they would of course be considerably more valuable than those obtained from trials of "1 lb. of seed," because we do not know what is considered an "unusual method of multiplication" in the States. In favourable seasons, 1 lb. of tubers can be made to cover a very large piece of ground by taking off and planting the shoots as fast as they grow, and by planting cuttings. The quantity raised from a piece of ground of given dimensions is, *cæteris paribus*, the criterion of the merits of a Potato. The Committee (Messrs. G. Thurber, F. M. Hexamer, and P. T. Quinn), are men well known throughout the United States, and they assure us in their report that, while they abstain from comment on the "astounding yields from single pounds," a "most careful and scrupulous investigation" has satisfied them of the "correctness of the statements made." That the skill of the cultivators and the productiveness of the soil have had much to do with the result, is tolerably evident from the fact that two of the competitors obtained prizes for each sort, while three others obtained prizes for two sorts. The season is said to have been unfavourable, and that added to the ravages of the Colorado beetle diminished the crops of many intending competitors for the quarter-acre prizes to such an extent, that they considered their chances of a prize as hopeless, and accordingly did not compete. The three varieties mentioned above have been tried in this country, and received first-class certificates from the Royal Horticultural Society. They are undoubtedly prolific even here; but opinions as to their merits when on the table are divided, and on the whole are not very favourable.—(*English Mechanic and World of Science.*)

SPARROWS VERSUS GOOSEBERRIES.

On reading Mr. Abbey's article on sparrows I cannot refrain from saying a few words, although not in support of his argument, for I have had hundreds of large Gooseberry trees spoiled by sparrows; and to prove that sparrows alone did the mischief, I have many times gone round the trees after a fall of snow and watched them cover the ground with buds. It is generally in hard weather, but they eat them more or less all the winter months. I have known acres of good trees in this neighbourhood, not only about a town but in country places, completely spoiled by sparrows. Linnets I never yet saw take a single bud, and have watched them early and late. As to the sparrows eating caterpillars on Gooseberry or Currant trees, each year I see trees completely leafless, but never yet saw a sparrow touch one, and have watched them for hours among the bushes.

I have known the cuckoo to clear a large quarter of Gooseberry trees from caterpillars, and most of the migratory birds eat them. The new Peas in early summer suffer severely when seeds are scarce, and corn fields about towns and villages are almost destroyed. During this last ten years sparrows have trebled themselves in this neighbourhood, and during my sixty years' experience in and about a garden. My advice to all would be, Kill every sparrow you can.—JOHN ALLCOCK, *The Nurseries, Sandbach.*

FLOWERS FOR OUR BORDERS.—No. 47.

CYCLOBOTHRA ALBA.—WHITE-FLOWERED CYCLOBOTHRA.

The plants formerly placed in the genus Cyclobothra are now by common consent merged in Calochortus, the present species taking the name originally conferred on it by Douglas, of Calochortus albus. Having put this fact on record it may, however, be more convenient to the readers of a popular Journal like the present if the better-known name be retained in connection with the following description of this pretty and interesting hardy bulb.

The Cyclobothra alba is a bulbous plant growing about a foot high, with one radical leaf of considerable length (much longer than is represented in our figure), and from three to five shorter ones upon the stem, from each of which proceeds a lateral shoot bearing two flowers (sometimes, however, there is but one), with a pair of leaf-like bracts at the base of the peduncles. It is only strong bulbs which will produce the number of blossoms shown by our artist; usually there are but six upon the same stem. The flowers are drooping, of a globular form, and about 1½ to 2 inches in diameter. The three petals are externally convex, and have their edges closely approximated, being rarely separated to a greater degree than shown in our figure. In colour they are of a silky white, with a tinge of green near the base; they are bearded on their inner surface with long white hairs, which, under the microscope, have a flattened ribband-like form. The three sepals are of a membranous texture, oval-pointed form, and of a pale green with a tinge of purple.

The curious nectariferous cavity which characterises this genus is well seen in the present species, appearing as a linear or oval depression in the petal, at a short distance from the base, and secreting a sweetish fluid.

The stamens are six in number, with yellow anthers attached by their base to the filament, as in the Tulip. The ovarium is oblong, bluntly triangular, with intermediate furrows, and terminating by three short spreading stigmas. Seeds of an oval form, wingless, and of a purplish-brown colour. It flowers from midsummer to the middle or end of July.

Fig. 25.—Cyclobothra alba.

The Cyclobothra alba is quite hardy, but the bulbs suffer from excessive wet; when planted in the open borders it should therefore be covered with a small hand-light or empty pot during long-continued rains in autumn and winter. It does well in a mixture of peat and sandy loam, and should be planted in a warm well-drained border. If the bulbs are removed from the ground after the foliage has withered, they must be replanted not later than the end of October, as they usually commence their growth at an early period. It may also be grown in pots, and in this case may be protected in a frame during the winter months. Seeds are generally ripened, by which, as well as by offsets, it may be increased. The seeds are best sown as soon as ripe, but in that case the young plants must be kept in a frame through the winter. If the seed is preserved until spring, it will, however, vegetate without much trouble, aided by a little heat.

The genus Calochortus, as now arranged by Mr. J. G. Baker in his recent Monograph on Tulipeæ, includes twenty-one species classed under four subgenera. The present species and the closely-allied C. pulchellus, with yellow flowers, are the only two having globose drooping perianths, the rest having their flowers erect.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

NOTES ON VILLA AND SUBURBAN GARDENING.

The Hardy Fernery.—I think it is not too much to say that a collection of hardy Ferns is an indispensable addition to the ornamental portion of a suburban residence, and when arranged upon a mound of rocks of a suitable size, &c., clinkers, or overburnt bricks, or among the roots and stumps of trees, they can

be made to assume in this artificial home so much of a natural appearance as if growing on the hedgebanks in the country, that they become doubly enjoyable to those who seldom have the opportunity of seeing them growing fresh and green as Nature has reared them. To this, however, something more may be added; for the rustic appearance of a fernery is an agreeable contrast to the more dressy portion of a garden, and if a sight is taken of them in a line with a bed of flowers they heighten the brilliancy of the flowers, and form a background at once very graceful and attractive. A group of Ferns arranged in a tasteful way is an excellent way of hiding anything unsightly, and the beauty and enjoyment of a summer-house can with little trouble be much enhanced by them whether arranged around the foot of it or planted in pots or boxes and stood around it. In the small enclosures we may call forecourt gardens attached to the fronts of a row of villa residences, and where the sun seldom reaches the plants growing there, Ferns grow luxuriantly, and if the stronger-growing specimens are planted in the soil the same as any other plant, they do not fail to please. In some of these gardens oval beds are struck out, and planted thus: The edging is either of Box, or the bed is cut out in the turf and a row of Snowdrops planted 6 inches from the edge. The bed is then planted with stools of some common and vigorous-growing Fern, such as Lastrea Filix-mas or Polystichum angulare, or some one or other of the Aspleniums, about 2 feet apart, and in the summer a coarse-growing scarlet Geranium is planted among them, the bloom of which rises up among the fronds of the Ferns and gives a very pleasing effect. Such a bed is a gay one with very little trouble or expense, and very suitable to such a position.

In constructing a fernery the space it is to occupy must be first determined on, because it is necessary to avoid all straight outlines. If it is long rather than broad the space should be broken up here and there with, perhaps, a hillock of misshapen stones of a corresponding size to the extent of space at command, and then terraced down in suitable places to a miniature dell, again to rise to the ordinary line with, perhaps, a recess and a projection here and there as taste may dictate, making it as rustic in appearance as the ruins of an old castle wall with the stones left as they fell.

Now it must also be remembered that Ferns like shelter, shade, and moisture, and it may not be so difficult to provide the two former as it will be to find moisture sufficient to carry them through a dry and hot period in the summer; and this is the most particular as well as the most enjoyable time of any. Moisture is necessary at such a time for the future benefit of the Ferns; and if the fronds can be kept fresh and green by its agency the more will their appearance lead one to admire them, because it is such a relief for the eye after gazing upon the bright flowers in the hot sun. Therefore, in building up the fernery, the soil under the stones is not so particular as to the mixture, but it must be porous, so that the water when applied may pass away quickly and avoid soddening the soil.

Generally speaking the roots of Ferns are of a wiry nature, and will cling to soil of an ordinary texture, but it ought not to be heavy. Some of the more delicate species may with advantage have peat and sand added to the soil, and some leaf soil; but none of them, whether vigorous or strong, are benefited by manure either in the solid or the liquid form.

Now a word or two as to the planting, or assigning the plants the position they ought to occupy. First of all, take care not to plant any of them too deep, but keep the crowns well above the soil as long as they are made firm, and plant the strongest growers first, allotting them their positions over the whole space, or they may be planted in groups here and there, and varied either high or low as it is wished. The dwarf species with finer-made fronds should be planted in prominent places, but not too much exposed, and, again, not immediately under those with coarse fronds so as to completely hide them from view. Some, such as the common Polypody or Polypodium vulgare, sends its stems or rhizomes completely over a projecting block if it finds sufficient earth or other substance to cling to; and therefore, where there is a prominent place to be thus covered this is the Fern to plant, and all those of a running or creeping nature should have suitable places provided for them.

Now, although a fernery is a very desirable thing to have, it is not everyone who can indulge in the luxury, but they may grow some plants in pots, which will form very conspicuous ornaments for the window, entrance-hall, or, in fact, for room-decoration. There is the Lastrea Filix-mas and Athyrium Filix-fœmina, Scolopendrium vulgare and S. undulatum or crispum very pretty, Lastrea angustata, cristata, and Osmunda regalis, besides many dwarfer species that thrive well in pots. It is the same with these as with those in the fernery—the pots must be well drained; and if kept in the rooms for any length of time they ought to be sprinkled overhead every morning, and the roots should never be allowed to become dry. They would be more delicate cultivated in this way than if they were in a more natural position outdoors. In the winter time when the fronds are dying down the pots should be plunged in coal ashes under a wall on the south side, and if severe frost set in the crowns may be just covered with some light material. In the spring, when the young fronds make their appearance, clear the crown of all rubbish, and keep a constant look-out for slugs, or they will eat several of them off in a night, and thereby destroy all prospect of a good decorative plant. After they are further advanced they may be taken out of the ashes and treated as above directed.—Thomas Record.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 29.

Assuredly, as Sir John Lubbock remarked in his recent lecture on "British Wild Flowers considered in relation to Insects," the fact is noteworthy that Mr. Darwin was the first to draw attention to the special work many insects perform in transferring pollen either from one flower to another, or else from the stamens to the pistil of the same flower. It was amongst the Orchids that this naturalist noticed peculiarities which led him to establish his theory on the subject, I believe, as enunciated in a book published about 1862. Others have since trodden in his footsteps and amplified considerably, and of recent observers none are more deserving of honourable mention than Dr. H. Müller, Mr. Bennett, and Sir John himself. But I regard Mr. Darwin's position as singular in view of the circumstance that his eminent, though less famous, grandfather thought fit to attempt to poetise the "Loves of the Plants" in a composition cleverly, if too hardly, satirised in another poem on the "Loves of the Triangles." As a more recent poet puts it, plants

> "languidly adjust
> Their vapid vegetable loves
> With anthers and with dust."

And even a child can scarcely credit a fable which would assume that there was any affection in the matter. But taking up the imagery for a moment, the first Darwin described the amours, and no more; it was reserved for a second Darwin to give us a glimpse of the "go-betweens." There are, however, many flowers that scorn these, as Sir John points out, and need no help to fertilisation from the insect races. From the Hymenopterous and Dipterous orders it is, as we should expect, that plants receive this aid in return for the honey and pollen which serve to supply the needs of their visitors. The interchange does not always proceed without unpleasantness; and I can fancy that the juvenile portion of Sir John Lubbock's audience, as they heard him describe the odd mode in which the common Arum is fertilised by the imprisonment of insects, chiefly flies, in the tube until the ripe anthers had showered their pollen on them, the shrivelling of the hairs giving them liberty afterwards, may have said to themselves, "What foolish creatures the flies must be to visit any more Arums after that!" On the whole, however, it is to be concluded that we are more indebted to bees than to flies for services thus rendered, because, as a rule, bees are longer-lived; and as in some species they are storers of honey as well as eaters, they necessarily visit more flowers than do flies. Some set-off in favour of the flies may be pleaded from the fact that many of the flower-loving flies are also predacious, a few in the imago, but a number of them while in the larval state. And in passing we may note that sometimes, as in the genus Tabanus, we have flies regarding which we may have difficulty in deciding as to their merits or demerits. The males, true flower-lovers, are occasional visitants to gardens, where they attract attention by their lustrous eyes. A friend has described the expression of one species as combining "intelligence with pathos," but I fail to see that myself. These organs are of various colours: in one species of a golden green, lined and spotted with purple; in another crimson predominates, crossed by green bands; and in a third a bronzy hue of much brilliancy prevails. The Tabani have wings well provided with nervures, and the buzzing noise they produce is to some folks one of the pleasures (?) of summer. Not so the bite, certainly, for they will occasionally attack the human subject, and the approach of one of these flies—a much more veritable "horse-stinger" than the harmless dragon-fly—is often the cause of a panic in a herd of cattle. The larvæ of these insects, popularly known as Breese-flies or Clegs, live either on the surface of the earth or underground, and help to remove decaying matter, or, as is suspected to be the case in several species, they prey on other larvæ, molluscs, or worms.

Mention has not been made in this series of the Soldier-flies, insects both of beauty and utility, appropriately named from the martial qualities manifested by most of the perfect in-

sects, which visit flowers with a double object—the extraction of the honey and the destruction of other insects, some of which are amongst our enemies. The antennæ in these insects are longer than in many flies, the bodies broad, and elegantly marked with spots and streaks of a variety of colours. On the thorax is usually an array of spines, perhaps to prevent birds from attacking these insects, which do not appear at all inclined to take up the refrain, "Let me like a soldier fall," but show great alacrity in escaping danger by flight if alarmed. The common Chameleon-fly (Stratiomys chamæleo) is one of the familiar examples of the group, taking its name from the varied colouring displayed by different specimens; black and yellow, however, predominate, and the legs are also yellow. The larva lives in ponds or streamlets that have little motion; it has rather a telescopic structure, and respires from orifices in the tail, set about with hairs much in the mode of the larvæ of the gnat. One of the most peculiar circumstances in its history is, that the period of larval growth having passed, the creature rises to the top of the water, where it floats about, the pupa remaining within the loose larva skin, which serves as a kind of cocoon. Other larvæ of the family are semi-aquatic, preferring damp places or burrowing in rotten stumps; the larva of Sargus cuprarius lives in the earth, and those of its congeners. In these insects the bodies are more slender than in the typical representatives of the family, yet we find brilliant, almost metallic colouring.

Fig. 23.—The metamorphosis of stratiomys chamælio.

A curious group of flies is that represented by the genus Phora, for at certain times of the year parties of these may be seen resting on the glass of window-panes, and if a crowd of them should haunt a greenhouse, as may happen, the gardener is doubtful whether to consider them as neutrals or enemies. It may be that his readiest theory is that they have bred from some manure that he has had on the premises, and some of the larvæ really feed on decomposing substances, vegetable rather than animal, though. Thus, the larva of P. Dauci has been discovered in decaying Radish roots. I don't suppose it would touch healthy ones, and if gardeners leave Radishes to decay in the ground they must not wonder that insects interfere. The majority are parasitic, with a history somewhat obscure as yet, though some of the flies have been bred from punctured larvæ of Lepidoptera. Like those of common Muscidæ, these larvæ are footless cylindrical maggots, slightly narrowed at the head, and with radiating points at the tail, by which they retain their hold. The perfect insects fly, or, one might say skip, about with briskness, the wings being deflexed and fringed without transverse veins; a ridge on the thorax also gives to them the appearance of being hump-backed. Some people have likened these flies to sand wasps in miniature, the size varying from the twenty-fourth to the sixth of an inch. We have about thirty British species. Besides these, though belonging to the Hymenopterous order, we might place the insects of the family Proctotrupidæ, some so small that they only look like moving dots until we magnify them. Here the wings have scarcely any nervures, and the insects spring rather than fly. The larvæ, so far as is known at present, live in the eggs of other insects, chiefly of moths or butterflies, one small egg serving as food for three or four larvæ; it is doubtful how the shell is punctured. Teleas elatior, one of these, is a beautiful object under the microscope, the body being an intense blue, and the wings exhibiting prismatic tints.

The Ruby-tailed flies are insects belonging to the division of Hymenopters, called the Tube-bearers (Tubulifera), from the segments of the abdomen being formed into a telescopic tube, which, though it seemingly consists of a small number of segments, contains the usual complement, but modified. It is secured by a short footstalk to the thorax. The object of this structure Mr. Wood thus states, "Owing to the mode in which the abdomen is attached, the insect is able when alarmed to roll itself up in a ball, in which it is aided by the shape of the abdomen, the under surface of which is concave so as to receive the thorax. At the end of the retractile tube is a small sting-like ovipositor, capable of inflicting a smart prick when the insect is moved to anger."

The claim of these flies to beauty must be admitted by everyone who has seen the Chrysididæ careering in the sunshine by the roadsides or over flower beds, especially in gardens near woods. Also they may be noticed crawling or running over posts and palings, round orchards and plantations—not without an object. England owns nearly a score of species, all of bright colours, green or greenish blue, the abdomen in most of some shade of red or purple. One of our commonest species is Chrysis ignita, the larvæ of which are nurtured in the nests of sand-wasps, carpenter and mining bees, and even, according to some authors, in the cells of the hornet. One or two species attack the tunnelling wasps, conveying their eggs with ingenuity into the cell prepared by the wasp for its progeny. In a certain sense, therefore, the Ruby-tailed flies are of use, by keeping under other Hymenoptera, though of course many of the wild bees do no harm in gardens. Whether, like the

cuckoo, the larva of the Chrysis only devours the food prepared for another, or whether it sometimes kills the rightful occupant of the home it has entered, is a disputed point. The parent whose progeny is threatened does not always tolerate the intrusion, and instances have been related of sharp contests between a Ruby-tail and a bee or wasp. The former, however, chiefly acts on the defensive, by rolling itself into a ball when threatened by the indignant owner of the domicile. —J. R. S. C.

THE LATE MR. THOMAS WEAVER.

Will you permit me to add one little item to all that has been so well said by others concerning our good old friend? I had the privilege of visiting him some years back, and I was struck not only with his qualities as a thoroughly good, honest, and old-fashioned gardener, but also by his simple and unaffected piety. He was truly a humble-minded Christian man, and his utterances on these higher subjects were characterised by the same plain, good, common sense that marked everything that he did. He was another instance of the many I have known who in their dealings with the things of nature had not been led to ignore Him whose handiwork they are, but in whom they had intensified the love which they had gained by the reading of that other Book which alike testifies of Him.—D., *Deal.*

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

Since sowing the Peas we have not had weather sufficiently favourable for getting-in any out-of-door crops. The early Potatoes are spread out very thinly on the ground in a cool place; but they have sprouted out rather more than usual, and we do not like to break the first sprouts off, as the first growths are not only the strongest, but if planted so they are undoubtedly earlier. The ground is too wet to allow of planting the tubers, and as the best resource under the circumstances they have been laid out in shallow boxes and placed on the floor of a cool glass house. This has been done to cause the growths to become stronger by exposure to the light and plenty of air. A very little fine mould has also been strewed amongst them, and when the ground is in good condition for them to be planted out the boxes are removed to the place, and the sets taken out of the boxes and transferred to the ground at once. We have started Potatoes in forcing houses to plant out in the open border, and would do it again at this time if the tubers were not starting into growth naturally. When this is done it is quite necessary to place the boxes containing the sets into a cool house before planting them out. It is a great advantage to have some sort of protecting material to place over the Potatoes when they have come through the ground, and this can be done very cheaply. A framework formed of a single rail fixed about 15 inches from the ground at the front and back of the borders, to a row of stumps driven into the ground, will support mats or straw coverings, or even old shading that has become useless for other purposes; but better than all are frame lights, which may be put on when the Potatoes are planted, and be left there permanently. This last would be not only the best, but would be in the end the cheapest if the first outlay can be got over, as not only is the protection the most effectual, but a vast amount of labour expended in covering and uncovering would be saved annually, and owing to the unsatisfactory condition of the labour market it behoves us to be on the alert, so that by mechanical or other appliances we may save in that respect.

A sowing of *Broad Windsor Beans* has also been put in on a south border. We like to get them in early, as the first sowing always produces the best crops. In another class of soil or in a more favourable district it may not be so, but we cannot find time to water such crops, and they become quite dried-up in the hot weather. We have not only to fight against a dry gravelly soil, but, what is quite as bad, a deficient rainfall. Last year our gauge did not register much over 18 inches. In such soil and under such adverse circumstances the only road to tolerable success is by trenching and working-in a liberal dressing of substantial farmyard manure. If our supply of that was restricted it would be enough to make us give up in despair. Mulching the ground with manure also serves to retain the moisture.

Sowed *Carrots* and *Lettuces* in ground vineries. For this purpose some dry loam was laid upon the surface of the ground after laying down some bricks on which to rest the vineries. Hicks's Hardy White Cos is the best Lettuce for our purpose, and the Early Horn Carrot; but it is needless to expect satisfactory results from very early crops without there is a good supply of dry mould at hand in which to sow the seeds, or some glass lights for protection from frosts. The Carrot and Lettuce are sown in rows 9 inches apart, and yet there is room between the rows for a crop of Radishes. Mustard and Cress is sown as wanted in boxes, which are placed in any of the forcing houses.

Sowed *Cauliflowers* in boxes, and placed the boxes in a hotbed to start the seeds. These come in immediately after the autumn-sown plants, which have been wintered in hand-lights and frames. Those in hand-lights are planted out in the autumn where they are to remain; they are the strongest plants selected from the bed. The smaller plants are pricked-out in boxes and merely protected from the weather until late in February or early in March, when they are planted out in the garden.

FRUIT AND FORCING HOUSES.

Pineries.—Little can be added to previous remarks in this department of our work. The higher minimum temperature kept up naturally requires that more moisture be allowed to evaporate in the houses. Two other matters which cannot be considered of minor importance must also be noticed, and that is watering and ventilation. The pots are usually plunged in some moist warm material, mostly spent tan from the leather-curers. Now the mould may become dry on the surface and be quite moist underneath, so that the utmost care is requisite in applying the water. Pines will not thrive if they are over-watered, and many fine fruits have been spoiled by this cause alone. Then fresh air is next in importance to good water. A small chink should be opened the first thing in the morning at the apex of the roof, not only in pineries but all forcing houses.

Peach Houses.—When it is perceived that the fruit is set it is advantageous to the trees to give them a thorough good syringing, which cleanses them from withered flowers, &c., and to continue the syringing every morning unless the weather is unfavourable. Trees that are now in flower are at the most critical period, and the blossoms should be set by shaking the trees or by using a camel-hair pencil. We have seen many different systems of training, but believe that the one having the most advantages is that of training the trees on the fan system to wires fixed horizontally about a foot from the glass. This allows of the fruit and young wood being thoroughly exposed to the sun, and they are also in the position where they are most freely exposed to the air. Trees planted on the back wall do very little good when the area of the glass is covered with foliage; but then if the trellis is arranged so that the sun can act upon the wall, a corresponding surface under the top lights must be unclothed from foliage, and this is just the place where the finest fruit is usually produced, so that there is no obvious advantage in trellising and being at the trouble of training trees to the back wall.

PLANT STOVE AND ORCHID HOUSES.

In many instances the stove is overdone with plants cultivated solely for their foliage. The rage has been for this class of plants during the last ten or more years, and a large proportion of recent introductions are not worth house-room. We must find room for some of the finer Palms and Dracænas, for such plants as Aralia Veitchii and A. leptophylla, for the more beautifully-marked Crotons and Pandanus Veitchii; but even then they must not be introduced to the exclusion of the flowering plants at present. Some of the easiest-managed Orchids may be had in flower if it is a house that requires a winter temperature of 60° or 65°; then the Phalænopsis grandiflora will be in beauty all the winter, if 50° or 55° be the minimum. The bridal Orchids are represented by Cœlogyne cristata, which thrives best in a temperature so low that it would be fatal to the beautiful Moth Orchid from Manilla. We find the pretty deep blue Eranthemum pulchellum very useful at this season; and for arranging in bijou bouquets the Euphorbia jacquiniæflora is not easily matched. They are also very easily grown. With the increasing light we also require a somewhat higher temperature; in the warmest stove 65° is now the lowest temperature. The weather has also been fine, which has allowed of more air being admitted. All plants that require potting are now being attended to, and a watchful eye is also being kept for all sorts of insect pests. Bougainvillea glabra wintered in a greenhouse has now been placed in heat.

FLOWER GARDEN.

Pruning shrubs, cutting dead wood out, and forking-over the ground in open spaces. The herbaceous borders are also being dug after some manure has been placed amongst the plants. However careful one may be to place labels to all the bulbous plants some of them get displaced, but now that nearly all spring-flowering subjects are above ground, digging can be performed with safety. Pinks had been thrown out of the ground or much loosened by the frost, and were pressed-in with the fingers, the ground being stirred between the rows. Removed withered and decaying leaves from Carnations and Picotees in frames. The lights are quite removed in fine weather, but no rain is allowed to fall upon them as yet; water is applied very sparingly to the roots. Auriculas in pots have been surface-dressed and watered. The plants show signs of returning animation after their winter rest. They have been plentifully supplied with water to thoroughly moisten the mould; the frame is aired, and the treatment similar to Carnations.

Potting-off all bedding plants and striking cuttings of all that we are short of. Calceolarias have not yet been removed from the shelter of a north wall. The cuttings were put in late, and

some have not yet started; they look quite green and healthy. A severe frost does not seem to affect them much.—J. Douglas.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

Secretaries will oblige us by informing us of the dates on which exhibitions are to be held.

TRADE CATALOGUES RECEIVED.

J. Jefferies & Sons, Cirencester.—*Garden Guide.*

W. Potten, Nursery, Sissinghurst, Staplehurst, Kent.—*Descriptive Catalogue of Seeds.*

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

Books (*Alicia*).—We know of no book on growing fruit for the London market. (*H. N. O.*).—The "Cottage Gardeners' Dictionary," with supplement, can be had of the publishers, Bell & Daldy, York Street, Covent Garden.

Seedling Apple (*Messrs. Brown*).—Your seedling Apple is very handsome in shape, very beautiful in colour, and very good.

Quarrenden Apple (*Inquirer*).—The flesh is usually pink near the rind, and becomes lighter until it passes into white nearer the core.

Arrangement of Ribbon Border (*C. P. B.*).—We repeat the statement so often made, that we cannot undertake such arrangements, but we most willingly criticise any which may be submitted to us. You have doubtless ideas of your own; let us see them, and we may then be able to assist you. You have ample materials for a rich and tasteful arrangement. Strive to make it good, not only in itself and for its position, but also in its relation to the surrounding features, of which you say nothing in your letter.

Mushroom Spawn (*R. Davies*).—Spawn may be found in dunghills, horse-mill tracks, and such places. In May a heap of the droppings of cows, sheep, and horses, or any one or two of them, without the admixture of any undecomposed straw, is to be collected, and one-fifth of road-scraping with one-twentieth of coal ashes added, the whole being mixed together with as much of the drainings from a dunghill as will make it of the consistency of mortar. Being well incorporated, it is then to be spread in a dry, sheltered, airy place, on a smooth surface, and beaten flat with a spade. When become of the consistency of clay it is to be cut into slabs about 8 inches square, a hole punched half through the middle of each, and piled to dry, an opening being left between every two bricks. When perfectly dry a fragment of the spawn is to be buried in the hole previously made. It will shortly spread through the whole texture of the slabs if kept in a warm dry place, when each may be broken into four pieces, and when quite dry laid on shelves, separate, and not in heaps, otherwise a bed will be formed for the spawn to run in.

Camellia Leaves Browned (*R. G.*).—The leaves sent show your plants to be in a "very unhealthy state," very small and spotted. The smallness of the leaves may be natural, but we know of none so small when in health. The ill health is a consequence of inactive roots, which may arise from an unsuitable compost, or it may be sodden and sour. The fault in the atmosphere is too much moisture upon the leaves, either from syringing or drip from the roof, which keeps the leaves wet, and drops hanging from their edges, the sun falling powerfully upon them then causes the brown blotches. The remedy is to syringe less or prevent the drip, and not allow the sun to fall powerfully upon them. Ours are shaded from early April to the end of September, and are not syringed at all, moisture being obtained by frequent sprinklings of the floor, walls, &c. Turn the plants out of the pots now, as they are not flowering, and remove any soil not occupied with roots, and repot in clean pots and well drained, just large enough to admit the roots and admit of about three-quarters of an inch of fresh soil all round, potting firmly, being careful not to injure the roots, but to work the soil in amongst them, so as to leave no cavities, and keep the neck or collar of the plants raised in the centre of the pots. Water carefully, but keep moist until the plants are growing freely, then water abundantly, but take care not to make the soil sodden. A good compost is three parts the top inch of a pasture taken off where the soil is a rich, light, sandy loam, one part sandy peat, one part leaf soil or thoroughly decomposed cow dung, and one-sixth silver sand, the loam chopped up rather fine, using it with its turf, the peat broken rather fine, and the whole well mixed.

Camellia (*J. W.*).—We are sorry we cannot name it. Florists' flowers can only be identified by those who specially cultivate them; they are in legions.

Heating Greenhouse (*Dr. Andre*).—Have a small stove boiler and 2-inch hot-water pipes; a flow and return all round the house except the doorway would be sufficient to exclude frost, to dry up damp, and promote a circulation of air in dull weather. You may have the stove outside the house in a shed, or in a hall or corridor if convenient, or the stove may be inside the house, having a funnel or pipe to carry outside the products of combustion. The price would not be much greater than a flue, but for expense write to those advertising in our columns and ask for estimates.

Protecting Fruit Buds from Small Birds (*A. G.*).—Boil a pound of quassia chips in four gallons of soft water ten minutes, and add to it as it cools a pound of soft soap, and add those in sufficient quantity to a paste formed of equal proportions lime and soot, passed through a hair sieve to form a liquid that will pass through a syringe, and eject that over the trees. The lime ought to be fresh slaked, and adding the soot afterwards. The composition is good against insects, lichen, and moss, as well as for protecting the buds from birds. Repeat if washed off, but usually one application suffices.

Protecting Iron Cistern from Frost (*P. C.*).—The best plan is a wood casing, allowing a 2-inch space between the wood and the cistern, and fill this with dry sawdust. The top should be protected in the same way, excepting, of course, the supply-pipe and overflow, and the pipes are best encased in wood filled with sawdust, or a straw or hay band wrapped round them.

Potting Rose Cuttings (*E. L. W.*).—The cuttings now rooting would be best potted if you intend to grow them in pots, and place them in the cold house or in a frame. For outdoors they should be potted and kept in a cold frame until they are well rooted, when they may be planted out, having been well hardened-off. You mistake about Gloxinias and Achimenes not being mentioned in the "Greenhouse Manual." They are mentioned in the calendar for March, April, May, &c. Williams's "Stove and Greenhouse Flowering Plants" may suit you. It may be had through any bookseller.

Muscat Vines Breaking Badly (*H. H. B.*).—Muscats early in the year usually start indifferently, and require to be brought on gradually, the atmosphere being kept very moist, as also the rods; these being depressed, as stated by Mr. Douglas a short time since, with a moderate temperature to begin with, and gradually raised. Their not breaking in your case is not depressing the upper part of the canes, bringing them at least level with the eyes at the lower part of the Vines. The Vines we presume are planted inside; or the bad breaking may be due to the roots being in a cold, wet, outside border. We should depress the rods now and maintain a temperature of 60° at night, 65° to 70° by day, and keep very moist. Vines this season have broken as well as we can remember.

Night-scented Stock Culture (*Somerset*).—The plants require an abundance of air and light and very careful watering. Pot-off the seedlings three in a 3-inch pot, not burying them deeper than the seed leaves, and water carefully, shading from sun until established. When the roots are showing at the sides of the pots shift into 5-inch pots, which are sufficiently large. Two parts loam, one part leaf soil, with a free admixture of silver sand will grow them well. Picotees sown last June and wintered in a greenhouse will, if planted-out in April after being well hardened-off, probably flower outdoors this summer. They ought to have an open situation.

Cucumbers Growing in Vinery (*Idem*).—They will grow in 11-inch pots, but 13-inch are better. They will require top-dressings with rich compost. Boxes may be 15 inches long, a foot wide, and a foot deep. The trellis for them ought not to be less than 2 feet from the Vines. If the roof of the house be closely covered with the Vines, the Cucumber plants will do little good beneath them.

Heating Houses (*J. P. of York*).—The houses would be heated more economically by a boiler than by flues; two furnaces consume more fuel than one, and you will not require a larger furnace for the boiler than for one flue. Two 4-inch pipes along the front and one end will be sufficient to exclude frost from a lean-to house if the width does not exceed 15 feet; if wider they ought to be taken along both ends, and all round if a span. To give a stove heat or for forcing Vines early in the season you will require twice the quantity of piping as for the other houses. It would be best to take the main flow and return along the back of the houses through a shed or sheds, which will be useful for Mushroom-growing, or if the roof were of glass for Ferns, and from these branch to the several houses, having valves to each, so as to work each separately or together.

Vines to Fruit Late (*Inquirer*).—Your Vines being Black Hamburgh need not be started, but allowed to break naturally, as they will in April or earlier, and need not have greater aid from fire heat than to keep the temperature from falling below 50° after they are in leaf, and when in leaf securing to them a night temperature of 55°, though it may in the morning fall to 50° without injury to the Vines or crop. In August and early September, or when the Grapes change colour, it may be necessary to afford a little fire heat by day if the weather be dull, cold, and wet, so as to cause a circulation of air, or allow of its being freely given without lowering the temperature below 65° to 70° by day, and 60° at night. The Grapes will colour in a lower temperature, but they will not be so rich in flavour, nor keep nearly so well as those ripened in a higher temperature. The Grapes will be ripe at the end of August or beginning of September; and the atmosphere being kept dry, having air day and night, and no moisture in the house from plants, they will hang in good condition until the new year.

Nertera scapanioides (*J. Field*).—We do not know the species. All those of the genus known to us are creeping plants, and half-hardy.

Sea-kale Pots (*E. M. P.*).—For so small a number as four the expense of packing and carriage would be more than equivalent to a retailer's charge.

You had better use four 18-inch flower pots, putting a cork into the drainage-hole of each.

Bedding Plants from Seed (*C. R.*).—In addition to Lobelia, Pyrethrum, Dell's Beet, and Phlox, you may have Ageratum Imperial Dwarf (blue), Alyssum maritimum (white), Centaurea candidissima (white foliage), Cineraria maritima (white foliage), Cuphea platycentra (red and purple), Linum grandiflorum coccineum (crimson), Nasturtium King Tom Thumb Scarlet (this is the best scarlet), N. King Tom Thumb Golden, Saponaria calabrica (rose), Scabious Dwarf, double (red, white, crimson, and maroon), these are fine for cutting, Senecio elegans, double vars. (crimson, lilac, dark purple, red, and white), Tagetes signata pumila (yellow), Tropæolum compactum coccineum (scarlet), and T. compactum luteum (yellow).

Heating a Greenhouse (*Idem*).—Your house having two 4-inch hot-water pipes along the front and one end, and the cubic contents being 1200 feet, would be heated sufficiently to exclude frost. The bore of the barrel pipe will not, we presume, be less than 1½ inch—it ought not, and the boiler must be of sufficient power to maintain the 4-inch pipe surface at a temperature of not less than 18°.

Sea-kale Forcing (*H. A. P.*).—The bed of Sea-kale may at once be forced without fear of its coming weak, as it will now start freely with only a gentle heat.

Potatoes for Forcing (*Idem*).—Queen is not good, nor any of the Victoria type. Forcing Potatoes require to have a short haulm, and mature early. Sandringham Ashleaf, Myatt's Prolific, and Veitch's Ashleaf are the best kinds, and the last-named the best of the three.

Jasminum nudiflorum (*Idem*).—The leaves are those of a sickly Orange, and have been covered with fungus arising from scale. Sponge with soft-soap solution 4 ozs. to a gallon, and at a temperature of 120°. The flower is Jasminum nudiflorum.

Soil of New Garden (*H. B.*).—Burn 2 feet in depth of all the subsoil clay, and mix it with the one foot of the lighter surface soil.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 7.

BY T. C. BURNELL.

No difficulty will be found in making a broody hen take to a strange nest, the only precautions necessary will be to move her when it is dark, to give her a china nest egg or two, and to keep her shut in upon the new nest till she becomes accustomed to it. It will not be advisable to put the good eggs under her for a couple of days, till she has become thoroughly used to being taken off and put on the nest again by strangers. This should always be done every morning, and the hen put into a coop or other convenient place where she can be easily caught, with food and water for her to eat, and left there for about twenty minutes, and then be replaced on the nest by hand and shut in. If a regular system be adopted it is astonishing how many hens may be kept going in this way with very little trouble.

Two days before the eggs are due to hatch they should be well soused in tepid water when the hen is off the nest, and after being left in the water for two or three minutes they should be replaced, and the hen put on top of them. This will go a long way in preventing the chickens from becoming stuck to the membranous lining of the shell. If fresh, Dorking eggs will hatch on the twentieth day; but if stale they may be a day longer. For this reason the eggs in a sitting should as nearly as possible be of the same age, so as to hatch out altogether; but on no account should the hen be interfered with till the expiration of at least twenty-four hours from the appearance of the first chicken. I consider it waste of time to help chickens out of the shell. I have often done so, but believe it to be far better to let them die at once, as if they are not strong enough to get out of the shell they are pretty sure to die afterwards, and at all events will never make prize chickens. If possible it will be better to sit two hens on the same day, so that if the eggs hatch out badly we may be able to make up one good brood by putting all the chickens under one hen. A little sulphur should always be sprinkled in the nests of the sitting hens, or otherwise they are likely to become infested with vermin.

The hen-coop as illustrated in the accompanying sketch is well worthy of the attention of amateurs. It has been designed by Mr. Henry Lingwood, who for many years has been one of the most successful exhibitors in the poultry fancy. Last year he very kindly let me have one as a pattern, and I found it answer so well that I have asked and received permission from him to have it drawn for general information. It combines every requisite for rearing chickens successfully, and with it no shed or coop-house is required. It also possesses the merit of being vermin-proof when shut up, and this, too, without the ventilation being at all impeded. Owing to an error in shading the engraving is not so intelligible as I could wish; but I will endeavour to make it a little more simple by explanation. Most hen-coops are entirely inadmissible for outdoor chicken-rearing for two reasons: one, that the wet drives into the front of the coop; the other, that in heavy rain the wet runs in underneath the sides. In Mr. Lingwood's model coop both these disadvantages are avoided, as the roof projects over the open front, and effectually keeps out the rain; while a wooden tray is made to fit inside (which should be always kept filled with sand or dry earth), which entirely keeps the little chickens out of the wet. The flap-door, which in the woodcut is seen lying on the ground, hinges at bottom on hooks, and when turned up and secured with a button, fastens the coop up for the night, secure against fox or rat. The top part of the open front is made of small-mesh wire, and should be placed perpendicularly, and not be made, as in the drawing, to lean forward. This, besides giving light and ventilation, will be found convenient for feeding the chickens through on a very inclement morning when it is not desirable to let them run out at once.

When twenty-four hours old the chickens may be safely put into such a coop as I have described, or into any other description of coop with a waterproof roof. The hen should be fed and watered, and the chickens too should receive their first feed of bread crumbs softened with milk, canary seed, or some such little delicacy.

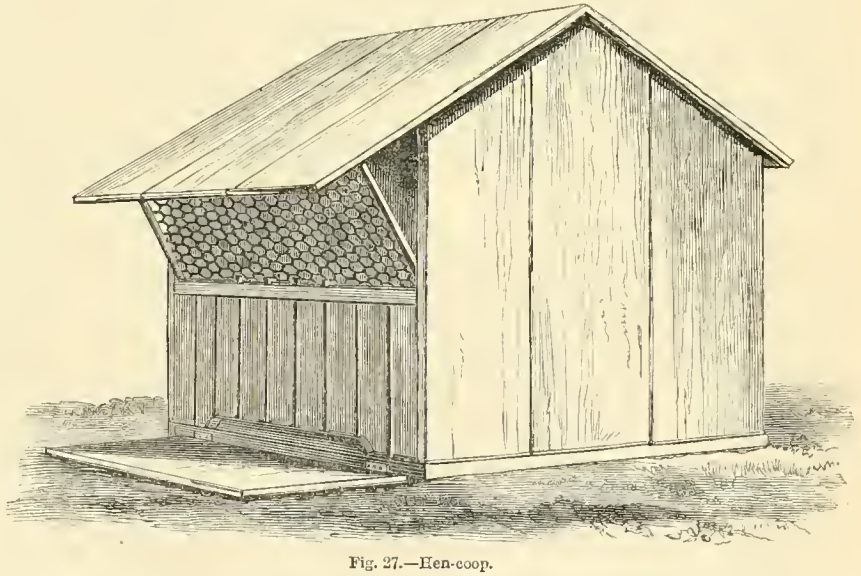

Fig. 27.—Hen-coop.

HARD CROP, OR CROP-BOUND.

This is undigested food in the crop either of fowls or Pigeons. It arises from being fed on food hard to digest, and consequently digestion does not take place fast enough to satisfy the cravings of hunger, hence the fowl or Pigeon keeps eating until it gorges itself. Hard crop will be caused by the bird being chilled while at roost. I advise all to avoid strong draughts of air. There needs no surgical operation for either fowl or Pigeon. By taking a penny tin extinguisher with the top cut off you will be provided with a funnel of proper shape, but I prefer a gutta percha one, as it is not so likely to hurt the throat or mouth of the bird treated. Place the funnel in the mouth, and then pour in as much warm water as the crop will hold; then work about with finger and thumb, squeezing well about till you get it into a liquid state; then place the finger of the left hand between the sides of the beak, the front finger of the right hand upon the tip of the lower half of the beak, and with the thumb of the same hand you may easily empty the crop in a few minutes. Then after awhile refill the crop as before with warm water, and so on till quite empty; then rinse-out well with warm water, and give the fowl some bread soaked in some warm milk. Some give bread soaked in ale, but unless the bird has fallen away in flesh or is weak it does not require it. Do not let the fowl have any hard food for a few days. In the case of Pigeons, if the bird will eat

bread give it; if not, rape seed is best, and in a few days give it split or crushed corn, but on no account whole corn. Old birds ought to be fed on crushed corn always.—W. Woodhouse, *King's Lynn.*

DORKINGS.

I feel very loth to take exception to anything that my friend Mr. Coke Burnell may say on the subject of Dorkings, and yet there is a passage in his interesting contribution of last week to which I should like to call his attention as well as that of other Dorking fanciers.

With his statement respecting the brief span allotted to Dorking cocks I quite agree. I recently bought for a trifling sum a cock whose shape and style I much admired, and which, curiously enough, I found had passed a portion of his time in Mr. Burnell's yard, in the hope that I should be able to use him for breeding, but at present he seems of no service. I should think his age is about three years. "Dorking hens, however," says Mr. Burnell, "do better; and I now know," he continues "a dark Dorking hen which has twice won the cup at the Crystal Palace Show, and which is still flourishing and winning, though certainly over eight years old."

As I happen to have won the Dorking cup at the Palace in the old class at the two last shows, I felt rather puzzled when I read those words. The hen that won the cup at the Palace in 1874 is not yet four years old. I am glad to say that she is still flourishing and winning, as she was given the cup at Bristol by a Judge who had never seen her before; yet I should indeed be sanguine if I expected to win with her until certainly over eight years old. But possibly Mr. Burnell is alluding to another hen; if so, I hope we shall hear something more of this interesting old lady.

My hen, though not four years old, is beginning to look very aged about the eyes, and another valuable hen that I kept for several years—I mean for three or four years—became so pitiable an object that I was really glad when an accident put an end to her existence.

Whilst writing I should like to say a word on a point respecting which I fear that I differ from some of my fellow fanciers. I see sometimes remarks which appear to indicate that Dorkings ought to be short on the leg. I do not believe that birds which are short on the leg ever can be, or at all events are, so heavy as those whose "columns of support" are longer. As weight and size are important features of a Dorking, a tolerable length of leg seems to me essential to a really fine bird. I am not advocating "leggy" birds; on the other hand, I wish to say that from my experience I think it a great mistake to insist upon a Dorking being a decidedly short-legged bird.—E. Bartrum, *Berkhampsted, Herts.*

HOUDANS.

Wishing to breed Houdans of a true strain, I hailed the appearance of the standard for the same in the *Horticultural Journal* of June 4th and 11th of last year. With this standard before me, I must say the awards at the last Birmingham Poultry Show are a puzzle to me. I was not there to see, but I read in a contemporary journal, "Second-prize pullet had palpably blue legs." Is this right? We were under the impression that they should be white spotted with black.

In the *Horticultural Journal* of December 3rd:—"First cock is a tall bird, thorough French Houdan in look, his only blemish being some rudimentary feathers on his legs. Second well marked and large, but tuft poor, and feathers appear on his legs too. First pullets very large, but too dark in plumage, and one with a poor tuft."

At the Aberdeen Poultry Show of the 8th and 9th ult. I saw the birds. The first-prize (as also the second if I remember rightly) had only rudimentary combs, and seemed very coarse-grown birds. The comb being absent you could hardly say these birds were cocks.

Then, as to feeding, fowls are granivorous. This is the main reason of the delicacy of their flesh and eggs; but since Judges (at least here) give prizes only for size, the public will be suspicious and somewhat revolted when they learn how that is obtained, and that one is recommended to "do as others do, feed one's birds on horseflesh." Supposing this feeding was allowed, the difficulties of obtaining fresh horseflesh would be great, and a temptation thrown-out in many cases to have poultry fed with mere offal.

Is it fair for birds honestly fed on the best grain and meal to have to compete with birds fed on any kind of flesh? That this is the practice of breeders and exhibitors I am aware, for I have in my hands a note from one of the successful exhibitors at the Birmingham Show, saying there was no harm in using flesh (I had said horseflesh in my note to him). These shows require to be well looked after and criticised publicly, as you are aware.—Sabrina.

[We hail your letter with pleasure. We know you will believe us when we say nothing is so unpalatable as the truth. We are neither going to defend or impugn the Houdan judgments at Birmingham, but we will say without the least fear of contradiction, being importers of fifteen years' standing, that the stubs or nascent feathers on the legs are almost the rule. They never grow to feathers. Standards are excellent things, but they are prone rather to describe that which is desirable and should be, than that which can be had. The legs of Houdans should be black and white, and all were so at Birmingham; but even in the standard it is not stated which colour should predominate. As regards dark plumage, some prefer it, others like lighter. In many instances even exhibitors prefer that which they have. There are also differences in critics. We believe it is Lord Macaulay who says no historian can be impartial. We think the same of critics. We like to believe they are honest, but spite of all endeavours we cannot believe them impartial. The combs should be well developed. The Houdan is a table fowl, and should have all the properties of such a bird. It is called the French Dorking, probably from its five claws. It should have the properties of its English associate. Remove the legs, head, and tail, and it should leave a square. When the size of the top-knot is made a complaint to the exclusion of the weight that should attach to the more valuable properties, it is a mistake, and may be attributed to the desire felt by the reporter or critic to say something that may vouch for his superior knowledge of the subject. Some go to approve everything, others view all things through a yellow glass.

Your remarks as to feeding are correct. A competent judge should be capable of distinguishing between a bright healthy bird with a frame capable of carrying a top weight and willing to put it on, and another weighing from the fact of having fed on raw flesh. No question has done more harm than that of brute weight overriding properties ten times as valuable. Fowls are granivorous and should not be fed like cats.]

DORSET SHOW OF POULTRY, &c.

This was held at the Town Hall and Corn Exchange, Dorchester, on January 27th and 28th.

Poultry matters are looking-up "in the west countree." Just recently I had to chronicle a splendid success at Bristol, and now I gladly "make a note of" another success at Dorchester. The county town of Dorsetshire is no modern-looking or wide-extending place; it has no northern bustle about it; but it has a look of its own—quite its own: four avenues of trees, right ancient ones, with broad gravel drives between them, seem to run round the town, or rather the town lies in the square in the midst. All is square, all right angles, at Dorchester; the main streets, as in a kindred place, Chichester, cross each other at right angles, only there is no ancient cross as there to fill the central space. Walking from the station I enter one of the four streets, pass upward, and before me at the opposite angle is a well-built Town Hall and Corn Exchange, with pretty clock turret at the corner, quite a marked object. Here the poultry Show is held. The building might be taken for an ancient place restored, or a comparatively modern one, which indeed it is. A throng is outside of foot people, and a continuous driving-up of carriage people. The waiter at the hotel where I dined told me "he had never seen Dorchester so full for many a day, and that he had had no time to sit down as yet and eat a meal." This was said at four o'clock. I see in this that an old county town is a good place to hold a show in. People go there to shop and chat, and if the day be fine the show is a nice object for a drive. The day was indeed fine—too fine and mild, a grumbler would say, for January; but enjoy the day, say I, and leave the future. "Take the good the gods provide you," leave the rest. Elbowing my way through the crowd, admiring Dorsetshire carriages and horses, and their occupants and riders (N.B.—Dorsetshire ladies are among the best-looking in England), I enter the Corn Exchange where the poultry is exhibited. The pens were Mr. Billett's, and they were well arranged, and a good space between. This better than Bristol, where the space was rather too narrow. The place is full, and a side room, or rather end room, is also full of Ducks and Geese. Looking round generally I ascend the staircase to the Town Hall, where are the special objects of my visit—the Pigeons.

It is always agreeable, when it can be done, that the Pigeons should occupy a separate room; but, of course, this cannot always be the case. This Town Hall was perfection; pretty in itself, with its open oak roof, and the shields and coats of armour of various families filling sufficiently the walls, while the light from the windows was excellent. The prize-shown Pigeons were in rows in the centre, while a beautiful collection of Pheasants, fourteen pens, were at the end and one side. The Pheasants were Golden, Silver, Piebald, Japanese, and one pen of the splendid "Reeve's Pheasants." A well-supplied refreshment stall occupied the other side; and so suitable and pretty the room, and so good the arrangements, that I must own I never beheld a more bright-looking show. The number of pens in the Town Hall, Pigeons chiefly, was about

two hundred; that of the poultry about five hundred, making in all 720.

Pigeons.—Carrier cocks, Any colour.—First (Fulton), colour very good; Yardley second with a very down-faced bird. Pen 522, a bird of much beauty. Carrier hens.—First (Yardley), a little small, but a good-carriaged bird. Second (Fulton), a fine large hen, but spouty. Highly commended good (530); commended (528), large, but flat-wattled. Ponter cocks, Any colour.—First (Pratt), a Black-pied bird, very nice. Second (Fulton), a good Yellow, but somewhat long-cropped—oval, not globular. Ponter hens.—First-and-cup (Pratt), a Yellow, good style and gracefnl; a pity that the white extends to each eye, and the eye partly bull. Second, White (Fulton). 538 (Pratt), Black, and good, but very heavily plucked in the leg. There was much need of blocks for the Ponters, without which they cannot show properly. Tumblers, Any variety, pairs.—First (Fulton), Almonds, hen being the better. Second (Yardley), also Almonds, the cock being much the better; hen mousy. This was a pretty class, having Agates, Beards, Kites, &c. Many of the Carriers were shown in a very dirty condition, as also the Tumblers. Barbs.—First and second (Fulton). In the latter the cock was poor, in the former the hen none too good, but one good in each pen secured two prizes. Oh! wise Scotchman! Pen 553 a nice pair of Yellows. Turbits.—This was a strong class, and contained some good birds, but unfortunately the pairs were, as a rule, badly matched; thus, a point crown and a shell crown in one pen, or at least a suspicion of each; now pairs should match. First (Crafers), a good pair of Yellows. Second (Dew), good Silvers. Jacobins, Any colour.—This class was a very interesting one. First (Fulton), good Reds, one of them beautifully short-faced, and the red in both reaching quite over the thighs; indeed they are excellent. A word of praise must be specially given to the second-prize birds (Mr. J. Andrews'). Colour and shape excellent, hood and chain equally so; indeed they ran Mr. Fulton's very hard, but then the colour was not so sound and thorough on the thighs. I was glad to see so many pairs of this elegant variety of Pigeon. I should like to see more Yellows, and Blacks, and Whites, and if possible Blues. Jacobins are a fine old variety, and have, even as far back as "The Treatise," been well depicted; the portrait in that work of the Jack being better than any other of the illustrations. Fantails.—These birds were exhibited in cages much too small for their tails. They would have done well enough for single birds, but not for a pair of Fans. First-and-cup (Loversidge); second (Spencer), good Blues. Mr. Yardley's Blues not noticed, which proved how superior were the two winning pens. Nuns.—Three pens only, and very poor. Antwerps.—Long-faced and Short together. First (Yardley), Short-faced, good head-and-beak birds, and general form, Red Chequer, but poorly chequered; in fact, nearly whole red. Second (Colson), Silver Duns. 596, same owner, very good Blue Chequers. Dragoons.—Now came the Show. A finer and more numerous class was, perhaps, never seen at a small show. Their fineness is revealed at once by the names of the two chief exhibitors, Mr. Graham and Mr. Bishop. Their number is accounted for by the fact that a point cup was subscribed for Dragoons. This was won by Mr. F. Graham with thirty-five points, against Mr. Bishop with twenty-eight. I own I should like to have seen Mr. Bishop win on his own ground at Dorchestor; but, then, he does not own either a Red or a Yellow Dragoon, in which Mr. Graham is so strong. But to proceed with these splendid classes of Dragoons in due order. Dragoons (Silver).—First (Bishop). This was the Palace cup bird for 1873, and also took a Bristol cup. Second (Graham), a very beautiful bird. 608 (Bishop), a very good bird. 612, very highly commended (Bishop), a very promising bird. 609 (Bishop), a Palace cup bird, but here only highly commended. Dragoons (Blue).—First (Shuttler), I did not care for. Second (Gregory), better than first, the bars being beautiful. Dragoons (Red or Yellow).—First-and-cup (Graham). I handled this bird, and it was marvellous to see how sound and beautiful the colour, rich yellow, was even in rump and tail. The colour, no doubt, won, for the head was heavy, the neck short and thick, the lash also red, which all do not approve. In short, Mr. Graham, your bird is a most beautiful Horseman, and as such I will give it any amount of praise. Second (Graham). Highly commended, 639 (Yardley), very sound Yellow. I must say that this class was most excellent. Dragoons (White).—First (Bishop). Second (Packham). 667, very highly commended, a very beautiful bird. 678, almost a White Carrier. 669, commended, is exactly my style of Dragoon. The Dragoons were alone worth travelling a hundred miles to see. Any other Variety.—A very small class, much too small. Mr. Fulton's Trumpeters were deservedly first. A nice pair of Frillbacks were commended. A pair of Blue Priests highly commended. There was also a Selling class, but if an exhibition can live and thrive without this class, it would surely be right that our eyes should be spared the sight of such a ragged regiment. In addition, a number of inferior birds are scattered over the country.

I have spoken of the *Pheasants*, they added considerably to the beauty of the Show. Indeed, what with the excellency, as a rule, of the birds exhibited, tho prettiness of the place of exhibition, the good taste shown, and to crown all, a crowd of visitors, I shall remember Dorchester Pigeon Show as one of the pleasantest I have ever seen. Mr. Allsop of Birmingham was the Judge, and as always, he judged well.—Wiltshire Rector.

Dorkings.—*Coloured.*—1 and Cup, W. Whitworth, jun., Manchester. 2, H. Lingwood, Needham Market. 3, F. Cawa, Southampton. *hc*, F. Cawa; Rev. H. Hamilton, Chard. *c*, C. Ogilvie, Hambledon.

Dorkings.—*Silver-Grey.*—1, L. Wren, Lowestoft. 2, T. Moore, Yeovil. 3, Miss B. Neville, Glastonbury.

Dorkings.—*White.*—1, 2, 3, and *c*, Mrs. M. A. Hayne, Dorchester.

Brahmas.—*Dark.*—1 and Cup, T. F. Ansdell, Cowley Mount, St. Helens. 2, W. H. Crabtree, Leveoshulme. 3, Newnham & Manby, Wolverhampton. *hc*, J. Watts, King's Heath, Birmingham (2); J. Evans, Bristol. *c*, Mrs. M. A. Hayne; W. T. Boden, Ringmore; F. L. Turner.

Brahmas.—*Light.*—1 and Cup, Mrs. T. Turner, Ringwood. 2, T. A. Dean, Marden, Hereford. 3, W. H. Crabtree. *hc*, Rev. G. Watson, Lympstone, Exeter; T. A. Dean; J. Bloodworth, Cheltenham. *c*, Mrs. T. Turner; P. Haines, Palgrave, Diss.

Cochins.—*Cinnamon and Buff.*—1 and Cup, S. R. Harris, Cusgarne, St. Day. 2, Capt. T. S. Robin, Jersey. 3, H. Tomlinson, Gravelly Hill, Birmingham. *vhc*, Henry Lingwood; J. K. Fowler, Aylesbury. *hc*, C. Taylor, Gloucester. *c*, J. Cattell, Birmingham; A. Martin, Dorchester.

Cochins.—*Partridge.*—1, G. Lias, Par Station. 2, J. K. Fowler. 3, W. H. Crabtree. *c*, H. Moore, Tiverton.

Cochins.—*Any other variety.*—1, J. Turner, Bath. 2, J. K. Fowler *hc*, Mrs. J. T. Holmes, Bath.

Spanish.—1 and Cup, J. Boulton, Bristol. 2, P. F. Le Sueur, Jersey. 3, Miss E. Browne, Chard. *hc*, E. Steele, Dorchester (2); J. Rodbard, Wrington, Bristol.

Game.—*Black-breasted Red.*—1, W. J. Pope, Biggleswade. 2, J. Mason, Worcester. 3, W. H. Stagg, Amesbury. *c*, F. A. Symes, Dorchester; E. G. Farquharson, Blandford; H. Bevise, Dorchester.

Game.—*Brown-breasted Red.*—1 and Cup, J. Jekin, Eltham. 2 and 3, H. Browne, St. Austell. *hc*, Westacott & Joint, Barnstaple; T. Mason, Lancaster; H. E. Martin, Fakenham. *c*, E. C. Pope, Falmouth.

Game.—*Any other variety.*—1 and 3, E. G. Farquharsen. 2, J. Mason. *hc*, H. Browne. *c*, W. J. Thomas, Brecon.

Hamburghs.—*Gold-pencilled.*—1 and Cup, W. K. Tickner, Ipswich. 2, S. Elliott, jun., Liskeard. 3, J. Long, Bromley. *hc*, G. Packham, Exeter.

Hamburghs.—*Silver-pencilled.*—1, H. Feast, Swansea. 2, J. Long. 3, N. Barter, Plymouth.

Hamburghs.—*Gold-spangled.*—1 and Cup, T. Blakeman, Wolverhampton. 2, W. A. Hyde, Ashton-under-Lyne. 3, T. Dean, Keighley. *c*, Mrs. J. Pattison, Dorchester; J. Carr, Swansea; J. Long.

Hamburghs.—*Silver-spangled.*—1, Miss E. Browne. 2, J. Long. 3, Mrs. J. Pattison.

Polands.—1, J. Hinton, Warminster. 2, G. Lias. 3, T. P. Edwards, Lyndhurst. *vhc*, T. Dean; T. P. Edwards.

Malays.—1, S. B. Perry, Lymington. 2, Rev. N. J. Ridley, Hollington House, Newbury. 3, E. Branford, Swaffham. *hc*, J. Hinton; Westacott & Joint. *c*, Capt. C. F. Terry, Reading.

Houdans.—1, W. Dring, Faversham. 2, W. Whitworth, jun. 3, F. Lake, Sittingbourne. *c*, Rev. E. Handley, Glastonbury.

French.—*Any other variety.*—1 and 3, W. H. Crabtree (Crêve-Cœurs). 2, Rev. N. J. Ridley (La Flèche). *hc*, W. Dring (Crève-Cœurs); G. De Faye, Jersey (La Flèche).

Any other Variety.—1, S. R. Harris (Indian Game). 2, R. S. S. Woodgate, Tunbridge Wells (Silkies). 3, R. H Luckham, Dorchester (White Spanish). *vhc*, R. R Fowler, Aylesbury; J. Long *hc*, W. Wildey, Cosham; J. Isard, Wokingham (Dorkings); Mrs. J. T. Holmes (Silkies). *c*, A. Ward, Wimpole Street, London.

Game Bantams.—*Black-breasted Red.*—1 and Cup, G. Hall, Kendal. 2, P. F. Le Sueur. 3, T. W. Anns, Clapham. *c*, Mrs. E. Farquharson, Blandford; Allen & Osborne, Plymouth; T. Hardy, Dorchester; Wingfield & Andrews, Worcester.

Game Bantams.—*Brown-breasted Red.*—1, S. & J. J. Stephens, Stroud. 2, J. Long. 3, T. R. Charles, Weymouth.

Game Bantams.—*Any other variety.*—1, G. Hall. 2, R. Brownlie, Kirkcaldy. 3, P. F. Le Sueur.

Bantams.—*Gold and Silver-laced.*—1, Miss M. J. Tonkin, Bristol. 2, C. H. Poole, Bridgwater. 3, Mrs. E. Pritchard, Wolverhampton. *hc*, S. Elliott, jun.; C. H. Poole.

Bantams.—*Any other variety.*—1, R H Ashton, Mottram. 2, W. H. Shackleton, Bradford. 3, R. S. S. Woodgate. *hc*, Wingfield & Andrews. *c*, Mrs. Hambro, Blandford; J. Watts.

Selling Class.—1, H. Browne. 2, Mrs. J. Pattison. 3, F. L. Turner, Dorchester. 4, T. Moore. 5, Miss E. Browne. *hc*, E. D. Sweet, Lymington; Mrs. Hayne; E. Steele (2); H. Yardley, Birmingham. *c*, R. H. Luckham; T. Moore; B. Hogg, Dorchester (3); Bellingham & Gill, Burnley; M. H. Start, Pewsey; J. Turner; J. K. Fowler.

Selling Class.—*Hens.*—1, J. N. Whitehead, Bridgewater. 2, Mrs. Martyn, Blandford. 3, Mrs. J. Pattison. 4, J. Hinton. 5, T. P. Edwards. *hc*, T. Moore; R. Gower, Wareham; E. Steele; Mrs. J. Pattison (2); J. N. Whitehead; T. Southerden, Bristol; A. Martin. *c*, Mrs. N. Grenville; N. Benjafield, Shaftesbury; Mrs. C. Radclyffe, Warnham; E. D. Sweet; Mrs. J. Pattison (2); P. Ogilvie; J. Chisman, Southampton; S. W. Thomas, Skithy; J. Watts.

Ducks.—*Aylesbury.*—1 and Cup, J. K. Fowler. 2 and 3, J. Hedges, Aylesbury.

Ducks.—*Rouen.*—1 and 2, Rev. E. Handley. 3, J. K. Fowler.

Ducks.—*Black East Indian.*—1, S. Burn, Whitby. 2 and 3, G. S. Sainsbury, Devizes. *hc*, G. S. Sainsbury; W. H. Stagg. *c*, J. W. Kelleway, Isle of Wight.

Ducks.—*Any other variety.*—1 and 2, Sir W. Marriott, Blandford. 3, J. K. Fowler. *hc*, W. Boutcher, Notting Hill, W.; Capt. C. F. Terry; R. Wilkinson, Guildford; C. H. Mayo, Dorchester (2); Sir W Marriott (2).

Ducks.—*Selling Class.*—1, J. Hedges. 2, E. Ponting, Cerne. 3, Mrs. C. Radclyffe. *c*, Mrs. Martyn (2); J. H. Hoit, St. Austell.

Turkeys.—1, Rev. N. J. Ridley. 2, E. Ponting. 3, A. Martin. *hc* and *c*, Mrs. W. Hull, Dorchester.

Geese.—1, J. K. Fowler. 2, Mrs. C. Radclyffe. 3, J. O. Riggs, Dorchester. *c*, W. H. Dunman, jun., Dorchester; Rev. E. Handley.

Pheasants.—1 and 2, C. H. Mayo. 3 and *vhc*, Mrs. T. Turner. *hc*, Lady Heathcote; C. H. Mayo (4).

PIGEONS.

Carriers.—1 and Cup, R. Fulton, London. 2, H. Yardley. *hc*, R. Fulton. *c*, G. Kempton, Packington Street, London, N. *Hens.*—1, H. Yardley. 2 and *hc*, R. Fulton. *c*, G. Kempton.

Pouters.—*Cocks.*—1 and *hc*, H. Pratt, Hampton-in-Arden. 2, R. Fulton. *c*, P. R. Spencer, Hereford. *Hens.*—1 and Cup, H. Pratt. 2 and *hc*, R. Fulton.

Tumblers.—1, Cup, and *hc*, R. Fulton. 2 and *vhc*, H. Yardley. *c*, W. B. Mappleheck, jun., Mayfield, Moseley.

Barbs.—1 and 2, R. Fulton. *hc* and *c*, H. Yardley.

Turbits.—1, C. A. Crafer, Wallington. 2, E. T. Dew, Weston-super-Mare. *hc*, G. Packham; C. W. Washbourne, Gloucester. *c*, Master J. Wainwright, Shipton Mallet; R. Fulton.

Jacobins.—1 and *vhc*, R. Fulton. 2, J. Andrews, Poole. *hc*, J. Andrews; H. Yardley. *c*, J. Andrews; W. Bishop, Dorchester.

Fantails.—1, Cup, and *hc*, J. F. Loversidge, Newark. 2, P. R. Spencer. *c*, W. Morris, West Bank, Ross.

Nuns.—1, G. Packham. 2, J. P. Mills, Exeter.

ANTWERPS.—1, H. Yardley. 2, G. Colson, Heavitree, Exeter. *hc*, W. B. Mapplebeck, jun. *c*, J. Andrews.

DRAGOONS.—*Silver.*—1, W. Bishop. 2, F. Graham, Birkenhead. *vhc*, F. Graham (2); W. Bishop. *hc*, F. & E. Osmond, Dorchester (2); W. Bishop. *c*, H. Yardley; W. Bishop.

DRAGOONS.—*Blue.*—1, R. Shuttler, Poole. 2, G. H. Gregory, Taunton. *vhc*, F. Graham; W. Bishop. *hc*, A. Boote, Crewe; F. Graham (2). *c*, H. Yardley; G. Packham; F. Graham; W. Bishop.

DRAGOONS.—*Red or Yellow.*—1, Cup, and 2, F. Graham. *vhc*, J. Edelsten, Waltham Cross; F. Graham. *hc*, H. Yardley; F. Graham. *c*, R. Shutler; G. H. Gregory; F. Graham.

DRAGOONS.—*White.*—1, *vhc*, and *c*, W. Bishop. 2, G. Packham. *hc*, F. Graham; W. Bishop.

DRAGOONS.—Point Cup, F. Graham.

ANY OTHER VARIETY.—1, R. Fulton. 2, H. Yardley. *hc*, G. Packham; R. Wilkinson, Guildford. *c*, O. C. Farrer, Binegar Hall, Warham.

SELLING CLASS.—1, J. H. Watkins, Hereford. 2, J. Andrew. *vhc*, W. Morris. *hc*, J. Andrews; Miss Dickinson, Somerton. *c*, O. C. Farrer; H. Yardley.

JUDGES.—*Poultry:* Rev. G. F. Hodgson, North Petherton, Bridgewater; Mr. E. Hewitt, Sparkbrook, Birmingham. *Pigeons:* Mr. H. Allsop, Spencer Street, Birmingham.

EXHIBITION COOP.

THIS coop was invented by Mr. James Shepard, and is termed by him "Shepard's Collapsible Coop." The top and bottom are drawer-shaped, and are held apart when expanded (as shown in fig. 28) by four removable posts. The two sides and back are

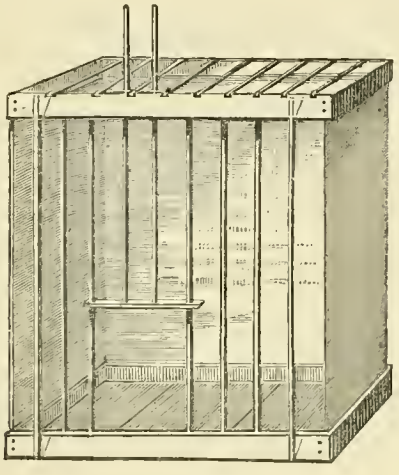

Fig. 28.

of cloth permanently secured to the top and bottom. The rear posts are on the outside of the cloth, so that there are three smooth cloth walls against which it is impossible to injure a feather. The posts are keyed-in by dove-tailed wedges, which hold the parts very rigidly together. For packing, the four posts and the rounds in front are withdrawn and packed inside the bottom, when the cloth sides are folded inwards with a bellows fold, and the top and bottom collapse as shown in fig. 29. This coop was used by the Central Connecticut and

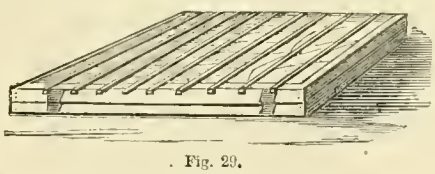

Fig. 29.

Connecticut State Societies at their late exhibitions at Bristol and Hartford, Connecticut, and was received with great favour. Although designed for exhibition purposes only, some of the exhibitors used it for transporting their birds to and from the exhibition.—(*American Fancier's Journal.*)

JERSEY EXHIBITION OF POULTRY, &c.

THIS was held in the new Vegetable Market, Beresford Street, January 20th and 21st.

DORKINGS.—*Cock or Cockerel.*—1, J. Downing. 2, Major H. Howell. *Hen or Pullet.*—1 and 2, S. Le Riche.

SPANISH.—*Cock or Cockerel.*—1 and 2, P. F. Le Sueur. 3, T. De Faye. *Hen or Pullet.*—Cup and 2, P. F. Le Sueur.

ANDALUSIANS AND MINORCAS.—*Cock or Cockerel.*—1, P. J. De Carteret. 2, J. H. Robin. *Hen or Pullet.*—1 and 2, P. Gallichan.

COCHINS.—*Cinnamon or Buff.*—*Cock.*—1, P. Gallichan. 2, —Le Feuvre. *Hen.*—1, Capt. T. S. Robin. 2, P. Gallichan. *Cockerel.*—1 and 2, Capt. T. S. Robin. *Pullet*—Cup and 2, Capt. T. S. Robin.

COCHINS.—*Any other variety.*—*Cock.*—1 and 2, Capt. T. S. Robin. *Hen.*—1 and 2, Capt. T. S. Robin. *Cockerel.*—1, J. Downing. 2, Capt. T. S. Robin. *Pullet.*—1, Capt. T. S. Robin. 2, J. Downing.

BRAHMAS.—*Light.*—*Cock.*—1, Capt. T. S. Robin. 2, P. J. De Carteret. *Hen*—1, P. J. De Carteret. 2, Capt. T. S. Robin. *Cockerel.*—1, Rev. J. Le Sueur. 2, J. Le Rossignol. *Pullet.*—1 and 2, Rev. J. Le Sueur.

BRAHMAS.—*Dark.*—*Cock.*—1, P. Gallichan. 2, Capt. T. S. Robin. *Hen.*—Cup, P. Gallichan. 2, E. Messervy. *Cockerel.*—1, P. F. Le Sueur. 2, Capt. T. S. Robin. *Pullet.*—1, P. J. De Carteret. 2, P. Gallichan.

HOUDANS.—*Cock or Cockerel.*—1, G. De Faye. 2 and 3, Capt. T. S. Robin. *Hen or Pullet.*—1 and 3, Capt. T. S. Robin. 2, P. J. De Carteret.

FRENCH BREEDS.—*Any other variety.*—*Cock or Cockerel.*—Cup, G. De Faye. 2, J. Eraut, jun. 3, P. J. De Carteret. *Hen or Pullet.*—1, P. J. De Carteret. 2 and 3, G. De Faye.

GAME.—*Black and other Reds.*—*Cock or Cockerel.*—Two Cups, 2, and 3, J. Voisin. *Hen or Pullet.*—1 and 2, J. Voisin. 3, F. G. Bertram.

GAME.—*Any other variety.*—*Cock or Cockerel.*—1 and 3, J. G. Falle. 2, J. Voisin. *Hen or Pullet.*—1, J. Voisin. 2, J. A. Ozouf. 3, P. Rideout.

HAMBURGHS.—*Spangled.*—*Cock or Cockerel.*—1 and 3, G. De Faye. 2, C. Nicolle. *Hen or Pullet*—1 and 3, G. De Faye. 2, C. Nicolle.

HAMBURGHS.—*Pencilled.*—*Cock or Cockerel.*—Cup, J. A. Carrè. 2, R. R. Lempriere. 3, J. Arthur. *Hen or Pullet.*—1, J. A. Carrè. 2, R. R. Lempriere. 3, G. R. Boydell.

MALAYS.—*Cock or Cockerel.*—Cup and 2, J. G. Falle. 3, J. Downing. *Hen or Pullet.*—1 and 2, J. G. Falle. 3, J. Downing.

POLISH.—*Cock or Cockerel.*—1, P. J. De Carteret. 2, A. Gallichan. *Hen or Pullet.*—1, P. J. De Carteret. 2, A. Gallichan.

ANY OTHER VARIETY.—*Cock or Cockerel.*—Cup, J. A. Ozouf (Black Hamburgh).

SELLING CLASS.—*Cock or Cockerel.*—1 and 2, P. F. Le Sueur (Spanish). 3, G. De Faye (La Fleche). 4, P. Gallichan (Light Brahma). *Hen or Pullet.*—1, P. F. Le Sueur (Spanish); J. Smith (Black Red Game). 2, P. F. Le Sueur (Spanish). 3, Capt. T. S. Robin (Dark Brahma). 4, P. Gallichan (Light Brahma).

CROSS BREEDS.—1, Major H. Howell (Brahma and Dorking).

HEAVIEST BIRDS.—1, Capt. T. S. Robin. 2, T. De Faye.

GAME BANTAMS.—*Black and other Reds.*—Cup and 2, P. F. Le Sueur. *Any other variety.*—1, P. F. Le Sueur. 2, F. R. Le Brun.

BANTAMS.—*Any other variety.*—1, J. A. Ozouf. 2, J. Cabot.

TURKEYS.—1, W. C. Gray. 2, N. Poingdestre.

GEESE.—1, P. Le Quesne. 2, J. A. Ozouf.

DUCKS.—1, P. F. Le Sueur. 2, P. Le Quesne.

EXTRA CLASSES.—*Peacocks.*—Extra prize, P. J. De Carteret. *Pheasants.*—1 and Extra 1, W. C. Gray. 2, P. J. De Carteret.

PIGEONS.—Cup, J. Le Rossignal. 2, H. Beyes. 3 and 6, J. A. Ozouf. 4, W. C. Gray. 5, F. G. Bertram.

RABBITS.—1, Dr. C. A. Godfray. 2, T. De Faye. 3, G. R. Boydell.

CATS.—1, C. Prince. 2, — Moignard. 3, A. Swanger.

PORTSMOUTH SHOW OF POULTRY, &c.

THIS Show was held in the Landport Volunteer Drill Shed on the 29th and 30th of January, and on the 1st of February; and as it is the second held in the same place within seven weeks the Portsmouth folks seemed determined to give fanciers plenty of opportunities of showing off their specimens. "Comparisons are odious," and we will not attempt to compare one Show with the other, and will only add that we hope the Committee another year will be a little quicker in putting up the prize cards, as when we left at four o'clock many of the awards were not known, though all the Judges had finished by two o'clock, and most of them long before. Dinners to the Judges are doubtless very commendable, but are not the public who pay their half-crowns also entitled to a little attention from the Committee? A poultry show is doubtless looked upon as a holiday, but the secretaries and committeemen who accept these offices have duties to perform to the public as well as to their insides. With this exception the management was fairly good. The poultry and Pigeons made 360 entries in all.

Game came first and formed three large classes, the cup going to a stylish pair belonging to a Jersey exhibitor; there were two or three other particularly rakish pens, but the Black Reds certainly carried off the palm. Pen 30 (Matthews) was not up to this exhibitor's usual form, the hen being heavy in body, and the cock with one light-coloured eye; they were put in at ten guineas, so doubtless meant to sell. Buff *Cochins* very good, the cup going to a large pair, rich in colour and good in shape. Mr. Tomlinson's pen was empty. The first-prize White Cochins must have run very hard for the cup; the cock's colour was simply superb, and it is no exaggeration to say that the pair were as white as the driven snow. Black Cochins were second, good as Blacks go, but certainly not equal to the third-prize Partridge, or to pen 48, Partridge. Each variety of *Brahmas* had two classes, one for old and the other for young birds: far better would it have been to have divided them into single birds, as it is ridiculous to talk about birds as chickens when they may be thirteen months old. The majority of the birds were certainly not good, Mr. Lingwood's birds standing out so far from the remainder, except in the class for Lights under a year, that it is no injustice to the Judge to say a beginner could have picked them out. Old Dark Brahmas were a poor class; the third pen quite as good as the second, and several hens in this class of a dirty brown colour. The young birds were a good deal better though, and a nice class. Light Brahmas, old birds, only brought together five entries, though a cup was offered. The hen in the cup pen was of a very good shape and colour, but destitute of toe nails, and with a diseased ear. The second-prize pen contained a very nicely-shaped cock with a good comb, and altogether the best cock in the class, but his hen not large enough. Young Light Brahmas were a very good class, this being the only case in which Mr. Lingwood met an opponent worthy of his metal. Pen 85 (Rice), which was third, contained a splendid cockerel, which looked very much like the Palace

winner, and mated with a first-rate pullet; the second-prize pen was also good all round. The first and second-prize *Dorkings* were both very good, Mr. Lingwood's pen containing his third-prize Palace cock mated with a large and dark hen. The second cock dark and good, but the pen spoilt by the hen having a bad "bumble" foot. The third cock rather too long in the leg. *Spanish.*—Mr. Le Sueur's was the only really good pen, and won easily; the hen's face of a beautiful texture, the cock, too, capital in face and comb. The cocks in the other pens looked as if they would have been glad of a little more daylight. *Hamburghs* were good classes. This breed is certainly looking up in the south. A splendid pen of Gold-pencils were easily first. In the next class Gold-spangles were first, and Silvers second and third. *Polands*, a small class but good. First to Golds, second to White-crested Blacks; third to Silvers. This was a very level class. In the *French* class an unaccountable mistake occurred, the third prize being given to Malays, which were entered by mistake instead of in the next class, the Variety class, in which several first-rate Malays were unnoticed. First going to Black Hamburghs; second to White Leghorns with very yellow ear-lobes; third to Andalusians. In Black *Bantams* there were only two pens. Silver Sebrights were first in Variety Bantams, while Duckwing and Pile Game Bantams were second and third.

Ducks fared badly, as all varieties competed together. First and third prizes to Ronens, second to East Indian. Some very handsome pens of Gold and Silver *Pheasants* attracted much attention.

PIGEONS.—Eleven classes of Pigeons only brought together fifty pens. Mr. Esquilant must have had quite a little holiday. *Carriers* were by far the best classes, the cup going to a magnificent hen. The Rev. Mr. Hodson's Blue *Dragoons*, which have been so successful lately, again came to the front, "walking in." *Tumblers* poor. *Fantails* good, especially the first-prize pair, which looked rather fresh. In *Jacobins*, first prize went to good Reds; the second prize withheld. In the Variety class first prize was justly awarded to Mr. Ivimy's Barbs. Carriers and Fantails were first and second in the Selling class.

RABBITS.—The Rabbits formed a capital show, but the classes were not well arranged. Instead of the first class for length of ear it would have been better to have had a class for the best all-property Rabbit, as when the prizes are solely for length of ear, they are a foregone conclusion. Messrs. Loveband's first-prize doe is long in ear (23⅝ inches), but rather narrow. Mr. Tomlinson's doe is ruined by having a piece pulled off the end of her ear. Several splendid Rabbits competed in the other classes—notably pen 455 (King), a Yellow-and-white doe, good all round, and pen 465, Mr. Vallom's Black doe; pen 467, a very good Belgian Hare, but too white in the nose. Mr. Greaves exhibited an exceedingly pretty Dutch doe.

GAME.—*Black-breasted Reds.*—Cup, J. Voisin, Jersey. 2 and 3, J. Carver, Tillington. *hc*, T. Faulkner, jun.; — Mason *c*, M. Sandford; W. H. Stagg. *Brown-breasted Reds.*—1, J. T. Brown, St. Austell. 2, W. Adams, Ipswich. 3, E. Winwood, Worcester. *hc*, J. Voisin. *c*, F. Warde. *Any other variety.*—1, J. Beattie, Southsea. 2, — Winwood. 3, J. Voisin. *hc*, T. Ratcliffe. *c*, J. T. Brown; H. Gibson.

COCHINS.—*Buff and Cinnamon.*—Cup, S. R. Harris, Cusgarne. 2, W. White, Canterbury. 3, Capt. T. S. Robin, Jersey. *hc*, R. Crabb; H. Feast; W. White, Canterbury; — Winwood. *Any other variety.*—1, R. S. S. Woodgate, Pembury. 2, H. Gibson, Brockenhurst. 3, J. Sleep, Islington, London. *hc*, C. H. Matthews; T. Derry; Capt. Trannois; Mrs. Brassey; Rev. A. Warde. *c*, Rev. C. Locke; W. Barker.

BRAHMA POOTRAS.—*Dark.*—Cup, Horace Lingwood, Creeting, Needham Market. 2, H. Feast, Swansea. 3, Mrs. Brassey, Battle. *hc*, Mrs. Neale; G. Gladwin. *c*, — Westcott *Chickens*—Cup, Horace Lingwood. 2, P. F. Le Sueur, Jersey. 3, Mrs. Brassey. *hc*, A. Cosens; R. Crabb (2); — Hammond.

BRAHMA POOTRAS.—*Light.*—Cup, A. Boissier, Penshurst. 2, J. Bradshaw, Cranleigh. 3, Rev. N. J. Ridley, Newbury. *hc*, Mrs. Brassey. *Chickens.*—Cup, Horace Lingwood. 2, Mrs. W. Drummond, Bath. 3, Rev. J. M. Rice, Bramber Rectory. *hc*, — Raynor. *c*, — Monckton.

DORKINGS.—Cup, Henry Lingwood, Barking. 2, Viscount Turnour, Shillinglee Park. 3, — Humphrey, Ashington. *hc*, — Humphrey; B. H. Greenhill (2).

SPANISH.—1, J. H. F. Le Sueur. 2, J. T. Parker, Northampton. *hc*, Mrs. Brassey; H. Brown.

HAMBURGHS.—*Gold or Silver-pencilled.*—1, — Tickner, Ipswich. 2, T. Faulkner, jun., Merston, Isle of Wight. 3, J. Long, Bromley Common. *hc*, Master E. Moore; T. Faulkner, jun. (2); H. Feast; J. Long. *c*, G. Packham. *Gold or Silver-spangled*—1, — Tickner. 2 and 3, J. Long. *c*, Mrs. Barnard.

POLANDS.—1, E. J. Reaves, Haywoods Heath. 2, T. P. Edwards, Lyndhurst. 3, J. Hinton, Warminster. *hc*, G. J. Lenny.

FRENCH.—Cup, W. Dring, Faversham. 2, M. Sturt, Pewsey. 3, S. B. Perry, Lymington. *hc*, M. Sturt; — Waters; A. Boissier; H. Feast; Rev. G. Chilton. *c*, Rev. C. Lock; R. J. Knight.

ANY OTHER VARIETY.—Cup, H. Feast. 2, Rev. C. Lock, Whitewell. 3, W. Wildey, Cosham. *hc*, E. J. King; J. Long; A. C. Croad. *c*, J. H. Puleston; W. West.

GAME BANTAMS.—*Black Red.*—1 and 2, W. Adams. 3, Wingfield & Andrews, Sudbury. *hc*, E. Payne; J. Long; W. Boutcher. *c*, Miss M. A. Vace. *Brown Red*—1 and 2, — Banker, Bromley. 3, S. & J. Stephens, Ebley.

BANTAMS.—*Black.*—1, R. H. Ashton, Mottram. 2, W. White. *Any other variety.*—Cup, M. Leno, Dunstable. 2, E. Payne, Cardiff. 3, P. F. Le Sueur. *hc*, M. Leno; G. Holloway.

DUCKS.—Cup, Mrs. Brassey. 2, J. W. Kelleway, Merston, Isle of Wight. 3, J. Gill, Winchester. *hc*, R. Wilkinson.

SELLING CLASS.—*Pair.*—Cup, Mrs. M. J. Passby (Brahmas). 2, Capt. T. S. Robin (Partridge Cochins). 3 C. Cork (Dorkings). Extra 3, H. Brown (Spanish). *hc*, Master M. V. Sandford (Houdans); — Whitehead (White Cochins); Capt. T. S. Robin (White Cochins); F. Rayner (Light Brahmas); — Humphrey (Dorkings); — Locke (Dorkings); T. W. Anns (Partridge Cochins); W. Ford (Spanish); J. R. Way (Dark Brahmas); J. Chisman (Light (Brahmas); J. Bradshaw (Light Brahmas); G. W. Pelter (Brahmas); T. P. Edwards (Polands); W. W. Pyne; T. Sheen (Spanish); F. Warde (Game); — Rummery (Dark Brahmas). *c*, Capt. T. S. Robin (Dark Brahmas); R. Bird (Light Brahmas); Rev. N. J. Ridley (Light Brahmas); J. Hardman (Dark Brahmas); G. W. Pelter (Brahmas).

SELLING CLASS.—*Cock or Cockerel.*—Cup, — Winwood. 2, S. Martin (Dark Brahmas). S, H. Tomlinson (Light Brahmas). *hc*, H. Sturt (Crêve-Cœur); Capt T. S. Robin (Light Brahmas); J. W. Anns (Partridge Cochin); H. S. Fraser (Coloured Dorking); W. H. Stagg (Black Red Game); J. T. Browne (Brown Red Game); B. Hill (Dark Brahmas); J. R. Way (Buff Cochin); Capt. Trannois (White Cochin); G. W. Pelter (Brahmas); T. Sheen (Spanish); F. Ward (Game). *c*, Mrs. Braithwaite (Dark Brahmas); F. Rayner (Light Brahmas); W. H. Stagg (Black Red Game); B. Hill (Dark Brahmas).

SELLING CLASS.—*Hens or Pullets.*—Cup, C. Cork, New Shoreham (Dorkings). *hc*, — Humphreys (Dorkings); W. Ford (Cochins); J. O. Hodges (Coloured Dorkings); T. Critchel (Game). *c*, H. D. Hoare (Light Brahmas); — Monckton (Light Brahmas); J. Long.

PHEASANTS.—1, Mrs. Brassey. 2, J. Collier, Northampton. *hc*, J. Collier; W. Boots; Mrs. Brassey.

EXTRA STOCK.—*hc*, — Sterne (White Bantams); — Wise (Buff Cochin); G. Richards (Chinese Geese). *c*, — Wise (Silver-spangled Hamburgh).

PIGEONS.

POUTERS.—*Cock.*—1 and 2, Mrs. Ladd, Calne. *hc*, G. Holloway, jun. *Hen.*—1 and 2, Mrs. Ladd.

CARRIERS.—*Cock.*—1, J. H. Ivimy, Ecclesfield. 2, Mrs. Carter, Farnham. *vhc*, H. Jacob. *Hen.*—Cup, J. H. Ivimy, Sandown, Isle of Wight. 2 and *hc*, H. Jacob. *vhc*, Mrs. Carter.

DRAGOONS.—1, Rev. G. F. Hodson, North Petherton. 2, H. Jacob.

TUMBLERS.—1 and 2, A. W. Pearce, Postwood.

FANTAILS.—1, O. E. Cresswell, Early Wood, Bagshot. 2, J. F. Loversidge, Newark.

JACOBINS.—1, O. E. Cresswell.

ANTWERPS.—1, W. B. Mapplebeck, jun., Mayfield. 2, C. L. Bryce, Havant.

ANY OTHER VARIETY.—1, J. H. Ivimy. 2, J. Woods, Sandown. *hc*, T. Randall; W. B. Mapplebeck, jun.; R. Wilkinson.

SELLING CLASS.—1, G. Packham, Exeter. 2, J. F. Loversidge. *vhc*, H. Jacob. *hc*, C. Cork; Miss M. A. Vace; — Durrant.

CANARIES.

NORWICH.—*Clear Yellow.*—1 and *vhc*, J. Athersuch & Son, Coventry. 2, J. Caplin, Canterbury. *hc*, T. Willsher.

NORWICH.—*Evenly-marked or Yellow Variegated.*—1 and *hc*, J. Athersuch and Son. 2, J. Caplin. *vhc*, — Willsher. *Evenly-marked or Buff Variegated.*—1 and *hc*, J. Athersuch & Son. 2, J. Caplin.

BELGIAN.—*Clear Yellow.*—1 and 2, T. Moore, Fareham. *Clear Buff.*—1, T. Moore. *Evenly-marked or Yellow Variegated, or Evenly-marked or Buff Variegated.*—1, T. Moore. 2, W. Bickell, Laudport.

LIZARDS.—*Gold or Silver-spangled.*—1, J. Athersuch & Son.

ANY OTHER VARIETY.—1, J. Athersuch & Son. 2, W. Radmore, Plymouth (Yellow-crested Norwich). *hc*, J. Athersuch & Son; — Nicolson. *c*, G. Beghurst.

MULE.—1, J. Caplin. 2, T. Willsher, Chichester.

BRITISH AND FOREIGN BIRDS.

BULLFINCH.—1, Fellingham & Wingfield, Brighton. 2, Howard & Cleaver, Wellingborough. *vhc* and *hc*, T. Willsher. *c*, O. Nicholson, Portsmouth; Mrs. W. C. Drummond.

GOLDFINCH.—1, T. Willsher. 2, Howard & Cleaver. *vhc*, O. Nicholson (2); Mrs. W. C. Drummond.

SKYLARK.—1, H. C. Furner, Emsworth. *vhc*, T. Willsher.

SISKIN, REDPOLE, OR LINNET.—1, Fellingham & Wingfield. *vhc*, T. Willsher. *hc*, T. Willsher; Mrs. W. C. Drummond.

BLACKBIRD OR THRUSH.—1, H. Noble, Portsmouth. *vhc*, G. Sparks; H. Noble; Mrs. W. C. Drummond. *hc*, — Simmons.

BRITISH BIRDS.—*Any other variety.*—1, Howard & Cleaver (Starling). 2, Mrs. W. C. Drummond (Yellowhammer). *vhc* and *hc*, — Simmons (Woodlarks). *c*, T. Willsher (Mountain Finch).

BRITISH BIRDS.—*Group in one Cage.*—Equal Prize, — Willsher; Miss M. Case.

FOREIGN BIRDS.—*Any variety.*—1, O. Nicholson (Purple-headed Glossy Starling). 2, Capt. G. A. Gray, Aldwich (Macaw). *vhc*, Mrs. E. Popham (Large Lemon-crested White Cockatoo); G. Bevis (King Parrot); O. Nicholson (Madagascar Bishop); Mrs. W. C. Drummond (Virginian Nightingale and White Java Sparrows). *hc*, Col. Elliott (Scarlet Macaw); — Crother (Green Paroquet); Capt. G. A. Gray (Macaw); O. Nicholson (Waxbills and Budgregars).

SELLING CLASS.—*Any variety of Canary or Mule, or British or Foreign Cage Birds.*—1, J. Caplin (Norwich Canary). 2, O. Nicholson (Madagascar Bishop).

RABBITS.

LENGTH OF EAR.—1, Loveband & Quick, Edgware Road, London.

BLACK-AND-WHITE AND BLUE-AND-WHITE.—1, B. Greaves, Grimsby. 2, H. Vallom, Plumstead. *vhc*, Mrs. M. E. Shelley; Loveband & Quick.

GREY-AND-WHITE AND YELLOW-AND-WHITE.—1, W. J. King, Islington, London. 2, H. W. Simmons. *vhc*, Loveband & Quick; E. Frost. *hc*, Loveband & Quick. *c*, W. J. King.

SELF-COLOURED.—1, H. Vallom. 2, E. Frost. *vhc*, Loveband & Quick. *c*, H. W. Simmons; Loveband & Quick.

FOREIGN.—1, B. Greaves (Dutch). 2, W. Lowman (Belgian Hare). *vhc*, Loveland & Quick (Silver-Grey).

SELLING CLASS.—1, E. Frost, Hackbridge. 2 and *vhc*, H. W. Simmons. *hc*, H. W. Simmons; — Westcot. *c*, H. W. Simmons; Loveband & Quick.

JUDGES.—*Poultry:* Mr. W. B. Jeffries; *Pigeons:* Mr. F. Esquilant and Mr. S. Harding; *Cage Birds:* Mr. A. Willmore; *Rabbits:* Mr. W. Heath.

WAVERLEY SHOW OF POULTRY, &c.

THE eighth Exhibition of the Waverley Society was held in the Corn Exchange at Melrose on the 27th and 28th ult., when the entries were far more extensive than those of several years back, and the quality such as was never before seen under this roof, most of the classes containing few birds except the champions of previous shows. The birds were well arranged and attended with great care.

Dorkings, which may almost be termed the figure-head of the Scotch poultry fancy, were unusually good, almost all being noticed. In old birds first was a massive pen of Silver-Greys, and second Dark Greys; but in young birds Dark Greys were first-and-cup, and second Silver-Greys. There were some good birds in *Cochins*, but with the exception of first not one well-matched pen, the second being the Belfast winning cock and a poor pullet; both pens were Buffs. *Brahmas* were a good class, the first being won by old and second by young birds, the two very highly commended pens running very close with the winners. *Game* were one of the best classes we have seen this season, to be mentioned in which was quite equal to a leading prize in some shows. The first was a grand pen of Brown Red chickens which were first at Hexham; the second (Duckwings) were the cup pen at that Show, but lost here on account of a sickle feather having gone; the third a pen of Black Red

chickens. The quality of the class may be better understood when it is known that Mr. Harley's crack pen of Brown Reds were only very highly commended. One otherwise grand Black Red had evidently been in the hands of the barber, treated for fever, or what we cannot say, but the top of his head was clean shaven. *Spanish* were unusually good, two fine pens of open-faced chickens winning the prize and one for the section, and both from one yard; every pen was fit for a prize. The *Hamburghs* were mixed classes, but the entries good; the Spangles of fair quality; the Penoils really good throughout, Gold being first and Silver second. Any other variety were first Crêve-Cœurs, and second Black Hamburghs. In Black Red *Bantams* there were some grand cocks, but the hens were not good; while on the contrary there were many good pens in the next class, where Piles were first-and-cup and Duckwings second, and in the following class Blacks were first and White-booted second; and in single cocks the first was a Pile, small and good in colour, and second Black Rose-combed. There were some Black Reds in this class very good in colour, but long in body and wing, and squirrel-tailed. The Cottagers' was a nice class. Aylesbury *Ducks* were a nice lot, but the Rouens a most extraordinary class, alike in size, with colour, marking, and bills. Some very pretty little Calls won in the next class. The Selling class was but poor. *Turkeys* were a good lot, the winners of the Cambridge variety. *Geese* were very large and good; the first Grey, and second White.

Pigeons had but few classes, the standards, such as Carriers, Tumblers, &c., not being provided for. *Pouters* were first, the first being White in grand show, large and fine in girth and limb; second Blues, equally large, but not so good in girth; a pair of most showy Blacks being highly commended, as also several other pens. *Nuns* were a large and good class; the winners very small. *Fantails* were poor, except the first-prize pen. In *Jacobins* the first were Reds and second Yellows: this was a good class. *Turbits* were in many cases fonl-thighed, but the two winning pens were really good; first Shell-crowned Silvers, faulty only in bars; second Blues, with spike crowns, but a little foul. English *Owls* were a large good class; the first Blues, and second Silvers. The Variety class had many standard birds, the first going to an exquisite pair of Almonds, second to Black Letz, and third to Dun Barbs. This was a "hot" class. The Selling class, like the poultry, was very poor. The point cup for Pigeons was won by Mr. Brydone of Edinburgh.

Cage Birds were a very good show, much bettar in fact than we have seen here before, the Scotch Fancy showing-up well, and being grand in style and colour. In Clear *Don* cocks the first was a Yellow and second Buff, but both were Yellows in hens, these being superior to the Flecked or Marked birds. There were some capital *Greens*, the winners being in fact about the best in the Show, the colour most perfect. Any other cage birds were numerous and good, the first going to a Jonque Variegated Goldfinch Mule of great beauty, second a moulted Goldfinch, and third a Bullfinch, while several good Goldfinch Mules were noticed in the list.

Dorkings.—1, D. Hardie, Priesthaugh. 2, T. Raines, Stirling. *vhc*, J. White. *hc*, G. Amos, Melrose; W. Martin, Stranraer. *c*, R. Reed, Canonbie. *Chickens.*—Cup and 1, D. Gellatly, Meigle. 2, G. Parker, Riddell. *hc*, J. White; R. Reed. *c*, G. Amos; T. Raines; J. White.

Cochin-China.—1, Mrs. W. Steven, Montrose. 2, W. Martin. *vhc*, Capt. G. F. Lyon, Kirkmichael. *hc*, Mrs. W. Steven; J. Wyse, Falkirk; A. Hutchison, Stranraer.

Brahma Pootra.—1 and 2, T. Raines. *vhc*, R. Maxwell, Dumfries; J. A. Dempster, Stirling. *hc*, J. Sandeman, Dundee. *c*, Capt. G. F. Lyon; W. G. Duncan, Dundee.

Game.—Cup, W. Ormerod. 2, Miss M. J. Nelson, Cockshaw. 3, J. A. Mather. *vhc*, D. Harley, Edinburgh. *hc*, W. Younghusband; W. Allen; J. A. Mather; Miss M. J. Nelson; D. Harley; J. Brough; W. Beveridge; R. M'Adam.

Spanish.—1 and 2, Mrs. Gracie. *vhc*, H. Wilkinson. *hc*, Willoughby and Purves; Mrs. W. Steven; W. Paterson; W. Martin. *c*, W. Paterson.

Hamburghs.—*Spangled.*—1, H. A. Clark. 2, G. Campbell. *hc*, W. Martin; H. Pickles. *Pencilled.*—1, D. Cheyne. 2, H. A. Clark. *vhc*, W. Linton; J. Taylor. *hc*, A. Pratt. *c*, D. Cheyne; T. Dickson.

Any other Variety.—1 and *vhc*, W. R. Park. 2, H. A. Clark. *hc*, T. Baillie; J. Taylor; W. Bearpark.

Bantams.—*Reds.*—1, Miss M. J. Nelson. 2, G. Dowie. *Any other variety.*—1, R. H. Ashton. 2, A. G. Lindsay. *hc*, J. Taylor; R. H. Ashton; R. Youle. *c*, J. Fairbairn; Miss J. M. Frew; Wells & Sherwise. *Any variety.*—*Cock.*—1, W. M'Gregor. 2, R. H. Ashton. *hc*, G. M'Millan; J. Ferry; Miss R. C. Frew.

Game Bantams.—*Any other variety.*—Cup and 2, Miss M. J. Nelson. *hc*, R. Youle; H. H Thomson. *c*, A. Hutton.

Cottagers' Class.—1, Mrs. Hinton. 2, Mrs. W. Allan. *hc*, J. Beith; R. H. Ashton. *c*, Mrs. Sharp; Mrs. Waugh.

Ducks.—*Aylesbury.*—1, — Dryden. 2, Capt. G. F. Lyon. *hc*, Lord A. Cecil. *c*, Lord A. Cecil; Mrs. Dickenson. *Rouen.*—1, D. Hardie. 2, W. Martin. *vhc*, J. A. Mather; D. Hardie; Miss M.IS. Nelson. *hc*, J. Steel. *c*, Capt. G. F. Lyon. *Indian or Call.*—1 and 2, D. Hardie *vhc*, J. T. Cathcart.

Selling Class.—1, W. Linton. 2, R. H Ashton. *c*, W. Paterson; T. Young.

Turkeys.—1, D. Hardie. 2, J. Allan. *hc*, Earl of Haddington.

Geese.—1, D. Hardie. 2, Lord A. Cecil. *hc*, D. Hardie; W. Brydone. *c*, G. Hamilton.

PIGEONS.

Pouters.—1 and 2, J. Dye. *hc*, A. Anderson; J. Dye; M'Gill Skinner (2); J. E. Spence.

Fantails.—1, A. Crosbie. 2, A. Smith.

Nuns.—1, W. Brydone. 2, M'Gill Skinner. *hc*, R. Laurie (2); W. Brydone; E. North.

Jacobins.—1 and 2, W. Brydone. *hc*, R. Raines.

Turbits.—1, W. Brydone. 2, A. Crosbie. *vhc*, R. Laurie; W. Brydone. *hc*, R. Laurie; J. Dye (3); M'Gill Skinner.

Owls.—*English.*—1, W. Brydone. 2, J. Dye. *vhc*, H. & G. Brown. *hc*, R. Laurie; J. Dye; A. Anderson; W. Brydone. *c*, A. Anderson.

Any other Variety.—1, W. Brydone. 2, A. Crosbie. 3, J. E. Spence. *vhc*, J. Dye. *hc*, A. Smith; J. Dye; M'Gill Skinner. *c*, E. North.

Selling Class.—1, A. Anderson. 2, J. Dye. *hc*, R. Raines; W. Brydone; M'Gill Skinner. *c*, W. Ritchie; J. Day (2); E. North (2); A. Hutton.

W. Brydone, Dunae, winner of Pigeon Cup.

CAGE BIRDS.

Yellow or Buff Don.—*Cock.*—1, Miss Hawkins. 2, R. Hunter. *hc*, W. Mirtle; J. Hardie; R. Hunter. *c*, T. Darling. *Hen.*—1, Miss Hawkins. 2, T. Darling. *hc*, R. Hunter (2); A. Mason. *c*, A. Mason; A. Jack.

Yellow or Buff-flecked Don.—*Cock.*—1, W. Mirtle. 2, R. Hunter. *vhc*, A. Mason; H. Mein. *hc*, Miss Drummond; T. Darling. *Hen.*—1 and *c*, R. Hunter. 2, A. Jack. *hc*, T. Darling (2); Miss Hawkins; J. Hardie (2).

Canary.—*Green.*—1, R. Hunter. 2, A. Mason. *hc*, A. Jack. *c*, J. Hardie.

Cage Bird.—1, T. Wilson. 2, J. Shiel. 3, J. Wishart. *vhc*, T. Frood; W. Douglas. *hc*, T. Frood; J. Shiel, jon.; R. Beattie; T. Wilson; W. Speirs. *c*, J. Crawford; A. Drummond; R. Moffat; J. Laidlaw; J. Wishart.

Parrots.—1, Mrs. Paterson. 2, Mrs. Main. *hc*, W. Romanes, Melrose. R. Hunter, Galashiels, winner of Canary Cup.

Judge.—Mr. E. Hutton, Pudsey, Leeds.

NATIONAL PERISTERONIC SOCIETY'S GRAND ANNUAL SHOW

AT THE CRYSTAL PALACE, Tuesday, January 26th.

The notice of this Show which we now place before our readers is perhaps somewhat impatiently looked for. We may say that we found it impossible to complete such a report as the Show merited in the few hours by which it preceded the issue of our last number.

This Exhibition, for quality of the birds, their numbers, or the perfection of the thousand and one arrangements necessary to prevent a hitch, proves what rapid strides in popular favour the National Peristeronic Society has made even during the last year. New names, new studs of Pigeons will be very noticeable in our description, and further indicates that amongst the members are working officers and a most energetic Committee. The Show was held as heretofore in the tropical department of the Crystal Palace, entering which, and following the rule of the road, we turn to the left, and find ourselves at once before the first of that long series of mahagony pens, so light and so uniform, admiring the Barbs of Mr. Hedley and Mr. Heritage. Some were specimens of the highest class. One young Red we singled out in Mr. Hedley's pen as a bird of extraordinary promise, and expect to hear of him again. Next are placed Mr. Gill's Almonds, then three pens containing about fifty birds of Mr. J. B. Jayne of Croydon, next Mr. Merck's contribution, and lastly Mr. Heritage's and Mr. Johnstone's. These almond-coloured birds formed a grand display if all the other Pigeons had flown away. The barleycorn beak, the puny wattle, the high forehead, the wide skull, the dolphin eye, the little coquettish whisker were here to the heart's content, whilst their variegated and bright feathers became resplendent as the beams of light descended on them through the crystal roof. Such a collection has not at any one time been seen before. We were gratified to find our old but too neglected favourites the Black Mottles represented by some good birds of Mr. Henning's. Next is a pen of good clean-cut clear-feathered Baldheads of Mr. South; then some good Baldheads shown by Mr. Newman. Mr. Clay of Manchester showed English and foreign Owls, the first exceptionally good; also some very stout Barbs, and a magnificent pair of Dun Carriers. We preferred the hen, though the cock is the hero of a hundred fights, and retains his prime condition.

This year Pouters were not remarkable for their absence, one table extending the whole length of the Alhambra façade, and containing compartments for thirty-one birds, was fully occupied by twelve grand birds of Mr. Gresham; fourteen shown by Mr. Gill, including some fine Yellows, and half a dozen by Capt. W. Hill, in the number a young Blue cock, every inch a Pouter, and perfect in line and contour. Mr. Herbert exhibited Owls, Magpies, and Turbits; Mr. Stevenson also Turbits of a rich yellow tint, and Magpies. Next is a pair of Jacobins, Mr. Easten's of Hull; the close frill, the hood, the true-shaped Jack skull here proved what skill and patience the birds had received from their owner. Mr. Easten also sent some good Yellow Turbits. In adjoining pens are Mr. Tegetmeier's Pigmy Pouters and homing birds, classes in which he is pre-eminent. Then comes a pen of Mr. South's Turbits; the rich, clear, and deep colour of these birds was so striking that we heard one good fancier confess how one illusion had been destroyed: he has hitherto felt confident he was first in colour for Red Turbits, and now he saw he was a bad second. We now have to notice a pair of that popular variety, the White Fantail, containing twelve birds, the flower of Mr. Vander Meersch's famous stock, and well they sustained his reputation. About two dozen beehive pens for single birds filled the centre table, and they are tenanted by young Carriers from the lofts of Mr. Hedley and Mr. Heritage. The majority were birds of high excellence, even for these days of Carrier development, and they formed a prominent feature in the Show.

Carriers, always the bird *par excellence* in the National Peristeronic gatherings, were represented here also by Col. Hassard, who penned a couple of dozen Blacks and Duns, and who, true

to his old fancy, sticks to the Blues, whilst many forsake them for the more popular colours; and we rejoiced to find he had sent fiue excellent Blues and Silvers to put in an appearance. Carriers are further represented by a pen of twelve fine birds shown by Mr. Hedley; by seven birds of an energetic fancier, Mr. Sargent; by two pens of Mr. Pratt; by twelve birds of Mr. Keylor, showing great snbstance; by twelve birds of Mr. Crisp, stylish and promising, also by two Whites—we see he is in earnest to follow up his Bristol success (cup for Whites), in which as a fancier of the right sort he has our hearty good wishes —by fifteen excellent birds of Mr. Faith's, ono of our oldest Carrier fanciers; by thirty birds from a fancier well settled in the right groove for Blues, Blacks, and Duns—Mr. Hodgson; by twenty Blues and Blacks from Mr. Ord (perhaps not such a display as in some former years, but then how many of his strain are there not in the lofts of our most noted judges?); by some excellent birds of Mr. Gill's, and by the Plymouth contingent sent by Mr. Square, always a powerful auxiliary in these grand shows; by twenty Blacks and Duns shown by an old member of the Society, Mr. Feltham—good birds, though we understand his best were in the country. We mnst now dismiss the Carriers, yet not without expressing a hope that in the next annual Show Mr. Montgomery may find his way from Belfast and pen a few of his magnificent strain of this breed.

There is a Pigeon bearing two names—*i.e.*, "Homing," to denote its characteristic, and "Antwerp," to mark the country of its origin. We find, however, it bears a third appellation—*i.e.*, the "Carrier;" at least we observed some pens so labelled. We hope to offer no indignity to their possessor if we include them not amongst Carriers as the term is accepted by us, but describe them as "Homing birds." About 150 of these were exhibited by Mr. Hudson; many of these birds of noted pedigrees, others crossed with the Dragoon, a fine collection of Smerles and Blue Beards, and in colours Blue, Blne-chequered, and Red-cheqnered. The journeys they had performed were dnly noted in the pens, ranging from 150 to 580 miles. Mr. Theobald sent a pen of fourteen fine-looking "Homers," and Mr. Little also a pen of twenty-four Red-chequered of his well-known strain.

We arrive now before a pen of Blue Dragoons, and of the true type, shown by Mr. Barnet; next is the pen of Mr. Esquilant, containing Silver and Powder-blue Owls. On sustaining this old-fashioned strain our well-known judge and enthusiastic Pigeon lover has exercised his skill for some years with the result now to place seventeen fine specimens before the younger fancier, to educate the eye but too frequently erring since the introduction of the Foreign variety as to the true points of the English Owl, which for beanty of shape, colour, and carriage we trust will retain its position amongst our most highly-prized Toys. Next is a pen of the same variety shown by Mr. P. H. Jones, very level in quality, and a pretty collection. In contrast with the prim close plumage of the Owl comes a pair of that highly-prized breed—the modern Trumpeter, shown by a recently-elected member of the Scciety, Mr. Schweitzer, who also exhibited a pen of twenty-four Foreign Owls—Silver, Whites, Blues, &c., each bird a gem. This pen could not fail to be a great attraction to visitors, in fact it was the largest collection we recollect to have seen or heard of as the property of any fancier. We wish Mr. Schweitzer all success in results after he has paired his birds. A pair of Jacobins also his property were high-class specimens. Mr. Whitehead's pen contained fourteen Yellow Owls (English), all of excellent colour, not so short-beaked as the Blues, their *confrères;* but where shall we find better?

Close by, Mr. Banks' Jacobins arrested the attention of all judges by their very superior style and quality, to which Mr. Bull's Jacobins proved themselves not unworthy neighbours. Some very excellent birds (perhaps, if they were well looked for, a few of the best Jacks in the country), would be found in his pen. This variety now holding snch a prominent place in public taste was worthily represented. Mr. Tegetmeier's pen of twelve Blue Dragoons had the head, beak, skull, colour, and carriage which this bird ought to possess. Mr. Whitehead's pen of Dragoons consisted of Grizzles, Blues, and Yellows. A very interesting collection. Of Yellow Dragoons, so profusely represented in former years, there was bnt one pen. It was filled by Mr. Betty's birds, which found admirers as usual. Lastly, a pen of Almonds, somewhat out of place it struck ns, amongst the larger Dragoons and Antwerps. We trust Mr. Ford will secure a place next year for his very pretty Tumblers near their own class.

Such are the notes we jotted down whilst doing the tour of the Show. Its extent is proved by their length, which we shall not extend further than to congratulate the officers and members of the National Peristeronic Society on their successful effort this year to carry ont one of the main objects in their scheme, to popularise and extend Pigeon cultnre.

Crystal Palace Bird Show.—The twelfth annual Exhibition of Canaries and British and Foreign Cage Birds is fixed to take place on Saturday, February 13th, extending to the 18th. The entries are announced to close February 3rd, after which date all post entries will be charged 25 per cent. in addition to the fixed entry. Post entries to close February 6th. The classes for entering birds amount to the unprecedented number of eighty, besides a class (a new feature in the Exhibition) for show cages, for which a silver medal will be awarded as a first prize, and two money prizes for second and third. The prizes offered for cages will be awarded with the view of giving a uniform appearance to cage bird shows. The cages will include fittings, which shall in the opinion of the Judges best fulfil the combined requirements of cheapness and excellence of construction. In the Selling class each exhibitor will be entitled to the same number of entries as he shall have made in the competing classes. The classes for Canaries and Mules extend to forty-one, with fourteen for British birds, three classes for birds of passage and migratory birds, and twenty-one classes for foreign birds. The Judges are Messrs. Harrison Weir, J. Jenner Weir, G. J. Barnesby, A. Willmore, and R. L. Wallace.

DEPRESSION OF HIVE FRAMES.

I thank Mr. Cheshire for his offer of assistance in trigonometrical calculation (page 601 of last volume), but as I require no such instruction, and as it has no bearing on the question at issue, it may be dispensed with.

I still maintain that it is impossible for the bees to depress the bars as stated. A bar might warp from fault in the wood, bnt not from the weight of the bees, considering that a swarm is distributed over several bars, and that the bees on one bar do not suspend themselves from the centre only, but from nearly the whole length. As to the bees commencing their comb in the centre, that greatly depends on the position of the hive, for they generally commence from the highest point, and, as it is extended along the bar, must necessarily give a certain amonnt of strength, and the conformation of the cells tends to support themselves. As to the bees attaching the comb to the floor-board, the instance Mr. Cheshire gives is no proof that they do so naturally; in his case it might have arisen from careless manipulation, and allowing pieces of comb to fall in the hive, which the bees would immediately make fast, and should those pieces be within a certain distance of the main comb they would of course attach them. I deny that bees ever naturally build down to the floorboards.

As Mr. Cheshire refers me to his letter, I refer him to mine. I said bees do "sometimes" attach the comb to the bottom "rail," not floorboard.

With regard to ventilation, Mr. Cheshire says that in full skeps the cluster extends down to the floorboard. I can only say I never saw so large a swarm in winter; and even if they did it could have no prejudicial effect, for no one will deny that bees winter as well in a skep as in any other hive if they have shelter and sufficient food.

I am still at a loss to understand how the bottom rail aids ventilation. I suppose Mr. Cheshire will allow that the heat in a hive is generated by the bees, as warm air is lighter than cold; but Mr. Cheshire does not tell how he gets rid of the warm air at the top to allow the cold to take its place, or how the said rail assists in doing so. Mr. Cheshire's letter as a literary production is all very good, but if the theories therein promulgated are correct, then the attempts that have been made to instil into my mind common reason have signally failed. Mr. Cheshire appears to be singularly erratic in his commendation of hives, and I would like to know how he can reconcile his letter in the "British Bee Journal," pages 186, 187, and 188, with his letter in the *Journal of Horticulture* of November 26th. Mr. Cheshire expresses himself puzzled by the last sentence of my letter. May I be allowed to explain that, if my memory serves me, the hive which Mr. Cheshire claims as his consisted of a combination of several gentlemen's ideas, and because the one improvement does not exist in his (?) he condemns it? Why does not Mr. Cheshire send his hive to the Editor of the "British Bee Journal" as he promised to do?—Pecchione.

THE SLINGER.

Some weeks ago one of your correspondents in reply to my letter on the slinger, asks, "Where is Mr. Pettigrew's authority for saying the patrons of the slinger tell us that swarms spend their first year in filling the bar frames with combs?" The literature of the bar-frame school which I have seen has led to this conviction. At the present moment I cannot remember of any records given of results of swarms in bar-framers. The principal bar-frame apiarian in the neighbourhood of Manchester told me, as I said before, that both honey and swarms could not be obtained in one season. When I penned the remark I had my mind fixed on an article of recent date, written as I think by an inventor or improver of bar-frame hives. I cannot lay my hands on the number which contained this article, but

I am of opinion that it was in a recent number of a periodical that I read very explicit statements that swarms spent their first year in filling frames with combs. But Mr. Hunter should be able to correct us (if we have been misled) from his own experience. What was the weight of his heaviest swarm last year? How much honey did he obtain from any one swarm? If his own locality is not a good one for honey, perhaps he will help us to information as to what swarms in frame hives have done elsewhere in their first year. If swarms in such hives rise to 100 lbs. and upwards first year (and why should they not?), the slinger may be used in casting honey from their combs before they are removed to the heather. Heather honey cannot be extracted by the machine in question; and I think it right to let Mr. Hunter know that the gentleman who bought the machine could not get it to extract heather honey, and he tried it fairly before he sent it here. The honey put into the machine here had never been "allowed to set," and at the present date is not set, standing where it did three months ago.

I have read an account of the slinger from the same pen that I fancy wrote the remark about the first year being spent by swarms in filling their frames. Mr. Hunter well knows the writer of this quotation:—"Extracted honey (by the machine) is for two reasons hardly equal in quality to run honey. It usually contains more water, and is darker in colour; but if the whole of the comb be sealed the first objection obviously will not stand, because bees allow the excess of moisture to evaporate before sealing. The strong colour arises from the stain given by the old and tough comb, which is more suitable for slinging than the young and tender."

The correctness of this writer's views may be questioned. I merely quote his utterances as I find them.—A. Pettigrew.

OUR LETTER BOX.

Intermittent Laying (*Dark Brahma*).—Your hens are merely suffering from change of home. It is usual for them on such occasions to leave off laying for a day or two, till they get settled-down in their new abode. They will soon begin again. Dress the cocks' combs with some citron ointment, and they will soon be well.

Brahma Crop-bound (*T. H. E.*).—See what is said on page 83 of our last number.

White Peacock (*D. Drake*).—The White is a distinct breed. When crossed with the common bird the white is mingled with the various colours, and often produces a very pretty and striking effect.

Proper Homing Pigeons (*G. H. R.*).—The Long-faced Antwerps are the proper Homing Pigeons. The Short-faced may perhaps home fairly; and the old-fashioned English homer was the Dragoon. If you get good homers when you let them out they are sure to go home; but get such, let them breed, and then train their young.

Crystal Palace Canary Show (*M. G.*).—No bird will be allowed to be removed until after 5 P.M. on the 18th of February. See the eighteenth rule.

Feeding Bees (*Alicia*).—See what is said on page 89 of our last number.

Canary and Goldfinch Mules (*Ornis Aghalee*).—The best-coloured Mules (Jonques) are undoubtedly bred from deep-coloured Canaries paired with Goldfinches. You may experience far less trouble when breeding with a cock Goldfinch and a Canary hen than *vice versâ*. As a rule, a hen Canary will go to nest and attend to her eggs and the young broods in a more shipshape way than a Goldfinch hen will. One understands the nature of her duties; the other bungles over her work, and fails to perform it satisfactorily. When breeding with a Goldfinch hen it is very necessary you have a Canary hen going on at the same time, so that you may transfer the eggs of the former to the nest of the latter. It is odds against the Goldfinch hen laying all her eggs in the nest; she may attempt to construct, or you may have to provide for her. They (the Goldfinch hens) take it into their heads sometimes to lay their eggs partly in the nest, and frequently they may be found upon the bottom of the cage. It is fortunate if they are not found broken. You are doing quite right in temporarily placing the Goldfinch hen with the Canaries; it will familiarise her somewhat. We should prefer the Jonque or deep yellow cock for her mate; but it will be time enough if you place them in their breeding quarters at the middle or latter end of April. Goldfinches are not ready for breeding purposes so early in the season as Canaries, unless they have been forwarded with an artificial temperature. We have known instances of Goldfinches breeding in early March, but we suppose, from what you have stated in your letters, that your birds have been kept away from artificial heat. You may let the birds "share each other's society" until the middle of March (when you will be breeding with the Canaries); and if by then you should perchance notice any one of the three cock birds "scrape an acquaintance" with the hen Goldfinch, then you may select the pair and place them in a smaller cage to make the cock Canary still more attentive in his loving devotions. If you were to keep the Goldfinch hen with the Canary hens in the apartment over the doorway whilst they were breeding, her presence very likely would cause an annoyance, and the work of building would not proceed so satisfactorily. Incubation would also be retarded, and broken eggs might be found.

Seed for Canaries (*R. H.*).—The seed we referred to in a previous issue, understood in some of the agricultural districts by the name of "kedlock," is corn-cale, a species of wild mustard seed (Charlock arvensis), the blossom of which is yellow, the seed being of a brownish colour. It grows very freely in corn fields. As the corn-cale is not a marketable seed, corn chandlers or seed merchants would be unlikely to supply it. The way we became possessed of our seed is through having purchased it from those who have had the opportunity of obtaining the same either as a perquisite or at a cheap sum after it had been sifted from threshed corn. An advertisement offering to purchase the seed would no doubt bring some to hand. Even since receiving your letter we have had the offer of half a peck from a bird dealer, which offer we accepted. A little rubbish, such as sweepings and fine chaff, is mostly unavoidably mixed with the "kedlock" or cale seed, and we find it better, when supplying it to the birds, to occasionally throw a handful or so on to the bottoms of the cages for the birds to seek after. This plan is preferable to placing it either in the seed fountains or drawers, and the birds are none the worse for being kept industriously employed hunting it up. The cale seed is of a warmish nature, but it suits our Canaries well, in the winter especially. Goldfinches will eat it, and Linnets have great liking for the same. The cale seed may be given to birds kept in small cages besides those in aviaries. It is of more value now, considering the scarcity of Canary seed, which is realising 200*s.* per quarter, with the not very cheering prospect to Canary fanciers of it still increasing in price. It behoves bird-keepers to study economy by bringing into use more freely hemp, rape (scalded), flax, white millet, and groats, and even the coarser portion of Scotch oatmeal, and crushed biscuits and German paste. By this plan the use of so much Canary seed may be avoided.

Cockatoo Management (*Polly*).—It should have some tepid water in a soup plate to bathe in once or twice a-week; and a constant supply of fresh water to drink. Feed on cold sopped bread and milk two days running, on the next rice boiled in milk, and on the fourth day soaked Indian corn. In addition to this a small quantity of hemp and canary seed mixed should be put in a separate tin every day. We should also occasionally give it some watercress, a radish, or a piece of raw potato, and sometimes a nut or some orange; but it should never taste pastry, meat, nor, in fact, anything that has fat in it.

Crickets and Beetles (*J. Ross*).—Try Chase's beetle poison. It is sold by chemists.

REMARKS.

27th.—Dull, though fair in the morning, and soon becoming a fine bright day.

28th.—Rain early, but soon clearing up; on the whole a fine, bright, and pleasant day.

29th.—A most uncomfortable day and night; very little rain fell, but it was a continued small fall during the day.

30th.—Very fine bright day, but rather windy and cold.

31st.—Very fine and pleasant all day.

Feb. 1st.—Fair, but rather hazy till 10 A.M., very fine after.

2nd.—Rather dense fog till after 9 A.M., and slightly so all day.

Temperature much the same as last week, but its range slightly greater, as there has been less rain and a less cloudy sky. Barometer very high throughout.—G. J. Symons.

COVENT GARDEN MARKET.—February 3.

The general demands of the trade have somewhat improved prices, but the supply is still well kept up, and very few articles will bear a higher quotation. French goods are coming in good condition, and frame Potatoes from the Channel Islands are now offered at 2*s.* to 3*s.* per pound.

*From observations taken near London during forty-three years, the average day temperature of the week is 45.7°; and its night temperature 30.3°.

SOME BEDDING PLANTS FROM SEED.

IT may be well to preface this paper by the remark that it is meant especially for those who, though anxious to have a well-furnished summer flower garden, have not the accommodation necessary for wintering a large stock of bedding plants. This class is, happily, year by year becoming larger, and the standard of taste is being so rapidly elevated that flowers, instead of being looked upon as things of luxury, are almost becoming necessaries of life. To very many a home without a nice garden is not a home at all, but only a house to live in. This being so, that law which almost always brings a supply where there is a demand is fast giving us a stock of hardy and annual plants specially adapted to the wants of the almost glassless amateur. Less than twenty years ago little could be done in the way of furnishing a flower garden with continuous summer-blooming plants, except with tender things kept over winter. Now, between those which are hardy and those which can be got up from seed in spring by the help of a little glass, a good display can be made.

It is presumed that the amateur has a frame or two and the means of making a hotbed, which should be done early in February; and as so many, in fact all, the good fortunes of the year depend upon this hotbed, it may be well to say a few words about the making of it.

At this season it is no mere cartload or so of stable litter and leaves that will do. For a single-light frame, say 6 feet by 3½ feet—and in most of cases this will be amply sufficient—a bed 9 feet by 6½ feet will be needed, which gives a margin of 18 inches all round the frame; and to do this four or five cartloads, according to size, of stable dung will be needed. If leaves are to be had, less by a cartload will do. They serve to steady and prolong the heat; but if the dung be properly prepared, and the bed well built, they can be very well done without. Let the dung be first thrown up into a high conical heap, shaking it well in doing so; and as at this season there is more danger of its being too wet than too dry, the outside of the heap should be lightly combed with a wooden rake, which helps to run off the heavy rains. When fermentation has set in, turn the heap two or three times at intervals of forty-eight hours or so, until the heat begins to moderate, and the dung is all of a uniform dark brown colour, when it is ready for use.

To make the bed, measure a space 6½ feet by 9 feet, or 3 feet more each way than the size of the frame, whatever that may be, drive in a stout stake at each corner, and proceed to build by putting on thin layers all round, shaking it well, and beating each layer level with the back of the fork. It is a bad practice to tread it every two or three layers, as I have seen some do; the weight of the frame and pots will soon make it solid enough. When about four-fifths of the material have been used slope the top of the bed so that it may be 6 inches lower at the front than at the back, and then put on the frame, when the remainder of the dung may be built round about it quite up to the top. I prefer this method early in the season for small frames; later and with larger frames 6 inches of a margin is sufficient. In a day or two a strong heat accompanied by a rank steam will be given off. This will not continue long if the dung has been well fermented in the first instance, and when the heat stands at about 75°, and the air in the frame is clear or nearly so, it is then fit for anything. For plunging material, although it has some disadvantages, I like nothing better than sawdust; but sandy soil, sifted coal ashes, or tan will do.

The next best thing to having plenty of plants when bedding-time comes is just to have enough and not very many to spare. Surplus plants represent wasted labour, which might have been more profitably employed in improving the quality of those really needed. It is, therefore, well to have an exact calculation made beforehand of what is wanted, allowing, of course, a pretty wide margin for mishaps.

Ageratums (the dwarf varieties).—If cuttings of these are to be had they are better than raising seedlings, and they strike very freely in heat, but the strain is now so well fixed that a very equal stock can be had from seed. Sow somewhat thinly in a shallow box or in pots, covering very lightly with fine soil. When the seedlings have attained two pair of leaves prick them into 3-inch pots, two in each, or two abreast, into long narrow boxes, out of which they are conveniently planted. Such of them as show undue grossness of growth should be pulled up as soon as noticed, or, at least, separated from the rest.

The best varieties are Chater's Imperial Dwarf, clear azure blue; Pluto, lightish blue, very profuse bloomer; Tom Thumb, porcelain-coloured.

Lobelias.—The Erinus varieties, especially the dwarf sorts, are indispensable in the flower garden, and they should be sown as early as possible. The seed is very small, and being sent out in infinitesimal pinches, which are called packets, requires to be carefully handled. Prepare the pots by thoroughly draining, and use soil composed of half loam, half leaf mould, tempered by a little silver sand, that for the top of the pot being finely sifted. Press it rather firmly down, so that it may not get dry so soon on the surface as it would if loose, making it quite smooth on the top. Having sown the seed as evenly as possible, do not cover it with soil at all, but give one watering through a very fine-rosed watering-pot, and then cover the pot with a sheet of glass. If it can be done without, do not water again until after the seed has germinated. If the pots should afterwards get dry take them out of the frame, and place them for a few minutes in 3 or 4 inches of lukewarm water, which will moisten the soil without disturbing the seeds. When the seedlings can be handled, prick them 2 inches apart into boxes, either returning them into the hotbed frame for two or three days, or, if put into a cold one, shading and keeping them close until they are somewhat established.

The following are good sorts:—Lobelia Erinus speciosa, Crystal Palace variety; L. Erinus compacta; L. Erinus

Paxtoniana, bright blue, with white eye, loose grower; L. pumila grandiflora, very dwarf and dense in habit. There are also white, lilac, and crimson varieties very pretty, but not much needed.

Petunias.—The Petunia, although immensely improved of late years, does not receive from florists that degree of attention which it deserves. Our present strain appears to have sprung originally from P. nyctaginiflora and P. integrifolia, or Nierembergia phœnicea as it was first called. Like the allied genus Salpiglossis, it is very variable, so much so that it is hardly possible to propagate any given variety by seed. The colours range through various shades of white, pink, rose, crimson, violet, purple, and green. Could the colours yellow and pure scarlet be imported into it there would be few more showy flowers than the Petunia.

Sow during the middle or end of February, and treat the same as Lobelias. If potted instead of being put into boxes it will be an advantage at planting-out time. As they are apt to grow too gross, the beds they are intended to fill should have little or no manure. For large beds sow the P. grandiflora, varieties kermesina, roseo-alba, and violacea; for smaller beds, atro-violacea and Countess of Ellesmere.

Tagetes signata pumila.—A most serviceable yellow bedding plant on wasted gravelly soils, although it is rather looked down upon. It is generally sown too late, the middle of February being nothing too early to secure good, bushy, little plants. Sow in heat, and when large enough to handle prick-out the seedlings into a cold frame prepared with light loamy soil. Stop and pinch as required to make stout stocky plants.

Verbena venosa.—An all but hardy Verbena with half-tuberous roots, from which, when once a stock has been obtained, it can be afterwards propagated with great facility. Seed sown now will produce plants fit to bed-out, and though they will be somewhat late in coming into bloom, they will make a fine display during the autumn months. The trusses are small, but very numerous, and of a beautiful purplish mauve colour. It makes good back lines for ribbon borders, or for filling the centres of large circular beds. The seed germinates more freely when sown late in spring in a very mild heat than it does in a strong heat at this season.

Gaillardia.—A half-hardy perennial possessed of great blooming powers, not so much used for bedding as it once was. The beginning of March is nothing too late to sow it, pricking-out the seedlings into a cold frame or under hand-glasses. The best known variety is G. picta, but the following are better worth growing:—G. hybrida grandiflora, yellow and scarlet; G. speciosa insignis, crimson; G. coccinea, scarlet; and G. Richardsonii, crimson and orauge.

Dianthus sinensis.—This, well known as the Chinese Pink, is in all its varieties a capital hardy bedding plant. Like its homely relation the Sweet-William, the variety of gorgeous colours which a bed of mixed sorts presents is something wonderful. Sow early, and as every seed will grow, sow thin, at no time allowing the seedlings to spindle-up for want of room. When in bloom during summer they require some attention in removing the seed pods, and even thinning the flowers, which greatly prolong the season of their blooming.

Perilla nankinensis.—This gloomy Nettle is, as an individual plant, about as ugly as it is possible for a plant to be yet few who have a flower garden to fill care to be without a little of it. The seed germinates very slowly, and not always very certainly, and should therefore be sown thickly. Transplant the seedlings into boxes, and protect from spring frosts, as it is very tender. P. laciniatus has deeply-cut leaves, and is rather more ornamental than the old sort.—Robert D. Taylor.

ROYAL HORTICULTURAL SOCIETY.

February 9th.

ANNUAL GENERAL MEETING.

The Annual General Meeting of the Royal Horticultural Society was held last Tuesday in the Council-room, South Kensington, under the presidency of Viscount Bury, the President. The members of Council present were Sir Alfred Slade, Bart.; Sir Coutts Lindsay, Bart.; Mr. Robert Warner, Mr. Little, Mr. W. A. Lindsay (Secretary), Mr. H. Webb, Mr. Kellock, &c. Amongst the Fellows present were Col. Trevor Clarke, Mr. S. H. Godson, Mr. G. F. Wilson, Mr. Robert Fortune, Mr. W. Paul, Dr. Hogg, Dr. Denny, Mr. Veitch, Mr. B. S. Williams, Mr. Hibberd, Mr. Charles Edmonds, Mr. Bull, Mr. Alfred Smee, Rev. George Kemp, Mr. Quilter, Mr. G. T. Saul, Mr. John Lee, Mr. H. Ormson, Mr. J. Bateman, Mr. Haughton, &c.

The Secretary, Mr. W. A. Lindsay, read the advertisement convening the meeting; and also the minutes of the last meeting, which were confirmed.

Mr. Pinches and Mr. Fortune were appointed Scrutineers, and the result of the voting was as follows:—In the place of the vacating members, J. A. Hardcastle, Alfred Smee, F.R.S., and J. Herbert Tritton, the following were elected:—The Hon. and Rev. J. T. Boscawen, Mr. William Longman, and Mr. J. D. Chambers. The extraordinary vacancy caused by the retirement of Lieut.-Gen. the Hon. Sir Alexander H. Gordon was filled by the election of Mr. Frederick Campion. The officers were re-elected as follows:—Viscount Bury, President; Mr. Bonamy Dobree, Treasurer; Mr. W. A. Lindsay, Secretary; Sir Coutts Lindsay, Bart., Sir Alfred Slade, Bart., and Mr. Bonamy Dobree as Expenses Committeemen; Mr. P. M. Leonard, Mr. H. Liggins, and Mr. Conrad H. Pinches as Auditors.

The Report of the Council was taken as read.

The Chairman rose and said—Ladies and Gentlemen: The question I have to submit to you, I am happy to say, will require but a few words from me on the present occasion—that is, upon the Report which the Council think it their duty to submit to you. There was a time when we had reason to believe that this meeting might be somewhat of a stormy character, and that we, the members of the Council, should, perhaps, have to battle for our lives; but I am happy to say that these sinister auguries have been entirely dispersed, and that we find, far from being called upon to encounter any direct or any covert hostility from our landlords the Royal Commissioners, that we are likely to receive from them all the support they can give consistently with their high position [cheers]. It is only quite recently that this happy state of affairs came into existence, or that I should have been able to announce to you the realisation of this happy state of affairs. It is as well to be perfectly candid in this matter, and I will confess that we, the Council of the Royal Horticultural Society, have felt that we have been somewhat hardly dealt with, and that the Commissioners did not appreciate our real position. It is possible, as we felt the interests of ourselves and of the Society have been trembling in the balance, we should not have been so courteous or conciliatory as we might have been under happier circumstances. There is no doubt in the heat of argument we have both said to each other hard things which we regret, and which we regard as better if not said [hear, hear]. We put forward this frank expression of opinion on our part—and I think I express the opinion of my colleagues; and I only hope it will be accepted as frankly as it is given, and that the circumstances will be taken into consideration under which the Report referring to the Commissioners has been made. I must go back only for a moment to the time when we first took office. The Commissioners were placed in relation with the Horticultural Society by a resolution the terms of which were undefined, and which might be taken to mean that both bodies would work in common for a common end. But outside the Royal Commissioners—I had almost said outside the Horticultural Society—there sprung up two bodies who had great and substantial rights under the agreement made with the Royal Commissioners—the Fellows on the one side, and the debenture-holders on the other. At last the time came when the Royal Commissioners, or rather when the Royal Horticultural Society, acting on what they then believed to be not altogether in their own interest, proposed to accept terms from the Royal Commissioners which the outside Fellows of the Royal Horticultural Society considered detrimental to the interests of the Society. Under these circumstances what does an Englishman do? It is suggested that he has rights, and he thinks his rights are invaded, and he accordingly takes constitutional means of asserting them. He moves the rejection of the proposition submitted to him, and if he is successful he places himself in the position of those who made the proposition, and pursues the course of business in the best way he can for himself; indeed, he succeeded the late ministry, and became a minister in power. When we did that we were in something like revolutionary troubles [laughter], and we did the best we could to make ourselves legal; and, according to the best legal advice we could obtain we succeeded in making ourselves a legal tribunal—in making ourselves, the Council of the Royal Horticultural Society, your legal representatives, gentlemen [hear, hear]. But I need not tell you that on all points the Royal Commissioners did not entertain that opinion of our legality which we ourselves were advised to entertain. They disputed our legality, and they would not deal with us as the Council of the Royal Horticultural Society; and from that time until now we have been met with this difficulty—that the Commissioners would not deal with us as frankly as they might have dealt, simply because we were not legally constituted a Council. That, frankly, was our position as regards the Commissioners. The Commissioners knew it. I do not know whether they think the result of the election under your auspices can remove that taint of illegality; but I am strongly inclined to believe, and you may take it as my own opinion and not an official one, that Her Majesty's Commissioners will assume that after the election to-day we are in a legal and proper position. In our position

to-day we have to be careful that there is no flaw as to the legality of our proceedings; but I am sure that at the end of our proceedings any objection to our existence as a legal body will be entirely removed. The position of the Society's finances may not be found to be very sound; but, while it may give the members of the Society ample room for reflection, it is not one which would allow us in any way to despair [hear, hear]. We are the only Society—I will not say the only—but we are the Society which has the means at its disposal to do the greatest amount of good, from our official position, for the horticultural world. We can easily keep that position; but, in order to do that, we must keep shoulder to shoulder and assist each other [hear, hear]. These gardens must be retained in the interest of horticulture. Then the question arises—there are, besides the horticultural Fellows proper, the Fellows who are owners or occupiers of house property all round this neighbourhood. I need not tell you that they are more likely than any others to be interested in keeping open this, one of the lungs of the metropolis [hear, hear], and that they feel that if it went over into the hands of any other body than the Royal Horticultural Society it would be a grievous disaster [applause]. As I have before said, Englishmen if they know they have rights are very careful to associate themselves in defence of those rights, and I think the local Fellows are not at all unlikely to die hard if they are put to it [cheers and laughter]. But I do not, as I said before, believe there will be any necessity for a fight, but that on the contrary—and I wish to repeat it even at the risk of wearying you—the Royal Commissioners are willing to meet us evenly and fairly [hear, hear]. I will not consider it either uncivil or uncourteous if I give this frank plain expression of our feelings and opinions, and say that we are perfectly aware we hold some good trump cards in our hands and know how to deal them on terms of perfect equality [hear, hear]. This will not be construed by members of the Royal Commission as in any sense hostile to them, and I believe I am right in saying that there are many gentlemen present representing the Royal Commissioners who will comment upon any statement I make on your behalf, and who will be able to make, on behalf of the Royal Commissioners any statement whether it be satisfactory or not, or correct or not. I will frankly say I have heard, and perhaps heard from very good authority, that some terms made use of in the Council's Report to the Society have been felt as wounding the feelings of Her Majesty's Commissioners. I hear that two paragraphs in the Report have been construed into a sneer. Now I am sure, and I know I speak the sentiments of my colleagues, that anything like a sneer towards Her Majesty's Commissioners was foreign to our minds [hear, hear]; and I say if such an impression was conveyed to them, I own I frankly regret any expression which can have caused it [applause]. I will, however, ask Her Majesty's Commissioners to remember that at the time this Report was framed the Society was labouring under the smart, I will not say of unjust, but any way of dealings with Her Majesty's Commissioners. One of the principal diversities of opinion between Her Majesty's Commissioners and ourselves is upon the proposed establishment of a skating rink in these Gardens [hear]. Her Majesty's Commissioners have felt offended that we did not communicate with them on the subject, because the agreement under which the rink was to be built was signed by us. The answer to that is a simple one. We are and always have been most desirous to be on the most friendly and open terms with Her Majesty's Commissioners; but I have taken the trouble to look into our letter book, and I can tell you that during the last two years we have seven times addressed letters to Her Majesty's Commissioners requesting them to allow that the Expenses Committee should meet to discuss the affairs of this Society, and on several occasions we were told that it was impossible the Commissioners could allow it to be done. I do not now question whether that was right or wrong. I merely state the fact that, having seven times asked Her Majesty's Commissioners to meet us for the purpose of entering into the affairs of the Society, and having been seven times refused—certainly in the most courteous and civil way—we felt we were bound to act for ourselves in this matter, and that we could not again ask Her Majesty's Commissioners to meet us on the affairs of the Society. Under the Charter and the bye-laws there is only one way of dealing with the affairs of the Society as between ourselves and the Royal Commissioners, and that is through the Expenses Committee. The Expenses Committee and all the monetary affairs of the Royal Horticultural Society are committed to their decision. That is the case. Now when, as I say, we seven times requested that the Expenses Committee should meet, and had seven times been met with a refusal, I think, without entering into bygones, and with a desire to avoid them, you will see it was quite impossible to approach Her Majesty's Commissioners on the subject of the skating rink; and now that they feel aggrieved that we have not consulted them, I hope that the representatives of Her Majesty's Commissioners will accept this frank explanation of the circumstances I have the honour to make to them as the real, true, and only reason why the communication was so long delayed [hear, hear]. And, after all, the concluding communication was not so long delayed, because it was only a few weeks after it was made the Royal Commissioners met, and to that meeting a letter was sent by Sir Coutts Lindsay, giving them the fullest information. I do not know whether I should enter at greater length into the arrangements between this Society and the Royal Commissioners. I hope I have explained our aim and object in acting as we have acted; and, as I have said, if there be anything in our Report written at a time when I am convinced we were labouring under some irritation, and with the notion that our dignity was offended, I regret it, and in the words of Hotspur I would say,

"Let not this report come betwixt my love and your Majesty."

[Cheers.] Having explained that, I have a hope on the part of myself and of my colleagues that all clouds may be swept away which lie between the bright sunshine of the full friendship of the Commissioners and ourselves [cheers]. I now pass away from the subject. Now about the Society's finance. We have not now, at the present moment, to discuss the position of our finance in detail. It will suffice to say that we are in a position which although grave is not irremediable. Not so, because by the terms of our lease we have yet to pay a certain rent to the Royal Commissioners, and if that rent be paid we will be free for several years to come. At the same time, the finances of the Society—I mean the income of the Society—does not meet its necessary expenditure by a long way. We must put our shoulder to the wheel as others have done, and devise some way of meeting the difficulty. The present Council has been in an unfortunate position since first it took office. They found themselves heirs to a very large amount of debt which ought to have been previously discharged. That debt amounted to £6300, to nearly £6400, and out of our limited income we have paid about £2000, so that our debt now stands at £4393. According to our Charter and bye-laws we ought to have no debt at all. The expenditure of the year and the income of the year ought to balance, and we ought to have nothing outstanding. You will agree with the Council when I say that when we find ourselves with a limited income, which a scientific society very frequently has, the position of having to discharge large amounts of debt places us in a very unfortunate position [hear, hear]. This year, I regret to say in the interest of horticulture, we have been obliged to diminish a number of prizes in order to curtail our expenditure, even in those legitimate prizes in which the Royal Horticultural Society ought to be liberal. With respect to the skating rink we no doubt divested a small portion of the funds from the legitimate pursuits of horticulture, but we felt that the income derived thereby would give a corresponding amount which could be devoted to the interests of scientific horticulture [a laugh]. Sir Coutts Lindsay reminds me that the sum to be paid was £1100. How happy could we be to get £1100 towards the cultivation of scientific horticulture! I must say that we come before you with the greatest possible confidence, and ask you to sanction what we have done. Another point upon that skating-rink question is that not one shilling of the Horticultural Society's money has been or would have been expended on that rink. The agreement we have concluded with Messrs. Prince is to the effect that the whole thing is to be done at their expense, that large privileges should be reserved for the Fellows of the Society; in fact, the whole agreement was favourable to the interests of the Society, and hence we feel no hesitation in recommending it for your adoption. I think, ladies and gentlemen, I need trouble you no further in introducing the Report. What alone remains for me to address you upon is our horticultural position. You will see in the Report before you that the Council have established a series of evening meetings for the discussion of horticulture. These meetings have already begun. I was going to refer to the black board behind me for illustration, but I see they have been effaced. However, I am told the meetings have been highly successful. I have just been reminded by Sir Alfred Slade of the fact that in the year 1875 our expenditure will be £2400 less than it was last year [hear, hear]. The very compendious statement which is in your hands will show you that the Council have most closely looked into the finances of the Society, and have tried to keep down the expenditure to the narrowest limit. The Lindley medal was last year struck, and it reflects credit upon the Society generally. I shall leave Sir Coutts Lindsay, who has taken so great an interest in the matter, to state the arrangements for the delivery of the medal, which is certainly the most important medal ever issued by the Society. Gentlemen, I have placed these matters before you, they are practical statements. It is quite unnecessary for me to indulge in oratorial flourishes, and I will sit down, recommending to you the adoption of the Report [cheers].

Mr. Bateman asked whether the adoption of the Report would be formally moved before criticism upon it was allowed? He, however, wished to say that he had listened to the Chairman's remarks with a great deal of interest and pleasure. He could hardly, nevertheless, go over the ground as daintily and delicately as the noble lord had done, just as if he was careering on

the polished surface of the skating rink [laughter]. He had no hostile feeling towards the Council, and he did not speak in a hostile spirit, and in referring to the Report he should confine himself to horticultural matters. In the second paragraph of the Report it is stated, "The Council have established a series of evening meetings for the discussion of horticulture. They are convinced that the comparatively small attendance at the ordinary meetings arises from the inconvenience of the hour rather than any indifference to them on the part of the Fellows, and they therefore consider that evening meetings may be considered of value both by the Fellows and others engaged in the pursuit of horticultural sciences." Now, here was a statement that there was a small attendance at the ordinary meetings, but it was the opinion of all horticulturists without exception that the meetings were for the cultivation of the science of horticulture. If the Chief Pontiff in the chair and his suffragans [laughter] thought the services of the Society were of such little moment, it was hardly to be expected that the outer world would pay them respect. It was said that all alterations were made in a non-horticultural direction, and that the Council went in for reductions. He went on to say that the local Fellows—the Kensingtonians—who lived in that neighbourhood did not express any special interest in horticultural matters. They had in their Society the town element and the country element. The town Fellows had the advantage of these gardens, and could attend all the Shows during the summer, whereas the country Fellows possessed the advantages which sprung from the distribution of new plants. He did not know how much more than £100 was the salary of an additional doorkeeper at Elvaston Place, but for his own part he should prefer a few pretty plants where entering by the old Orchid house to the new entrance, even though it be amongst the chalk and plaster effigies of some monsters of the deep [laughter]. It did appear to him that horticulture had fallen upon evil days [a laugh]. The vexed question of exhibitions, from which much of their bitterness sprung, was happily removed by the total failure and collapse of these exhibitions [laughter]. He could not see why the difficulties and antagonistic interests between the Commissioners and the local Fellows could not be arranged. The local Fellows only wanted their colonnade, and their band, and their promenade; but these were no horticultural elements whatever; but still, why should not people have these things as long as they were willing to pay for them? Why should not some arrangement be come to between the Royal Commissioners and local Fellows, in order that the latter might be provided with the accommodation they required? He felt perfectly certain that the Commissioners would not be slow to give the Fellows all the accommodation they required. He again said he could see no reason why an amicable arrangement should not be come to between the two bodies [hear, hear].

Mr. Walford said he had long taken a deep interest in the affairs of the Society. He had watched the changes which had taken place in the Council with the hope that they might go on from what was regarded as bad to something better. He was not sure they had been successful in that [hear, hear]. The Chairman, who put everything so pleasantly that it went against one's heart to say anything in an opposite direction, said he saw nothing in our present position at which they need be too much alarmed. However, if his own expenditure rapidly exceeded his income, and he found himself surrounded with debt, he should regard the position as a serious one indeed. He knew very well that the people who lived in the neighbourhood did not feel the same interest in horticulture that others did. He should not trespass on Sir Alfred Slade, as he saw now what he had perceived before, that while Fellows were addressing the chair, the members of the Council were holding a conversation [cries of hear, hear]. He should stop if he saw that conversation renewed [cheers and laughter]. The fact was that the local Fellows had made the Gardens a nursery very different from the sort of nursery it was originally intended to be [hear, hear]. The whole thing had not been successful, and the time had arrived when they ought to take some steps to have matters remedied. Would it not be prudent to go to the Commissioners in some form, and treat with them, if, as had been said, the existence of the Society depended upon the Commissioners? Why not place the whole case before them, and say that a number of gentlemen both in London and the country had joined the Society for the purpose of cultivating horticulture, but that horticultural purposes were being wiped away to make room for other purposes? He saw with great regret that the name of Mr. Smee, a practical horticulturist, had been withdrawn. When he saw the black board that day behind the Chairman he thought it was typical of the black condition of the Society [oh! and hear].

The Chairman.—I can only say in respect to what has just been said, that we have already approached the Commissioners on very many occasions, and that we have had several interviews with them. Mr. Walford appears to think that we have never been before the Commissioners, but it might have been gleaned from my speech that we have had many conversations and consultations. As to Mr. Smee, the rule has been to eliminate three names of members of Council who have given the least number of attendances. Mr. Smee was one of those; not that his interest in horticulture has at all suffered [hear, hear].

Mr. G. F. Wilson observed that for some time past Fellows, not local but horticultural ones, had been coming to him and saying, "Really there is so little being done for horticulture that I shall retire." He had heard that over and over again, and he had always said to those people, "A good time will come; don't be in a hurry." He thought that everything which was possible to be done to introduce a better state of things ought to be done, and done at once [cheers]. The Chairman had spoken of his fellow counsellors, and had spoken of the feelings of Englishmen. Now, he (Mr. Wilson) thought a charge might be brought against the Chairman and the Council, which was peculiarly objectionable to Englishmen, and that was a want of pluck [laughter]. He alluded by that remark to the country shows. They had heard nothing about them in the Report, although he had heard there was a rule for keeping up a sufficient guarantee fund. When they held a Show at Bury St. Edmunds it was an untried experiment; but what had been an untried experiment was now an ascertained success, and therefore he accused the Council of want of pluck in not entering into country shows.

Sir Henry Trino wished to say what he was bound to say on behalf of the Royal Commissioners. He wished to allude to himself respecting some advice he had given to the Commissioners lately, and he wished to say a few words upon the legal aspect of the question, having for twenty-four years taken a very deep interest in the Society. He might say he was no longer a Commissioner. As to the legality of the Council, when the revolution occurred, either for good or bad, the Commissioners sought the advice of the law officers of the Crown, and the latter said in their opinion the Council was illegal; consequently the Commissioners did not appoint the Expenses Committee, and thus they were brought to a deadlock. The Commissioners did not think it their duty to interfere, but to let matters alone. The Commissioners were perfectly willing that when the present or the next Council obtained an opinion from the law officers of the Crown in their favour to at once acknowledge them. The Commissioners never had the slightest hostile feeling towards the noblemen and gentlemen on the Council. The Commissioners never had the slightest feeling as to the revolution, but they were advised by the law officers of the Crown that the acts of the Council were illegal. The next question referred to the unhappy rink. He believed he was the most guilty of anybody, for when he was asked whether in his opinion it was legal to devote any portion of the Gardens to the purposes of the rink he pronounced it with the greatest confidence to be illegal. He told the Commissioners this—"It is illegal, and we cannot allow it." That was the whole history of the affair [loud cheers]. He was perfectly certain there was no more hostile feeling on the part of the Commissioners in refusing to sanction the rink than in any other matter. The Chairman had spoken of "hard words," but really the Commissioners had not spoken a hard word at all. The refusal to sanction the rink was not the result of a hostile spirit, but was simply a question of law. If ever there was a clear case of ordinary common sense and legal common sense it was this. It was really quite impossible for a body like the Commission, established for the promotion of science and art, to allow a Society which was established for the purpose of scientific horticulture to put up a skating rink. He now came to the intention of the Commissioners generally with respect to the Royal Horticultural Society. Whatever might have been the intentions of the Council, or whatever had been the speech of the Chairman, there appeared to have been something sore in their minds when the Report was written. He did not blame them for it, but he was authorised to say on behalf of the Commissioners that with regard to horticulture their intentions had never been in the remotest degree hostile [cheers]. The Commissioners considered themselves *quasi* partners in the promotion of horticulture, and it was their entire wish to promote the objects of horticulture [cheers]. On that point, therefore, whatever might have been said of the Commissioners, he was authorised to state that they never had any wish to do anything but to promote the objects of the Society in every possible way [cheers]. So far as regarded horticulture; and now as to the appropriation of land. It had been whispered that the Commissioners wanted to build upon the land. Now he was authorised to say that proposition had never been brought before them; he meant the proposition to build upon the Horticultural Gardens [cheers]. He was authorised to say such a proposition was never submitted to them; that they never for one moment thought of such a proposition; and that they never had any intention upon the subject [hear, hear]. It appeared to him that the arrangement or agreement of the Society with the Commissioners was drawn in a worse and more loose manner than any Act of Parliament he had ever seen [laughter]. He could say, on behalf of the Commissioners, that they never thought of determining the lease or of putting an end to the

Society in order to benefit themselves. Now, he wished to address a few words to his brother Fellows, the "Kensingtonians." With great deference to the noble Chairman, he could not but think, after reading the Report, that it did not bear a pleasant aspect as regarded the Commission. He had now nothing to do with the Commissioners—he might say in the language of Shakespeare, "Our withers are unwrung." Since, however, they were in a great measure dependant upon the Commission, he could not think it was wise to use terms which appeared to him, he would not say offensive, but assuredly not calculated to conciliate the Commissioners [hear, hear]. He was not finding fault with the Council. He thought that meeting ought to be good enough to authorise the Council to consider some of the sentences in the Report, and either to omit these sentences or recast them [hear, hear]. That would not be the slightest reflection upon the Council of the Society. He should also suggest that after reconsidering their Report the Council should take steps to establish their own legality [cheers].

Mr. Shirley Hibberd felt that there were so many unsatisfactory passages in the Report, and the Society appeared to be in such an unfortunate position, and the Council seemed to be so entirely destitute of a policy, that he should move that the Report be referred back to the Council for reconsideration. He would point out one clause in this Report which they could not allow to pass after what the Chairman said as to what had sprung up between the two authorities. It was impossible for them to be on friendly terms, or even on proper business terms, with Her Majesty's Commissioners, when they had in their Report a paragraph which told them that Her Majesty's Commissioners attempted to get the lease voided, so that the Society should be cast upon their mercy to receive some dole. The jar was upon the whole of the proceedings that day, and there appeared to be no other course open than to ask the Council to take the Report back, read it through, and consider it. He begged to move as an amendment that the Report be referred back to the Council for reconsideration.

Dr. Denny said, that considering the way in which the Chairman spoke, and the conciliatory way in which he mentioned Her Majesty's Commissioners, he (Dr. Denny) looked upon the Report as one of the least possible taste, and besides as being untrue [cries of oh! and hear]. They had no right to say that Her Majesty's Commissioners intended to take away from them their lease. They seemed to forget that if the lease was voided it was voided by themselves, and not by the Commissioners [hear, hear], and simply because they did not pay their rent to the Commissioners. The Report alleged what was not true; and as it was impossible for them to pass the Report as it stood, he had much pleasure in seconding the amendment moved by Mr. Shirley Hibberd. They were told they were to save £2500 next year. What was it to be saved out of? Was it not to be saved out of horticulture and out of shows? He did not find fault with South Kensington interests, for they had a right to be represented, but they had not a right to swamp every man. The President was a South Kensingtonian, the Vice-President was a South Kensingtonian [laughter] The Treasurer was a South Kensingtonian [more laughter], the Secretary was a South Kensingtonian, the Finance Committee were composed entirely of South Kensingtonians, and those outside South Kensington had not a voice in the matter at all [laughter]. He should like to know how they were going to pay their rent next year. If they were going to do it they ought to do it at once, and not leave it until Her Majesty's Commissioners chose to take proceedings against the Society. If they could not meet their expenditure they ought to take means to do so. It would be far better to propose to the wealthy Fellows of South Kensington to put their hands in their pockets and pay off the debentures. There were, say, a thousand very rich people in South Kensington, and it would only cost about £17 each to pay it all off [question, question]. Well, it would be better to do that than to go begging for what they had no right to, and nothing whatever to do with. They ought to know with regard to horticulture, what it was proposed to take off and what it was proposed to put on. Everything should be given up before they touched their staff. Had they a right to ask gentlemen whose time was valuable to give it to the Society, and to pay a considerable amount for railway fares, whilst the lawyer they employed would not do his work for nothing?

The Chairman—What are you alluding to?

Dr. Denny.—To your scientific staff.

The Chairman.—What do you say about the Council?

Dr. Denny.—I am alluding to your scientific staff.

The Chairman.—All the members of the Council are unpaid.

Dr. Denny.—I am quite aware you are unpaid. Next year when they would not be able to pay their rent, they would find horticulture would drop down to nothing.

Mr. Haughton congratulated the Chairman upon the speech he had made, the more so because it appeared to be a total reversal of the policy hitherto pursued, and because that at the last moment they had ceased to wage war against Her Majesty's Commissioners, and that practically a treaty of peace had been entered into [hear, and cheers.] He had hoped to have heard something more of the details of the treaty. He had hoped to have heard something more of the real state of the Society, and of the loss which had accrued to it in consequence of ill-advised warfare. On both points they had had nothing but promises. He was told they were to have a great reduction in expenditure next year, but how that reduction was to be effected they were not told. No estimate had been laid before them—nothing but a bare statement. He thought it must be obvious to everyone in that room that a reduction must be effected if they were not to forfeit their lease or be turned out of their Gardens. Mr. Haughton then went through the accounts submitted by the Council, and, having shown what he considered their bankrupt position, said that the Council should pause before they went to open war with the Commissioners, and should ascertain what their position really was, and see whether the Commissioners were acting rightly or wrongly. It was most desirable that amicable and friendly arrangements should be made with Her Majesty's Commissioners, and that when that was accomplished the result should be announced to the Fellows. He thought the concluding words in the Report ought to be struck out, and if they were not he should support the amendment.

Mr. Quilter, as a country member, was anxious to see some amicable arrangement come to, so as to end this continued strife [hear, hear]. He should be sorry to see the Gardens done away with, but there were many ways in which they could be helped, just as the Prince Consort wished to help them.

After a few words from Sir Alfred Slade, correcting some figures quoted by Mr. Haughton,

Mr. Edgar Bowring said he should speak as a member of the Royal Horticultural Society, and not as a member of the Royal Commission. He had listened with much pleasure to the speech of the Chairman, and with the Chairman he trusted that some amicable arrangement would be come to between the two bodies. He completely endorsed the remarks of Sir Henry Tring [cheers]. He did not think the Royal Commissioners would show any hostility whatever to the Council, but that, on the contrary, the desire of the Commissioners was to exhibit goodwill and friendship towards the Council [cheers]. He should support the amendment that the Report be sent back to the Council for reconsideration. He could only say that he hoped the result of the meeting would be that the present Council would be declared to be legally appointed. It was because of the opinion expressed by the law officers of the Crown that the Expenses Committee on the part of the Commissioners had not met; and he might say that the question of the skating rink was outside the functions of the Expenses Committee altogether.

The Chairman.—I asked the meeting not to sanction, but to discuss the question.

Mr. Bowring.—I should not have done so—I should have referred it to the Royal Commissioners. The Commissioners had full power under the Act. On the whole it seemed to him better to refer the Report back to the Council.

The Chairman.—It may save the time of the Fellows if I at once state the course the Council feel it their duty to pursue in this matter. I do, in the first place, entreat you to put a little trust in the Council which has carried on your affairs during the last two years. We have, with the greatest possible satisfaction, two announcements from the Commissioners—first, that it is not their intention to build on the Gardens. Now, we accept that as a most gratifying fact [cheers], and I will not state the evidence on which we thought otherwise. We are glad of it. Another gratifying fact is that the Royal Commissioners do not intend in any hostile sense to determine our lease, or to attempt to do so, and we accept that statement as frankly as it is given, and with very sincere delight. However, gentlemen, if this meeting were to come to a resolution that this Report was to be sent back, what would happen? The Council of course would resign. Speaking personally I could not fill a more thankless office; but, speaking as a member of the Society, and looking to the welfare of the Society, I should be sorry if at this moment you should turn out your Council [no, no]. I tell you the reason why. If you tell us to take back our Report, of course we resign; but it would be churlish, as this is the first time we have been met by the Royal Commissioners in a friendly spirit, to say we would not adjourn our meeting to look at our Report, so as to arrive at some solution which would be amicable [loud cheers]. If you put this amendment to the vote, we will be bound in honour, at this moment to stand by this Report, and you know it. I ask you not to put us in this embarrassing position.

Mr. Godson.—I move the adjournment of the debate to this day month.

Mr. Haughton.—I beg to second that.

Mr. Shirley Hibberd.—Then under the circumstances I shall withdraw my amendment with great pleasure [hear, hear].

The motion for adjournment to the second Tuesday in March was then put and carried, and a vote of thanks to the Chairman closed the protracted proceedings.

Report of the Council to the Annual General Meeting.

The Council, in presenting their Report for 1874-5 to the Fellows, have great pleasure in again commenting upon the magnificent displays which the Society's Shows have produced. The amendments introduced into the Schedule, together with the reduction in the number of the Shows, have both contributed to this result, and in no instance more remarkably than in the concluding Exhibition of the season, when the collection of fruits and Chrysanthemums transcended almost all similar collections of former years. The more purely scientific work of the Society has again been attended with success. The experiments made at Chiswick form, as usual, the subject of a supplementary Report. The meetings of the Scientific, Fruit, and Floral Committees have been well attended, and the work done considerable.

The Council have established a series of evening meetings for the discussion of horticulture. They are convinced that the comparatively small attendance at the ordinary meetings arises from the inconvenience of the hour rather than any indifference to them on the part of the Fellows, and they therefore consider that evening meetings may be considered of value both by the Fellows and others engaged in the pursuit of horticultural science.

In the course of the past summer the Council received an offer from Messrs. Prince, the proprietors of Prince's Club, of a large sum by way of rent for the privilege of constructing a skating rink in the Society's Gardens under certain conditions. Whilst considering this offer, the Council gave weight to the following points:—1, That the present expenditure of the Society cannot be maintained upon its present income, and that some increase would have to be made in the Fellows' subscriptions, or additional sources of income be provided. 2, That the large majority of the Fellows would prefer to give up the absolute use for a time of a small portion of their ground rather than pay an increased subscription. 3, That a great number of Fellows would be likely to accept the opportunity of subscribing to a very popular amusement brought to their own doors, and that many persons would be induced to become Fellows in order to obtain the privilege of so subscribing. 4, That Messrs. Prince proposed to erect the rink at their own cost; to reserve three days of the week for those Fellows who should subscribe to it; to conduct the rink in concert with the Society's officials; and to pay sums of money as rent, amounting on the average to £1100 a-year. The advantages thus offered appeared to the Council to be opposed by few countervailing objections, and they came to the conclusion that they ought not to let slip so admirable an opportunity of increasing the income of the Society. It is true the scheme had nothing to do with horticulture directly, but it would have been a great indirect benefit, tending to set more of the Society's funds at liberty for the direct advancement of horticultural science.

In this last respect the Council had before them the example of Her Majesty's Commissioners for the Exhibition of 1851, who have considered the sale on building leases of land which they had acquired for purposes connected with science and art a legitimate manner of advancing those interests. The mention of Her Majesty's Commissioners introduces the one difficulty which lay in the way of the skating rink. The Council had no power to sub-let any part of the ground held of the Commissioners, but Messrs. Prince were ready to accept of a "licenae to use" without a leaae. But in addition to this the Commissioners have power to prohibit any proceeding of the Society with regard to the Gardens which shall not be of a horticultural nature. The Council felt that to communicate with the Board of Management on this subject would be useless, seeing that the Board had declined to discuss with them the Society's affairs; but the earliest opportunity was taken of bringing the matter to the notice of the Commissioners at their meeting on December 11th. It was finally resolved to acquaint Messrs. Prince fully with the exact terms on which the Gardens are held, and if they were willing to proceed the Council would then undertake such arrangements as they were competent to make. Messrs. Prince, after examining the Society's documents, entered into an agreement and commenced operations. It was confidently expected that in view of the many difficulties which the Society had encountered in consequence of the onerous engagements originally made with the Commissioners, and in consideration of the many concessions made to them from time to time in support of the International Exhibitions, no interference would take place. Such non-interference would have been at least consistent with the expressions of amity towards the Society with which the refusals to co-operate with the Council had been accompanied. Accordingly, for the first four or five weeks no objection was offered. The officials of the Commission were well aware of what was in course of erection, and conversed about it to the Society's officials. Messrs. Prince spent a considerable sum in furthering the undertaking, when suddenly the Commissioners came to the conclusion that an interference was convenient, and intimated that they were about to file a bill in Chancery to test the legality of the Council and to litigate all disputed points with the Society. The Council having repeatedly received this threat for two years, and having taken the highest legal opinion as to its status and as to all other points in dispute, cannot feel any regret that the relations of the two bodies should be at length brought before the public. They are satisfied that not only will their own *bona fides* be vindicated, but that a public discussion will redound to the credit of the Society.

The Council have now to call the earnest attention of the Fellows to the state of the Society's finances. It has been impossible to make any serious reduction in the debt to which the Council called the attention of the Fellows in their last Report. Indeed, since the accession of the present Members to office, the Council have been called upon to pay debts previously ignored in the published accounts of the Society. Sir Trayton Drake advanced prior to 1860 £1000 to the Society at interest; no interest had been paid since 1864, and although the matter had been before 1873 brought to the Council's notice by legal proceedings, no settlement has been effected. The Council have succeeded in compromising this claim by a payment of £600. There was also a claim by Mr. Cooper of £105, which the Council have settled.

It has become evident to the Council, as already stated, that the ordinary revenue of the Society cannot support its expenditure. Several reductions have been made which will prevent any increase of liability in 1875;* but this course is looked upon by the Council as wholly unsatisfactory. The question as to whether the Society is to remain at South Kensington is brought into prominence by the necessity of paying rent to the Commissioners in 1876, so that the local Fellows (and neighbourhood) must now make up their minds definitely either to risk the loss of the Gardens at South Kensington or to subscribe more largely. The Council feel that any increased subscriptions ought fairly to fall upon those who use the Gardens most frequently, and to whom their loss would be most serious. Those Fellows who live at a distance and support the Society on account of its being the national representative of horticulture ought not, in the Council's opinion, to be further taxed for the maintenance of the South Kensington Gardens. To this end the Council are prepared to suggest a scheme for increasing the annual income of the Society should the above policy be accepted, and will call a special meeting for the purpose of submitting their scheme to the Fellows.

In conclusion, the Council feel it their duty to remind the Fellows that whatever opinion they may have as to the desirability of retaining the South Kensington Gardens, the Society is bound to do its utmost to maintain its lease, if only for its obligations to the Life Fellows, and, above all, to the debenture-holders. If Her Majesty's Commissioners should succeed in an attempt to get the lease avoided, the property would be released of its debt to the debenture-holders, who would thus lose the whole of their £50,000 originally advanced, or be obliged to accept such a dole as the charity of the Commissioners might induce them to offer.

Report of the Chiswick Board of Direction, February, 1875.

The Chiswick Board of Directors have to report that the operations in that establishment during the past year have been chiefly directed to the general maintenance of the garden, the experimental trials of vegetables and flowers, the supply of plants for the decoration of the gardens and conservatory at Kensington, and the provision of seeds and plants for distribution to the Fellows. As regards the latter, the new plan which has been adopted in lieu of the ballot, of allowing the Fellows to select a certain number of plants from a list provided for the purpose, has been found convenient to work, and, as they believe, has given greater satisfaction to the recipients.

During the year the garden has been supplied with water from the waterworks, which has proved a great advantage both as to convenience and economy of labour. The immediate cause of this supply being laid down was the failure, during the dry period with which we were visited last summer, of the wells upon which the water supply had formerly depended.

In the Floral Department the distributions to Fellows have consisted of 42,684 packets of flower seeds, 3643 plants selected from the distribution list by Fellows, and 428 packages of cuttings and bedding plants. The Garden at Kensington has been supplied from Chiswick with 13,936 plants for the decoration of the conservatory; 56,627 plants have been used in the summer bedding arrangements, 3164 plants in the bedding provided for the spring season, and 8487 plants for autumn bedding.

The comparative trials of new flowers which took place last year, were devoted to Pelargoniums and bedding Pansies, and reports of the results, drawn up by the Floral Director, will be found in the last number of the Society's Journal. The number of varieties of Pelargoniums planted out for these experimental purposes was 293, while eighty-three sorts, chiefly consisting of

* In particular, reductions have been made in the staff; prizes will only be offered at the most important Shows, those in May, June, July 7th and 21st, and October. Other extensive reductions have been temporarily sanctioned.

the rose-pink varieties, were grown in pots under glass, in order to ascertain which varieties were the best adapted for that mode of cultivation. Amongst the former nine new certificates were granted, and in twenty-four cases the previous certificates were confirmed, on a comparison of the newer with some of the best older varieties. In the pot trial six new certificates were awarded, and the previously granted certificates were confirmed in the case of five others.

In the case of bedding Pansies, 139 varieties (some of them of the fancy class) were received and planted. The Floral Committee awarded eleven certificates, and suggested that the best varieties should be grown again and examined earlier in the season. In accordance with this suggestion, Mr. Barron is preparing to plant out an entire bed of each of the selected varieties.

So far as this year's limited means will allow, these interesting trials will be continued as heretofore.

The trials which were made during the past season in the garden at Chiswick, were a continuation of the examination of the Potatoes which was commenced last year, and an investigation of complete collections of Broad Beans, Kidney Beans and Celeries. Of Potatoes, 158 varieties were dealt with which had not been included in the trial of the previous season, and of these five received first-class certificates. In the trial of Broad Beans there were forty-seven varieties, of which a full report will be found in the Society's Journal; but on account of the dry cold season the Kidney Beans, of which 113 varieties were sown, proved a failure, and it was determined not to proceed with any examination of them till another year, when a second attempt will be made. The trial of Celeries was a very successful one. Fifty reputed sorts were sown, and these were reduced after careful comparison to eighteen, of which six were distinct red varieties, and twelve distinct white.

The vegetable trials which are contemplated for 1875 are Kidney Beans and Onions.

The subject most worthy of remark in relation to fruits which have come before the Board this season are a set of seedling Vines raised by crossing Black Monukka and Black Hamburgh, with the view of obtaining a seedless variety with the quality of the Black Hamburgh—the result of this experiment will be found in the Journal—and the other is the fruiting of the Pommier de Paradis for the first time in this country. The result of this is to determine the distinct individuality of this variety, and to prove that it is not only valuable as a dwarfing stock, but that its fruit is one of great excellence as a dessert variety.

The distributions that have been made are as follows:—430 cuttings of Vines, 65 of Figs, 258 of Apples, and 119 of Pears.

London, 1st February, 1875.

HENRY LIGGINS, *Auditor.*

AT the present crisis of the Royal Horticultural Society's affairs, I conceive the policy of the horticultural Fellows is to request our Council to open at once communications with Her Majesty's Commissioners with a view of transferring to them the Gardens, under satisfactory arrangements for our debenture-holders, the life and local Fellows, with a *locus standi* there for our shows and meetings. We have but to be united, act with vigour and with determination, and the thing is done.—JOHN DENNY.

[In all the recommendations specified by Dr. Denny we fully concur. It is the only course to restore efficiency and independent action to the Society, and to save it from utter annihilation. Its history for the last ten years has been one of disquiet and conflict, such as to give rise to painful apprehension for the future.—EDS.]

JOTTINGS ON LAST YEAR'S GARDENING.

No. 3.

ENDIVE.—This suffered from drought, and was not so good as in 1873. Improved Round-leaved Batavian and Green Curled are grown and answer well. Endive was first used (it is not used when Lettuces are good) December 15th, in 1873; November 1st, and up to March 19th, 1874. Digswell Prize is a fine curled, and Fraser's Broad-leaved Batavian large and good.

KOHL RABI is grown—the Early Green and Purple Vienna, but find no favour. They should not be sown too early, or the plants run. May is soon enough. A foot distance every way is sufficient for them, and sown where to stand.

LEEKS.—Ayton Castle Giant is large and fine, and so is Musselburgh. Leeks are best sown where they are to remain without transplanting, as is usual. We sow in rows a foot apart, thin to 3 inches, and draw every other plant as required for use, which gives room to those remaining, and they become large. The first we used July 17th; and last (of 1873 crop), June 11th, 1874.

LETTUCE.—I had last year of Cabbage, All, the Year Round, Grand Admiral, Neapolitan, Blonde de Berlin Commodore Nutt, Gem, and for winter work in frames Commodore Nutt already mentioned, as also All the Year Round, Hardy White Dutch, Lee's Immense Hardy Green (which is said to be the same as All the Year Round, but as I have it is distinct), and Stanstead Park. Cos—Alexandra White, Sutton's Superb White, Paris White, Hicks's Hardy White, Brown Bath (black seed), and Bath Sugarloaf, also Laitue Verte Maraschere, Laitue Blanche Maraschere—the one Spotted Cos, very pretty in leaf, and the other Paris White. Laitue Rourse and Laitue Petit Noire, both Cabbage kinds, and the last has a distautly spotted leaf, and is the same as Stanstead Park, and does well in frames, not being so liable to suffer damp as many. Of these kinds outdoors, in Cabbage kinds Neapolitan is the best for crispness, then Gem, which may be described as a golden Neapolitan or Malta. All the Year Round is very much earlier; and earlier still is Commodore Nutt, a small close-hearting kind. Blonde de Berlin is a close-hearting kind, bright golden

green externally, having a good close white heart. Grand Admiral coming in early, and having a good large white heart. The Spotted Cos is, as before stated, very pretty, and that is all. Paris White, Alexandra, and Suttons' Superb were fine, the two last fine stocks of the first; Hicks's Hardy White is a fine kind for late summer and spring use, also first sowings in spring, it being hardier than Paris White, but very similar to that kind. Brown Bath Cos is hardier than Hicks's, and is good in early summer, and continues a long time before running to seed. Its colour, no matter how well blanched, is objected to; and the Bath Sugarloaf, although having narrow tapering leaves, forms fine conical hearts and needs no tying. It is not so hardy as Hicks's or Brown Bath (black seed). The best Cos, Paris White for summer; and winter, Hicks's Hardy White. The best Cabbage, Neapolitan for summer; for winter, Stanstead Park. I have given up transplanting Lettuces, only it has sometimes to be resorted to, as the ground for them is not always clear at sowing time. Good rich well-manured soil is wanted well dug, and then made firm as for Onions. The seed is put-in in drills a foot apart, the seed lightly covered, and the plants thinned to 9 inches distance apart, and in cutting every other plant taken out. They grow less flabby in firm than light soil, have firmer closer hearts, and stand drought better, and escape frost in winter when those in loose soil perish. In frames they are sown in drills about 6 inches apart; every other row is a Cabbage kind, and the other Cos. The lights are not used until frost. The Cos kinds are Hicks's Hardy White and Bath Sugarloaf, and the Cabbage between the rows Commodore Nutt, All the Year Round, and Stanstead Park. They are thinned to 6 inches distance apart, but Commodore Nutt to 4 inches. This kind comes in first, and All the Year Round and Stanstead Park succeed, leaving the Cos plenty of room, and every other plant of Cos is cut, leaving the others, which are of course largest and best, and the salads keep on improving with the season. Two lots are sown in frames, narrow ones 4 feet wide, and 60 feet long each, one in early August, and the other at the end or early September. The frames are removed from the last so soon in March or after as the weather determines. Lettuces must have hearts and white before they are used, but Commodore might be cut now (January 20th), but will not be until March. The first were cut March 23rd, the last November 16th.

Curled Mallow is noted because its leaves are so fine for garnishing, infinitely superior to Vine leaves. Those worried for Vine leaves, and not having any without injuring the Vines, may use Sycamore leaves; they are very similar; but don't say what they are if it can be helped. Cooks and housekeepers know no substitutes, but have many fancies, which it is not always wise to ignore.

Mushroom.—In the fields this esteemed vegetable was tolerably plentiful in August, but very scarce after that month. Our plan is to depend upon those in the Mushroom house from October to July, and in summer upon the fields for a supply, which usually yield abundantly.

Onion.—This crop suffered from the drought, and the bulbs were smaller than usual, but have kept well. Reading is a capital kind for early winter use, and for the same purpose Danver's Yellow, and White Spanish or Portugal, Deptford or Strasburg, Bedfordshire Champion, and Brown Globe are good keeping Onions. The best for keeping is James's Keeping, excepting Blood Red, which is the longest keeper of all; James's Keeping is a very desirable kind. The autumn-sown mildewed, and were not good. Queen I think nothing of; the old Silver-skinned is superior to it. Small Onions meet with no favour from cooks, and for pickling Two-bladed is the best. Giant Rocca, if the seed be not better than I had, means failure, and Giant Madeira is simply a Globe Tripoli. The Flat Italian and Globe Tripoli with White Lisbon are as good as any for autumn sowing. Improved Reading (Suttons') was the best of the white summer kinds.

Parsley.—To have this is no easy matter in winter. The best plan is to sow largely and in April, cutting over in July what is wanted for winter use, and it will be fine by autumn. Two rows about 100 yards long are sufficient for the demand upon us. Veitch's Curled is the finest I know.

Parsnip is not much used in most cases, but must be had. Hollow-crowned Improved is unquestionably superior. It does best in rich, deep, light, moist soil, and is a very useful and profitable variety.

Peas.—These were, as regards the earliest and latest crops, good, but those coming-in in August were much infested with mildew. The sorts grown were Ringleader, the earliest, but not last year, Blue Peter, a dwarf blue kind, having the protection or shelter of a south wall, being gathered before Ringleader. Emerald Gem was in at the same time as Ringleader, and before First and Best, but this Pea is the best cropping early Pea known. Alpha (Laxton's) succeeds First and Best, which is a blue Pea with large well-filled pods. Advancer, green-wrinkled, follows Alpha, and is a good cropper and good flavour. Hundredfold is a green Marrow of the Prizetaker class, and follows Advancer, as does Best of All, one of the best-cropping and finest-flavoured of Peas. The same raiser's Dwarf Prolific (Prince of Wales) and Wonderful, both white-wrinkled, being good croppers and fine-flavoured. Jersey Hero is also a fine Pea of the Veitch's Perfection type, a little earlier, as is also Best of All, but both are earlier than Veitch's Perfection, both very good croppers, and has unquestionably the finest flavour of any Pea in cultivation. All the Peas of medium height with the most delicious flavour are of the Veitch's Perfection class, and they do not surpass it in that or any respect, only some are a little forwarder and others a little later in coming into use than that variety. Premier (McLean's) is a green-wrinkled Marrow, and a grand one for late crops. G. F. Wilson was very free-cropping, long-continued, and most excellent in quality. It is a wrinkled Pea of high excellence. None of the preceding are large growers, not exceeding 5 feet in height; and of this class is Champion of England, a Pea I have thought highly of hitherto, but last year it was, though very productive, poor in quality. Those do not require tall stakes, but we had others that do, as Emperor of the Marrows, Berkshire Challenge, and Ne Plus Ultra. The two first are larger in pod and pea than Ne Plus Ultra, and of excellent quality, but Ne Plus Ultra is later—in fact, the best late Pea I know. I am mindful of what Mr. Wright told us respecting another late kind, but I have not seen or grown it. These tall Peas I do not like; they want tree-like stakes, and are so liable to be blown about and broken by wind and rain, which in hilly districts do great harm in late summer and autumn. There is, however, one advantage they have over the dwarf kinds in the pods being produced at a greater height from the ground; they are more out of the reach of pheasants, which are very frequent visitors of our late Pea quarters.

Of the recently-introduced Peas I have not grown many. Superlative has an immense pod, but is not a great cropper, nor has any merit in flavour. Fillbasket (Laxton) is a wonder of fertility—the pods long, curved, closely filled, and the peas of good flavour; as a general-crop Pea and for market purposes it will be in great demand. The greatest novelty I ever saw or heard of is Suttons' Giant Emerald Marrow. It is of strong robust habit; and whilst Jersey Hero, Fillbasket, G. F. Wilson, Hundredfold, Best of All, Superlative, Champion of England, Berkshire Challenge, and two edible-podded kinds upon the same plot of ground were attacked by mildew, this kind was not infested. It is of the brightest green in its foliage as Emerald Gem, without glaucescence, and has the leaves white-splashed or spotted. The pods are large, produced in pairs, containing eight to ten large peas, green when cooked, and exquisite in flavour. In our rich soil it attained to a height of 7 feet. Good as this was, it yields in my opinion in quality to Duchess of Edinburgh (the Royal Dukes and Duchesses are greatly, almost exclusively, patronised), which in flavour surpassed all others, being very tender and sweet. It attained a height of 6 feet, was very prolific, the pods being large and well filled, generally eight or nine peas in a pod, straight or nearly so, and is very similar to Ne Plus Ultra. It, however, is distinct from that variety; the pods are better filled, and is not so tall nor so late, and it withstands drought well, the peas not being so soon hard as many varieties, and is on that account a good kind for hot light soils. We had also McLean's Little Gem, which will not be grown again, and three other kinds which did not do well. The first dish outdoors was had June 22nd; last, November 14th. In 1873 the first July 7th; and last, November 7th.—G. Abbey.

(To be continued.)

MR. THOMAS BRAGG.

Those, who like myself can look back on thirty or forty years of horticultural lore, can remember when the name of the aged veteran (who, like so many others, has succumbed to the vicissitudes of this trying winter) was a household word. If we take the years 1840 to 1850, such flowers as Beauty

of the Plain, Springfield Rival, Topaz, Essex Rival, and other Dahlias which have long since disappeared were considered the acme of perfection, beyond which it was impossible to go. Mr. Bragg was a successful raiser and exhibitor. Pinks, Panies, and Hollyhocks were amongst the things he successfully cultivated. Of late years he has been far out-distanced by other growers, but in those days he was a well-known and constant visitor at all our horticultural shows in the neighbourhood of London. He was one of the old school of florists, of whom very few are now left.—D., *Deal.*

LUNARIA BIENNIS.

This popular old garden plant is of German origin, and has been cultivated for upwards of three centuries in British gardens. So perfectly has it adapted itself to our island, so spontaneous is its upspringing in congenial sites, and so persistent is its clinging to favourite nooks, that we are apt to regard it as born to the soil on which it has prospered so long, and to claim it as a native plant of our native land. It is commonly known by its homely name of Honesty, or Moonwort, in reference to its peculiarly flattened seed-vessels, which in themselves are no insignificant ornaments for room-decoration, and are especially attractive to those who find pleasure in the curious forms of plant-development. Such examples of quiet and quaint decoration, as distinguished from gay colouring, would seem to be pushing their claims on the taste of the times; and the best proof that even this old plant has intrinsic merit about it is the extraordinary period of probation (if such a term is permissible) it has undergone, and still—yes, still—evokes terms of admiration when dancing in the sunshine of a bright May morning, a shimmering purple sea; or when the quaking shivering seed-stems are viewed as a mid-winter household ornament, white and pure within almost as the fleecy snow without.

To these attractive merits of this old and common plant must be added this great advantage, that it is within the means of everyone to enjoy who owns a garden. So accommodating is it, that it is not at all particular as to soil or site. Either amongst roots or stones, in sun or in shade, in rich soil or poor, the Honesty will grow, and bloom, and enliven any plot, or garden, or corner—aye, or wood, where it is encouraged or permitted to establish itself.

We have written "wood," and the association is suggestive. Because it will flourish there it will succeed well and is one of the best plants that can be encouraged to brighten-up the home-surroundings—the borderland as we may term it—of garden and copse. In how many places is the ground where garden merges into wood the most uninviting, we had almost written abandoned, of all parts of the demesne? Look round and see. You behold, no doubt, native plants whose simple charms cannot be overlooked, and you see also rubbish—Nettles, Thistles, Docks. That is unquestionably the fact, and it is as well to admit it on the principle that hidden sores seldom heal freely. Now in this particular wood or garden environs the Honesty is the plant of plants to change the scene from an aspect of neglect to a position of enjoyment. In the place of rank weeds will spring up a bright cheerful flower, requiring, when once established, little more attention than the weeds themselves receive. In thousands of such wildernesses the plant, when just once planted and tended into bloom, will perpetuate itself by its own inherent force of reproduction. In such places use the Honesty by the hundred or thousand as required, and many a cheerless walk and dingy drive will smile with beauty and be made cheerful, as that period of the year should be.

But besides occupying the border laud mentioned, the Lunaria may be admitted into the garden proper. "What! a common plant like that have a place in the garden! It may do for the cottagers' corner, or to hide an unsightly background; but a garden!" Does such a thought as that really arise? Well, let the corner be made attractive, and the cottagers' home be made brighter, and then the old Honesty will have done something, and something withal worth the doing.

But it will do more than this—has done, and will do more. It has played its part in ducal parterres, and played it well. In spring gardening, which is so delightful, it is adapted for a telling mass of a colour just then not at all too abundant. For lines or centreing, for distant effect especially, it is capable of doing much to fill-in a coveted floral picture.

For this purpose it may be produced at almost any height required. If it is wanted to create a fine bold mass 4 feet high, give it rich soil, and stakes to support it; if wanted one-fourth of that height, plant in soil less rich, and peg down. So remarkably tractable is the old plant, either as to altitude and adaptability to site, that we may almost do as we like with it.

For massing and garden purposes the purple variety is generally most suitable used alone, but for woodland and wilderness and approaches thereto, the white one mixed-in adds an air of sprightliness to the scene, which would otherwise, by the natural greenery prevailing, be somewhat too heavy and sombre. Where sub-tropical gardening is in question, and plants used which cannot safely be put out until the

Fig. 30.—Lunaria biennis.

middle of June, this plant comes in as a useful ante-decorator, occupying the ground until just that time and taking off its blankness. For that purpose it is quite suited and is used, but its home is to be found in less imposing sites, to lighten-up the shrubbery and brighten dull approaches. It is at home with the cottager, and with the gardening-under-difficulties amateur, and will serve each well in return for anything like fair treatment.

As to propagation. Although it may be increased by division, it being occasionally perennial, it is altogether more easy to take it as it is, a biennial, and raise it by seed annually. If stout early-blooming plants are required, sow in drills at the end of April, and transplant in nursery beds after the manner of Cabbages, in rows 18 inches apart. Each plant will then have room to develope itself and be of hardy constitution, and such as scarcely any winter will harm. These plants if finally planted in the autumn will, under a mild spring, commence to flower at the end of March and continue two months. Smaller plants, if such are required in quantity

for semi-woodland decoration, may be had by sowing in June and transplanting less thinly, to be again put-in expeditiously with the spade in the hope of their continuing, as they often will, to haunt their home for many after-years with little or no assistance.

Because we look upon this plant as a very old friend, and, as such, possesses many good qualities with very little fuss attached, we do not hesitate to aid it from the comparative obscurity in which it has too long been suffered to continue.

CORDYLINE INDIVISA—SNOW'S WINTER WHITE BROCCOLI—MEALY BUG.

I FANCY the plant known to "R. P." (page 93) as Cordyline indivisa is not what is generally known by that name, and consequently his testimony to the hardiness of that particular kind is not so valuable as it would appear to be; but Cordylines are all handsome, scarcely inferior to Palms for their graceful habit, and any of them that prove to be sufficiently hardy for planting as specimens on lawns, or by the side of walks in semi-natural pleasure grounds, will be very welcome. The plant I know as C. indivisa has leaves 2 inches or more in width, with conspicuous red veins. The testimony I can offer will go a long way to prove the hardiness of it, but it is not quite conclusive. It has stood in a pot, not plunged or covered in any way, on the north side of a wall since midsummer to the present time (February 5th), apparently uninjured. Standing in a pot above ground its roots as well as its top would be exposed to the frost, and we had 25° December 31st. It had very little sun to ripen it, as from its position the sun could only reach it a little in the evening during the summer months. But on the other hand it is in a comparatively small pot, and did not make much growth, and its position is a sheltered one. I have no room for it indoors, and intend planting it out when time permits. Another Cordyline, which I take to be C. australis, has stood outside four years, and is a very handsome object. Is not the plant described by "R. P." Cordyline Veitchii?

Either Mr. G. Abbey has not got the true Snow's Winter White Broccoli or his cultivation differs materially from mine. I consider Snow's Winter White Broccoli, as supplied guaranteed by Messrs. Veitch, the most useful vegetable in the kitchen garden. Sown here in April and May it comes into use in November, and with management lasts till February, when it is followed by Cooling's Matchless. It is not so hardy as some kinds—it requires protection. No Broccoli that I am acquainted with will, when the head is formed, bear 25° frost; yet I had some of the variety in question, with heads as large as teacups, merely covered with snow during the late severe weather, that were perfectly uninjured. Most of the crop, however, had been taken up and replanted in pits. I have seen many varieties grown under the name of Snow's, most of them good, but still not the true kind. It is very difficult to save seed of this variety from its habit of turning-in at midwinter, and consequently it is always dear and scarce. Even the Messrs. Veitch have or had another stock besides the guaranteed one.

I am afraid "H.," who gives advice about getting rid of mealy bug off Vines by means of a spoke brush and clear water, can never have had much to do with that terrible pest. I do not recommend peeling bark off Vines, and had almost forgotten that such a practice existed till reminded by Mr. Wright in his excellent articles; but if I had mealy bug on the Vines I should certainly pull off the loose bark and then wash, not with pure water, but with hot soapsuds. Mealy bug has a great dislike to soft soap; it is within the bounds of possibility to exterminate it by this means, but it is extremely difficult. The soap must be kept off the glass, or at least not allowed to remain on.—WM. TAYLOR.

OVERPOTTING GERANIUMS.

As the season is now at hand for potting I wish to say a few words against overpotting Zonal Geraniums for greenhouse decoration. It is very well if you want to grow them for exhibition to give large shifts, but not without; they never throw up a quantity of bloom, but all leaves and strong growth, which makes your greenhouse look very green through the summer. Now, if you want abundance of flower shake all the old soil from the roots, and pot them in clean pots, with three parts loam, two parts leaf mould, and a little silver sand, in small pots, according to the size of the plant. When the pots are full of roots then feed them with liquid manure, but clear water given at first, and place them on a shelf near the glass.—WILLIAM DODGSON.

TRANSPLANTING VINES.

I AM delighted to hear of Mr. Blackburn's success (page 72) in Vine-growing. His is a striking instance of what may be done in the work of renovation when intelligently performed. Mr. Blackburn's Vines, it may be remembered, were twenty years old in 1872; their growth was weakly, and their produce altogether unsatisfactory. He decided to remove the house and the Vines too. How many, or how few, who, when making a new border on a new site, would not have had new Vines also? Who but Mr. Blackburn would have preferred the removal of Vines twenty years old confessedly in a miserable state, to the planting of healthy young canes, which would have been in accordance with good practice and sound prudence? Yet he deliberately pinned his faith on his old friends, and they have not deceived him.

His experience is very valuable, and is another instance of the sound lessons which can be, and are frequently, given by amateur cultivators on the different subjects to which they give attention. The Vines in question were removed in November, 1872, but in the February preceding (admittedly too late, as proved by excessive bleeding) were each cut down to within a foot of the surface of the ground. That was a bold proceeding on the part of one who had had no similar practice to guide him, the stems being cut where there were no visible eyes to form new canes; yet canes followed the same season, of vastly superior growth to that of the years preceding—in fact the growth, it seems, was of extraordinary vigour. These old cut-backs were replanted in a border "half a yard deep of good, kindly, but rather light loam, without a particle of manure or dressing of any kind; this border covered with stable manure, never to be dug, but the Vines to be fed by repeated top-dressings." Such is the mode of culture adopted in 1872. We now have the results of it in 1874. The two are worthy of being joined together. "Vines all that could be desired, vigorous growth, a sufficient number of moderately-sized bunches, berries as fine as ever seen by cultivator under same circumstances, in colour, bloom, and condition scarcely to be surpassed; structure unheated." That is what Vines will do—have done, under common-sense practice. Here is no extravagant outlay in border, no technicality, no elaborate structural aid, no artificial heat, but plenty of Grapes.

I have had—everybody has had, abundance of proof that good, useful, serviceable Grapes are producible—fruit fitted for a nobleman's table—by simple means. Give a Vine fair play, and in nine cases out of ten good Grapes will follow; yet there are the tenths where they will not come at the call of gardeners whose experience and success in other branches entitle them to respect, and, it must be added, sympathy. Nothing is more disheartening than for an able man to struggle to produce Grapes, and who yet fails, while others, without any seeming trouble, have them, as it were, at their bidding. There is nothing for it but to go on chronicling successes with the means producing them, and, peradventure, some missing link may be picked up by those who struggle, but struggle in vain, to produce good fruit.

Now, in the case of Mr. Blackburn's Grapes we must not lose sight of the cutting-down process. That was undoubtedly an important item in the account of success. Had his soil, site, and general system of culture been exactly applied to Vines lifted without being cut down, he would not now rejoice in such Grapes which he has just cause to be proud of. But another question arises, What would those cut-down Vines have done if they had not been removed? Previous to the heading they were confessedly worthless, making weakly wood and small sickly foliage. Of course, no fruit could follow under such circumstances; but after the heading-down, in the same border and house they made splendid canes, which duly ripened. Would not those canes have produced good Grapes if the Vines had not been removed? I venture to assert that they would have given Grapes as superior to those previous to the heading as were the canes and foliage. But why should this be so? To a great extent it is due to the new, free, unobstructed sap-passages which the young growth has provided. In the old canes the sap vessels were restricted and tortuous. The natural result of that is small wood, small foliage, and small fruit. Thus, Mr. Blackburn's Grapes by the mere pro-

cess of heading-down, irrespective of removal and change of soil, teach a lesson of some importance.

It is certain that numerous instances exist of weakly, stubborn, old Vines, but which, however, cannot be transferred to a new site and fresh soil. In such a case much good may accrue by cutting-down alone, when, as in the case in question, the old stock will push-up fresh fine canes. Every alternate Vine so cut down, and heavy border-dressings of rich manure, and with occasional soakings of guano water at the rate of 1 to 2 ozs. per gallon, would very soon work a decided improvement in many Vines which are apparently worn out. How many examples are there in the country in which, when old Vines have been uprooted, one solitary individual has been left, just for "old acquaintance sake," and this old friend has for years yielded as good, often better, than any Vine in the house! This old remnant, however, like Mr. Blackburn's, had the benefit of fresh soil. This should always be afforded if at all possible; it is only where it is impossible that the cutting-down alone is recommended as a means to procure Grapes on Vines previously barren.

Proceeding to Mr. Blackburn's request as to the formation of a *beau ideal* border, my reply is, I have no idealistic standard to set up to be worked by in all places and under varying circumstances. Any inflexible recipe, however good it might be in itself, would be calculated to mislead. A thorough knowledge of local circumstances, such as nature of soil, its retentiveness of moisture or otherwise; subsoil, its relative percolative power; natural district drainage and rainfall;—these are important incidences of which it is necessary to have a thorough knowledge, and there would be then no guesswork in border-formation. But Mr. Blackburn has a good border, at least that is what his Grapes say, and how simple it is! yet if I may venture a remark, it is not the border in itself that has such a Grape-producing power, but that it is pre-eminently the management of it in which lies the secret of success. Such a border of 18 inches deep only, and this rather light loam with no intermixture, must be managed—it must have attention, or in a very few years, unless the surrounding soil is naturally adapted to Vine wants, the Grapes would lack both size and quality. The top-dressings must be continued and an occasional change of food given. There must be loam additions, or a mass of humus will be created, which alone will fail to do the required work. Next autumn, if he dare do so, let him carefully point-off 2 inches of the surface if that can be done without the slightest root-injury—not without, and replace with 3 inches of sound loam (not light fibry stuff, as the manure will keep the bulk light enough), with 2 cwt. of inch bones per cartload of loam. Let this dressing alternate with the manure-coverings, and then with intelligent top-treatment no one can say how long the Vines will continue in vigour.

Large bunches and large berries by no means go together, as Mr. Blackburn supposes. Quite as often just the reverse is the case, and a pound or two-pound bunch with fine and perfectly finished berries, such as our friend has produced, are far more satisfactory to the consumer and creditable to the producer than larger bunches with berries destitute of colour, size, and bloom. Mr. Blackburn is on the royal road to large berries; he has only to crop lightly, thin freely, and if his border is perfectly drained or subsoil porous, water with liquid manure after stoning; keep the foliage thin, clean, and healthy; keep insects down by a genial atmosphere impregnated with ammonia from guano sprinklings, and then large berries will follow.

These jottings, it is believed, will be more really serviceable than a mere tabulated composition for any ideal border, which, by the way, I think I did not promise to supply; but I will now promise what is better—viz., at a convenient opportunity draw attention to some of the largest Grapes that have ever been grown, stating the governing conditions, and I venture to predict a surprise to somebody.—J. Wright.

VARIEGATED KALES FOR DECORATION.

In writing of these I do not pretend to have anything new to say, but rather to call attention to them as useful aids in the winter, when flowers, especially in small or medium-sized gardens, are scarce. This being the time when the majority of people who have gardens order their vegetable seeds, a little of the Variegated Kale seed could be ordered at the same time, as most respectable nurserymen keep good strains. The purpose for which they are here used is for the decoration of the dinner table, which purpose they answer capitally, the colours showing much better by artificial light than during the day, varying as they do from white to deep crimson. These, with a very few flowers added, such as Chrysanthemums, &c., sprays of Solanum Capsicastrum with two or three berries on each spray, form a lively contrast to the White Kale, with a few fronds of Adiantum cuneatum or other airy-looking Ferns over them; also a few dried Grasses might be mixed among them. Stands made of these materials were much admired here during the past winter.

I will add that the Variegated Kale is a very good vegetable cooked in the usual way.—G. H. Cooke, *The Gardens, Penlarth, Towyn, N.W.*

OUR AJUGAS.

All flowering plants are interesting in their season; among these we have the family of Ajuga, not a very numerous one, but none the less interesting. I think no admirer of our beautiful flowers can pass through our meadows during the early summer months without noticing the common Bugle, as it is called, with its lovely spike of blue flowers peering through the short grass. Ajugas grow well in most situations and in almost any soil. The Ajuga reptans section succeeds best in a good sound loam, and will bear almost any amount of moisture.

There are a few kinds that I would direct attention to as worthy of more extensive cultivation than they are at present receiving. Ajuga reptans alba is of diminutive habit, but is worthy of a place in the herbaceous border or the foot of the rockery, its pretty white flowers lasting for a length of time. Ajuga reptans variegata, white and green, is very attractive, useful where dwarf plants are in request for edging in the spring garden or border. Ajuga orientalis—or, if I mistake not, in some lists atropurpurea—is a very valuable and useful plant for edging purposes, its leaves being of a deep bronzy-purple colour, retaining their colour under all circumstances. It is very effective, and most desirable for those of limited means, for bedding purposes, and it is of very free habit. Ajuga genevensis is a plant of compact habit, has no creeping shoots; its flowers are of the deepest blue. It is a very desirable plant for rock or border. Ajuga pyramidalis, one of our native beauties, ought to be on all rockeries and borders too. Ajuga rosea, said to be a variety of this, is desirable for the sake of contrast of colour in the flowers.

They are all easily increased by seed and division, and may be propagated almost at all seasons. Ajuga rupestris is well adapted for planting on the rockery. Some are imported from other countries, but none are more desirable than our own natives of this family. We have an annual variety called Ajuga chamæpitys, but it is not often met with; it has yellow flowers; interesting chiefly as a botanical rarity.—Veritas.

KNIGHT'S MONARCH PEAR—GOLDEN KNOB APPLE.

Before the planting season closes I should like to call the attention of your readers to Knight's Monarch Pear. It is a variety which ought to be in every collection. The flavour is excellent; it is a good bearer, and remains longer in season than any other variety. It began to ripen here on the 1st of November, and was good for ten weeks. I do not mean to say that the Pears were all ripe then, but one could always have a dish from the shelf. What I wish to state is that they do not ripen all at once like other varieties, and I found it the latest kind here, except Prince Albert, which with me is only fit for stewing. Knight's Monarch ripens well as a standard in favourable localities.

I will also mention a first-class late dessert Apple called Golden Knob, a good bearer, tree very hardy, and fruit an excellent flavour, coming into season now when fruit of all kinds is scarce. As a kitchen variety of Apple for late use I recommend Dumelow's Seedling; this is a great favourite here, and is capital for all culinary purposes after Christmas.—J. Rust, *Tunbridge Wells.*

THE SWEET CHESTNUT (CASTANEA VESCA).

It seems certain that the most ancient of Greek naturalists described this tree under the name of "Dios Balanos," or Jove's Acorn Tree. In our authorised translation of the Old Testament it is mentioned thrice; but in the original Hebrew

the name *Ormun*, derived from a root-word implying nakedness, is believed by recent authorities to apply more fittingly to the Plane tree, which sheds its bark annually. It is found native over all southern Europe, but especially in the warmer parts of the temperate zone. It has been doubted whether the Chestnut is an English indigenous tree; but if not, it must have been introduced before the Norman Conquest, for in the reign of Henry II. (1154–1189) the Earl of Hereford granted a tithe of all his Chestnuts in the forest of Dean to Flexley Abbey.

The most noteworthy Chestnut trees in England are those in Lord Dacie's Park at Tortworth in Gloucestershire. Even in 1150 one of them was known as "the great Tortworth Chestnut." It marks a boundary of the manor, and a century since was considered to be a thousand years old. Its girth in 1720 was 51 feet at 6 feet from the surface. Even this is small compared with the "Chestnut of a Hundred Horses" on Mount Etna in Sicily, of which we add an engraving (fig. 31).

Houel writes of it as follows:—"Its size is so much beyond all others that we find it impossible to express the sensation we experienced on first seeing it. Having examined it carefully I proceeded to sketch it from nature. It is a faithful portrait, having demonstrated to my own satisfaction that the tree was 160 feet in circumference, and having heard its history related by the savants of the hamlet. This tree is called the 'Chestnut of a Hundred Horses' in consequence of the vast extent of ground it covers. They tell me that Jean of Aragon, while journeying from Spain to Naples, stopped in

Fig. 31.—The chestnut of a hundred horses.

Sicily and visited Mount Etna, accompanied by all the noblesse of Catania on horseback. A storm came on, and the Queen and her *cortége* took shelter under this tree, whose vast foliage served to protect her and all these cavaliers from the rain. It is true that out of the hamlet the tradition of the Queen's visit is looked upon as fabulous; but however that may be, the tree itself seems very capable of doing the office assigned to it.

"This tree is entirely hollow. It is supported chiefly by its bark, having lost its interior entirely by age, but is not the less crowned with verdure. The people of the country have erected a house here, with a sort of furnace for drying the Chestnuts and other fruits which they wish to preserve. They are even so indifferent to the preservation of this wonderful natural curiosity that they do not hesitate to cut off branches to burn in the furnace.

"Some persons think that this mass of vegetation is formed of many trees which have united their trunks; but a careful examination disposes of this notion. They are deceived. All the parts which have been destroyed by time or the hand of man have evidently belonged to a single trunk. I have measured them carefully, and found the one trunk as I have said, 160 feet in circumference."

We regret that this Chestnut is not more largely planted. It is one of the most ornamental of trees. When of mature growth it has a noble bearing, its branches graceful, and its foliage bright and free. It is a total contrast to the Horse Chestnut, which Gilpin justly condemns as a heavy disagreeable tree, and even when in flower inharmonious and unpicturesque.

EUCHARIS AMAZONICA.

This beautiful plant is rather capricious in flowering, sometimes growing for several seasons and never blooming. I cannot give the *modus operandi* to flower it with the same certainty as a Hyacinth or Tulip, for I think it would be difficult to attain; but the following may not appear a bad result:—

In the spring of 1873 we potted several bulbs in a 14-inch pot in a compost of turfy loam, leaf mould, and rotten dung, with good drainage. They grew luxuriantly, but never bloomed. The following spring we partially dried them off by spare watering, then in about two months placed the pot on a slate slab over the hot-water pipes, and watered copiously. When the new growth was made it threw up fourteen spikes, six or seven blooms on each, and was in perfection in July. After flower-

ing was over I treated as above, and it has this month (January) thrown up four strong spikes with larger blooms than before. Some growers recommend frequent potting, but I think this is not required, as the bulbs in the present instance have not been potted since 1873. I do not think it should be dried-off so as to lose all its foliage, as it weakens the bulbs. Your able correspondent, Mr. Douglas, wrote in a contemporary that he bloomed it thrice a-year, but whether he meant the same bulbs or a succession I cannot say.—G. P., JUN.

GRAPES OF THE PAST.

IN the retrospect, Mr. Abbey says, all honour to Mr. Hunter; so I, too, would say, Honour to whom honour is due, for the unequalled success that has attended Mr. Hunter's labours in the production of the world-renowned bunches of Grapes produced at Lambton Castle. It may be that Mr. Hunter has been a surprise to himself. Did he really anticipate the result that has fallen to his lot? Perhaps Mr. Hunter will, for the benefit of our craft, enlighten us on the subject. Mr. Abbey names the 19½-lb. bunch of Speechly at Welbeck, where many years ago it was said that the Duke of Portland had more than a hundred kinds of Grape Vines, and in 1781 the bunch above named was presented to the Marquis of Rockingham. The account says it was 4½ feet in circumference and 20¾ inches in length. It was conveyed to Wentworth House, a distance of twenty miles, by four labourers, who in pairs in turns carried it suspended on a staff.

There can be no doubt but there are accounts of other large bunches of Grapes on record if we could only ascertain their whereabouts. I once saw a Vine at Kirkleatham, Redcar, Yorkshire, that had produced many years ago a bunch of Grapes weighing nearly 20 lbs. I do not know whether the gardener's name was Pringle or Proudlock who was there at that time. I was told there was a drawing of the bunch in the hall at Kirkleatham with the particulars. I had the promise when I left that I should be furnished with particulars, but I am sorry to say my informant has failed to fulfil his promise, and has since left the place.

Whatever kind of Grape it may be, whether Syrian, Hamburgh, Barbarossa, or what else, 21 lbs. 12 ozs. is a high standard to aim at. There can be no doubt that Mr. Hunter has arrived at the acme of perfection in the present generation of Grape-growers. May he live long to enjoy the honour so nobly won. I have no idea what the bunches of Grapes grown at Eschol might weigh, but from the account in the good old Book they must have weighed something extraordinary.—H.

FLOWERS CHANGING COLOUR.

WHEN a lad I used to apply blood from a neighbouring slaughter-house to Cowslips and Paigles, which after a season changed the blossom to a reddish shade. In a neighbouring village may be seen in a cottage garden an immense number of Primroses the children have brought home from the hedgerows, changed by some action of the soil to a purplish tinge.—ST. EDMUND.

[We know of an instance of double purple Primroses being brought to a garden at Dunse in Scotland. The next season they retained their colour, but the second season and ever since the flowers have been double white.—EDS.]

WELLINGTONIA GIGANTEA.

THERE have been in the various gardening journals of the past few years measurements given of the heights and sizes of various Wellingtonias in this country. There is a fine specimen in the Priory pleasure grounds, Prittlewell, Essex, the country residence of J. F. Leigh, Esq., M.P. It is nearly 40 feet in height, 8 feet 6 inches in circumference at the base of the trunk, 20 feet in diameter through the branches from tip to tip, and 60 feet in circumference outside of branches. From the information gained in the neighbourhood it has been planted nearly, if not quite, twenty years; and presuming it to have been 5 feet in height when planted, it must have grown on an average 20 inches a-year.—G. A. BROMFIELD, *Gardener, The Priory, Prittlewell, Essex.*

BLUE CORNFLOWER.—I think, but may be wrong, that what a "LITTLE SAVAGE" calls Cornflower is the same as Bluebottle—Centaurea cyanus, blue. July. England. There are also Centaurea depressa, hardy annual or biennial, blue. June. Caucasus, 1818. Centaurea pulchra, beautiful hardy annual, 1 foot high. Flowers blue and crimson. June. Cashmere, 1838. If she likes blue flowers for bouquets I recommend her to get blue Lobelias.—W. F. RADCLYFFE.

THE BLACKBERRY.

MANY years ago we heard a gardener in Essex assert that he had a hybrid seedling bearing fruit that had for its parents the Raspberry and Blackberry, but when we returned from India the gardener was dead, and no one knew of his seedling. Without any such hybridising our American relatives have several varieties of Blackberry which they cultivate, such as the Lawton, Dorchester, &c. The Lawton may be obtained at some of our fruit nurseries. A Californian paper announces another under the name of the Aughinbaugh Blackberry, and publishes the following drawing and description of it. It is named after its raiser, Mr. G. Aughinbaugh.

Fig. 82.—Aughinbaugh Blackberry.

"This berry ripens from four to five weeks earlier than any other variety of the Blackberry known in California, as has been shown by the result of its cultivation for the last two or three seasons. It begins to ripen there from the 1st to the 15th of May, and continues to produce berries until about the middle of July—about the time other varieties of this berry begin to appear. By reference to the engraving it will be observed that the fruit is very large, and in form quite unlike to other varieties, being more the Mulberry than the ordinary Blackberry.

"In addition to the advantage of large size and early ripening, the fruit is of excellent flavour, and does not contain so large a proportion of seeds and cores as other varieties. The plants grow up hardy, thrive well, and produce abundantly. We can attest from personal knowledge to all we have said above, and have no hesitation in commending this berry to the attention of fruit-growers everywhere."

NOTES AND GLEANINGS.

BOXWOOD, the wood of BUXUS SEMPERVIRENS, which is almost exclusively used for the best kinds of wood-engraving, has been for some years becoming more and more scarce. Wood of the largest diameter is the produce of the forests of the countries bordering on the Black Sea. Large quantities are produced in the neighbourhood of Poti, from which port the wood is shipped direct to England. The supply, however, from this port is, we learn, becoming fast exhausted; and it is said, unless the forests of Abkhassia are opened to the trade it must soon cease altogether. The quantity exported from Poti during the year 1873 amounted to 2897 tons, of the value of £20,621; besides this, from 5000 to 7000 tons of the finest quality annually pass through Constantinople, being brought from Southern Russia and from some of the Turkish ports of the Black Sea for shipment, chiefly to Liverpool. An inferior and smaller kind of wood supplied from the neighbourhood of Samsoon is also shipped at Constantinople to the extent of about 1500 tons annually. With regard to the boxwood forests of Turkey, the British Consul at Constantinople reports that they are nearly exhausted and that very little really good wood can now be obtained from them. In Russia, however, where some little Government care has been bestowed upon forestry, a considerable quantity of choice wood still exists; but even there it can only be obtained at an ever-increasing cost, as the forests near the sea have been denuded of their best trees. The trade is now entirely in English hands, although formerly Greek merchants exclusively exported the wood. In the province of Trebizonde the wood is generally of an inferior quality; nevertheless, from 25,000 to 30,000 cwts. are annually shipped, chiefly to the United Kingdom.

—— THE distillation and manufacture of ATTAR OF ROSES is a large and important branch of industry in Adrianople. In the northern parts of the country, we are told in an official document, the produce of 1873 exceeded by 35 per cent. that of the

previous year, the quantity distilled being some 121,875 ozs., valued at about £90,000. It is chiefly exported from Philippopoli to England, France, Germany, and Austria; and recently merchants in the United States and Germany have opened correspondence with firms in Adrianople, with the view of establishing agencies to further extend this branch of commerce.—(*Nature.*)

—— The Metropolitan Floral Society have been enabled to make arrangements (through the liberality of the Directors of the Alexandra Palace Company) for holding a grand autumn Exhibition of Flowers at their Palace, on August 24th and 25th, 1875.

—— On the 3rd inst. at his residence Heath Cottage, Thorpe Hamlet, Norwich, Mr. John Bell, aged seventy-one. For thirty-nine years nurseryman and seedsman in that city.

SEED-SOWING.

To sow seed well is to lay the foundation of success with any crop, and more especially of such as are cultivated altogether in the open air. Simple as this matter may appear, it is in reality a most important one, and to which, I think, particular attention may be given with greater advantage at this period of the year than at any other; not that it is ever to be lost sight of, for had we not the approaching seed time in view when we hastened last autumn to dig and expose every bare space or garden bed to the sweetening influence of the coming winter's frosts, winds, aye, and snow and rain too? for soil well-drained that is thrown up as loosely and roughly as possible not only runs no risk of becoming sodden, but, on the contrary, derives much benefit from the moisture which passes so quickly through it, depositing nutriment in its passage, so that even in winter the clouds may literally be said to "drop fatness."

How many times has the importance of autumnal digging been explained, and yet how frequently do we see kitchen gardens altogether neglected throughout winter? There lies the soil—inert, cold, and sodden. No care or attention whatever has it received since the past season's crops were removed; and when approacing spring compels some attention to be given it, what medium can possibly be worse for the assistance of vegetation than the crude sour clods which, but for such tardy and untimely culture, would have been free and open as ashes? Much more might one say upon the rough, unkempt, and most unpleasant appearance of such gardens in winter, but I will only add that high culture and neatness are inseparable.

It may be asked, What has all this to do with seed-sowing? The answer is—and I wish to make it as plain and forcible as possible—when seed is sown in unsuitable soil there is much risk of failure, and the loss of a single crop implies a corresponding failure in our future supply. True it is that some blame may be attached to the weather, but the aim of a really earnest man is undoubtedly to maintain a full and unbroken supply of whatever may be required at his hands, to combat and overcome, so far as may be, the difficulties of unkindly seasons, more or less of which he must always be prepared to encounter; and he will do so successfully if he be a man of forethought, energy, and resource—anticipating the future by his plans—working with a system thoroughly digested but as elastic as possible—adapting his measures to the circumstances by which he finds himself surrounded.

Now, do not suppose that I am writing solely for the benefit of those having, or hoping to have, the charge of extensive gardens; rather should these remarks be regarded as applicable with equal force to gardeners of every class, and my aim is to animate those who have hitherto been content to remain passive under evils that are not irremediable to such exertions as experience has proved likely to be rewarded by success. I heard a person remark last year that he had lost the first two sowings of Peas, and felt doubtful about the third, and I gathered from his manner that he did not consider himself at all blameable in the matter. No, the soil was at fault; it was so close and heavy in texture, and so foul withal, that the seed either perished outright or was rendered useless by the attacks of insects as soon as it became softened by the excessive moisture of the soil. Here was an evil plainly set forth. What was the remedy? Just this: for each Pea row the soil should have been raised a little above the ordinary level, a drill made and almost filled with a mixture of soot, old leaf mould, ashes, or sand, upon which the seed should be sown and covered with some of the same light porous materials, settling the whole gently down with the back of the spade. Thus the seed would be kept from contact with the cold wet soil, and the process of vegetation rendered far less critical and uncertain.

It is an excellent rule never to sow seed in soil that is in an unsuitable condition to receive it, or there will be considerable risk of failure, say in about an equal ratio to its want of soundness. I will give an example drawn from my own practice last season. Several beds of Carrots were sown, one of them in soil which, although in excellent condition at the time of sowing, was liable to be reduced to a hard compact mass by a heavy shower; and that is just what happened before any growth was visible, the crop proving a total failure. What was to be done? The other beds were in a flourishing condition, but were not calculated to afford enough Carrots for the maintenance of a full supply. I had therefore to revert to an old but certain plan, which was to make holes a foot apart and as much in depth over the whole of the surface of the bed which had failed, filling them firmly with a mixture of leaf mould and sand, and in each sowing a pinch of seed. The result was even better than I anticipated, for those late Carrots were decidedly the best in the garden. That piece of land received such a heavy dressing of ashes and manure last autumn that no future crops can fail from a similar cause. It is only fair to add that no such failure could have happened at all had the plan adopted as a certain remedy been followed in the first instance.

It was about four or five years ago that the plan of covering Pea rows with small squares of glass immediately after sowing was propounded; since then I have so used glass for the protection of a variety of seeds that are liable to suffer from the attacks of birds or mice. The advantages attendant upon the plan and benefit derived are so great, that I do not hesitate to call especial attention to it once more. The glass is laid upon the soil covering the seeds at the time of sowing, and is not removed till the young plants lift it from the ground, which they do very quickly, for the glass acts not only as a most efficient protector, but as a capital agent for the attraction and transmission of heat to the soil from the sun's rays, so that vegetation is a much quicker process than under ordinary circumstances.—Edward Luckhurst.

DINNER-TABLE DECORATIONS.

There can be no doubt a moderate arrangement of flowers gives a dinner table an elegant appearance that nothing else will. If the dinner table be of a medium size, one large stand or vase with some specimen glasses grouped round it will be quite sufficient; but for a table of large dimensions, of course, the arrangement of flowers must be of a much larger scale. In selecting flowers, those with a powerful odour should be avoided as much as possible, or, at all events, only a judicious amount employed, as large quantities of such as Gardenias or Stephanotis make some feel faint. Arrangements of cut flowers should, as a rule, have plenty of Fern fronds interspersed through them, which set off, but at the same time tone down, their varied hues. When selecting flowers for cutting, it should be borne in mind if they are to be subjected to artificial light, as it is well known some yellow and mauve shades, if subjected to gas or any similar artificial light, change, and not for the better. As far as possible all Ferns, foliage and flowering plants, from which a supply is intended to be cut, should be cooled-off as much as possible before being subjected to the knife. In some cases this cannot be managed: but, as far as possible, those cut from a warm stove should be avoided, as, when subjected to the dry hot atmosphere of sitting-rooms, they soon shrivel and fade. Another thing which tends much to keep flowers and Ferns fresh, is having their stems severed by a sharp knife in place of a pair of scissors. They should be cut in a slanting direction. By so doing the little tubes and vessels in the stem are cleanly severed, and not crushed, as they would be were scissors employed, and so are enabled to draw up the moisture more freely, which keeps them fresh. When about to make an arrangement, it is a good plan to have a bowl of water at hand, with the chill just taken off; and before each Fern frond is about to be placed in the position which it is to occupy, dip it into the water in the bowl, lift it out, and give it a gentle shake, which will, to all appearance, remove the water from it; but though not visible, tiny drops will remain on the leaflets, which help much to keep them fresh. Some flowers can be subjected to the same treatment; but it is more adapted for Ferns and sprays of foliage than for flowers. Some people

have an idea that different things, such as sal-ammoniac for instance, if put in the water in which flowers are placed, helps to keep them fresh for a longer period; but I myself have always found nothing better than fresh cold water. If the vase be small, and the flowers in it required to last as long as possible, if the water be changed every second day, and the points of the stems fresh cut, it will be found surprising for what a length of time they will remain fresh-looking. Some flowers to last should have a drop of prepared gum dropped into their centre, others be wired; but space will not here permit of me enumerating those varieties which require that treatment. Be the arrangement large or small, plenty of fronds of light-looking Ferns, such as Maidenhair, should be associated with the flowers.—A. Hassard (in *The Gardener*).

GILBERT'S SEA-KALE AND RHUBARB TUBS.

In looking through the renowned gardens of the Marquis of Exeter recently, my attention was drawn to a very useful aid in forcing Sea-kale. Mr. Gilbert, who is known as one of the most practical gardeners of the day, refuses to be bound to conventional appliances; hence the innovation in hand-lights, which are so eminently serviceable as protectors. He has now fallen foul on Sea-kale and Rhubarb pots: being unwieldy and cumbersome, and even liable to breakage, they fell short of his standard of excellence, and he sought to obviate their dis-

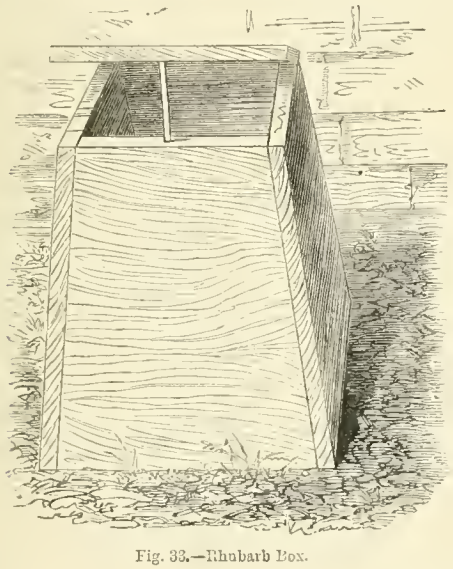

Fig. 33.—Rhubarb Box.

advantages by a trial of wooden tubs or boxes. These are simply four plain inch-boards nailed together without dove-tailing. They are 1 foot wide at the top, increasing to 18 inches at the bottom for covering the root. In height they vary from 18 to 30 inches, according to the kind and height of vegetable requiring to be forced. As seen in use they answered perfectly, and made one wonder that something of the same simple and effectual nature was not in more general use long ago.

The accompanying engraving (fig. 33), from a photograph will sufficiently explain these pseudo tubs, for of course they are bottomless, therefore not really tubs at all.—J. Wright.

SPARROWS versus FRUIT BUDS.

In order that the domestic sparrow may not get off under Mr. Abbey's enthusiasm I trouble you with a few lines. My experience of him in the gardens of Surrey is quite the reverse to his. When I came here the place swarmed with sparrows. I bought wire pea-guards, and put netting over other seeds. Afterwards I found the sparrows eating my Pear buds, one tree being cleared. Gooseberries suffered the same fate. As a last resort I began shooting them, and have shot them flying with buds in their bills—caterpillar once! Why, when I have had Gooseberry trees covered with caterpillars, did they not clear them? Because they prefer seeds; even Potatoes are a relish. My gardener is often told by those around, "I wish your master would not drive his sparrows over here!" Surely we are not all wrong.

The blue titmouse spoils Pears by picking them near the stalk, &c., but see how he works the rest of the year! If Mr. Abbey had written-up the hedge sparrow I would have joined him heartily. I say the house sparrow and finch tribe should be shot without pity. Do they send Mr. Abbey's pet bird to New Zealand? I think not: he would be as bad as the Scotch Thistle.—Age.

NOTES on VILLA and SUBURBAN GARDENING.

Finish with all expediency the alterations or improvements on hand in the planting of trees and groundwork. Any delay in this important matter too late in the season is detrimental to the well-doing of the subjects concerned, and will be liable to disappoint those who watch the results with an expectation of success.

The lawn ought now to be attended to by rolling frequently, and any defects or unlevel portions, which will be easily discernible after the severe frosts we have had, must now be put right, as it is as good a time as any in the whole year for this kind of work. Let all the outlines of embankments or terraces be put in order if not well defined. This adds as much as anything to the beauty of a lawn, especially that connected with many residences around a town, for the eye can at once glance upon the whole of it. Any of the edgings by the walks of turf which are out of the regular line may now be cut into shape with the edging-iron; and although it is not well to do it too early, owing to the liability of frost and rain to perish the sides down again, yet if cut about this time they will be safe from that contingency.

Box hedges may also be clipped before the month is out; these, if done before, are liable to be turned brown by a severe frost, especially if trimming has not been regularly practised, and they have to be cut rather severely. There is some difference of opinion as to the shape of these hedges; some prefer them cut square on the sides and flat on the top, others choose a triangular form, so that they may be narrow at the top. I give preference to the latter plan, not only because it looks best, but the hedge has a better chance to grow. When cut square at the top it must of necessity be cut hard in order to regulate its height, and then it turns brown and does not break into growth regularly, causing it to appear unsightly during the whole summer. It is well to proceed with this work now, so that it may not interfere with other and more important operations that will come on as the season advances.

As most of the bulbs of Hyacinths, Tulips, &c., in beds will now be showing their foliage above the ground, they ought to be protected every night with canvas or netting spread out upon hoops thrown across the beds, to be uncovered every morning as soon as the weather will allow.

It will be remembered that in the autumn I gave a list of annuals that might be then sown for spring-blooming, and I may again remind those who are fond of such things—and they are most of them really beautiful—that most of the sorts may be again sown to bloom during the season. The same rules then stated may be applied now, except that, if the ground can be now spared, the seed may be sown where they are to flower, which will save the work of planting-out. Those sorts from the autumn sowing that have not yet been planted-out should be by this time, and the beds kept very clean on the surface and be frequently stirred, as the plants will in time spread so as to preclude the operation. A few of the sorts, such as the Nemophilas, must be carefully watched, as the slugs are a great pest to them. Again, it frequently happens that small plants in the beds are frequently almost worked out of the soil owing to the loose nature of it from the effects of the frost. Choose a dry day, and fasten such plants with the hand.

Look to plants in frames, such as the pots of Mignonette, Stocks, Carnations, and Picotees. Clean them and move the pots to prevent them rooting into the soil beneath. Go on with the propagation of bedding plants as fast as cuttings can be obtained. A good plan is to put the cuttings thickly into small pots, and pot them off when well rooted, singly if room is abundant or the plants delicate, or three or more in a pot to economise space.

The Centaurea candidissima is better propagated by putting one cutting in a pot, so that when it is rooted it will be the better shifted into a larger pot. This plant will not so well bear pulling about at the roots as a Verbena and many other plants; moreover, in the propagating bed much damp must not circulate over this plant, or the chances are that most of the cuttings will die off before they are rooted. Light and air are better agents to assist them than a shady and damp atmosphere, and the soil must be of a sandy nature, not liable to hold too much moisture. I have been thus particular in detailing the mode of propagating this plant in the spring because I know so many

amateurs fail with it, and its being so desirable a plant for bedding purposes.—Thomas Record.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

All the planting, pruning, and digging amongst the trees have now been finished, and the buds are rapidly swelling; they are not very forward this year, and at present the nights are frosty and the days cold, so that but little progress is made, and as late blossoms are more likely to escape the frosts than early, the chances are in favour of a good crop. We are not troubled with feathered songsters eating the buds, but the house sparrows are a continual source of annoyance; their object does not seem to be so much to make a daily meal off the buds, but to pick them off and drop them on the ground. They put us to a considerable expense for wire protectors (something like a shilling a-yard), without which no Peas could be obtained. The flowers of Crocuses, Snowdrops, and Primroses are objects of their special attention; as soon as the flowers show signs of opening the birds pick them off and strew them around the plants. On the other hand, it is said that the good they do more than compensates for the mischief; but it is not so at Loxford, and it is quite necessary in self-defence to destroy as many of the birds as we can, and to demolish all the nests before the eggs are hatched. An amateur friend residing at Ilford was very much annoyed with their eating the buds of his Gooseberry bushes. He tried catching them with steel traps, which he thought was cruel, neither was it effectual. The next plan was successful, and it is now always adopted when the buds are bursting; it is a plan, moreover, that commends itself to amateurs. He treats the birds kindly by feeding them with bread crumbs after breakfast, and placing water for them to drink; the sparrows appreciate this treatment, and leave the buds alone. The small maggot that bores into the Apples and occasionally attacks the Pear has been very troublesome; it has been considerably reduced in numbers during the last two or three years, but has not quite been eradicated. The most certain way to destroy it is to gather all Apples attacked, and to destroy them at once; but dusting the trees at this season with dry lime has been tried, and we fancied with good result. A calm dry day is the best time to do it. The branches must first be made wet by syringing with soapy water, and immediately after apply the lime by throwing it on with the hand. The Gooseberry caterpillar has been quite destroyed, not by the sparrows, nor by picking, or dusting the trees with poison, but by removing the surface-mould from under the trees, and trenching it deep in the garden quarters, and filling its place with loam free from larvæ. Another desperate enemy to the trees is the immense larvæ of the goat moth, which has killed many of our trees. When once a colony of them has become established on a tree—or rather in, for they penetrate the hardest wood and tunnel it in all directions—the chances are that the tree will be destroyed. Should any of the trees become cankered, the eggs are deposited there in preference to a healthy tree.

FRUIT AND FORCING HOUSES.

Vineries.—The earliest houses are progressing favourably, and the growing shoots require almost daily attention, tying them down, stopping, and thinning-out where crowded. The Vines are trained on the short-spur system, and a young rod or two are trained-up annually to replace those which have become unsightly by long spurs. The rod should not be allowed to grow to the top of the house in one season, but be stopped when it has grown 8 or 9 feet, and at pruning time this length is reduced to 4 or 6 feet. Stopping the rod at 3 or 4 feet has been tried, and causing the main bud to start again; but this is not the best way, as the buds immediately above the place where the growth was stopped do not always start well. All such young growths should be freely exposed to the light. We have just cut the Lady Downe's Grapes in the latest house, pruned the Vines, and are washing and dressing them as well as surfacing the borders. The bunches have been cut with a good length of cane, the end of which has been inserted in bottles of water.

Cucumber Houses.—The plants are now growing freely, but the leaves have been formed in a high temperature and almost without the aid of sunshine. It has therefore been necessary to dull the glass when the sun shone out powerfully for a few days, as the leaves suffered. Smoked the house to destroy aphides and thrips. It is quite necessary to maintain a minimum temperature of 65°, and the atmospheric conditions should be such that continuous healthy growth may be kept up. The plants will grow freely in a steaming atmosphere with a high temperature, but the leaves are such that they will not resist the dry hot days we have in March. Evaporating troughs are provided in the house at Loxford, but it was found that the plants succeeded by far the best when only half the quantity was kept filled with water. The surface of the border in which the Cucumbers are growing is damped over once every day; the paths, walls, &c., twice or three times.

Peach Houses.—The weather has been unfavourable for Peaches, especially those that are setting, and it is very undesirable to maintain a high night temperature if it necessitates overheating the hot-water pipes; 55° is quite high enough. Thinning the fruit and superfluous shoots is attended to at the same time. As soon as the fruit is fairly set it ought to be well thinned out, leaving about twice as much as will ultimately be allowed to remain. The young wood must also be removed with an unsparing hand. Two more growths besides the leader will be quite sufficient. The side growth nearest the base should remain, and one on the opposite side a little higher up the shoot. If there are any aphides on the growths it must be destroyed at once by fumigating. Syringing will hold red spider in check, rendering its attacks harmless, but the Peach aphis must be destroyed in its earliest stages. Decoctions of quassia chips, soft soap, tobacco water, and insecticides innumerable have been recommended to destroy this pest on Peach trees. This most of them will do if all the fly can be reached, but in a large house with the most careful syringing it cannot be done, as the leaves curl up as soon as they are attacked, and thus shelter the aphis; but tobacco smoke penetrates everywhere, and is certain death to them.

GREENHOUSE AND CONSERVATORY.

Owing to some mistake of the punctuation in last week's "Doings," Phalænopsis grandiflora is said to flower all through the winter in a minimum temperature of 50° to 55°; it ought to be 60° to 65°, the lower temperature given is for Cœlogyne cristata. Both species are the very cream of what Mr. Bateman styled bridal Orchids, and everybody ought to know that they can be grown as easily as Zonal Pelargoniums if they have the right treatment. Now that plants from the forcing houses are being removed to the conservatory, the plants must not be so freely exposed on cold days, as the opening flower buds receive a check which oft-times prevents their unfolding altogether. Tying and placing sticks to tree or perpetual-flowering Carnations. Any flower buds where the pods are likely to burst, are tied with a strip of soft matting or small gutta-percha rings.

Potting Stage Pelargoniums. These are not grown to make exhibition specimens, but for the flower trusses; and both for decorative purposes and for cutting, small plants in 5 and 6-inch pots are the best, the flower trusses from such are not only larger but the flowers are of better quality. Exhibition plants require much attention at this time as regards tying-out the growths. These project over the pots to a considerable extent, and cannot be effectually trained-out to a fastening round the rim of the pot. Two stout sticks must be laid on the pot at right angles to each other and be tied-down to the rim. They ought to project as far as the outer branches. A stout wire ring is then tied to the outer ends of the sticks, to this ring the ties can be fastened. Cinerarias intended to flower late as specimen plants, require to be trained in the same way as Pelargoniums, but it is not usual to do more than to place a wire ring under the rim of the pot, to which the growths are brought down. This must be done with care, as the succulent growths are very easily broken off. Cyclamens are very useful in this respect, that they do not require any tying or training of the growths; and all the attention, except watering, required at present is to remove mouldy flowers and leaves at once. This matter has been noticed in previous numbers, but it is so important that unless the mould is speedily removed the best plants might be destroyed by it. Now is the time to get rid of green fly; fumigating must be kept-up until not one remains. With the lengthening days the insect breeds more rapidly, and it is but seldom that any houses are quite free from it. If any should be supposed to be, it is better to fumigate as a preventive.—J. Douglas.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

Secretaries will oblige us by informing us of the dates on which exhibitions are to be held.

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

Books (*T. Bradshaw*). — The best illustrated book on flowers is the "Botanical Magazine;" on birds we only know very expensive works, each confined to the ornithology of one country.

Veronica serpyllifolia under Trees.—In answer to "Surrey's" inquiry as to whether Veronica serpyllifolia will grow under trees where grass does not do well, I may state that I have never tried it in such a situation. Two years ago I recommended an amateur friend to use it for carpeting narrow paths between small flower beds, which he did, and is now highly pleased with it. One end of his little flower garden is partially shaded, but not much overhung, by a large Sycamore, and near that end I notice that the Veronica grows a little weaker and not so dense, although it does not get patchy. I would not, however, expect it to succeed very well under the thick shade of the Lime tree.—R. D. Taylor.

Crystal Palace (*W. Ayre*).—We never heard of the essay you mention.

Passifloras Pruning (*F. H.*).—The Passifloras which have not flowered and have foliage different from those which have flowered, may be different varieties, but probably the foliage is not yet in character. Cut all the side shoots to within an eye or two of their base, and leave the main shoots at 15 inches apart. Do not prune these or the side shoots until the end of March or beginning of April, but before they grow shorten the main shoots of last year's growth to firm wood, say one or two-thirds their length according to their strength and ripeness of wood; if weak, two-thirds; if strong and firm, one-third.

Removing Worms from Lawn (*Idem*).—Dissolve 1 oz. of corrosive sublimate (bichloride of mercury) in thirty gallons of water, and with this water the lawn. The worms will come to the surface and may be swept off. Take care that fowls, &c., do not eat them, or they will be poisoned.

Pruning Roses (*W. W.*).—Strong-growing Roses ought, when established to be pruned less than weak growers. In your case we should cut the weak growers to two, and the strong growers to three or four eyes, or if they have but little root cut them in to two eyes.

Heating a Propagating Pit (*P. E. M.*).—Your plunging bed will be about 3 feet wide, and will require two rows of 3-inch pipes. For top heat you will require a pipe to be taken along the end and front above the plunging bed, and to the door, then along the plunging bed side to the other end of the pathway, alongside or beneath the stage to the door, continuing across the end, along the back wall, and return beneath the plunging bed, the pipes being taken 9 inches from the walls of the bed and 18 inches between them. Your house will have with this arrangement a cool stove temperature.

Sowing Rose Seeds (*St. Edmund*).—Sow them now, after breaking-up the heps into parts with the hand, in pots or pans well drained, in light rich soil, and cover with fine soil about half an inch deep. Plunge in an open sheltered situation outdoors, keeping moist and protecting from mice, which are very fond of the seeds. Very close wire netting is the best for this purpose. The soil is to be kept moist, and when the seedlings have three or four rough leaves raise them with a piece of wood, and pot singly in small pots; place in a close cold frame until established, shaded from the sun. When the pots have become full of roots transplant in an open situation in good, rich, light soil. A portion of the seed only may vegetate the first year.

Transplanting Rose Cuttings (*Idem*).—Pot them at once if showing incipient roots, and plunge in a cool frame until established, then plant out. If intended for pot plants shift into larger pots, and plunge in the open air. Hollyhock cuttings should be encouraged to fill the pots with roots, be duly hardened-off, and planted-out in April.

Plants for Surfacing Ground Beneath Chestnut Trees (*Alpha*).—The best subjects are the Ivies, the common Hedera Helix with H. hibernica (canariensis) being good. They should be planted with the roots as much in the open parts as possible, so that they may have the benefit of moisture, and the shoots should be trained into the shaded and dry parts. The Periwinkles are good. They should be planted a foot apart, the Ivies 6 feet, or for quick covering 3 feet. Rhododendrons and Laurels might also be tried should the subjects named he too dwarf or their growth unsatisfactory.

Raising Vines from Eyes (*H. T.*).—You can raise them in the dung hotbeds, and now is a good time to begin. The eyes should be taken from well-ripened wood, and cut over transversely above the eye and just clear of it, and from the back of it make a slanting cut downwards and through the shoot, commencing opposite the eye, and bringing out on the same side as the eye about an inch below it. You may put them singly into small pots filled with light tarfy loam, moderately drained, and gently pressed. The wedge-like end of the eye is to be thrust into the soil and level with the surface. The pots are to be plunged in the hotbed and kept moist. In due time they will put out a shoot, and when this is about 6 inches long shift into larger pots and grow on in a light warm house.

Early Rhubarb (*D. D.*).—The best kind for earliness and quality is Johnson's St. Martin's. Chrysanthemums—detach a shoot from the base when about 3 inches long, and pot either singly or three in a small pot, and place in a close cold frame or mild hotbed until rooted, then remove to a cold frame, and shift into larger pots as the pots fill with roots, and in and after April they may be stood on coal ashes in an open situation, but sheltered from winds. Half a dozen large-flowering varieties are Empress of India, white; Blonde Beauty, white, delicate rose stripe; Lady Hardinge, rose; Antonelli, salmon orange; John Salter, red cinnamon; Mr. George Glenny, pale yellow; and Jardin des Plantes, golden yellow, the best of the yellows.

Vines for Greenhouse (*A. H. S.*).—Your prospect of Vines succeeding is not good, the house having an east aspect, a wall to the south, and no means of heating. Besides, they would not succeed well did it get sun in summer, unless they were trained to the roof at about 15 inches from the glass, and were grown in large pots (18-inch), and had top-dressings of rich compost. The best kinds would be Black Hamburgh and Buckland Sweetwater.

Cutting-in a Laurel and Holly Hedge (*K. Y.*). — Cut the Laurel hedge in about the middle to the end of March, and the Holly hedge from the middle to the end of April. Both will bear cutting severely.

Plants for Carpet Bedding (*Idem*).—A few are Sedum glaucum, S. anglicum, Pachyphiton bracteosum, Howarthia cymbifolia, Alternantheras amœna, A. magnifica, A. amabilis, A. paronychioides, Ajuga reptans purpurea, Oxalis corniculata rubra, Pyrethrum Tchihatchewi, Lobelia pumila grandiflora, and the double variety flore-pleno, Antennaria tomentosa, Santolina incana. Those are the plants, or some of them, usually employed for covering the ground, but there are others which require to be associated. Arrangements of the kind have been given from time to time in the Journal, notably last year, the last volume, pages 247, 279, 298, and 323, containing much information on the subject, with practical illustrations of the bedding at Hampton Court Palace.

Soft Putty (*Mootee*).—Dr. Hogg, in the "Year Book," states, "My friend, Rev. W. Kingsley, has long used a composition which he has found to answer the purpose admirably. It consists of boiled linseed oil nine parts, tallow one part; let these be mixed with whiting to the required consistency, and they will form a putty suitable for all garden glazing, and which can be removed at any time without difficulty."

Double Furze Propagation (*Idem*).—By cuttings in March of last year's growth in sandy soil, better if a little peaty, in a slightly shaded border; or at the end of summer of the growth of the current year, on an east border.

Fruit Trees for Wall of Melon House (*A Lady in Cheshire*).—The soil being light and little of it will not suit Peaches, unless you were to remove it and form a border of a more retentive description; or you may enrich it and make firm. Cow dung would be the most suitable stimulant. In this case it would be best employed for Peaches and a Nectarine; or you might have one Apricot, and a Peach and Nectarine. The soil as it is would best suit Apricots and Plums. It is too light for Pears. Figs would be suitable if this fruit is liked.

Tenants Removing Shrubs, &c. (*Wishful to Do Right*).—So soon as the Rose and fruit trees were planted by you, the law is that they were affixed to the soil and belonged to the landlord. You cannot legally remove them without his permission.

Maréchal Niel Rose in Greenhouse (*Constant Subscriber*).—You may thin-out weak wood and slightly shorten strong shoots of Marechal Niel, but do not let your gardener overprune.

Tea Roses for Border (*Lady Jane*).—Adam, Alba Rosea, Belle Lyonnais, Catherine Mermet, Devoniensis, La Boule d'Or, Louise de Savoie, Madame Levet, Madame Willermoz, Marie Sisley, Cheshunt Hybrid, Souvenir d'Elise, Souvenir d'un Ami. *Noisettes*—Maréchal Niel and Céline Forestier. The above fifteen will most probably succeed well in the situation named. To these we might add Veitch's Duchess of Edinburgh, Madame Falcot, Madame Margottin, Homère, Madame Bravy, and Perle de Lyon.

Apple and Pear Trees Diseased (*J. M. A.*).—The vast number of swellings on the branches you enclosed are all the results of the American blight. That blight is the Aphis lanigera, and if it still attacks the trees the insects at this season are down upon the roots of the trees, where they winter. Remove the earth from over the roots, leave them exposed for a few days, pour over them abundance of ammoniacal liquor from the gasworks, and then return the earth.

Lily of the Valley (*C. B.*).—Mr. Standish, Royal Nurseries, Ascot, imports extensively the foreign rhizomes you need. Write to him and explain your requirements.

Growing Ferns (*Alpha*).—We have no doubt that "H. L." would show his Ferns grown in common garden soil, but your cheapest and most certain test would be to grow two or three in such soil yourself.

Bark of Fruit Trees Partially Destroyed (*J. H.*).—As the rabbits have only eaten off part of the bark the trees will not be killed. Cover the wounds with a plaster made of equal parts clay and cowdung. To prevent further mischief wrap a hay or straw band round each stem to the height a rabbit can reach.

Heating Greenhouse (*G. W. J.*).—A colza-oil lamp will be of no use for heating your house. You will require a stove boiler and two rows, a flow and return 2-inch hot-water pipes all round the house, excepting doorway. The stove boiler may be either in a shed at the back of the house or within the house, but it must have an iron funnel or pipe to take away the smoke and other obnoxious products of combustion, being careful to keep it clear of woodwork.

Annuals for Smoky Gardens (*A Lady Gardener*).—We presume you wish for hardy kinds only; such are *Alyssum maritimum, white; Leptosiphon densiflorus, lilac, and its white (albus) variety, but the last two do not bloom well after the beginning of September; Nasturtium Tom Thumb, vars. *Beauty, orange-spotted, *crimson; N. King of Tom Thumbs, scarlet, and *King of Tom Thumbs, golden; Nolana atriplicifolia, blue, white, and yellow; N. lanceolata, blue; Sauvitalia procumbens, flore-pleno, yellow; *Saponaria calabrica, rose; *S. calabrica alba, white; and Calendula officinalis superba, orange, though of no good for bedding, stands smoke remarkably well. Those marked with an asterisk will bloom as late as you wish, but the others will not. To make up your number we name some which are half-hardy annuals, or may be treated as such: Ageratum Imperial Dwarf, Lobelia speciosa, Pyrethrum Golden Feather, Senecio elegans—double crimson, lilac, purple, red, and white; and Tagetes signata pumila. Œnothera macrocarpa and taraxacifolia, yellow and white-flowered respectively, are sometimes used for beds, but they do not bloom late enough. The Passion-Flower against a south wall ought to have flowered within four years, but probably it is in too exposed a position, the wood not ripening well. It is not likely it will flower, though if it grow freely we should give it further trial. Glory of Waltham is a good red Rose for a wall.

Propagating Apples, Arbor-Vitæ, and Thuja Lobbi by Cuttings (*J. W.*).—Apple cuttings should be of last year's growth, with or without a short heel of the old wood, and they should be about 10 inches in length, and be inserted in the soil two-thirds of their length, and from this the eyes should be removed. They are to be cut transversely below the lowest joint, and if they have any old wood an inch is sufficient. Plant firmly in rows 9 inches apart, and 3 inches asunder in the rows. A sheltered and slightly

shaded position on a north border is most suitable. Now is a good time to put in the cuttings. Arbor-Vitæ and Thuja Lobbi cuttings should be made in July or August after the growth is complete, taking them off close at the base of the current year's growth, and inserting in sandy loam, mixed with a third of sandy peat, and the surface covered with half an inch of silver sand. They are best placed in a frame or hand-light in a cold house, or they may be placed in a cold pit or frame, and should be kept moist and shaded, and have air only to allow any accumulation of damp to pass off. When they begin to grow air will need to be given more freely. The cuttings will also succeed under a hand-light. We know of no book giving "full instructions for striking cuttings of all sorts."

Grass Keeping in London Churchyard (*George Allen*).—The ground is no doubt much infested with moss, and has a firm surface. It will need to have the surface loosened, and a top-dressing given of rich soil or compost, with a sixth part of lime intermixed. A covering of this half an inch thick in March, and raked over well early in April, when you may sow it rather thickly with Poa nemoralis sempervirens, Festuca duriuscula, Cynosurus cristatus, Poa trivialis, 5 lbs. of each, Lolium perenne tenue 20 lbs., Trifolium repens 8 lbs., Trifolium minus 4 lbs., in mixture a sufficient quantity for one acre. Rake very lightly after sowing, and roll well, or if this be not practicable beat with a spade. If sparrows are not numerous the raking after sowing may be dispensed with. Do not keep very closely cut, as the grass, if much used, will be liable to burn and die in dry weather, and if possible cut with an early prospect of rain or in moist weather.

Pruning Neglected—Pear and Cherry Trees (*H. Timperley*).—Cut away the young shoots to the last eye of their base, and any very long spurs we should also shorten to the lowest bud at the base; but you must not remove the apex if a fruit bud, which you will be able to distinguish now, so that the pruning should be at once done. We should confine any treatment of the spurs this year to shortening the very longest ones. The Cherry tree is to be treated same as the Pear.

Gloxinias, Caladiums, and Achimenes (*H.*).—*Gloxinias*—Mr. Haines, Prince Leopold, Brilliant, Fanny Wilder, Monarch, Richard Thornton, Emperor of Brazil, Prince Arthur, Hon. Mrs. Yorke, Madame Patti, Miss Hannah da Rothschild, and Rev. A. H. Bridges. *Caladiums*—Chelsoni, Leplay, Vesta, Princess of Teck, and Princess Royal. *Achimenes*—Ambroise Verschaffelt, Chelsoni major, Nesida, Purpurea Magnifica, Longiflora major, and Sir Treherne Thomas.

Hardy Melon for Frame (*A Constant Reader*).—Turner's Scarlet Gem, though a highly-flavoured scarlet-fleshed Melon, is not suitable for a frame with little heat beyond that of the sun. Munro's Little Heath is the best Melon for an amateur with but a limited supply of heating material. A strong tenacious loam is most suitable for Melons. A compost of rather strong fibrous loam with a fourth of rotten manure well incorporated is best for Strawberries for forcing. They should be potted as firmly as possible. The best Pea for general crop is, to our liking, G. F. Wilson, but we should hardly like to restrict ourselves to one kind.

Peas Sowing in Trenches (*West Coast*).—You cannot have read the matter aright, for no one knowing anything of Peas would recommend them to be sown in trenches 2 feet wide and deep. What is said, we have no doubt, is to make trenches of the size named, and manuring well, working it well into the soil as for Celery, and return the soil to its original level before sowing the Peas. Everybody knows this practice to be good, especially in light poor soils. The best time to move Conifers is in early spring, say April, just when they are beginning to grow; and the same remarks hold good of evergreen shrubs, but they may be moved quite safely at this time and until they begin to grow; also in September after the growth is complete. What shrubs do you wish to propagate? To enumerate those which may be raised from cuttings would cause us to enumerate a majority of those in cultivation, no one, except a nurseryman, having half of them. Variegated Hollies are propagated by budding or grafting at the latter end of March, in April, or just when the stocks are growing, and by budding in July or early August. Really good bedding annuals are scarce. The names of some are given to-day in answer to another correspondent, but we give a list of those which may be raised from seed, and will be available the same season for bedding purposes. Dell's Crimson Beet, Cineraria acanthifolia, C. maritima, Echeveria metallica, E. secunda glauca, Oxalis tropæoloides, Perilla nankinensis, Pyrethrum Golden Feather, Ageratum Imperial Dwarf, Alyssum maritimum, Centaurea candidissima, Cerastium tomentosum, Cuphea platycentra, Lobelia speciosa, Nasturtium King of Tom Thumbs, scarlet, and the golden variety; Sapenaria calabrica, and white variety alba; Tagetes signata pumila, Tropæolum compactum coccineum, T. compactum luteum, Viola cornuta Perfection, and V. lutea major. The duration you may find in any catalogue.

Quantity of Gas Tar for Mixing Asphalt (*J. K.*).—We have not been particular to note the quantity of gas tar required for bringing to the consistency of mortar the ashes used for asphalting walks. As near as we can tell, about a gallon per square yard for a thickness of 3 inches. If any have noted the exact quantity of boiling tar required for mixing we should be obliged were it communicated.

Cucumber for Frame (*R. B. N.*).—Tender and True is probably the best of Cucumbers for quality. It or Blue Gown we recommend. Your frame will only accommodate one plant, planted in the centre; and upon a dung bed 3 to 4 feet high, with 10 inches of soil upon it, you will have a fair chance of success.

Sea-kale Crowns Decaying in Winter (*G. B.*).—We are unable to account for the decay of the crowns, though we apprehend it is in consequence of the seeding to which you allude, it being remarkable that the growth is good during summer. This is also past our experience—the root-stem to form eyes and shoots with abundance of flower stems the same season. The decay we believe to be only that of the flower stems, and small crowns below them are the true crowns, the growth of last year. Otherwise the decay of the crowns, and especially in light soil, is inexplicable.

Shrub for Centre of Raised Bed (*J. K.*).—A very suitable subject and very distinct is Abies excelsa glaubra-pilliana, a very close slow-growing Spruce, which for what you want ought to be about 2 feet 6 inches through, and to secure this size of plant the price will be more, perhaps, than you may wish to give. Thuja orientalis aurea is also suitable; but the cheapest and most tractable subject would be a green or variegated tree Box.

Smoke from a Brick Kiln (*A. B.*).—At a distance of 80 to 100 yards from a number of brick kilns we have seen gardening successfully practised, and the plants you name thriving at no greater distance than 50 yards; the smoke was taken off by a chimney. If the kiln be an ordinary one, twice the above distance will be necessary.

Roller Shading for Stove (*G. B.*).—There ought to be no difficulty with the shading by means of a roller, pulleys, and line, especially as it is an end house. The length is certainly considerable, but you might arrange to have it in two lengths. If you object to blinds you may brush the inside of the glass with whiting and skim milk, or a glue size if put on the outside, and this you may wash off or renew as required.

Names of Fruits (*J. Royle*).—1, Not known; 2, Beurré d'Aremberg; 3, Doyenné d'Alençon.

Names of Plants (*G. Aulger*).—We think No. 1 is Veronica agrestis, and No. 2 V. cymbalaria; but specimens should be sent in a box. (*A. R.*).—Your Orchid seems to be a form of Orchis fusca (O. purpurea); it has nothing to do with O. longicornu. (*W. T.*).—Cyperus alternifolius, and C. alternifolius variegatus. (*H. B., Prestbury*).—Cannot determine from specimen sent.

POULTRY, BEE, AND PIGEON CHRONICLE.

HOUDAN COCK TURNING WHITE IN ONE MOULT.

Have any of your readers known of a similar *lusus naturæ* as the aforesaid?

Mr. Cooper of Limerick, who is well known to all poultry fanciers in this country, has the gold medal Paris winner which has performed this feat. Had he been an old worn-out bird gradually growing white it could be easily explained, but for a bird in perfectly rich colour in one moult to turn pure white I think is not a matter of everyday occurrence.

As I have on two occasions awarded him prizes, and remember his rich dark colour as well as size and frame, my astonishment is great to find in one moult he has turned perfectly white, retaining all other Houdan characteristics. I suppose we shall have White Houdans in Variety classes now as well as White Crêves.—C. F. Staunton.

THE AGE OF DORKINGS.

In your last number Mr. Bartrum says, "I happen to have won the Dorking cup at the Palace in the Old class at the last two Shows;" but if Mr. Bartrum refers to the official prize list of this Show for 1873 he will find that Mr. Beachey was awarded a cup for the best hen in that year. Mr. Beachey's hen, though not sold at the auction, was afterwards claimed; and as Mr. Bartrum had told me that he did not breed his cup hen of the Palace and Bristol Shows last year, and Mr. Beachey at Bristol when going round the classes with me recognised Mr. Bartrum's hen as his old Palace bird, I thought I was justified in assuming that this same bird had twice won at the Palace, and that she was, on Mr. Beachey's authority, over eight years old. However, as Mr. Bartrum says this is not the same bird Mr. Beachey doubtless made a mistake, and I am sure he would be the first to acknowledge it.

I bought a Dark Dorking hen at the Crystal Palace in 1872 shown by Mr. White, which I afterwards ascertained from him had won the cup at Leeds in 1868. This hen I still have; she is alive and well and now laying, and must at the very least be seven years old.—T. C. Burnell.

CUP NOT OF THE VALUE STATED IN THE SCHEDULE.

It was stated in the schedule of the late Oxford Poultry Show, in a head-note to the list of cups, that the cups would be silver and of the full money value. In the list itself the cups were also described as silver. Thus far previously to the Show. At the Show a reprint of the schedule was published in the catalogue, and the same description of the cups was repeated. I of course relied upon the statements made, and entered, amongst others, a pen of Mandarin Ducks in the Variety Duck class. To this pen the cup was awarded, and it was subsequently sent to me. It proves to be, not silver, but *a plated article!* Will you tell me what you think of the matter, and what course I ought to adopt respecting it? I have informed the Secretary of the discovery which I have made, but he seems to think it a sufficient answer to say that the cup was a presentation cup. I shall be happy to let you inspect both the cup and the schedule, should you wish to do so.—An Exhibitor Misled.

[Whether it was a presentation cup or a cup offered by the Committee makes no difference. The Committee have failed to fulfil their engagement.—Eds.]

Poultry-keeping.—The following is my experience of poultry fancying during the last three months:—My stock of fowls consists of sixteen Brahma hens of 1872 and 1873; these have not distinguished themselves in any way but as food-consumers, and an occasional egg or two. I have also ten Brahma pullets and three Crève pullets hatched last March; these three last named began to lay at six months. From these thirteen pullets

I have had from the 21st of October to the 21st of January 533 eggs. They are liberally fed in much the same way as your correspondent states in the Journal of January 21st. Eggs have been so very scarce this season that I am inclined to think this great success. I should add that one of these pullets has sat without hatching owing to the extreme cold, and another is now sitting.—A Successful Contributor.

BRAHMAS AS EGG-PRODUCERS.

I notice a few remarks on Dark Brahmas, in the management of which "Ealing" appears to have experienced much better results than myself during the past year. I must, however, correct his idea of "intruders visiting the nests;" that is, I think, completely guarded against. The strain may have something to do with pullets' backwardness, though some of my older birds have at last commenced laying on the 18th; and on the 26th two of my pullets (these just turned eleven months old), where last year they began at seven months. I presume "Ealing" is able to give his birds a wide grass range during the day, which coupled with two feeds per diem I should expect would prove more satisfactory than three feeds under more confinement.—Agricola, *Liverpool.*

CRITICISMS OF AWARDS AT PORTSMOUTH SHOW.

I most fully appreciate fair and impartial reports of the various exhibitions, as also criticisms upon the awards; but, being one of the Judges at the late Portsmouth Exhibition, think a little more care should be taken by the reporter of your contemporary ere he make such remarks as the following: "Mr. Lingwood's Buff Cochins were remarkably distinguished by being not even commended." Now, had that reporter taken the slightest trouble he could have known that pen of Buffs arrived without any label, and two pens being empty, Nos. 40 and 41 (which I afterwards learned were Mr. Lingwood's and Mr. Tomlinson's), the Committee decided not to pen those birds until they could be certain to whom they belonged, therefore they were not in the pen when the awards were given in. There were other cases where birds were exhibited with wire or tape round their legs, consequently all such plainly-marked birds were passed over. Possibly, when the exhibitors heard such marks could not be tolerated they removed them, and visitors not knowing the reason might wonder why they were not noticed. If possible the reporter should interview the Judges, and thereby hear why this or that pen was passed before he impugns the judgment. Again, birds arriving after the class is judged should have cards "too late for competition" attached.—W. B. Jeffries.

DORSET SHOW OF POULTRY, &c.

This Show was held on the 27th and 28th January, and the building much reminded us of Oxford, the poultry being in the Corn Exchange below, and the Pigeons in the Town Hall above. The Show was a complete success in every way, the management being in the hands of Mr. Billett. The attendance was wonderfully good, the whole country around turning out to see the Exhibition. The Judges were advertised many weeks ago as being for poultry Messrs. Hewitt and Hodson; but, as we all are aware, the former gentleman has been too unwell for many weeks to judge at the different shows where he was expected, so Mr. Tegetmeier filled his place here. But we must say we think all shows which make a point of advertising their Judges should most decidedly also advertise who the substitutes are to be when they find that those engaged are, from illness or any other cause, prevented from attending. At Dorchester they certainly kept up the error even to putting on their catalogues that the Judges were Mr. Hewitt and Rev. G. F. Hodson, when they must have been aware, long before the catalogue was in the printer's hands, that Mr. Hewitt would unhappily not be able to be with them. We do most sincerely trust that committees will take the hint, and when their first advertised judge cannot come will by means of a public advertisement let the exhibitors (who have made their entries on the faith of a certain gentleman judging them) know who the substitute is to be, for it is well known that different judges have different opinions about birds, and that while some are crotchetty on some minor point, others think nothing of it.

At Dorchester, as at most good old-fashioned shows, *Dorkings*, the table bird of the people, opened the ball, and Mr. Whitworth won the cup with a grand old pair; the second also being fine. Silver-Greys were not good except the first-prize pair, while in Whites Mrs. Hayne cleared the board with three good pens. *Brahmas* (Dark) were good; Light not so fine as usual. In Darks the winners all were well-known birds, and well placed here. Lights were a large class, but winning was easy. *Cochins* were very good. They had three classes—Buffs, Partridges, and Any other variety. The cup pen of Buffs were grand. In Partridge we almost preferred the third-prize pen (Crabtree). In the next class the first Whites were a fair pen, but the cock seemed down on his legs and looked overshown. Mr. Woodgate had the best pen in the class, but the bird's tails had got crushed in coming, and one or two feathers were broken off, consequently the Judges decided to pass them by. Not knowing whether it was the result of accident or design, we were much surprised at this, for they stood out a long way the best, and it must have been clear to any judge, we should have thought, that "faked" tails would have been very different. We confess we saw no reason why in spite of the broken tails the birds in question should not have stood first. We frequently see such accidentally-broken tails in Spanish and Dorkings (notably so the cup hen at Bristol), yet they are not in consequence left out in the cold. The third prize in this class was not awarded; why we cannot conceive, for if there was a pen worthy of being highly commended, as there was (*vide* Mrs. Holmes), surely it was also deserving of third. *Spanish* were good, the cup pen well shown. The second prize-pen (Le Sueur) went on and won the cup at Portsmouth we believe, as too did Mr. Dring's highly commended pen of Crêves. *Game* were a good lot and well judged. The cup went to Mr. Jekin's Brown Reds. *Hamburghs* mustered fairly, but besides the winners, which seemed for the most part well placed, there was nothing much worthy of notice. *Polands* were capital, good Silvers of Mr. Hinton's taking first; White-crested Blacks second and third. *Malays* made a fine class, and the quality was unusually good. *French* also brought two good classes. The first *Houdans* were the first-prize Tunbridge Wells pen, and deserve their place. In the next class Crêves, La Flèche, and Crêves won in the order named. The Variety class was various and varied. Mr. Tegetmeier made, we thought, a most happy selection; perhaps we might have placed Mr. Long's Black Hamburgh third, but there was not much wrong. *Bantams* made large classes, Game especially good, and the Judges picked out the winners well. We are sure the most critical could find but little fault here. The Laced classes were conspicuous by the absence of Mr. Leno. We could not understand why this gentleman, who seems ubiquitous, should not have had a "go in" here where there were a Laced class and good prizes. In the Variety Bantam class good Blacks were first and second, and White-booted (not White-breasted as stated in catalogue) third. This latter pen was very white, but a trifle too large. The Sale classes were large, and many of the birds good and cheap.

Ducks were large classes mostly, and the quality capital, Mr. Fowler's cup Aylesbury being very fine. In Blacks the first drake was simply gorgeous in colour, but rather large by the side of Mr. Kelleway's. The Variety Duck class was one of the best we ever saw, pen after pen of surpassing excellence. The winners were beautifully shown and well selected for their places. We were again glad to see our friend Mr. Fowler's most useful Cayugas in the list. The first-prize *Turkeys* were old friends. Second and third also good. In *Geese* the winners were enormous, and ran in first.

There was a class for *Pheasants*, and a most beautiful one it was, we never remember a more charming sight. The pens too for them were large, and they were well attended to. First went to Reeves, a little shabby in tail, still well first. Second went to Japanese, a wonderfully good pair. The Gold and Silvers were beautiful. We much admired Lady Heathcote's pen, and almost thought them deserving of third place. There were also Pied. In fact it was one of the best classes ever seen.

Rev. G. Hodson and Mr. Tegetmeier judged the Dorkings, Brahmas, and Cochins together; then Mr. Hodson, we believe, took the Malays, French fowls, and Variety Bantams, while Mr. Tegetmeier did the remainder. This report was laid on one side by mistake, and hence the delay.

We published the list of awards and notes on the Pigeons last week.

THE BARB, OWL, &c.

I was much pleased in our Journal of January 21st with the remarks from the ever-welcome "Wiltshire Rector's" pen on Dr. Morgan's article on the Barb. With the Rector I admire the Doctor's writings very much. His descriptions of the Pouter and Fantail were admirable, but in my opinion he is not quite so happy in his last on the Barb, no doubt from not having seen the bird in its best form. As "Wiltshire Rector" remarks, the show Barb of America must differ a good deal from ours. The best Barbs are certainly not small natty birds such as Dr. Morgan would seem to wish them to be. The Tumbler style is bad. The best birds look really bigger than they are when handled, rather loose-looking in feather, with very long wings broad at the points. I think it is certainly a mistake to attempt to breed them down to a delicate point.

I cannot imagine how Dr. Morgan thinks the Barb and Carrier so like each other; unless in being both wattled birds they really have very little resemblance. If one could fancy the

birds alive with their heads off it would be easy to tell them at a glance, they are so unlike in shape, attitude, habits, &c. A good many years ago a few fanciers tried to push forward the Tumbler style, but, fortunately, they did not succeed. Black is, I think, the best colour for a Barb, or white if they could be got fine enough. Reds and Yellows never show so well, though as good as the others in points, and the colours are besides often not good. As to their having the same origin nothing can certainly be known now, as they are both very old varieties, and it would take Dr. Morgan, I am persuaded, a very long time to make the one out of the other; so I trust with the fancy talent he evidently has that he will rather take up one or both and set himself the task of improving them, which I feel sure he could do if he set himself to it.

Being in the scribbling mood I wish to say a few words more, but this time I am to be reluctantly in opposition to "Wiltshire Rector;" but I know well he will forgive me, though I may not be able to bring him to my way of thinking. It is about English Owls. A short time ago (I speak from memory) in one of his articles he said they were a nice variety of birds, and that they ought to be encouraged. Now here lies our difference. I think, on the other hand, that they are a lot of degenerate mongrels that ought to be extinguished at once. This, I think, must be quite clear to anyone who looks at the foreign Owls and the English, unless there are two standards for Owls, which I never heard was the case. Ours are beyond a doubt a degenerated form of the bird, quite as much so as our old Trumpeters in comparison with the new type as it is called (the old it should be). This I think is felt if not acknowledged by Owl-fanciers and breeders of the English sort, as it is quite evident that they are crossing with the foreign birds; but this ought not to be if there is a standard for the English bird. The best way to make an improvement would be to have only one class for Owls at shows. This would put good breeders on their mettle, and I am sure that within a short time as good home-bred birds could be shown as the foreign. The best foreign birds are really gems, and they must be good fanciers who can turn out such lovely birds. I tried them twice—I have such a fancy for them, but I fear our climate is against them; but in the south of England I cannot see what is to hinder them from succeeding. The hens with me never lived over the second winter. If those who have them would refrain from overshowing them, they would have a far better chance of succeeding in breeding them. This is one of the evils of shows. They often fall into hands that want them for nothing else, and so are lost to the fancy. I intended to have made a few remarks on Jacobins, but find this is already long enough, but may yet do so.—Bubo.

THE POULTRY-KEEPER.—No. 30.

PLUMAGE OF THE PENCILLED HAMBURGH.

The plumage of the Silver variety does not differ from the Golden variety except in the ground colour. The Silver variety is of a clear white, the Golden of bright chamois yellow. In the Silver the feathers of the hackle and the head should be of a pure white without the slightest spot (fig. 34), and that to the back and shoulders where the beautiful black markings begin, which show on the feathers of the back (fig. 35). These markings are repeated on the feathers of the shoulders, the covert feathers of the wings, on those of the breast and thighs; but the marks diminish a little in intensity of colour and neatness of form in proportion as the feathers get towards the under parts, and they end by becoming mixed on the sides and abdomen. The same markings are repeated on the covert feathers of the tail, the feathers becoming longer and longer in approaching the large sickles, the beginning of which they hide.

Fig. 34.—Hackle Feather

Fig. 35.—Back Feather.

The large wing feathers (fig. 36) are neatly but a little irregularly marked with numerous black cross marks. The large sickles have the more regular characteristi markings, and are very like the large covert feathers of the tail (fig. 37). The front of the neck is like the hackle, white, and forms with it and the head an entirely white part, which occurs in circles over the rest of the body.

Fig. 36.—Wing Feather.

Fig. 37.—Tail Feather.

THE MEALY POUTER.

"Alas! Hope is not prophecy. We dream,
But seldom does the glad fulfilment come."

Two days ago my attention was directed to a melancholy editorial article in the pages of a contemporary, whose hopes as to the ending of this subject have been evidently blighted. I should not have taken notice of this at all but for the cool presumption of its Editor, taking to himself the credit of legislating upon a matter which, only twelve months ago, he admitted to me that he knew nothing whatever about. He challenges me for my "cool claim to the credit of a proposal which we believe first came from ourselves." Why, I advocated the raising of this bird many years before the journal in question or its Editor was known to the fancy. As for having a class for this bird, that was debated by Mr. Ure and myself over and over again, when we were members of the North British Columbarian

Society, settled and carried out; and it was because the said Society excluded it altogether from their last Show, as well as the other so-called off-colours, that I felt constrained to take up the subject.

But the querulous Editor in question, it seems, must have something or somebody to blow at, and requests an explanation. My explanation simply is, that whether Mr. Wallace and his friends do or do not object to a class for this and the other colours before referred to, they certainly excluded it and them (as Mr. Wallace frankly admits) from their Show.

I am further found fault with for raising "an entirely different and distinct question." Well, what of it? Am I not at liberty to raise any question? Perhaps I have done so in the wrong journal. I have "professed" nothing, but have given facts, and intimated my own course for the future.—James Huie.

Dorset Show of Poultry, &c.—The cup for best pen in classes 17 and 18 at the recent Show went to Mr. Hinton's Polands. The first and cup for best pen of French fowls in the Show was won by Mr. W. H. Crabtree with his Crève-Cœurs. The fourth prize was won in class 28 (Selling Class, hens) by Mr. Prosser, and not by Mr. Hinton, as misprinted in catalogue; and third in class 54 went to Mr. W. Morris. We are informed that the moneys for prizes and sales were all paid within three or four days after the Show closed.

THE DRAGOON CONTROVERSY.

The suggestion of Mr. South in a contemporary is certainly worthy of consideration if the vexed question relative to the standard of a Dragoon is to be settled; though I much question whether all fanciers of the birds at present exhibited as Dragoons will ever become united, since on certain points they are directly opposed.

For instance, one "goes in" for the broad-headed bird, while another fancier eschews all that are not the very opposite in this respect—viz., long and narrow. Then, again, the judges—what a variation in their awards! Mr. A says, "A barrel head is the first point I look for in a Dragoon, and unless possessed of this, however good in other points, must be left out in the cold." Mr. B fancies a flat broad-skulled bird; and Mr. C picks out the large heavily-wattled fellow with short thick beak, while Mr. D selects the small, graceful, and lightly-wattled friend of the "Wiltshire Rector."

Sufficiently perplexing as this is, one gets deeper in the mist by noticing that a judge not unfrequently contradicts his previous judgment, and this in a very short space of time. It would be invidious to mention names, but I could give instances in which the same judge awards a bird the premier honour at one show, and at the very next exhibition at which he officiates (within a few days) the same bird is again exhibited; but mark the difference—only to be passed unnoticed! or at most receive the judge's prize "commended." Some may argue, "Want of condition would justify this otherwise unaccountable variation;" but the fact of the birds being in the same good condition as in the first instance completely nulls this argument.

Does not this alone prove the unsound footing on which the standard of the show Dragoon is at present based? Undoubtedly there are now many standards held up for the Dragoon, some very much opposed to each other, others only varying on one or two minor points. To reduce these many standards to one is the desire of all true fanciers of this most beautiful and much-abused bird; and what we have to consider is the most desirable manner in which to proceed. I for one, as I previously expressed, doubt very much whether this can be accomplished, and shall, in the event of its being necessary, give my vote for the recognition of two totally distinct standards. We must, in my opinion, countenance both the tight little, closely-wattled, narrow-headed "gentleman," so frequently and admirably described by "Wiltshire Rector," and the large, heavily-wattled, broad-skulled bird.

Then comes the question of Which is which? Which is to be called the Dragoon proper, and what is the other variety to be nominated? I would suggest for the consideration of my brother fanciers that the former retain the old name Dragoon, or English Dragoon, since this bird illustrates more fully the general descriptions of all the old writers upon the bird in question, and that the heavier bird be designated Horseman, or London Dragoon.

Moreover, I am of opinion that the classes would fill to a greater extent than they ever do at present were both birds placed on an equal footing. Committeemen, make a note of this, and provide classes at your next show for both varieties; we should not then see birds so totally different penned side by side for competition with each other.

There is another question worthy of the consideration of all committees, and that is, Why should not classes be provided for each sex of Dragoons, the same as for Carriers, Pouters, &c.? Everyone knows the Dragoon class is invariably larger and pays better than any other; sometimes the entry fees amount to double the amount of prize money offered for competition: they have therefore a right to receive better treatment. If greater inducement were held out for hens by thus providing classes as I have suggested, it would, I doubt not, be one means of making the Dragoon classes more uniform.

Hoping my brother fanciers will state their views through the medium of "our Journal," I beg to subscribe myself—Nottinghamshire Rector.

READING PIGEON AND CAGE BIRD SHOW.

The first Reading Show was held on the 3rd and 4th inst. in the Corn Exchange, a spacious, well-lighted, and comfortably-warmed building. There were 530 Pigeons, 300 Canaries, 78 British birds, and 55 foreign birds exhibited. All were excellently arranged and cared for, and the undertaking so great a success that we hope it will become annual. We regret to say that the awards in the Pigeon classes did not give general satisfaction, and after carefully examining them we were not surprised at the complaints we heard.

First on the list came *Carriers*, shown singly, in two classes, for cocks and hens respectively, of any colour; both classes contained a number of Blues, nice birds, though they could not compete with the superb Blacks and Duns shown. In cocks Mr. Fulton was first and second with grand Blacks; we rather preferred the general form of the second, though his wattle was not equal to the first. Two third prizes were awarded: Mr. Yardley's bird was a fine Black, with apparently a stiff wing; Mr. James's a Dun, a beautiful bird, but disfigured by an excessive growth of beak with the end apparently pared off. A nice Dun of Mr. Yardley's was very highly commended. In hens, too, Mr. Fulton was first with a dark Dun, and second with a Black, marvellously developed in wattle for a hen; third was an excellent Dun, slim and strong in form, not very large in wattle. *Dragoons* had two classes, and were divided in the same way as Carriers. Birds of all colours were shown; but the Judge seemed to have a partiality for one colour and for one type of bird—five out of the six prizes went to Blues, all birds quite devoid of wattle. This we think is to be regretted when there are two recognised types of Dragoons. In cocks first was a stylish Blue in form, but in our opinion not worthy of its position; second and third much alike, long-limbed Blues. Two good birds of Mr. Fulton's were left out, apparently for having too much beak, and two beautiful Blues and a Yellow of Mr. Baker's for the same reason. In hens, again, a Blue was first, a poor little Blue second, and a nice Yellow third. *Antwerps* had two classes, which numbered sixty-three and thirty-two birds. We could not see the principle upon which awards were made here, some of the winners being neither Long-faced nor Short-faced, and of no definite colour. The first cock was a nice-looking bird, pale Blue Chequer. Where the merit of birds chiefly consists in their performances on the wing it is impossible to criticise them fairly in a show room. The first-prize hen was in form like a Blue Rock, though dark blue in colour. Extra prizes were liberally given in these large classes. *Pouters* were shown in pairs, and very uncomfortable they looked in small pens; we hope to see them shown singly at the next Reading Show. Mr. Fulton was first with Whites and second with Blacks; a fine pair of Yellows were third, and Blues highly commended. *Tumblers*, Short-faced, had one class for pairs; the first winners were, as is generally the case, Almonds. They well deserved their position. Second were good Black Mottles; and third Agates. Mr. Fulton's and Mr. Yardley's highly-commended Almonds were both good, but the latter not well matched. *Fantails* were a splendid class. We could not comprehend the first award; doubtless the birds would carry their tails beautifully if they had them, but every feather was broken off about 3 inches from the roots. We know the birds, and know them to be good, but for all the Judge knew their tails might have been black. Second were coarse birds, but with large tails and fairly carried; third were small and nice Blues. Mr. Baker's commended Whites and Mr. Cresswell's highly commended pair should have been higher. *Trumpeters*.—A magnificent pair of Russian Blacks were first; second were Mottles, even better in points, but out of condition; third were far behind the other winners, fair in points, but very light splashy mottles in colour. Pen 247 (Baker) contained a single bird, a grand Black. Whites unfortunately are now but second-rate; two pairs were shown, one fair, the other very poor. *Magpies* were fortunate in having a class to themselves, which was denied to Barbs, Jacobins, Owls, and Turbits. Cleanly-cut Blacks were first and far ahead. Black seems the natural colour of a Magpie, and Reds and Yellows but abnormal varieties. Second went to Yellows, third to Reds. Any other variety class was a most interesting one from the unusual number of popular breeds relegated to it. Much grumbling over the awards in this class was heard; but a Judge may be pardoned for peculiarities in placing so many and such excellent specimens. Extra second and third prizes were most properly given. First were Yellow Barbs, confessedly fine

birds, but the cock coarser than we like, and far larger than the hen. The second went to Blue Owls, called English, but evidently a cross between English and African, or at least with much African blood; and to a pair of Black Shell-crested Turbits, not nearly so good as an unnoticed pair of the same variety. The third were a pretty pair of Blue Priests, and a pair of White foreign Owls; why entered as Jacobins we do not know. This growing habit of sending birds other than those entered is most inconvenient for absent exhibitors, and most misleading to novices. We think that birds so sent should be disqualified after due announcement of this regulation in the schedule. Mr. Baker, who won the point cup, seemed determined not to be beaten, and sent many lovely pairs to the Variety class, including White Jacobins and Turbits, nearly all wrongly entered in the catalogue. A rich-coloured pair of Archangele, evidently two cocks, were properly passed over. The Selling class was not remarkable; a soft pair of Ice were first, a bargain for some one; fair Blue Priests and Nuns also in the list.

The silver cup of five guineas for the greatest number of points in Classes 17 to 30 was awarded to Mr. J. Adams; and the Mayor's cup, value £3 3*s.*, to Messrs. G. & J. Mackley.

A show of *Cage Birds* is always attractive to the general public, to ladies in particular, and that at Reading seemed so especially, from the number of local exhibitors. How wonderful is the colour of Canaries dieted on the new *régime!* A new-fashioned Canary among the old is like an orange among lemons.

Belgians were poorly represented, but every variety of English Canary was there in force. The Mules were particularly handsome, the first-prize light-coloured one of the prettiest of the kind we ever saw. Goldfinches and Linnets filled large classes—happy little birds, which looked as if they had never known and never wished for more space than their cages gave. The class for Any other variety of British birds was most interesting; Magpies, Jackdaws, Owls, Bramblefinches, Blackbirds, and others were there. Some blue Titmice in a quaint artistic habitation of cork were scarcely visible for the crowd round them. In Parrots the first prize went to a marvel of loquacity; some seventy of the bird's sayings were written down. A grand white Cockatoo of the venerable age of thirty-six carried all before it in the foreign Variety class; and Mrs. Holmes showed a Mocking Bird, to which an extra prize was given, in lovely plumage, but provokingly silent, in spite of our endeavours to excite him. A Parakeet, exhibited by Mrs. Monck, of Coley Park, Reading, much amused the visitors by piping "Merrily Danced the Quaker's Wife."

All the birds were so arranged as to be seen with comfort and to advantage. We hope to have another and equally pleasant day at Reading Show next year.

The following are the awards :—

CARRIERS.—*Cock.*—1 and 2, R. Fulton, London. 3, H. Yardley, Birmingham; J. James, Bath. *hc*, H. Yardley; R. Payze, jun., Wood Green (2); J. James; J. Baker, Kew Bridge (2). *c*, E. C. Stretch, Ormskirk (2); J. James; J Baker. *Hen.*—1 and 2, R. Fulton. 3, J. James *hc*, H. Yardley; R. Payze, jun.; J. James (2). *c*, R Payze; J. James; H. Yardley.

DRAGOONS.—*Cock.*—1, Powell & Crane, Oxford. 2, H. Yardley. 3, A. McKenzie. *hc*, H. Yardley; W. R. Pratt, Oxford; C. A. Pearson, Liverpool. *c*, G. Packham, Exeter; R. Fulton; A. McKenzis. Liverpool; W. V. & J. M. Longe, Ipswich; J. Baker. *Hen.*—1, Powell & Crane. 2, W. V. & J. M. Longe. 3, R. Fulton. *hc*, H. Yardley (2); A. McKenzie; E. Durrant, Tunbridge Wells; J. Baker. *c*, H. W. Wren, Lowestoft; J. Baker.

ANTWERPS.—*Cock.*—1, A. R. Burrel, Cambridge. 2, Scragg & Valters, Oxford; W. R. Pratt. 3, W. G. Flanagan, Reading; A. T. Withers, Reading. *hc*, H. W. Weaving, Oxford; F. P. Bulley, Oxford; S. L. B. Smith, Sydenham; W. G. Flanagan; C. G. Butler, Reading (2); C. H. Buckland, Reading; Powell and Crane. *c*, H. W Weaving; H. Yardley; F. P. Bulley; C. G. Butler. *Hen.*—1, J. Taylor, Reading. 2, W. R Pratt; W. Ellis, Leeds. 3, H. M. Turner, Oxford. *hc*, C. W. Billett, Southampton; W. Norris, Newbury; C. H. Buckland; G. P. Palmer, Caversham. *c*, F. G. Russell, Blackheath; S. L. B. Smith (2); A. R. Burrel; T. Holmes, Lower Sydenham; E. C. Stretch (2); W. G. Flanagan; C. G. Butler.

POUTERS.—1 and 2, R. Fulton. 3, J. Baker. *hc*, H Yardley; J. Baker.

TUMBLERS.—*Short-faced.*—1 and *c*, J. Baker. 2, R. Fulton. 3, H. Yardley. *hc*, H. Yardley; G. Packham; R. Fulton; W. R. Pratt; J. Baker.

FANTAILS.—1, 3, and *c*. J. Baker. 2, J. F. Loversidge, Newark. *hc*, H. Yardley; J. F. Loversidge; O. E. Creswell, Early Wood, Bagshot; J. Baker.

TRUMPETERS.—1 and 2, R. Fulton. 3, J. Baker. *c*, W. G. Flanagan; J. Baker.

MAGPIES.—1, T. Homes. 2, G. J. Dewey, Gloucester. 3, J. Baker. *hc*, J. T. Hincks, Leicester; J. Baker. *c*, W. Tedd, Erdington (2); Powell & Crane; F. S. Barnard.

LOCAL CLASS.—1, C. G. Butler (Antwerps). 2, J. Roberts, Reading (Antwerps). 3, Mrs. Blagrave, Reading (Black Swallows).

ANY OTHER VARIETY.—1, J. Baker (Barbs). 2, H. W. Weaving (Blue English Owls); J. Baker (Turbits). 3, G. Packham (Priests); J. Baker (Jacobins). *hc*, H. Yardley (Barbs) (2); O. E. Cresswell (Jacobins); J. Baker (Jacobins and Nuns); R. Wilkinson, Guildford (Archangels). *c*, F. P. Bulley (Silver Owls); L. Lawson, Preston (2); J. B. Hicks, London (Pigmy Pouters); J. Baker (Foreign Owls).

SELLING CLASS.—1, H. Yardley (Toys). 2, W. Morris, Ross; J. Baker. 3, H. Yardley (Toys); G Packham (Nuns). *hc*, F. B. Cuble, Farnborough (Nuns); W. H. Edwards (White Dragoons); F. Skey, Reading (Starling); T. Kinchin, Reading (Baldheads); G. P Palmer (Antwerps); C. Etheridge, Reading (Magpies). *c*, B. W. Weaving (Antwerps); E. A. Thornton, Hull (Tumblers).

SPECIAL FLYING CLASS.—*Homing Antwerps.*—*Cocks.*—1 and 2, H. W. Crosse, Kensington, London. 3, G. P. Palmer. *hc*, C. C. Butler (2); W. E. Butler (2); G. Gillingham, Reading. *c*, F. G. Harris, Newbury; C. G Butler; H. Dibley, Reading. *Hen.*—1, H. W. Crosse. 2, T. T. Cooper, Swallowfield, Reading. 3 and *c*, C. G. Butler. *hc*, C. G. Butler; W. E. Butler, Reading.

CANARIES.

BELGIAN.—*Clear, Ticked, or Variegated*—2 and 3, R. Hawman, Middlesborough. *Clear, Ticked or Variegated Buff.*—2 and 3, J. W. Savage, Guildford.

NORWICH.—*Clear Yellow.*—1 and 3, J. Athersuch & Son, Coventry. 2, J. Adams, Coventry. *hc*, J. Athersuch & Son; J. Adams (2). *c*, G. & J. Mackley, Norwich (2); Moore & Wynne, Southampton; G. Cox, Northampton. *Clear Buff*—1, W. Pratt, Leicester. 2, J. Athersuch & Son. 3, J. Adams. *hc*, J. Athersuch & Son; J. Adams; G. & J. Mackley.

NORWICH.—*Evenly-marked Yellow.*—1, Brown & Gayton, Northampton. 2 and 3, G. & J. Mackley. *hc*, G. & J. Mackley; Moore & Wynne. *c*, J. Adams (2). *Evenly-marked Buff.*—1 and 2, J. Athersuch & Son. 3, J. Adams. *hc*, J. Athersuch & Son; J. Adams (2); G. & J. Mackley.

NORWICH.—*Ticked or Unevenly-marked Yellow.*—1, 2, and 3, J. Athersuch and Son. *hc*, J. Adams (3). *c*, G. & J. Mackley. *Ticked or Unevenly-marked Buff.*—1, 2, and 3, J. Adams. *hc*, J. Athersuch & Son (2). *c*, G. & J. Mackley (2).

NORWICH.—*Crested Yellow.*—1, 2, and 3, G. & J. Mackley. *Crested Buff.*—1 and 2, G. & J. Mackley. 3, Martin & Griffin, Southampton. *hc*, J. Moffatt, Bethnal Green, London; R. Hawman; G. & J. Mackley; Moore & Wynne. *c*, Martin & Griffin; S. Stratford, Northampton.

LIZARDS.—*Golden-spangled.*—1, 2, and 3, T. Fairbrass. Canterbury. *hc*, J. Athersuch & Son; W. Badcock, Reading; T. Fairbrass. *c*, J. Athersuch and Son; T. Fairbrass (2). *Silver-spangled.*—1, 2, and 3, T. Fairbrass. *hc*, S. Bunting, Derby; T. Fairbrass (3). *c*, G. & J. Mackley; S. Bunting; T. Fairbrass.

CINNAMONS.—*Jonque.*—1, J. Adams. 2, J. Athersuch & Son. 3, G. F. Dunn, Basingstoke. *hc*, J. Adams (2); C. H. Legg, Derby. *c*, W. Weston, Warddington. *Mealy.*—1 and 2, J. Adams. 3, G. & J. Mackley. *c*, J. Adams (3); G. and J. Mackley; C. H. Legg.

VARIEGATED MULES.—1, G. & J. Mackley. 2, R. Hawman. *hc*, G. & J. Mackley; J. Moore, Boston. *c*, J. Adams; S. Bunting. *Dark.*—1 and 2, R. Hawman. *hc*, G. & J. Mackley; S. Bunting; Moore & Wynne. *c*, J. Adams; C. H. Legg.

SIX CANARIES IN ONE CAGE.—1 and *hc*, J. Adams. 2 and 3, G. & J. Mackley, *c*, C. H. Legg.

SELLING CLASS.—1, G. Cox 2, J. Adams (Norwich). 3, G. & J. Mackley (Norwich). Extra 3, C. H. Legg (Variegated Cinnamon and Broken-capped Silver Lizard). *hc*, J. Adams (Norwich); R. Hawman (Jonque Cinnamon); G. and J. Mackley (Norwich); S. Bunting (Goldfinch Mule); R. Bishop; C. H. Legg (Cinnamon); L. Williams, Reading (Golden Lizard). *c*, G. & J. Mackley (Norwich); H. Pyke, Reading (Green Pied).

LOCAL CLASS.—1, J. Weston (Yellow Norwich). 2, F. J. Crapp, Reading. 3, T. Fife, Reading (Clear Yellow Norwich) *hc*, H. Gregory, Reading (Yellow Belgian); H. Pyke (Ticked Yellow Norwich); T. Rogers, Reading (Variegated Yellow); F. J. Crapp (Yellow Norwich) (2); L. Williams (Ticked Yellow). *c*, T. Pullen, Reading (Green); T. Fife (Norwich) (2); F. J. Crapp (Ticked Yellow).

BRITISH BIRDS.

GOLDFINCH.—1, S. Bunting. 2, C. H. Legg. 3, E. Cawston, Caversham. *hc*, H. Gregory; R. Hawman; G. Cox. *c*, E. Cawston; J. C. Bamber, Preston (2).

BROWN LINNETS.—1, R. Hawman. 2, G. & J. Mackley. *hc*, J. Adams. *c*, S. Bunting.

ANY OTHER VARIETY.—1, G. & J. Mackley (Blackbird). 2, M. Butler, Reading (Magpie). 3, J. Robinson, Reading (Thrush); J C. Bamber (Bullfinch). Extra, W. Nobbs, Reading (Skylark) *hc*, F. Wheatley, Reading (Thrush); Miss B. Cole, Reading (Blackbird); W. Nobbs (Thrush); T. Ashton, Reading (Thrush); E. Salmon, Reading (Skylark); S. Bunting; W. Bedford, Reading (Owls); G. Cox. *c*, W. Dorchester, Reading (Bullfinch); Miss M. A. Robinson (Thrush).

FOREIGN BIRDS.

PARROTS.—1, W. Exall, Reading. 2, Miss A. Brooke. 3 and *c*, G. & J. Mackley. *hc*, M. Butler; Mrs. Monck, Reading; Mrs. M. A. Chapman, Reading; Mrs. Giles, Reading; Mrs. E. Silver, Reading.

ANY VARIETY.—1, J. Whatley (Cockatoo). 2, S. Bunting (King Parrot). 3, Mrs. Monck (Parakeets). Extra, Mrs. J. T. Holmes, Bath (Mocking Bird). *hc*, Mrs. J. T. Holmes (Cockatoo); Miss M. A. Robinson (Ring-necked Parakeet). *c*, G. Chancellor, Reading (Budgerigars); G. & J. Mackley (Parakeets and Java Sparrows); Miss M. A. Robinson (Rose-crested Cockatoo); L. Williams (Australian).

JUDGES.—*Pigeons:* Mr. Harrison Weir. *Canaries:* Mr. A. Wilmore.

DRONES.

DRONE bees do seem very worthless stupid creatures, and never get a good name from anybody. They are graceless, mannerless, and shiftless. Drones of all kinds bear characters which are not inviting and attractive. Drone bees are lazy idle creatures beyond compare. Though they are stronger in build and body than either queens or working bees, they will die of want rather than work. Born in scenes of great activity and industry, and amongst communities of self-sacrificing workers, drones seem quite unaffected and uninfluenced by example, and remain apathetic and insensible to all around them but food and sunshine. They do seem to enjoy a warm noon-day excursion. Indolence is the great characteristic of drone bees. Having no weapons of defence they are naturally cowardly and helpless. They are very unfortunate creatures, and no right-minded person can study their history without feeling a touch of commiseration for them. To the naturalist the history of drones is most interesting. The immediate cause of their sex is shrouded in mystery, and their end is tragical to a degree. The queen lays both male and female eggs. The male eggs hatch into drones only, whether set in drone or worker cells, and female eggs hatch into workers, but can be converted into queens in royal cells. Many writers tell us that the eggs laid by a queen are differently treated in passing through the oviduct, that all eggs touched by the contents of the spermatheca become female, and that those which pass untouched are male—in a word, that all are male till some become femalised in passing the duct of the spermatheca. Whether this is a fact or a mere hypothesis we are unable to say; but in either case it is wonderfully mysterious. If it is a fact, the sex of drones remains unchanged from the formation of the eggs, while the sex and superiority of workers are determined by the application of the contents of the spermatheca in the body of the queen. Drones, then, are drones from deprivation before the eggs are laid.

Male eggs are generally deposited in drone cells. Is it not wonderful how queen bees know when they are going to deposit male and female eggs? And if they do not know this, is it not equally wonderful that the working bees know how to distinguish the male from the female eggs after they are laid?

In trying to fathom this great mystery a writer on the sub-

ject suggests the possibility of the narrow cells of worker-comb being the cause of the difference of sex; that these narrow cells compress the abdomens of queens in the act of laying, and thus press the contents of the spermatheca against the eggs; whereas the drone cells, being large, produce no pressure. The writer in question does not know that many eggs female in character are laid in almost all hives containing swarms on the foundations of cells before their sides are erected at all. In such cases there can be no pressure whatever on the abdomens of queens in laying eggs, and yet the eggs laid on these foundations hatch into workers.

Much has been written about queens laying female eggs for months, and then commencing to lay nothing but male eggs. If the writers had possessed accurate knowledge of the producing cause of the difference of male and female eggs they would not have written as they have done. We have never in our experience found a queen suspend the laying of eggs in worker cells for days in order to lay eggs in drone cells. We have no doubt at all that both kinds are laid by one queen on the same day. Drones are twenty-four days in their cells, and workers twenty-one days. If a strong hive be bereft of its queen the workers are being hatched and born every day for three weeks, and all the drones are not hatched till the twenty-fourth day.

The function of drones is to pair with queens and thus perpetuate the race of bees. There is produced in the swarming season a marvellous superabundance of drones in almost every hive. But if the importance of the fertilisation of queens be considered, and the limits of time in which it should take place (within ten or twelve days after queens are born), an abundant male population is perhaps a wise provision in an uncertain climate like that of Great Britain. If the weather be unfavourable during the early days of queens, many of them fail to be mated by drones and are worthless. But queens timely fertilised commence to lay in a few days afterwards, and in about ten days after egg-laying has begun by fertile young queens the bees commence to worry and kill the drones. The poor unfortunate creatures are driven from the provision cells by their merciless masters, whose deadly intentions become more manifest every day, till a scene of carnage takes place painful to witness.

Recently drone traps have been introduced to assist the bees in ridding hives of their condemned drones. We have one which does the work of trapping very well, but we seldom use it, for it hinders and confuses the bees at work during the best part of the day for honey-gathering; and then there follows the trouble of killing the drones that have been trapped. We try to select stocks in autumn that have but little drone comb in them, and when any that are selected have drone combs near their centres these are cut out, and worker combs are fitted in their places. In this way hives may be kept from having too many drones.—A. Pettigrew.

SWARMS AND BAR-FRAME HIVES.

Mr. Pettigrew cannot have read what he calls "the literature of the bar-frame school" with much attention if he cannot remember any results of swarms. I can find abundant results chronicled. Mr. Pettigrew implies that swarms spend their first year in making combs, was a statement made by Mr. Cheshire. I have read all Mr. Cheshire's articles again, and they contain no such expression, but I find one which says, speaking of a swarm which came off April 28th, 1872, "On July 15th in—*i.e.*, eleven weeks, the swarm had not only filled the hive but had also thoroughly filled and sealed a large super with beautiful comb. It was on that day removed and found to weigh 44 lbs. nett. A smaller super of glass was now put upon the hive, and on August 15th removed, containing 10 lbs. nett, making 54 lbs. nett from a swarm which was left with a hive so full of store that stimulative feeding in 1873 was prevented, as it would have crippled breeding." This hive the next year gave four swarms, all of which wintered well, and one filled a super. Now if Mr. Pettigrew turns to Class 13 of the British Bee-keepers' Association's Crystal Palace Catalogue (in case he has not a copy I now post him one), he will see No. 114, 38 lbs., one of two supers same size from a swarm of Ligurians, 1874; No. 115, 44 lbs. from a swarm of black bees, 1874; No. 119, 43 lbs. from a swarm of 1874. And these were not the only ones. Following Mr. Pettigrew's way of calculating, the weight of the hive contents must be added, which will augment the gross weight to more than the 100 lbs. desired. A filled super from a bar-frame hive is not at all uncommon, even although we have no heather to send them to, which will make a material addition.

Mr. Pettigrew asks for the result of my harvest. I answer that through the force of circumstances I was obliged to discontinue bee-keeping for a year or two, and began last season with two stocks only, from which I had no surplus; but then they were in skeps, from which I am thankful to say they were as soon as possible safely transferred to Woodburys, afterwards ligurianised, and then made use of for queen-breeding and experimental purposes, so that they had no fair chance, and therefore the skeps are not wholly to blame.

The columns of the back volumes of the *Journal of Horticulture* will give other instances of supers from swarms in bar-frame hives, if Mr. Pettigrew wishes for further evidence. With regard to the slinger, if Mr. Bagshaw had fairly tried its power in extracting heather honey and found it fail, what was the use of Mr. Pettigrew inviting bee-keepers to see him try the same experiment which he knew would not succeed? Referring to your correspondent's extract from Mr. Cheshire's article as to the colour and value of extracted honey, the quotation should go a little further and add, "But notwithstanding these slight drawbacks, so great is the economy to the bees and so, too, ourselves, in preserving the combs, that the balance in favour of slinging is very large indeed. As much as 600 lbs. have been taken in one year from a single stock in America." Now it is obvious that if the honey is slung from sealed cells only (of course with the seal shaved off), it must be identically the same as if run out uncontaminated by brood; but if unsealed honey is extracted a certain amount of evaporation (very little) will take place, but there is no loss of quality, and no colour will be imparted to it that it would not have had if the other process had been followed.

The relative value of extracted and run honey has not yet been determined in England, as we have used the extractor but little at present. At the Paris Exhibition last year extracted honey was quoted 1 franc per half kilo, and run honey 90 centimes; so, then, our neighbours, who are generally allowed to have the organ of taste pretty well developed, prefer the extracted. In America the case is reversed, and their method of procedure will perhaps explain this, as also why the honey would sometimes be dark-coloured. Across the Atlantic the following practice is commonly pursued:—Two hives containing strong stocks are selected. From No. 1 the whole of the bees with their queen are driven, making what we may call a strong swarm. The crown board is removed from No. 2, an adapter substituted, and No. 1 minus its floorboard is placed full of combs and brood in all stages on it, the bees in which swarm up, and hatch-out in due time all the brood. By the time this is done, the queen of No. 2 having been breeding all the time, the hive contains an immense population, who then, used to the super as they have become, immediately work their hardest to store the empty combs with honey, and as fast as they do so, without waiting for sealing, the bee-master empties them with his extractor, replacing again to be filled. It will thus be perceived that from such a hive all the honey is obtained from combs which have been well used, and perhaps thereby have gained the undesirable dark tint.—John Hunter, *Eaton Rise, Ealing.*

DEPRESSION OF HIVE FRAMES.

Mr. Pettigrew, in the Journal of November 5th, pointed to the removal of the bottom rail in frames for bar hives as an improvement. I replied, stating that I regarded the bottom rail as essential, and gave the reasons for my opinion, adding, as matters of experience, that the bar occasionally sank beneath the weight of comb and bees it had to support; that in the absence of the bottom rail the sides would be splayed against the hive wall and there attached; and that, further, the combs are sometimes built down to and fastened to the floorboard. December 17th, "Pecchione" disputes the facts adduced, and asks as follows:—"Will Mr. Cheshire tell us if the contingency he predicts with regard to the so-called bar-frame without the bottom rail is grounded on any actual fact, or is it a mere idea of his own?" I answer (December 31st), that "I have not a few instances in which the sinking is at least double of that upon which I based my calculations," and explain that I cannot then give the exact measurements, because the low temperature precluded an examination. I have since, however, ascertained them exactly, and find the greatest sinking 0.32 of an inch—rather more than three times the amount suggested. I can add, moreover, that the frames in which these depressions had occurred were seen by Mr. Abbott during 1873, when he asked whether the frames were those he supplied with the hives, to which he received a reply in the affirmative.

"Pecchione" in his last thanks me for an offer that was never made, of assistance in trigonometrical calculations, and then re-asserts "That it is impossible for bees to depress the bars as stated. A bar might warp from fault in the wood, but not from weight of the bees," &c.; his reason being (*vide* his letter), that as the weight is extended along the bar it must necessarily give a certain amount of strength.

Does "Pecchione" not know that if a plank be supported at each end it will sag by the weight of the wood it contains, and which is evenly distributed through its length? To talk of extension of the bees giving a certain amount of strength, is not to talk with reason but against it. If "Pecchione" be right, a straw supported at its ends will bear a swarm extended along it. It is next suggested that the case I instanced of bees attaching their comb to the floorboard might have arisen from careless manipulation. I can only say, that of those hundreds who saw me manipulating at the Palace Show, I hope but few

will think this probable. The question of ventilation is next touched. As I have written more than any other bee-keeper on the scientific bearings of this question, I refer to what I have already advanced, stating my willingness to debate with any who approach me in a friendly manner any proposition laid down if the object be the advancement of our hobby, but declining to discuss with one whose animus is so evident, and whose logic is so much at fault as to say, "I suppose Mr. Cheshire will allow that the heat in a hive is generated by the bees, as warm air is lighter than cold." I certainly allow the first, but not on account of the second.

"PECCHIONE" then adds, "Mr. Cheshire appears to be singularly erratic in his condemnation of hives, and I would like to know how he can reconcile his letter in the 'British Bee Journal,' pages 186, 187, and 188, with his letter in the *Journal of Horticulture*." I have condemned no hives, and if my letters are not reconcilable why does not "PECCHIONE" cite an instance? The subjects of the two letters are as little connected as the Baltic and the Mediterranean. I challenge anyone to show that they clash. Did they, I would not hesitate to acknowledge it, since I think it no discredit to admit that I may be wiser to-day than I have been in the past. "PECCHIONE" then says, "May I be allowed to explain that, if my memory serves me, the hive which Mr. Cheshire claims as his consisted of a combination of several gentlemen's ideas, and because the one improvement does not exist in his (?) he condemns it." Was ever a charge made with such a proviso?—"if my memory serves me!" I can afford to leave the decision with those who judge from knowledge, and would shrink from detraction upon dubious memory. That I carried off all the new-invention prizes at the Crystal Palace is a sufficient answer to the ungenerous insinuation, the utter baselessness of which I may at a future time clearly show by an explanation of the hive. The frame without the bottom rail, however, had its birth across the Atlantic, and was illustrated in the "American Bee-Keepers' Magazine" in 1872.

"PECCHIONE'S" last sentence is, "Why does not Mr. Cheshire send his hive to the Editor of the 'British Bee Journal,' as he promised to do?" Am I to submit to the questioning of one hiding himself behind a *soubriquet* as to my relations with a journal totally disconnected from the one in which the question appears? This correspondence must close, so far as I am concerned, by my stating that I am not aware of having made any promise to the Editor of the "British Bee Jonrnal."—F. CHESHIRE, *Acton, Middlesex.*

[This controversy must now close.—EDS.]

EGGS IMPORTED.—The import of these in 1844 amounted to less than 68 millions, but in 1874 to more than 680 millions. We paid less than a quarter of a million sterling for foreign eggs in 1854; in 1874 we paid nearly two-and-a-half millions for them.

OUR LETTER BOX.

HEN-COOP (*G. R.*).—The dimensions of Mr. Lingwood's model hen-coop are as follows:—Width, 2 feet; depth, 2 feet; height to the top of the roof, 2 feet 3 inches. This size would of course be for the large breeds, such as Dorkings, Cochins, or Brahmas; for Game and Hamburghs they should be made smaller, and for Bantams only half the size. The large size can be made by any carpenter for about 14s.—T. C. BURNELL.

FEATHER-EATING FOWLS (*B. W.*).—We have repeatedly replied that we know of no remedy. An American writer says a net full of hay hung up for the birds to pick diverts them. They only acquire the habit in confinement. We have sometimes lessened the habit by supplying the run with a barrow-load of fresh earth mixed with grass. We have also given fresh horse dung with advantage. Lettuces are very good, especially if they are run to seed. Nothing, however, has ever overcome the habit, and we should be delighted to know a cure. It begins about this time and lasts till after the moulting: they are then safe until the next spring.

PETTIGREW'S HIVES (*Jane*).—The hives used by Mr. Pettigrew are 16 and 18 inches wide, and 12 inches deep, inside measure. In future he will purchase none less than 14 inches deep, the sizes he now recommends.

THE COLOURS OF CANARIES (*Ornis Aghalee*).—The terms Jonque, Yellow, and Golden are applied to the deeper or richer-coloured Canaries; and Buff, Mealy, and Silver to others. Cinnamon birds, of which there are two colours, do not approach in any degree to the appearance of any of the feathers in the five packets sent. Cinnamon-coloured birds resemble more the spice sold by that name. Had we your birds to examine instead of the small clippings of feathers, it would have been much more satisfactory to us, but the Irish Sea betwixt us was, no doubt, the cause why we did not see your birds. The diminutive detached feathers of Canaries examined singly is no small matter to study, more especially when we found some of them possess an artificial appearance, as though they were impregnated with a colouring matter. When we opened packet No. 4 we opened our eyes wider, although our vision is strong. We suggested to ourselves the question—"Pepper?" No! Further examination dispelled the idea. Upon the webbing of the part of feather from the right wing of the Canary distinct patches of colour were very distinctly visible. This is quite unnatural. The tail feather from the left side was also of very high colour. The small feathers taken from the body of the bird were likewise of strong colour. We carefully examined each packet. No. 1, To all appearance the feathers from a blooming Buff or Mealy hen Norwich. No. 2, Feathers from a Mealy bird, but not an entire Green specimen, as two or three light-coloured small body feathers were mixed with the dark ones. No. 3, Apparently from a Jonque Green, the feathers being stronger in colour, but, like No. 2, not of a decided green to qualify the bird being shown in a Green class, owing to a small light-coloured feather being amongst the rest sent. Green birds vary much in appearance. A Norwich Green is a very different bird to those exhibited at some of the north of England shows. No. 4, Feathers of exceedingly high colour. At first sight we imagined them to have been taken from a very high-coloured Yellow specimen. We tested the greater portion of the feathers, and finding two or three of the small body feathers to be tipped with a mealy fringe, we are inclined to think they have been taken from a strong-coloured Buff cock bird. After our test the portion of the feathers tested appeared of a very different and much paler colour to the others, which appear the same as when forwarded. No. 5, Feathers from a Variegated kind, but would not make a very showy bird, owing to its being so very heavily variegated, and, as you state, a hen. If any of your birds have been washing in, or had access to, any colouring fluid, do not exhibit them.

MOVING A HIVE (*W. S.*).—It is always advisable in removing hives from one site to another to wait until the spring, when the bees have attained vigorous flight. It is even then prudent to proceed cautiously, shifting the hive gradually a very few feet at a time, allowing a period of at least one good working day to elapse between each removal. In first moving a hive from the bee-house, stand it exactly in front of its previous entrance, where it can be easily seen by the bees, afterwards shifting it a little right or left as may be required. By these precautions removal may be effected with little loss.

DISTEMPERED TERRIER (*Alpha*).—We know of no cure; and the treatment differs according to the symptoms.

REMARKS.

3rd.—Dark morning and dull all day, but no rain fell, and it was starlight at night.

4th.—White frost in the morning; beautifully bright all day and night.

5th.—Rather hazy the early part of the day; damp and cold in the after part.

6th.—Foggy damp morning, splendidly bright at noon, but a wet night.

7th.—Dull and damp, though not rainy morning; a slight shower just after noon, fair but not bright afterwards, and much colder towards night.

8th.—A fair but frosty morning; very fine in the middle of the day; cold and frosty throughout.

9th.—Cold morning; snow at 9 A.M. quite covering the ground, but soon ceasing and disappearing; fair the remainder of the day.

Temperature very much lower than last week, and frost every morning. The snow of Tuesday was not of a measureable amount.—G. J. SYMONS.

COVENT GARDEN MARKET.—FEBRUARY 10.

QUOTATIONS remain much the same, and business remains in much the same condition as last week.

From observations taken near London during forty-three years, the average day temperature of the week is 46.6°; and its night temperature 31.6°.

STRAWBERRY FORCING.

AT the risk of repeating much I said on the subject last year, I wish to recommend, in preference to any other plan, that of layering the runners into the fruiting pots, which in my case are 7-inch ones. Those who have not so good a Strawberry soil at command as I have, had perhaps better be content with 6-inch pots, for the reason that it is of the greatest possible importance that the pots used should be filled with roots early in autumn, in order to have the crowns of the plants plump and ripe before winter. Bear in mind that the crown of the Strawberry plant already contains the embryo flower, which needs perfecting in autumn just as much as the plump buds on the Vine or Peach tree. If the materials for the flower are not there in autumn, the best possible treatment in the spring would fail to produce them. The flower should be so far advanced as to need only a continuation of warmth to expand it. With properly-prepared Strawberry plants there is no more difficulty in getting them to flower in December than there is in February. Black Prince if layered early will often commence flowering outside in October, and the fruit may be easily ripened in December, but it will be deficient in flavour unless the weather happens to be bright and mild while it is ripening.

I am never requested and I never attempt to produce Strawberries in winter, because I know it would only bring discredit on me, as it takes something more than appearance to satisfy those I have the honour of serving. In September and October we have a plentiful supply of Alpine Strawberries, which in my opinion are the most delicious Strawberries grown so long as there is sufficient sun to bring out their proper flavour, and December would be too soon for Black Prince to be tolerated, which at best is only second-rate in quality, while the delicate aroma of the mountain Strawberry still lingers on one's palate; but by the end of March good fruit of all sorts is becoming exceedingly scarce. There may be Grapes of the previous year's growth, but if so there has probably been already a satiety of them; or if the *£ s. d.* are not looked into too strictly, there may be new Grapes produced perhaps—taking account of fuel, labour, and ruined Vines—for the modest sum of 30*s.* a-pound, and even then they are not perfect in flavour; but Strawberries—good-flavoured fruits from three-quarters to an ounce weight—are honestly worth a shilling each in the beginning of April, and I believe they can be grown for less than that sum. Black Prince will not grow to the above weight, but Keens' Seedling will; and if Strawberries are not required before the 1st of April it is not necessary to force Black Prince at all. Keens' Seedling in April with me is often better flavoured than the same variety is out of doors in June. After April it does not do so well indoors as British Queen.

April of all the months is the month for forced Strawberries, and, let me add, forced Roses. I believe an amateur with plenty of spare time who mastered the subject—and it is not a difficult one—would have more to be proud of in a little house of Strawberries and Roses than he could possibly have from any other indoor gardening. The two can be grown perfectly well together. I always grow them together, although I have the command of half an acre of glass. The Strawberries require removing to a greenhouse after they have turned red, but before they assume a dark red, to perfect their ripening, and the Roses require removal to the same place to prolong their beauty. They both like bottom heat to start them, and an atmospheric temperature of 50° to 75°, with constant ventilation. The bottom heat in my house also supplies the atmospheric heat, excepting in very severe weather; this is a great advantage, for percolating as it does through the plunging material, which is always kept damp, it gives a moister and more genial atmosphere than could be obtained from bare pipes. Shelves I seldom use; I wish there were none. Stuck up as they generally are close to where the cold air is admitted, is the worst possible place in the house for tender plants; but strange to say such a position always seems to produce insects with good constitutions. My plants are from 3 to 7 feet from the glass, but of course there is nothing between them and it to obstruct the light.

I find, in addition to the fruit being larger and of better flavour from plants that have never received a check, it is also of a handsomer shape. I believe that is principally the result of perfect impregnation. I have an idea that a distinct individual impregnation is required for every perfect seed to be produced—and there are hundreds on some fruits—and therefore where it is not perfect the fruit does not swell. This accounts for the hard green patches seen on some fruits which are afterwards partially hid by other parts which have been impregnated, and consequently swell faster. Most Strawberries, I believe, if the flower has been perfectly impregnated, will have a regular surface, and generally round or conical, and the flesh will all be good alike. If I am right in this respect it shows that the Strawberry flower more than any other needs a healthy circulation of air when it is expanding. After the fruit once fairly commences to swell it will bear a very high temperature, and a close atmosphere will not hurt it till such time as colouring commences.

I will now state some of the advantages which layering into the fruiting pots in the first place has over the ordinary method of layering and afterwards potting. It is impossible during a hot summer to keep the small portion of soil contained in a 4-inch pot standing above ground in the sun in a suitable condition as regards moisture and temperature; there is always a risk of the pots getting dry in the middle of the day, and the temperature of them at that time is much higher than most people would dream of applying water, so that whether they get watered or not they receive a check, and even with the greatest care under the most skilful hands they will suffer at times. Some I know recommend plunging the pots as a remedy for this; it is partially so, but there is then a risk of going to the other extreme and over-

watering them, and also the roots may get out at the bottom of the pots. Moreover, I do not consider the root-growth so healthy as it would be above ground in a larger pot where it would be moderately aërated. Further, the labour saved at a time when labour is always scarce and valuable is immense, and the pots can all be got in readiness in a dry shed during bad weather; and lastly, the young plants when layered into the fruiting pots at first need not be severed so early, they can continue to draw supplies from the parent plants till the runners begin to wither, and there is no check from any cause whatever. Taking into account the check received when the runner is cut as soon as rooting has fairly commenced, the shading necessarily following this, the breakage and bruising of roots when transferring the plants from the small pots to larger ones, I am persuaded that runners layered into the fruiting pots are fully a fortnight in advance of those layered in small pots and afterwards shifted.

I suppose it is unnecessary to remind practical readers that the more checks the plants receive the more liable they are to insects. Red spider is often very troublesome to forced Strawberries; it not only injures the foliage by extracting its juices, but it is very partial to ripe fruit, and will frequently disfigure it altogether by robbing it of its refreshing brightness. My Strawberry plants last spring were entirely free from red spider, and this season, too, they are so far free. I attribute this to the summer treatment and the unchecked growth resulting from it. I believe it is generally in summer that the plants get their breeding stock of red spider, and then as soon as they are introduced to warmth in spring they are not slow to increase and multiply.

Strawberries for forcing should not be kept in houses till they are actually required to commence growth; failing a cold pit, they will do equally well plunged in a bank of ashes. The plants of course are quite hardy; it is only the pots that require protection. When in the forcing house, if the plants are placed on shelves, it is a good plan to place a piece of turf under each pot, which will greatly assist to keep them moist, and if cut into squares a little larger than the pots they can easily be moved about with them. The roots will enter the turf and obtain nourishment from it, and when ripening commences it will be found that the plants will bear to be kept drier than they otherwise would, and it is also well known that the drier they can be kept then without suffering the better flavoured will be the fruit. On no account must a plant be allowed to become very dry while the fruit is swelling; if this happens only once, it can never be fully remedied. If fine fruit is required, six to eight are quite sufficient to have on a plant. All the late flowers should be cut off with a sharp pair of scissors immediately a sufficient number of the forwardest are seen to be perfectly developed.—Wm. Taylor.

BLACK MUSCAT (MUSCAT HAMBURGH) GRAPE.

Opinions are conflicting as to the identity and merits of this Grape. Dr. Hogg in the "Fruit Manual" gives its name as the Black Muscat; Mr. Thompson in the "Gardener's Assistant," page 670, describes the Black Muscat of Alexandria and Muscat Hamburgh as distinct kinds. Muscat Hamburgh is thus described by Mr. Thompson—"Leaves large, deeply three-lobed, nearly smooth above, pubescent beneath; ribs set with short bristly hairs. Bunch long, tapering, and shouldered. Berries large, oval, black; flesh of the consistence of the Black Hamburgh, very rich, with a decidedly muscat flavour. This excellent variety is stated to have been raised from the Black Hamburgh crossed with the Muscat of Alexandria, in consequence of which the rich muscat flavour of the latter has been imparted to the Hamburgh breed, and a great desideratum obtained. It fruited for the first time in 1848, and produced fruit of great excellence in an old house, it was stated, without fire heat. It is one of the best new Grapes in existence—in fact we think the very best as far as we are aware." Mr. Thompson describes the Black Muscat of Alexandria as follows—"This in size, form, and quality is similar to the White Muscat of Alexandria, the only difference being in regard to colour. It is not generally cultivated, probably owing to its requiring much heat and yet not always colouring well; and when that is the case, although its flavour may be good, its appearance is inferior to that of the white variety, which is accordingly preferred." To make the description complete we must refer to Mr. Thompson's note on the Muscat of Alexandria ("Gardener's Assistant," page 672)—"Leaves large, deeply lobed, sharply serrated, smooth above, slightly pubescent beneath; petioles long, smooth, stained with red, as also are the ribs for some distance from them. Bunch very large, strongly shouldered. Berries large, oval, hanging loosely; skin rather thick; flesh firm, with an exceedingly rich muscat flavour."

Assuming Black Hamburgh to be Muscat Hamburgh, how are we to reconcile the divergence of the descriptions? Muscat Hamburgh has a Hamburgh flesh, ripens in a house without fire heat, Black Muscat has firm flesh and requires much heat. Not knowing the Black Muscat that was cultivated prior to the introduction of another kind under the title of Muscat Hamburgh I do not propose to express an opinion as to the identity of the two, but I submit that there is greater similarity between the Black Hamburgh and Muscat Hamburgh than between Muscat of Alexandria and Muscat Hamburgh, and these I shall note as best I can, taking that of the leaves first, then the bunch, and influence of temperature.

Firstly of the leaves. Muscat Hamburgh has leaves more like a Black Hamburgh than Muscat of Alexandria. All are five-lobed, the middle one tapering and elongated, and midrib straight. The midrib of the principal side lobes is straight in Muscat of Alexandria, but the midrib of the principal side lobes of Black and Muscat Hamburgh curve inwards, as also do the lobes to the middle or central one. The lower divisions of the leaves of Muscat Hamburgh meet or overlap at the footstalk, those of Black Hamburgh and Muscat of Alexandria not meeting or overlapping. The Muscat Hamburgh leaves are deeply cut as regards those between the middle and principal side lobes, as much so as those of Muscat of Alexandria, both being twice as deeply cut as those of Black Hamburgh. The divisions or cuts forming the two lower lobes are greater in Muscat of Alexandria by one-third than in either Black or Muscat Hamburgh, the length in both being about equal. The leaves also in Muscat Hamburgh are more deeply serrated than in either Black Hamburgh or Muscat of Alexandria. In texture the leaves of Muscat Hamburgh are more flabby and quicker dried up than either Muscat of Alexandria or Black Hamburgh.

The bunch of Muscat Hamburgh is more loose, and the berry-stalks are thin and flexile as compared with Muscat of Alexandria, which everybody knows are stiff and brittle.

Then as to influence of temperature upon the three kinds, I may state that I have these with others in a house forced to ripen in May, and also in another to ripen in August. In the first instance the Muscat Hamburgh starts as soon and as freely as the Black Hamburgh or Mill Hill Hamburgh, they being only a few days later than White Frontignan. Buckland Sweetwater starts same time as the Black Hamburgh. Muscat of Alexandria is a fortnight later in starting than White Frontignan, and fully a week later than Muscat Hamburgh. Muscat Hamburgh flowers simultaneously with the Hamburghs. Muscat of Alexandria is seven to ten days later in flowering; and whilst the Muscat of Alexandria has a tendency, when early forced, to dry up or shrivel in the bunch, the Muscat Hamburgh exhibits no such tendency. The berries set very freely, there being no small "deaf" flowers with spider-weblike-thread footstalks which characterise Muscat of Alexandria. This defect is not confined to this variety, and is not greater in it than in Lady Downes' and Mrs. Pince's. Muscat Hamburgh commences to colour at the same time as Black Hamburgh, and is ripe at the same time as it and Mill Hill Hamburgh, Muscat of Alexandria being a fortnight later. The flesh is firmer than Black Hamburgh, slightly crackling—about half as much so as Muscat of Alexandria, and the muscat flavour about as much developed as in Mrs. Pince's—in neither not more than a third that of Muscat of Alexandria. It hangs longer in good condition than Muscat of Alexandria ripened in an early house, and does not lose its muscat flavour by hanging.

Its doings in the later house are only a confirmation of its doings in the earlier one. Muscat Hamburgh starts with the Black Hamburgh, ripens at the same time, and keeps in good condition after the Black Hamburgh. Muscat of Alexandria are spotted, and rotten if the air be damp, and like Mrs. Pince's, and sometimes Lady Downes', are shrivelled if the air be dry; while Muscat Hamburgh has never yet spotted by a too moist atmosphere, but, instead of this, cracks at the point of the berry. It will hang well until February; how much longer I know not, as I have not tested, and the muscat flavour is as marked at that time as in September. There is one other point—viz., its colouring. It is the worst of any Grape I know in this respect. Heavy crop and large bunches in this, as in Hamburghs, result in bad colour.

No authority since Speechley seems to have known Black Muscat. Thompson ("Gardener's Assistant") describes it in 1859. Mackintosh ("Practical Gardener") does not name it in 1853. Masters in his catalogue ("Hortus Duroverni") has "Black Muscat of Alexandria, syn. Red Muscat of Alexandria. Colour, red-purple; shape of berry, long; bunch, long; flavour, rich musky; place, hothouse; time, late."

The wood of Muscat Hamburgh is very deep in colour, being very dark brown when well ripened, having no equal in this respect except by the Strawberry Grape, Mrs. Pince's, and Barbarossa.

The Vines of Muscat Hamburgh are upon their own roots, and planted in an inside border with liberty for the roots to pass outside. I have no idea of its setting better when grafted upon Black Hamburgh, neither of its colouring better or aiding its constitution, which is a good one. Artificial impregnation does not aid the setting of the berries except by distributing the pollen, when perfect flowers may be fertilised, which without the artificial impregnation might escape fecundation. Stoneless berries are simply such because they have no ovaries, or imperfect ones. The defect is in the flower, and may not be altered at the time of flowering; though well ripening of the wood, its exposure to abundance of light in formation, and development, and perfecting of the parts from which is to issue the fruit, will do so in the highest possible degree; and notwithstanding this, there are and will be flowers deriving no aid from impregnation natural or artificial.—G. Abbey.

NOTES FROM MY GARDEN IN 1874.

No. 3.—FRUIT.

It is not because our gardens are small and our cultures insignificant, that therefore we can have no interest in matters which are to be seen in other places in tenfold or fiftyfold greater quantities. Our few rows of Peas, our small Cucumber frames, our plot of Gooseberries, are of quite as much moment to us as when Peas are grown by the quarter-acre, and Cucumbers fill houses specially devoted to their culture, or fruits are produced by the hundredweight or ton. We have our little experiences, our successes, and our failures to describe, and we would fain hope that there are some other minnows who will like to desport themselves in our little streams, although the great tritons cannot find enough to cover them. We delight sometimes to see the bewildered looks of my lord's gardener when he condescends to come into our "diggings." His amazement at our presumption in asking *him* to see such a miserable little place, mingled with a desire not to appear rude, compels us to help him out of his trouble by deprecating his wrath, and assuring him we have really nothing to show him, and only wanted a little advice. I make no apology to readers of our Journal, for I know there are many possessors of small gardens amongst them, and they, it may be, will take an interest in these jottings.

In our neighbourhood fruit was tolerably abundant, and in my own garden I do not think I have had during my six years of tenancy a better crop altogether than in 1874.

Strawberries.—As a general rule this was not a very abundant crop last summer, the dry weather interfering with the swelling of the berries; but mine gave a very fair supply. The sorts which I grew were Dr. Hogg, Sir Joseph Paxton, Victoria, Marguerite, Viscomtease Hericart de Thury, La Constante, and Lucas. I commenced with some in my greenhouse, and had a few very fair dishes of Dr. Hogg from the shelf which, as I have described, is above the pathway of the house; and then I had a couple of rows under Looker's Acme frames, which came in a little before those from the open ground, so that by this means the season was considerably prolonged. For general purposes I find nothing better than Dr. Hogg, for you have size combined with flavour and productiveness. Victoria (Trollope's) is a most useful Strawberry, but lacks flavour; still its great productiveness, its suitability to all soils, and the length of time the plants last, all tend to make it a desirable fruit. Lucas is a very good hardy fruit and productive. The Viscomtesse did not do very well. Sir Joseph Paxton is a most excellent sort, very hardy, a strong grower and productive; the flavour not equal to the British Queen section, but still good. La Constante is one of the most delicious and aromatic of Strawberries, but I have not found it hardy. As to cultivation, I adopt the usual plan of letting the beds remain for three years; but I saw at my friend Mr. Peach's, Appleton-le-Street, most prolific beds which had been undisturbed for a much longer time—I think six years. I rather quake for my prospects this year, for I never knew so bad a season for making Strawberry beds. The continued drought made the beds so dry, that although I watered freely, and although I had the plants all ready rooted close at hand, yet I had to renew them again and again, and even now they look very irregular, or, as they say here, "very spotty."

Raspberries.—Of these I had an immense crop; in fact I do not think I ever saw canes fuller of fruit. They are planted in rows, and tied to a stout piece of galvanised wire stretched along the row. They are never dug, but only slightly forked over. Last year I gave them a good dose from the deposit in the cesspool in the garden into which the sewage of the house flows; and to this and the cool bottom in which they grow I attribute a great deal of the immense crop. The kind I do not know, but it is undoubtedly a good one.

Pears.—I had a great calamity in my miniature fruit garden, for I moved all in the autumn of 1873, and owing to the light character of the soil and the excessive drought I lost many: all the Cherries died, and the Pears and Apples look very puny. I ought to have watered, but really one cannot water everything, and so these perished. With regard to sorts, I very seldom see recommended an October Pear of great merit—Comte de Lamy, and if I may judge from my own experience a most constant bearer. I have one small tree of it which has never failed, and this year I gathered nearly three bushels from it, and had to prop up the branches, or otherwise they would have been broken by the weight of the fruit. In last week's Journal I see Knight's Monarch recommended, and I know it is a good Pear, but strange to say I never can get any ripe fruit of it. It bore well this year. I did not gather the fruit too soon, as they dropped off in my hand when gathering, and yet they would not ripen. They were laid out singly in an attic, but one and all either shrivelled-up or else rotted. It has been the same every year. Can any of your correspondents explain this or tell me where I am wrong? Two other large trees in my garden, Bon Chrétien and Beurré de Capiaumont, bore three or four bushels each; so that, although my small tree failed me, the larger ones gave me a good supply.

Figs.—I think that the most extraordinary crop I have had this year was from two standard Fig trees in front of my drawing-room window. Some of my northern friends will envy me no doubt; say, "Lucky fellow to live where Figs will ripen as standards!" These two trees are each about 12 feet in length, about 8 through, and 10 high. They are the old Brown Turkey, and from them I gathered last year more than one hundred dozen of fine large fruit; those that I sold fetched more than £4, and besides I had a large quantity for our own use, and also to give to my friends. It strikes me that this is a rather unusual crop, and so perhaps worthy of notice.

Other fruits hardly call for any notice. I have added this year British Queen, Amateur, Frogmore Late Pine to my Strawberries; but, as I have already said, my prospects of this fruit are rather indifferent. I have also Lee's Black Currant, and on my wall have placed the following:—Apricot: Moorpark. Peaches: Barrington, Royal George, Alexandra Noblesse, and Walburton Admirable. Nectarines: Elruge and Violette Hâtive. Pears: Easter Beurré, Beurré d'Aremberg. Plums: Coe's Golden Drop, Green Gage, and Jefferson's. But of course I cannot expect any from them this year; and as in all our neighbourhood disease has attacked the Peach, I very much fear I shall have to substitute other fruits for them.—D., *Deal.*

PACKING FLOWERS.

I have seen flowers packed in many different ways and in all kinds of boxes, and have heard many complaints that they are of little good when taken out of the box—that is, when they are packed in the ordinary way. I have been told it is useless laying flowers loose in the box, especially when they have a long way to go. In my case they are in the box about twenty-four hours.

I have packed them in both tin and wooden boxes with the same result. The boxes I now use are made of wood, 15 inches by 12, and 5 inches deep, with a false bottom, which has holes bored through, 1 inch asunder each way, with a good-sized gimlet. In the bottom of the box I place about an inch of clay mixed into a rather stiff mortar. This is rammed evenly over the bottom of the box, and then the false bottom is placed over it with just a tack on each side to keep it in its place. The stems of the flowers are now introduced through the holes into the clay, which will hold them quite firmly and upright.

Flowers packed in this way will be as fresh when taken out

of the box as when first cut from the plants, and the box may be thrown over and over by the railway officials and not a flower will leave its place.

Another plan I find very successful is to tack pieces of list or broad tape about halfway down the inside of the box, some one way and some the other, so as to form small squares large enough to admit a Rose or Camellia to the under side. The flowers, such as Roses or Camellias, may be pinned on the list separately. Smaller kinds may be tied in little bunches and pinned on the under side of the list, and when that is filled another lot can be pinned on the top side in the same way. A little damp moss tied round the stem of each flower or bunch will keep the flowers fresh. To a certain extent this mode of packing flowers is preferable to the former, as in that case the clay makes the box much heavier.—Thomas Sneasby, *Hare Hill Gardens.*

ROYAL HORTICULTURAL SOCIETY.

February 17th.

Fruit Committee.—Henry Webb, Esq., in the chair. A communication was read from Mr. J. Batters, The Gardens, Chilworth Manor, Romsey, describing the culture by which the new Potatoes exhibited at the last meeting were produced, and the Committee unanimously awarded him a cultural commendation for the exhibition, and a vote of thanks for the communication. Mr. McRonald of Chichester sent specimens of a large Pear, which was said to be for dessert use, and was called Gloria Mundi. This was exhibited in November last, but the Committee are of opinion that it is identical with Catillac. Mr. George Wheeler of Warminster sent a dish of Apples called Wheeler's Favourite; a very excellent dessert Apple, but they were very much shrivelled and not in good condition, so that the Committee considered it not better than some others in use at this season. Messrs. W. & J. Brown of Stamford sent a seedling Apple Beauty of Barnock, a medium-sized yellow Apple with broken streaks of crimson; a nice fresh and well-flavoured Apple, but not of sufficient merit to obtain a certificate. Mr. Bennett, The Gardens, Hatfield House, sent fruit of Lowndes Pippin, a large handsome round Apple, the flavour of which was gone.

Rev. George Kemp, The Vine, Sevenoaks, exhibited a dish of Beurré de Jonghe Pear, the flavour of which was delicious. It was awarded a first-class certificate. He also exhibited fruit of Délices Everard de Tournay, a richly-flavoured Pear, with the salmon-tinted flesh of Joséphine de Malines. Mr. Speed of Chatsworth sent fruit of the Cape Gooseberry, Physalis edulis. Mr. Taylor, Longleat Gardens, sent a dish of Orangefield Tomatoes, which were much admired for their brilliant colour, and a letter of thanks was awarded to Mr. Taylor.

Mr. Parsons of Danesbury sent roots of Magnum Bonum Onion, which were very fine and firm. The seed was sown in July, 1873. He also sent roots of the same variety from seed sown in March, 1874, and the firm-keeping character of the former was very remarkable. A vote of thanks was awarded to Mr. Parsons. Mr. Taylor of Longleat sent a dish of Dickson's Favourite Cucumber, which proved its merits as a valuable winter variety.

Floral Committee.—A limited number of plants only were brought before the Committee. There was almost a total absence of stove plants, owing, possibly, to the northerly wind having a deterring influence in keeping such tender subjects in their safer quarters at home.

The only first-class certificate awarded was attached to half a dozen plants of Abutilon Darwinii exhibited by Messrs. Veitch. This is a species of very dwarf habit, and extremely floriferous. The foliage is a vivid green, and the young growth slightly pubescent. The colour of the blooms may be described as orange brown, in which, however, the orange decidedly predominates, and contrasts well with the foliage. Some of the plants were blooming at 4 inches from the soil, continuing at each leaf-axil upwards. The species was introduced from Berlin, and gives promise of decorative usefulness, and more especially as it is amenable to greenhouse culture.

Messrs. Veitch also sent two small plants of Odontoglossum Warscewiczii, the growth of which somewhat resembles O. vexillarium, while the flowers are not unlike O. phalænopsis, but with several blooms on each spike. A second-class certificate was awarded. The same firm also sent a very fine group of Cyclamens. The plants (about fifty) were remarkably well bloomed, and were of firm and decided colours. A vote of thanks was deservedly given to the collection. Messrs. Hooper, Covent Garden, sent twelve good plants of Cyclamen. The foliage of some of these was distinctly marbled, and the blooms were nearly all spotted. The individual flowers were very large, and merited the vote of thanks accorded them.

Mr. H. B. Smith, Ealing Dean Nursery, contributed a collection of Cyclamens and Primulas. The blooms of the former were of good form and substance, but were limited to the lighter shades of colours. The Primulas consisted principally of semi-double varieties raised from seed, and were effective, yet with more scarlet in the colour their value would be enhanced. Some of the blooms of these were almost fully double. The collection also comprised a few good single white-flowered plants. A vote of thanks was given to the group.

Messrs. W. G. Caldwell & Sons, Knutsford, sent a nice plant of Azalea amœna Caldwellii, the result of a cross between A. amœna and A. Magnificent. It may be described as an amœna with large blooms, and is an effective early-blooming variety. A vote of thanks was awarded. Mr. Perry, gardener to J. W. Miles, Esq., sent a basket of Primula altaica. This is a very desirable and distinct variety for the hardy spring garden. The purity and cleanliness of the plants sent, however, suggested their having had protection, or had been grown under extraordinarily fine weather. A vote of thanks was given. Mr. Taylor, Longleat, sent an example of Browallia alata grandiflora, which is evidently a larger and more continuous-flowering variety than the normal form of this plant. Mr. Bennett, Hatfield, had a small plant of Thunbergia Harrisii splendens, a very showy variety, recommended for continuous winter blooming. A plant of Aucuba viridifolia, with bright green leaves and scarlet berries, was sent from the gardens of J. Drewry, Esq., Burton-on-Trent. Cut blooms were again exhibited by Mr. Parker, Tooting, of the hardy aquatic Aponogeton distachyon, which were very attractive and delicately perfumed.

OUR LETTUCES.

Paris Cos is the best of Lettuces. I have also found Holme Park Cos a valuable variety. I had it both transplanted and untransplanted, and, dry as the summer was, many of them weighed from 2 to 3 lbs. each. From a sowing made in September I have now in use good Lettuces of this variety, which have stood through the late winter without any other protection than the snow afforded them. Commodore Nutt was a failure with me. All the Year Round proved a very serviceable kind. I consider the lists of varieties, or rather of names, are too long for practical purposes. In the trials of Lettuces in the Royal Horticultural Society's Gardens was one called Magnum Bonum. Twenty-five years ago I had seed given me of a variety named Alphengs Cos. I grew this by the side of Magnum Bonum, but could discover no difference between the two; I concluded, therefore, that they were synonymous, and in this I am supported by the official report of the Chiswick trials, which reported Alphenge Cos and Magnum Bonum to be one and the same variety. This is a very useful summer Lettuce. After extensive trials I recommend Paris Cos, All the Year Round, and Drumhead for summer use; for winter, Black-seeded Bath Cos, and Hardy Green or Hammersmith.—Z. Z.

HELLEBORUS NIGER, OR CHRISTMAS ROSE.

This fine hardy midwinter flower grown in the open air and covered with hand-lights furnishes an abundance of cut blooms, which at this dull season of the year are especially appreciated. Those who have vases to fill, and who lack the convenience of heated structures in which to provide tender flowers, should grow this plant largely, and for two months they will never be short of bold white flowers to intermix with sprigs of evergreens and make a sitting-room cheerful. Of course these flowers are freely produced without any sheltering aid, yet a little glass covering ensures their cleanliness and conduces to their purity. This fine old herbaceous perennial is as hardy as the Buttercup, to which it is allied as belonging to the same natural order, Ranunculaceæ. Like most of this family the Christmas Rose luxuriates in rich soil and a partially shaded place, although it will flourish in the full sun providing the soil is strong and deep. Its adaptability to a shaded place is, however, an advantage, as being a position in which but few fine-flowering hardy plants will succeed. It is freely increased by root-division, but established plants should not be needlessly disturbed. A small plantation on which a frame can be placed will be found useful in most gardens. An annual surface dressing of rich manure will keep the plants in good blooming condition for many years. Can anyone communicate their experience in successfully raising this plant from seed? The information would be a boon to many besides—A Gardener without a Greenhouse.

The Late Mr. W. P. Ayres.—The widow and daughter of this well-known horticulturist having been left wholly unprovided for, some of his friends have determined to raise a subscription for their benefit. I am confident that many who remember the services rendered to horticulture by Mr. Ayres,

both personally and by his pen, will be ready to lend their assistance towards the accomplishment of so charitable an object, and will be only too pleased at having an opportunity of doing so.—JOHN WILLS, *Onslow Crescent, Onslow Square, Brompton.*

A CLASSIC TREE.

WHEN Dr. Johnson made his celebrated tour through Scotland, he saw only two trees from which a prudent hangman would venture to suspend a full-grown victim without fear of breakages, but unfortunately that method of sylvan decoration was largely practised in this country long before his day. Be that as it may, however, one of the two so highly honoured by his notice has just been totally destroyed by a recent gale. This was the remains of an old giant Ash which stood near the village of Ellon in Aberdeenshire, and which for the last fourteen years has only been an all-but-naked trunk.

A Banffshire newspaper in recording its destruction, says in connection with the cause of its more than local celebrity, that "it is well known that the Doctor got the blinds of his carriage pulled down so as not to see the avenue of fine trees while going up to Cullen House."

The following particulars have been kindly sent me by a correspondent at Ellon:—"All that latterly remained of the old tree referred to was a trunk of about 13 feet in height, and measuring 10 feet in circumference at 4 feet from the ground. It was supposed to be upwards of 250 years old. It was sold along with a number of other old trees on the Ellon property to a timber merchant about the year 1835, but the late Rev. Dr. Robertson, who was then parish minister here, having a liking for the old tree, rebought it and allowed it to stand. It was then comparatively healthy and far exceeded in size any in this neighbourhood. Some years afterwards it lost one or two large branches, partly from gales and partly from natural decay which began to set in about the upper part of the trunk. In order to prolong its existence if possible, the then proprietor had all the decaying parts removed, stopping-up the hollows with cement and covering with lead, also hooping the main limbs with strong iron and connecting them together by long links and screws. For a number of years after this was done it seemed to prosper, until the memorable hurricane of October 3rd, 1860, which completely disbranched it, leaving only the trunk above mentioned.

"In connection with its partial destruction at that time a curious incident occurred. Dr. Robertson, who had left Ellon some time before and gone to reside in Edinburgh, was that very morning a passenger by the stage coach on his way to revisit his old home. Just as the coach was nearing the tree, and no doubt while the Doctor's eye was resting on it with a kindly interest, the old tree waved its manacled arms for the last time, and fell crashing into the highway almost literally at the feet of its former protector."—R. D. TAYLOR.

FAILURES IN CUCUMBERS.

IN answer to "A MARKET GARDENER" (page 94), I have been troubled with a similar grub in the roots of Cucumber plants six years ago. In the garden I then had charge of I had a large house for growing Cucumbers, and I began to cut fruit the first week in March. The plants grew well to the end of June, when some of them began to die at the tips of the branches, injuring also the young fruit, and in two or three days the plants so affected died. In searching for the cause of this fatality I very carefully cleared all the soil from around the stem to examine the roots, when I found several white swellings on the bottom part of the stem, and also on the roots, about the size of large peas, which on being cut through the centre revealed a small white grub about an eighth of an inch, and some a quarter of an inch long. If I destroyed the grub, and then dusted the stem and roots over with fresh slaked lime, added a little light turfy loam previously warmed, and shaded the house for a few days many of the plants recovered and gave fruit to the end of October. I advise "A MARKET GARDENER" to follow the plan I found so successful. I trust some of the readers of the Journal will give their experience of any Cucumber disease, and the remedies which may have been successfully applied.—G. S., *Hadlow, Kent.*

ROYAL HORTICULTURAL SOCIETY OF IRELAND.—The following are the Society's Exhibitions during the present year:—Spring Exhibition, Thursday, April 22nd; May ditto, Thursday, May 20th; summer ditto, Thursday, June 24th; autumn ditto, Thursday, August 26th; winter ditto, Thursday, November 25th.

BROCCOLIS.

"I HAVE not entered on the subject of Broccolis, &c., for in truth I know not what to say." That is a remark of "D., *Deal's*," on page 92. Fancy our gifted and versatile friend driven to such a strait as to "not know what to say!" The case must indeed be a bad one when the veteran thus throws up his brief so summarily. He plants so as to gain a succession, but they all "come in of a heap." "So they do," will be the mental remark of hundreds of readers. Yet why should they when we see what the catalogues say? By these authorities we may cut Broccoli for ten months in the year. What! ten months out of twelve, and yet they "come in all of a heap!" Well, it is true—both assertions are true, as I have proved. Last year I cut Walcheren, September and November; Snow's Winter White, December and January; Adams's Early White, February and March; Wilcove, April and May; Carter's Summer, June. By just one variety of each section a continuous supply was kept up until the 17th of June; I observed that particularly, while at the same time duplicate varieties were also in use, thus making the period of cutting doubly sure. In the September and November period were Veitch's fine autumn Cauliflower and Early White Cape Broccoli; December and January, Backhouse's White; February and March, Hampton Court; April and May, Dilcock's Bride; June, Cattell's Eclipse. Thus by five varieties the above period was covered, having in reserve half a dozen varieties more. But the fact remains, that had the quantity of the five first mentioned been doubled every purpose would have been answered just as satisfactorily as it was done by the whole list of kinds.

Now there is this to be said in the matter of Broccolis, that they possess no clearly-defined standard of nomenclature. Should this important desideratum ever be attained it would be to the general advantage. Seedsmen would gladly abridge their lists if the public knew what they were ordering. But they don't know—that is, if they, as many do, change their seedsmen every year. If you order a given kind from one house this year, and from another house the next, the probability is that you will get two different sorts, except in the case of a new variety, which is everywhere alike for about a year if the demand is not too great. I have had a good deal to do with Broccolis, and have experienced considerable inconvenience by blanks and failures. I have had Snow's Winter rushing-in in April a few days after Cattell's Eclipse, which should have waited until June. I was then in "D., *Deal's*" dilemma. It was "all of a heap" with a vengeance. The only way I got over it was to order small quantities of several varieties from an established house and take note of their conduct. In that way a train of sorts was found following each other with satisfactory regularity. By sticking to these and the source of supply I have had for some years no further difficulty. I cannot give any better advice to others than to do likewise. Find what suits best, and order the same from the same place again. Don't be hypercritical as to the varieties being correctly named. Names are nothing in your case then; it is simply a case of time and Broccolis, and fitting the one to the other. To sum-up this part of the question: Go to a house with a reputation to lose, and if you are served well stick to the place and the varieties until you have proved for yourself that a new introduction will serve you better. That is the advice I give to my personal friends on this matter, and it occurs to me, if it is of any use privately (as it has been), it may be publicly.

Perhaps I may add a word as to sowing. With the sorts above named two sowings have always sufficed—viz., all the kinds by April 1st, except the latest kinds, and these—that is, Carter's Summer and Cattell's Eclipse, towards the end of the first week in June. These late-sown plants attain no great size in the summer, and in the autumn, if the weather has been dry, do not appear to have build enough about them ever to produce heads at all. Do not, however, dig them up, but dung them—that is, give the ground between the rows a good covering of manure, packing it up to where the hearts should be. This will protect them from frost, and the enriching material will go directly to the formation of heads. The plants so treated will in spring grow marvellously, and will yield more eatable produce and less waste in large leaves than

by any other mode of culture known. I have no opinion of digging-in a superabundance of manure for Broccolis, having a notion that a succulent, and consequently a tender growth, is thereby fostered. I prefer growing them on firm solid ground in summer for spring use, giving each plant plenty of room. If the plants do not get rank and robust they will have some woody fibre in their stems, which will stand them in good stead when winter comes, and the heavy surface-dressing of manure will bring out the heads. As a rule there is a fearful waste in growing Broccolis for a gentleman's table by applying manure to the ground at the wrong time. By planting in rich ground large plants are produced when smaller ones would be better. If they survive the winter the heads are twice too large for table purposes, while the gross foliage goes to the rot-heap. A dwarfer, sturdier, steadier, and harder growth in summer is a point worth aiming at, and then give the manure on the surface at the approach of winter. This will protect the stems and give a lift to the plants at the right time, when they will push up their heads small, free, clean, and sweet. When a garden boy I well remember the remark of the cook on receiving such nice small stuff; it was, "Them's the sort, lad!" but the bigger the Broccoli the bigger the scowl. It was so when I was a boy, it is so yet.—Old Friend.

PEARS.

Some very important additions have of late been made to our dessert Pears, such as Bezi Msi, Commissaire Delmotte, Madame Millet, &c., all of which are said to come into use from February to May.

When we read the advice given at page 121 by your gifted and careful correspondent Mr. J. Rust, some may be inclined to say, "This is a retrograde step. Why plant such old varieties as Knight's Monarch when we have such superior new sorts which will ripen late and supply us with dessert Pears nearly until summer Pears come into use again?"

There is something to be said for and against this. It is a very important matter to know which varieties suit certain soils and localities. This requires many years of patient culture. Those new varieties which have of late been introduced to our notice are generally described "as really good, melting, buttery, aromatic, sugary, &c." (very tempting to young gardeners and amateurs), and may after years of patient cultivation turn out very good stewing Pears, but may also come far short of the high character with which they were brought before the public.

Mr. Rust would have done well if he had added a few more well-known useful hardy sorts of late dessert Pears, good bearers, such as Ne Plus Meuris, often taken for Knight's Monarch, being nearly alike in size, shape, and period of use; Easter Beurré, Bergamotte d'Esperen, Passe Colmar, Crasanne, &c.

No doubt Dumelow's Seedling Apple is the same as Wellington, and requires much sugar. Another good late kitchen Apple is Norfolk Beefing; also the Russet varieties are good for late dessert as well as kitchen use.—D. Cunningham, *Moor Park*.

THE ROYAL ASHLEAF POTATO.

Mr. Rivers wishes me to correct an error as regards this valuable Potato. It was brought out by him, but was raised by his friend, Mr. James Ashwen of Evesham, in 1858. He adds, the Royal Horticultural Society makes it a synonym of Myatt's. The Royal Ashleaf is not Myatt's, but is like it. The same may be said of the Lapstone and its race, Hero, Taylor's Hybrid, and Pebble White. Taylor's Hybrid has blue flowers, and the other three Potatoes have white flowers.

Years ago Mr. Rivers wished the mistake about the Royal Ashleaf to be corrected. I ought to have complied at once. The following, as well as I can remember, is what he told me. He said, "I was staying with my friend Ashwen at Evesham, and he gave me and Mr. John Spencer, then head gardener at Bowood (now steward) three seedlings, A, B, and C, to try. We both fixed on the one now called the Royal Ashleaf. As I brought it out the salesmen for their purposes attributed its origin to me. This I corrected at the time; but it has ever since gone by the name of 'Rivers's Royal Ashleaf.'"—W. F. Radclyffe, *Okeford Fitzpaine*.

Gardeners' Royal Benevolent Institution. — Robert Broadwater, Esq., Master of the Worshipful Company of Fruiterers, will preside at the thirty-second anniversary festival of this Insititution, to be held at the London Tavern on the 2nd of July next.

NARCISSUS POETICUS.

The Narcissus is one of the oldest, hardiest, sweetest, and most beautiful of bulbous-rooted garden plants. Poets have sung its praises, and artists have endeavoured to delineate its graceful forms; authors have written on its beauties, and it has received honour and attention from florists and plant-lovers in almost all lands. That was in the somewhat remote past, when intrinsic and individual beauty was more fully appreciated than was the case in the massing period which succeeded. But fashion, with all its exacting sternness, could never annihilate the plants which our forefathers admired, and which are now rising again from the neglect to which for a few years they have been relegated.

Fig. 38.—Narcissus poeticus.

The genus Narcissus belongs to the natural order Amaryllidaceæ, and is divided into a variety of distinct types or subgenera, but which, however, while being popularly admitted, are by no means authoritatively defined. The thorough distinctness of these groups, however, is unquestionable, and they serve special purposes of decoration, and cover a lonely period by their season of flowering in the spring time of the year. The particular form above figured is a fair typical representation of the genus, and is in itself a most useful and attractive species. The normal form of poeticus is single, pure white, with red corona. It grows to a height of about 1 foot, and flowers in May. It is a beautiful border plant, and has a fine, free, wavy effect used in lines in the shrubbery. The sub-varieties vary but little from the original in colour, but some have larger flowers, as N. poeticus majalis, while others, as grandiflorus, are earlier in coming into bloom.

There is also the double variety, pure white and exceedingly fragrant. This is fine; indeed, all are especially suitable to furnish cut flowers for room-decoration.

We would now glance at some of the allies of the type just noticed, and we appreciate at a glance the great diversity of character, colour, and form which exists in the numerous varieties of the family. There are the lowly Corbularias, some of the sweetest of Flora's gems, which are so neglected as not to have a place in nine-tenths of English gardens, instead of having, as they ought to have, a welcome and a home in all. One of the smallest of these, and one of the best, is C. tenuifolia (Hoop Petticoat), golden yellow, growing only a few inches high. C. conspicua is equally worth growing, and is more plentiful. The white variety, C. alba, is exceedingly chaste, and, unfortunately, somewhat rare.

From these miniatures we pass to notice very briefly another group almost perfectly opposite in character—viz., the Pseudo-Narcissus, or Daffodils. There is less refined elegance in this group, and they are better described as gaudy; yet this term is only legitimately permissible when they are used in unsuitable places, and the term is then more applicable to the taste which misapplies the plant than to the plant itself. Close beneath the drawing-room windows in loose careless patches they may be regarded as coarse; but see them in bold massive groups or broad thick lines skirting the wood of some distant view, and what can be compared to their dazzling brightness at the period of their blooming? As thus seen with the sunlight glistening on their massive heads the effect is positively exhilirating. Used in quantity for distant effect they are especially adapted, and never look better than when growing out of the green turf of lawn or pasture. When once established in fairly good soil they will push through the grass at the call of each succeeding spring, and will last for years with little or no attention.

Very nearly allied to this section is another with conspicuous, yet withal very beautiful flowers, alike in form to the above, but softer in colour, of which N. incomparabilis is a typical example. The whole of this section are particularly beautiful. Their prevailing hues are primrose and the softer shades of yellow with white. The flowers of these have considerable intrinsic merit, possessing in no small degree the form and substance of the Rose; they are, moreover, sweet, and for cutting for vases few things are more suitable and effective. The double white variety has long enjoyed the designation of the Peerless Daffodil, and certainly few can question its simple beauty.

But even more beautiful than this is the waxy-petalled pure white variety, N. cernuus plenus. As a flower for a lady's hair and other room-decorative purposes the stove Eucharis amazonica or the greenhouse white Camellia can hardly surpass this charming hardy flower. To see it growing in the border with its partially drooping head it might be passed by unnoticed, but cut it and intermix with it fronds of Ferns and it will compel a pause for admiration from every passer-by. It is almost as sweet, quite as pure, equally good in texture, and superior in form to the finest blooms of Gardenias. This variety is unfortunately somewhat scarce, its increase having been neglected, but it is worthy a place in every garden where cut blooms are in request. It is commended to all lovers of white cut flowers as giving a supply when white Camellias fail and before Roses are in profusion.

We now pass on in this cursory review, to which N. poeticus has led the way, to the well-known N. Tazetta or Polyanthus group. These are commonly cultivated in pots, but are fine for the outside garden, and are better adapted for growing under the partial shade of trees than most plants. It is not necessary to enumerate, but we may say that the chaste old Paper White variety is worthy of more extended cultivation than it generally receives.

With the necessary omission of many varieties of Narcissus we would not pass in silence the bright and sprightly Jonquils. A quarter of a century ago most gardens had glittering masses of these—both the double and single, but they are not commonly seen now; yet grown in quantity nothing else can give in April such decided brightness to a garden.

It remains only to say, in closing these gossiping notes, that the whole of this tribe of plants are bulbous-rooted, and can be purchased and planted any time during their season of rest. Do not forget them. Do not limit bulb orders to Hyacinths and Tulips. Think of the Narcissus in its various forms. The genus literally teems with quiet, chaste, satisfying beauty. They will grow in any kind of soil, but of course the richer and deeper it is the better will the plants flourish. Further—and this may not be so well known—they will remove from place to place at this season of the year, preserving earth to the roots, and not suffering them to become dry during removal. The varieties too, which are suitable for indoor decorative purposes, may be taken out of the ground and potted just when the plants are breaking through the ground. The flowers are then formed, and only require free soil, a suitable—that is, a moderate temperature, with a sufficiency of water to bring them to perfection.—W.

BUDDING.

In the number of January 21st Mr. Benstead describes his method of separating the wood from the shield, of which I do not quite approve, although it may suit some sorts, such as Lord Raglan, because, separate the wood from the shield how you will, it is very rarely that the eye will come out. I will attempt to describe my method, but I do not use the quill, not deeming it necessary at all. Insert the knife above the eye and bring it out obliquely, then put the nail of the left-hand thumb on the wood opposite the eye. Next put the point of the knife under the wood, snatch the wood and shield asunder, breaking the wood at the thumb nail; then sever the other end of the bud, and snatch the wood out in the same way.

I have found all kinds of Rose buds so taken out to be quite perfect. Perhaps some may think the way I have described tedious, but I do not find it the least so, as I can put in two buds in one minute, and with good success. I lately budded ten rows, numbering sixty in a row, and not one failed amongst them.—J. C. Colman, *Greenford Hall.*

A HARDY PITCHER-PLANT.

We have been asked by "A Lady Gardener" to name a Sarracenia sufficiently hardy to grow in the border of a midland county garden. Not knowing of one, we referred to the catalogues of various florists, and find the following in that of Mr. T. S. Ware, Hale Farm Nurseries, Tottenham. He has obliged us also by sending this wood-engraving from his "Illustrated Catalogue of New and Rare Hardy Perennials."

Fig. 39.—Sarracenia purpurea.

"Sarracenia purpurea.—This is the only hardy Pitcher-plant in cultivation. It is a native of the American swamps, where it forms a dwarf prostrate mass, producing large winged pitchers of a dark green colour, while the throat and lip are beautifully veined with crimson. The flowers are solitary, nodding, and of a deep purplish-red colour; a fine associate for Cypripedium spectabile, Parnassias, Pinguiculas, and others of this character."

NOVELTIES IN THE ROYAL GARDENS, KEW.

Of the large number of Acanthaceæ known in cultivation comparatively few only are worth universal attention. A few of the best well-known kinds will always hold their own; but in addition to these are several beautiful species that we rarely meet with. Stephanophysum Baikiei, now flowering in the Palm house, may be mentioned as one. During the winter season it produces fine panicles of tubular scarlet flowers, which have the advantage of being more persistent than is often the case in the order. The habit of the plant is dwarf, and though not much inclined to branch, is easily compelled to do so by cutting back. Its leaves are ovate lanceolate, in opposite pairs. This and several other Acanthaceæ appear to receive much benefit from being shifted shortly before the time of flowering. The production of bloom is much strengthened, and the quantity in no degree diminished. It was introduced to Kew by the Niger Expedition under the command of Dr. Baikie, after whom it was named, and was figured in the "Botanical Magazine" of 1859. Cuttings are rooted without difficulty in a few days, and now is a good time to get them in for flowering next winter. An intermediate-house temperature is

sufficient, and the soil used should be a rich mixture consisting in good part of loam.

Roudeletia (Rogiera) cordata, an uncommon plant, is also flowering in the same house. It has large trusses of pale pink flowers having a slight scent. The nearest relation is perhaps the well-known R. gratissima, from which it differs by the larger and stronger growth. It is a native of South America. The genus Rogiera is now merged into Roudeletia; and if so nearly related we would suggest the possibility of raising hybrids between R. speciosa and the subject of this paragraph which might surpass either of the parents, the one possessing colour, the other size of truss with good habit and fine foliage.

In the Succulent house we observe Echeveria fulgens and E. retusa finely in flower. They are beautiful species, and worth growing for decorative purposes. This recalls the use that may be made of the allies for conservatory decoration after having been taken from their summer sites of display out of doors. E. metallica, for instance, if carefully potted before the advent of frost, will throw up vigorous panicles of bloom that will have a fine effect during several of the winter months.

Cytisus filipes is very attractive in the Conservatory, and, though pretty well known, is not often cultivated. The weeping branches studded with pure white flowers have a very pleasing effect. It is said that by grafting on tall Laburnum stems the drooping habit may be shown to advantage. The flowers are sweetly scented.

On the Rockwork is a new species of Milla (Triteleia)—M. Leichtlini. The flowers are white, and the look of the entire plant reminds one of an Ornithogalum. It is not the most beautiful of the genus. Here also Cyclamen coum is showing its brilliant rose-coloured flowers.

SPARROWS—SNOW'S WINTER WHITE BROCCOLI.

I WRITE principally to make recantation of a statement in the *Journal of Horticulture*, vol. i., p. 461—viz., "That sparrows eat Peas and the buds of trees I admit." The statement relating to the buds I beg to withdraw, as it was made through fear of offending that sense of supposed right of those who may have had their schooling, as I had, from "old prejudices" in matters relating to sparrows. My father taught me to take sparrows at night with a riddle from haystacks, whither the birds had withdrawn at night for warmth or shelter. The farmers at that time offered a farthing for each young unfledged bird or egg, and a halfpenny for every old bird taken to the individual appointed to receive and pay for them. This was just the thing for boys always on the look-out for a little money. Sparrows I was taught were of no value whatever to man. Imbued with this idea I waged war against the birds by every contrivance and weapon known at the time, but after-years of careful observation have taught me how much I erred in that murderous work.

With the above recantation rests my ease of mind. I readily admit "AGE" and Mr. Allcock are entitled to their own views, which, however, do not alter mine. I first require absolute proof of the birds at the buds, and taken with the buds in their crops. May I refer "AGE" to an article on the house sparrow in the *Journal of Horticulture*, vol. iii., p. 681? after reading which may we not exclaim together, "Surely we are not all wrong!" There is no need to write-up the hedge sparrow; it does no harm, it has no enemies in man, while the house sparrow had at one time a price put upon it for destruction.

Just a word in reply to Mr. William Taylor. I had and have the true Snow's Winter White Broccoli as supplied guaranteed by Messrs. Veitch. My treatment differs from his there can be no doubt, but there is another difference which Mr. Taylor fails to see—that of climate. Three hundred miles further north and 500 feet above sea level means something. I have cut Snow's Winter White Broccoli early in December within seven miles of York and elsewhere; but what that has to do with the trueness of a variety or cultivation I am unable to apprehend.—G. ABBEY.

I HAVE been somewhat concerned to read the numerous complaints in the Journal respecting the ravages committed upon Gooseberry and Currant trees by the irrepressible sparrow, and have feared that the advice of some of your correspondents may be too generally acted upon, in which case the poor sparrow is likely to have a hard time of it during the coming spring. The particulars of the system pursued by me, and which has succeeded perfectly, may be useful to some of your numerous readers, and save the lives of some of my feathered friends. Sparrows literally swarm here; one cannot cross a stubble field without pulling up, not hundreds merely, but tens of thousands. Therefore if he be so destructive, as some allege, the mischief done must be very serious indeed.

Now, taking into consideration that this is one of the most highly cultivated and highly rented districts near the metropolis, and also taking into consideration the money-making nature of the West Surrey farmer, it does seem strange that such swarms of destructive (?) birds should be allowed to increase and multiply at the rate they are doing, unless those worthy people are quite blind to their own interests upon this point—a failing, however, which those who enjoy their acquaintance will hardly credit them with. I have just examined my Currant and Gooseberry bushes, but cannot discover a bud touched, and the reason is this:—During the late inclement weather our birds were fed every morning with bread crumbled very fine, so that considerable time should be occupied by Mr. Sparrow in filling his crop. But what I apprehend more effectually checked his disbudding propensity was a good dusting of soot applied to the trees occasionally, throwing the soot well at the trees so that it may stick among the buds. The Currant and Gooseberry buds are now swelling, and no time should be lost in giving them a good dusting; the buds are now very tempting, and if this is not done at once many will be destroyed.

The sparrow will not touch the filthy Gooseberry caterpillar nor will (so far as my experience goes) any other bird. But why rear Gooseberry caterpillar, the remedy for its destruction being so very simple? All I do is to remove the soil under the trees to the depth of about 4 inches, scattering it far and wide about the garden, birds and frosts will do the rest; then replace the soil removed with fresh earth, adding a small quantity of manure, thus removing an enemy and supplying a fertiliser at the same time. November is the best time for this operation.

To protect Peas from the sparrow with string or cotton, much depends upon the time and mode in which it is fixed. Many people do this at the sowing time, running it close to the ground. This is wrong the thread should be laid just as the Peas are breaking through the soil, and at a height of about 4 or 5 inches, one strand on each side of the line, these should be about 4 inches apart. If the stringing be done at the sowing time the birds get used to it by the time the Peas come up, whereas if done at the proper time the Peas get well into leaf and out of danger before the birds get accustomed to the threads. A few lines here and there across the garden at the height of about 7 feet would materially assist, the sparrows being very shy about going under anything which looks like a net. Crocuses and Primroses may be protected in a similar manner, and the more invisible the colour of the thread the more effectual would it be in scaring the birds. Do not let us take to shooting our small birds until other remedies have been tried, or it has been clearly proved that they are in excess of our requirements.

I may add that a few summers ago 150 birds at least were hatched and reared in my small premises of 10 yards by 30, those included three families of robins, by what appeared to be the same pair of birds, and in exactly the same spot—viz., the porch over our back door. These young birds were, as well as we could make out, entirely fed upon caterpillars, and from early morn to dewy eve the parent birds were unceasingly occupied in bringing food to their voracious offspring. The number of caterpillars thus destroyed by the parents of our 150 young friends must have been incalculable.

The sparrows last summer cleared my Roses of aphides, and no cockchafer has the smallest chance of escaping with his life, he is captured when on the wing.

My greatest enemies in a gardening sense are cats and dogs. If Sir Stafford Northcote would but tax the one and double the tax on the other, or instruct his myrmidons to see that every wretched cur contributed its crown to the revenue, many small gardeners in this neighbourhood would be exceedingly grateful, and carry on the cultivation of their little plots with renewed vigour, knowing that a sensible reduction of those (in too many cases), useless and annoying pets would soon follow. —WEST SURREY.

As the crusade advised against the sparrows may be acted upon with indiscrimination by many readers, and, conse-

quently, the lives of all the sparrows of the kingdom be placed in jeopardy, I will array myself on Mr. Abbey's side, and endeavour to state a few plain facts, which I trust will deter some enthusiasts of the *chasse à la mort* from entirely banishing sparrows from their places. The principal question is: Does the good they do compensate for the alleged mischief? I have watched the doings of these little birds in this and other countries, and I do not for a moment assert their innocence of the crime of eating Goosebury buds, but never to an alarming extent. A few bright-coloured shreds hung on the bushes will usually keep them at a respectful distance. The destruction of seeds they are charged with is not to be compared to that of chaffinches, which are most determined seed-eaters.

If anyone takes the trouble to notice the kind of food the sparrows feed their young with, they will see that it consists of larvæ, ants, caterpillars, beetles, worms, &c., and it is estimated that to satisfy those hungry little ones requires weekly at least three thousand of the above-named insects, because from my own observation each of the old ones carries food to the nest no less than twenty times per hour. This wholesale destruction of innumerable noxious insects is, to say the least, an equivalent for a few fruit buds. I would recommend, where sparrows really abound in alarming numbers, to destroy part of the young before they are fledged. By that method you ensure the destruction of a large number of insects, and at the same time keep the sparrows within bounds.

I will conclude with the following fact, which will speak for itself:—Frederick the Great, as is well known, was a great epicure of Cherries, but could not obtain them in sufficient quantities from his gardens at Potsdam on account of the depredations committed on them by sparrows. He determined on the utter extirpation of these birds. Sixpence was paid for every couple brought in, and in course of a few months not a sparrow was to be seen for many miles round.

What was the consequence of this war? The great king not only had no Cherries, but no other fruit, the trees were covered with caterpillars, fruitless and nearly leafless. Seeing that he could not violate a law of Nature with impunity, he rescinded the order, and was even compelled to import large numbers of those little Cherry fanciers at a great cost.

In reply to "Age," I would state that sparrows have been sent to New Zealand some years ago, where they have sufficiently multiplied to answer all necessary purposes.—A. Wipf, *Heighington Hall Gardens.*

I am no advocate for destroying life, but when it becomes a nuisance I believe we are authorised to use our judgment in taking away life.

Notwithstanding all the praise lavished on the sparrow by Mr. Abbey (and I look on him as an authority), my experience tends in an opposite direction. I had much rather my young Peas, Lettuces, and the like were left alone than picked to pieces by sparrows, to say nothing of them in connection with the bud question. I have seldom known early Peas and winter Lettuces attacked by caterpillars, but I have known them much injured by sparrows. This is not all their mischief, for when you are anxiously looking for gathering your Peas you often find them gathered for you, and on approaching the place you see the sparrows go, and your Peas with them. It is all very well to talk about a dusting of lime, a red thread, a net, and the like, but birds will be fed. It may be that persons like Mr. Abbey may have men and means at command, but there are hundreds that have not, and it is the latter class that suffer most from the depredations of the feathered tribe.

There ought to be a very large margin left between great and small means. I have had the good fortune to be placed in at least one place where Ivy was a prevailing feature, affording abundance of shelter for the sparrows, and from experience I know more of them than I care to tell. I know they will eat caterpillars and buds too, but they prefer Veitch's Perfection Peas in a young state.

I endorse Mr. Allcock's sentiment, and say Catch them and kill them. I had rather contend with the caterpillars than have both caterpillars and sparrows to fight against.—H.

VEGETABLE INSECT-EATERS.

The genera known as insectivorous are eight in number—Cephalotus, Darlingtonia, Dionæa, Drosera, Heliamphora, Nepenthes, Pinguicula, and Sarracenia. Of these, Darlingtonia, Dionæa, Drosera, and Sarracenia have been most carefully watched. So far as is known, Ellis, an American botanist and collector who lived near a hundred years ago, was the first to notice that the entrapping of insects by Dionæa was anything more than accidental. These observations and some others that were made about the same time were published in the Transactions of the Linnæan Society in 1815, but did not then attract much attention, being generally discredited by botanists.

The observations of Mrs. Mary Treat of Vineland, New Jersey, are the most recent, as well as among the most thorough that have been made on these curious plants. In the month of May last she received from Dr. Wood of Wilmington, N.C., some thirty fine specimens of the Dionæa muscipula, and placed them at once in separate pots, numbering each and keeping a careful diary from the outset.

When an insect is entrapped a slimy secretion begins to ooze from the inside of the leaf, and in a day or two envelopes the insect's body. After a period of several days the insect disappears, with the exception, perhaps, of some hard parts, which are ejected, and the leaf re-opens if it is healthy, to receive another victim. Such being the *modus operandi* in general terms, Mrs. Treat proceeded to make more careful observations. She found that the leaves and plants differed greatly in their powers of assimilation. Some leaves were unable to digest even a single fly, while others disposed of three successively, but never could manage a fourth. When a leaf has done its duty in contributing nutriment to the parent stem it dies, and is replaced by another or others. The leaves were not restricted to a uniform diet. Mrs. Treat tested them with beetles, spiders (of the daddy-longlegs variety), &c., and even sat for some two hours with her little finger in one of the leaves. This last experiment was unsatisfactory, as for some reason her nerves refused, much to her regret, to let her remain a prisoner long enough to be even partially digested. The leaf had, however, begun to exude its digestive fluid, as if it would have been quite pleased with a human victim had it been big enough. Beetles and other hard-winged insects were digested by some of the stronger leaves, the operation requiring in some cases as much as two weeks. The strongest plant in the collection caught in all forty insects between May and October, and digested most of them, but this was accomplished by successive sets or relays of leaves. Insects removed after two or three hours of confinement sometimes recovered, but if they were left long enough to become covered with the slimy secretion they always died, although in some cases the secretion was carefully washed off. Such in brief are some of Mrs. Treat's conclusions.

In the case of Drosera, natives of the Northern States of America, she found that while the leaves would close over bits of beef and the like, they would take no notice of dry mineral substances, and seemed doubtful about fruit. If, however, a fly were fastened within, say, half an inch of a leaf, it would begin to reach toward it, and usually made fast within two hours.

Mr. Darwin has found that the digestive secretion has an acid reaction like that of the gastric juice of animals, a discovery which doubtless gave him great satisfaction. He likewise thought that he proved the existence of nerve points in the bristles which border the edges of the leaves. Other observers who are disciples of the evolutionists have noticed electrical currents induced by the closing of the traps, such as follow muscular action in animals.

Some of the genera referred to, such, for instance, as Sarracenia, have tube-like leaves lined with inward-pointing bristles. These leaves are baited with a sweetish fluid, which attracts wingless insects within the tube, and they are unable to climb out. So, also, winged insects encounter the introverted hairs in their efforts to escape, and they, too, fall into the little pool of deadly fluid at the bottom of the tube. Of this tubular structure, also, are Darlingtonia, Nepenthes, and Cephalotus. The other genera enumerated at the beginning of this paper have leaves which roll themselves together with their prey inside, or are divided in two parts like a clam-shell, these remaining wide open when ready for a victim, but closing firmly together and interlacing the marginal spines, which, according to Darwin, may be rudimentary nerve-points, as soon as an insect alights on the sensitive surface.—(*Medico-Pharmaceutical Review.*)

THE LIME OR LINDEN TREE (Tilia europæa).

This is one of the most beautiful and most useful of our forest trees. Planted singly it is a tall graceful object, and an avenue of Limes, as is to be seen in the Cathedral yard at

Winchester is not forgotten by the visitor. Such an avenue is grand, and when the flowers are fully expanded in July their fragrance, though powerful, is delicious.

Being well known to and admired by the Romans, it is probable that they introduced it to this country; but whether they did so, or whether it was introduced from Germany, it is certain that it was cultivated in England much earlier than many have concluded. Turner in his "Herbal," published in 1562, says, "Tilia is named in Greek Philyra, in Dutch Linden baum, in English a Lind Tree. It groweth very plenteously in Essex in a park within two miles of Colchester in the possession of one Master Boggis."

Fig. 40.—The Linden Tree.

This leads us to note the absurd corruption of the name of this tree now applied in this country. It has no relation either to the true Lime, which is a Citrus, nor to the earth called lime. The true Englished name is the Line or Linden Tree, a contraction of the Dutch and German name, which alludes to the bark being employed for making cord and other lines.

The usefulness of the tree is great. Its extremely white wood is turned into bowls, bread plates, &c. Its sprays are woven into baskets; it furnishes the cutting-board to shoemakers, and the sounding-boards of pianos; it is largely used for carved work—Grinlin Gibbons's beautiful carvings are of this wood; from its inner bark the mats woven in Russia, and a few in Monmouthshire and Lincolnshire, and so well known as *bast*, are made. This is an Anglo-Saxon name, for in that language *bæst* is the inner bark of a tree. Three millions and a half of these mats are annually exported from Russia, chiefly from the port of Archangel, and more than half a million of them come to England. In southern Europe hats are made of bast, and in Russia the upper parts of shoes; and their soles are made of the outer bark of the Linden. Fishing nets are made of it in Sweden, and in Carniola the shepherds have their usual clothing formed of a coarse fabric into which it is woven. The wood when made into charcoal is employed to form crayon pencils, toothpowder, and gunpowder. The flowers abound in honey, and are as valuable in some districts to the apiarian as is the heather in other localities.

The "Kowno Honey," so highly valued on the continent for making liqueurs and in compounding medicines, is gathered by the bees from the extensive Lime forests near Kowno in Lithuania.

Such being the great utility of the Linden, Pliny justly speaks of it as "the tree of a thousand uses."

The flowers are profusely numerous, and are so peculiarly borne from the centre of large yellowish green bracts, that we add a wood engraving of this mode of inflorescence.

We must not conclude without reminding our readers that the name of the first efficient inventor of botanical classification was derived from this tree. Lind is its Swedish name; and Linnæus was applied to the earliest ancestor who bore it, probably because his dwelling was sheltered by Linden trees.

Fig. 41.—Inflorescence.

TRANSPLANTING VINES, AND THE CUTTING-DOWN PROCESS.

I, LIKE Mr. J. Wright, am delighted to hear of Mr. Blackburn's success in transplanting his old Vines. Now, in the cutting-down process there are great results to be obtained by following Mr. J. Wright's instructions in pages 120 and 121; but still there are greater results to be obtained if Grape-growers,

after cutting down their old Vines within a foot or more from the ground, were to layer them in fresh loam along an inside border where they have an advantage of artificial heat, and allow one or two new canes to form from the layer. They would find, with careful management and a watchful eye, that in a few years they would reap the fruits of their labour equally as good as from young Vines, and in much less time than they could grow young Vines from eyes.—H. S., *Ringwood Gardens.*

EARLY WRITERS ON ENGLISH GARDENING.

No. 3.

JOHN GERARDE.

Gerarde, or Gerard, for it was spelt both ways, was the Philip Miller of his time, for he was a gardener as well as botanist, and in 1597 he thus states his occupation in his address to Lord Burleigh :—"Under your Lordship I have served now by the space of twenty years. To the large and singular of this noble Island I have added from forreine places all the varietie of herbes and flonres that I might any way obtaine. I have laboured with the soile to make it fit for planta—what my succesee hath beene, and what my furniture is I leave to the report of them that have seen your Lordship's gardens, and the little plot of myne owne especiall care & husbandry."

Fig. 43.—Born 1545 at Nampturich, in Cheshire, and died at London in 1611-2.

Where that "little plot" was situated is not exactly known, but he has told us of its whereabouts, for he dates his address to his Herbal's readers :—"From my house in Holborn within the suburbs of London, this first of December, 1597." I incline to believe that his house and garden were about where Ely Place and Hatton Garden are now, and from whence he could readily walk to his patron's, Lord Burleigh's, garden, now occupied partly by Burleigh and Cecil Streets in the Strand. He could visit at the same time another "little plot" of his own, for among the public records are the following :—"Anne Queene of England, &c., for the sum of five shillings by way of fine paid by John Gerrard of London surgeon and herbarist to the King, and for other considerations, but especially of his singular and approved art, skill, and minstrie in planting, nursing, and preserving of plants, hearbes, flowers, and fruits of all kinds, do grant and let to him one garden plott belonging and adjoining to the east part of Somersett or Strand House, abutting on the west wall of the said house, on the east on Strand Lane, on the south on the bank of the River of Thames, and on the north on the back side of the house standing in the high street called the Strand, the said plott containing about two acres, and to be held by him, his executors, administrators, and assigns from the feast of St. Michael next ensuing, for the term of the Queen's life, and for 21 years, paying annually a rent of four pence, to be paid quarterly, and yielding for our own use at the proper seasons of the year a convenient quantity of herbes, flowers, and fruits growing in the said garden, by the art and industry of the said John Gerrard, if they be lawfully demanded of him. Given under our seal at Whitehall, the 14th of August, in the reign of the King the 38th (of Scotland). Endorsed by T. R. Ewens, auditor, 30th August, 1604."

On the back of the Grant is written :—

"27th of June, 1611. Whereas the Queen by her deed dated 14th day of August, in the second year of the reign of James, did grant a garden plott belonging to Somersett House unto John Gerrard, Surgeon, for her life, which John Gerrard by deed dated 26th November, 3rd of James (1605), granted all his estate therein to Robert Earle of Salisbury, who by indenture dated 8th day of April in the 5th year of the reign of James, granted the same to William Goodroud, Surgeon, for twenty years, who afterwards granted and surrendered it to him again, and the Earl again surrendered it to the Queen."

Queen Anne who granted the plot to Gerarde was the consort of James I. She had Somerset House assigned to her as a palace, and her contemporary Howes records—

"Shrove-tuesday, the fourth of March, this year 1616, the Queene feasted the King at her Pallace in the Strand, formerly called Somersett-house, and then the King commanded it should no more be so called, but that it should from henceforth bee called Denmarke-house, which said Denmarke-house the Queene had many wayes repaired, beautified, new builded, and enlarged, and brought to it a pipe of Conduit water from Hyde-park."

It is very near the truth, if not quite, to state that the biographers of our oldest authors troubled themselves very little to be accurate in the dates of events of the lives of those about whom they wrote. If one biographer assigned a date, subsequent biographers accepted it without testing its accuracy. The death time of Gerarde is an example. All who have written about him state that he died in 1607. As he lived and died in Holborn, it would have been easy to consult the registers of St. Andrew's Church in that parish, but no one ever did until within a few days of my writing this I turned over the parchment leaves of those well-kept registers, and in them found this entry :—

"Mr. John Gerrard, freeman of the Barber Chirurgeons, buried the xviii Februarv, 1611." That would have been 1612 had the year then as now commenced in January.

Gerarde was evidently a parishioner of consideration, for he is the only one in that and other years with the prefix of "Mr." All others have at the most merely their Christian and surnames recorded, whilst too many have such a totally useless record as "A poor man" or "A maid from John Smith's," "buried this day."

Contrary to the usual order of biography I have recorded Gerarde's death without any reference to his birth and parentage, an omission caused by my hoping to obtain fuller and original information. This hope has not been gratified, for the Rev. Jortin G. Blackburne, in courteous replies to my inquiries, states that there is no entry of the baptism of Gerarde

in the Nantwich registers from 1539 to 1545, the only early entries, and all subsequent entries are lost down to the year 1572.

The date of his birth has been derived from the Latin inscription round his portrait prefixed to his "Herball"—Englished it is—"Portrait of John Gerarde of Cheshire, citizen and surgeon of London, in the 53 year of his age, 1598." From it we also learn his native county, but the authority for Nantwich being his birthplace does not appear. Ormerod in his "History of Cheshire" merely mentions that Gerarde was born at Nantwich in 1545, and that he was most probably a collateral descendant of one of the great Cheshire families of that name.

The occupation of barber and surgeon were conjoined even among the ancient Greeks and Romans, and continued on the continent and in England throughout the Middle Ages. The Barber-Chirurgeons were incorporated here in 1436, and their Hall was on the west side of Monkwell Street, in Farringdon ward. The two occupations were divided by the statute passed in the thirty-second year of Henry VIII. (1541), for that statute forbade the barber to perform any surgical operation but tooth-drawing. The surgeons thus separated had liberty to dissect executed malefactors, and were required to pass a slight examination as a test of their ability. It is certain that Gerarde never followed the barber occupation, for, as noticed in Queen Anne's grant, he was then "surgeon and herbarist to the king;" and though the company of Barber-Surgeons continued to exist and he was its chairman, yet its occupation was gone, and it was finally extinguished by Act of Parliament in the eighteenth of George II. (1745).

Gerarde's first publication appeared in 1596, being "Catalogus Arborum, Fruticum, ac Plantarum tam Indigenarum quam Exoticarum, in Horto Johannis Gerardi, Civis et Chirurgi Londinensis Nascentium. 1596." It is dedicated to his patron and employer Cecil, Baron Burleigh. He states that his botanical friends had urged him to publish a catalogue of the plants he had collected from most remote regions, and "cultivated in my little suburban garden for some years." It occupies only eighteen small quarto pages and in double columns. The plants are named in alphabetical order from Abies to Zizyphus; they are 1039 in number, and Matthias de Lobel testifies on the last page that he had often seen them all growing in Gerarde's garden.

In the preface Gerarde intimates an intention to publish a larger work on plants, and even alludes to coloured plates. Better advice made him prefer the plain woodcuts with which he illustrated his "Herbal," published in 1597. It is entitled, "The Herball, or General Historie of Plantes Gathered by John Gerarde of London, Master in Chirurgerie. Imprinted at London by John Norton, 1597." It is dedicated to "his singular good lord and master, Sir William Cecil, Knight, and Baron of Burghley, &c." How skilled he was in a knowledge of plants, their history and qualities, that work testifies; and there is prefixed to it this testimonial from "George Baker, one of her Majesties chiefe Chirurgions in ordinarie, and M. of the Chirurgions of the Citie of London."—"I do not think for the knowledge of plants that he (Gerarde) is inferiour to any, for I did once see him tried with one of the best strangers that ever came into England, and was accounted in Paris the onely man, being recommended unto me by that famous man Master Amb. Pareus, and he being here was desirous to goe abroad with some of our herbarists, for the which I was the meane to bring them together, and one whole day we spent therein, searching the rarest simples; but when it came to the triall my Frenchman did not know one to his foure."

There are many other testimonials both in prose and verse, but we can only quote an extract from one written by Thomas Thorney, Master in Chirurgerie.

"Herein (as in a glasse) we see
How thou thy mind hath bent,
Thy bodye toyld, thy time bestowed,
And many a pounde hath spent;
In sleeplesse nights, in restlesse daies,
In places far and neere,
In searching this, in trying that,
In countries here and there."

Whither he travelled we have no specific information, but he intimates he had seen the native Firs growing near Narva, near the Gulf of Finland.

Gerarde founded his "Herbal" on Dodoen's "Stirpium Historiæ Pemptades," published in 1583. This was in Latin, and being translated by Dr. Priest, Gerarde obtained the translation and incorporated with it the plants described by Garcias, Monardes, Cæsalpinus, Camerariscus, Dalechamp, Thalius, Tabernæmontanus, and A. Costa, in addition to the plants brought home by Raleigh and Cavendish, and which were cultivated and nursed in Gerarde's own gardens, and those of Lord Burleigh and others.

The system, if system it deserves to be called, is to divide all known plants into three groups.—1, Grasses, Corn, Rushes, and bulbous-rooted plants; 2, Herbs used for diet, physic, or for ornament or pleasure; 3, Trees, shrubs, fruit-bearing plants, resins, Roses, Mushrooms, &c. The woodcuts had been employed previously to illustrate Tabernæmontanus's "Herbal."

No further example of the absurdity of the three divisions need be quoted than the Potato. It is in the second division, and consequently is associated with the Turnip, Cucumber, Pompion, Crane's-bill, &c.

I have named the Potato because a sprig of its stem bearing leaves, flower, and berry are in Gerarde's hand, as represented in our wood engraving, copied from the frontispiece of Johnson's edition of the "Herball." I believe it was placed there because Gerarde was its first cultivator in England. In that volume, after particularising the Sweet Potato, which he calls "Sisarum Peruvianum, sive Batata Hispanarum, Potatus or Potatoes," he proceeds to the consideration of the common Potato, under the title of "Potatoes of Virginia. Battata Virginiana sive Virginianorum et Pappus." The woodcut and the description demonstrate that the plant he had before him was our common Potato, and he proceeds to observe that "It groweth naturally in America, where it was discovered, as reporteth C. Clusius, since which time I have received roots hereof from Virginia, otherwise called Norembega, which grow and prosper in my garden as in their own native country." After stating the time of its blooming, &c., Gerarde adds, "The Indians call it papus (meaning the roots), by which name the common Potatoes (Sweet) are known to them. We have the name proper unto it mentioned in the title, because it hath not only the shape and proportion of Potatoes, but also the pleasant taste and virtues of the same; so we may call it in English Potatoes of America or Virginia. Being likewise a food, as also a meat for pleasure, either roasted in the embers or boiled, and eaten with oil, vinegar, and pepper; or dressed any other way by the hand of some cunning in cookery."

I hoped to find some indications of Gerarde's family in the registers preserved at Somerset House, but no will or letters of administration are there. So of whether he was married or what were the results of his industry we have no information. Nor could I obtain any information from the registers of St. Andrew's, as those of baptisms in the sixteenth century are lost.—G.

GILBERT'S SEA-KALE AND RHUBARB TUB.

I THINK Mr. Wright is a trifle too enthusiastic in his notice of these tubs for Sea-kale and Rhubarb forcing. Firstly, they are no new invention, but one that has been resorted to as a makeshift for many years. I have used them for twelve years to make up with when short of the usual pots, and several friends of mine have used them for thirty or more years, and during that time have often found them useful, but will agree with me in saying they have not found them so good in any way, nor so cheap in the end, as the usual Sea-kale pot.—T. KEETLEY.

I SEE in the Journal an engraving of a Sea-kale and Rhubarb forcing box used by Mr. Gilbert, which I consider a superior article to the old Sea-kale and Rhubarb pots. Having used them in Scotland some years ago, the idea is not new to me. I can say that they answer the purpose equally as well as the pots. They are cheaper and easier to manage in every way, and not so liable to be broken as the pots. Now that the idea is published I have no doubt but they will become more generally used, as they deserve to be.—JAS. FAIRWEATHER.

PROTECTING PEAS FROM SPARROWS.

THE following is the mode I protect my Peas: Just as they appear above ground my gardener has a piece of wirework netting, about a foot in width, at a cost of about 2½*d.* per yard, which is cut to the length of the row, and is placed on them and left until they are high enough out of the ground, say about 3 inches, when the birds will not touch them, and then they are put on later sorts. When done with they fold into

a small compass, and are put away till the next spring; or will be found very useful put round small beds to protect them from croquet balls, &c.—C. Martin.

ADELAIDE BOTANIC GARDEN.

Dr. Schomburgk's labels are worthy of special note. They stand out with a black-and-white clearness that led to a particular inquiry as to his method. The labels are of sheet iron, and, before painting, a mordant of composition is employed thus—one part chloride of copper, one of nitrate of copper, and one of sal ammoniac are dissolved in sixty-four parts of water, to which solution is added one part commercial hydrochloric acid. The iron labels are brushed over with this liquid, which gives them a darkish colour. In the course of twelve or twenty-four hours they become dry, and to their now dirty-grey surface a coat or two of black oil colour will firmly adhere. When dry the names of the plants are written with white oil colour, and immediately sanded with white sand, which dries with the white paint and becomes compact. On these labels, which resist all action of the weather, Dr. Schomburgk's rule is to print the botanical name of each plant, its natural order, and native country.

The collection of outdoor and pot plants in this garden is understood to be the largest to be found in any kindred institution in the southern hemisphere. There are about eight thousand species. The collection of Cacti and other succulents contains alone six hundred species, and I believe a similar collection is not to be found in Australia. Many of the pot plants which have lately appeared in the European market are already found in the collection, and, notwithstanding somewhat overcrowding in the houses, have a healthy appearance, and show the care with which they are treated. The Orchid collection is also very fine. In 1870 Dr. Schomburgk made the experiment of planting a Palm group at the lower end of the garden with Palms of the following genera:—Latania, Sabal, Chamærops, Rhapis, Cocos, and Phœnix, which seem to have become acclimatised, and are doing well, considering the unfavourable climate for tropical plants.—(*Adelaide Leader.*)

NOTES on VILLA and SUBURBAN GARDENING.

The planting and pruning of evergreens does without doubt concern the occupier of a villa or suburban residence quite as much, if not more, than any other class of interested persons. First, as to the time of planting. He is by compulsion often obliged to depart from the advice given, because the building is unfinished and the ground not put into proper order to receive the plants until very late in the season. Secondly, rather than see his place go bare of these ornaments for a whole season, he is constrained to plant even at the risk of losing many of the shrubs, which he certainly will do if a period of dry weather set in immediately after planting, and if the greatest care is not bestowed upon them by ample mulching and frequent waterings both overhead and at the roots, and this so copiously as to thoroughly soak every particle of soil and reach every root belonging to the plant.

The greatest cause of failure is the lack of attention in these essential points. But this possibly the amateur is unable to do of himself, and to employ others to do it becomes expensive. But even this outlay may be economical in the end; for if planting must be done beyond the season, in addition to the annoyance of several dead and dying plants constantly coming before the eyes, there is the expense again of purchasing others to replace them. But I fancy I hear him say, "What am I to do in such extreme cases?" My answer is, Let planting alone until the proper time, which I consider to be in the early autumn. That is the best time for planting most shrubs, though some of them, if they are large and good balls of earth can be ensured, may be successfully planted during January and February, providing always that the weather be mild and the soil in good condition.

Gardeners of skill, and who know the conditions under which a plant will recover itself after removal, are not so particular as to the time of transplanting, but an amateur's case is very different and must be treated cautiously. The advantages of autumn planting are in my opinion much greater than at any other season. The earth is then warmed by the summer's sun, and the soil is generally in better condition than at any other time. The plants, too, at that season are in the best order for removal, because the roots are still vigorous and growing, and will consequently take hold of the new soil more readily, and quickly establish themselves. This is important, as enabling them to pass through the winter without injury. It is moreover easily seen that by autumn planting almost a season is gained, and they will be likely to thrive much better the following year on account of being early established. What I mean by early autumn planting is in September and October; November planting is only permissible if the weather is mild, and on no account do I advise planting in frosty weather, even if the soil is not frozen hard enough to prevent working it. I think for an amateur it is not wise to advise him to plant evergreens after the month of February, because towards the latter end of March, or sometimes even before then, the weather is dry and frosty with cutting winds, which do more injury to newly-planted shrubs than many people are aware of.

Again, I am of opinion that when the season is getting late and planting has to be done at more risk, the smaller the shrubs planted the better success will attend them, because the roots are more fibrous and close to the stem of the plant, and if necessary to have them brought from a distance more earth can be secured to them. While attending to small plants for late planting I would like to mention that there are some sorts of shrubs, such as Phillyreas, Evergreen Oaks, some sorts of Hollies, particularly the golden-leaved kinds, and Arbutus or Strawberry Tree, which it would be better at all times to select small for planting, because they do not move so well when large, and especially the Evergreen Oak and Phillyrea. These planted too large make no satisfactory progress for a season or two afterwards. The only fault the planting of small plants leads one to commit is that of planting too thickly. The foremost idea at planting time is to produce an effect at once, which is all very good provided a judicious thinning of them takes place every time they are getting too close together, bearing in mind at each thinning to remove in favour of those plants that are to remain permanent.

This brings me to the pruning portion of their treatment, which is of great consequence to an amateur, because in the small space devoted to the shrubbery it ought to be the aim to have as much variation as possible in the outline, with shrubs of different size and colour of foliage to meet the eye at every turn. The pruning consists in merely shortening the straggling shoots every year, when they appear likely to draw the plant away from its natural habit. This will induce the shrub to form a dense body without producing a formal and rigid outline. Shrubs, such as Laurels and Yews, will need more severe pruning than such slow growers as Hollies, Box, Laurustinus, and many others. To keep those last named neat without closeness will only require the leading shoots cut back an inch or two; this is the more necessary on account of their not breaking into growth so well as others of a more vigorous nature. I cannot name a better time than the present for any necessary pruning, as the plants are not likely to start into growth again till all danger from frost is over; it is also convenient as being the season of dressing the borders containing them, so that the whole may possess a neat and attractive appearance throughout the spring months.—Thomas Record.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

The weather has been still unfavourable for cropping—frosty at night, and just enough thaw in the day to make wheeling or digging impracticable. Pea sticks can be cut and pointed, and we always prepare a stock of the smaller branchlets for supporting the Strawberries. The Pea sticks should be arranged in the required lengths according to the quantity of each variety that is sown—viz., 3 feet 6 inches for the Veitch's Perfection type, 5 feet for Supreme, and between 6 and 7 feet for Ne Plus Ultra and allied sorts. The sticks should not be tied-up in bundles as is sometimes done, but placed upright with the pointed end downwards. Beech, elm, and hornbeam are well adapted for making Pea sticks.

The earliest Rhubarb is starting nicely into growth out of doors, and, should the weather become warmer, will soon be ready for use. Of course the whole quarter where it has been planted is well covered over with stable litter. *Sea-kale* will be planted out if weather permit. The system of forcing causes us to lift the whole of it, selecting all the roots that are strong enough, retaining all the smaller ones to plant-out. The best of the roots that have been forced are also selected to plant with them, and a sowing is made every year to keep up the supply of healthy young plants. Sea-kale requires a moderately rich soil, but no crude manure should come in contact with the roots. Coal ashes may be dug into the ground or placed over the rows with advantage. The seeds may be sown on well-prepared ground in March, and will then make strong plants by autumn; a number of them will be strong enough for forcing.

FRUIT AND FORCING HOUSES.

Pineries.—Queens are generally so plentiful that any suckers requiring to be removed are usually thrown on the rubbish-heap at this season. Charlotte Rothschild does not throw-up suckers quite so freely, but it is more readily increased than Smooth-leaved Cayenne. Of this last we never have too many, as friends are quite ready to ease us of any surplus stock. It is best not to allow plants that have thrown-up fruit, or are about

to do so, to grow a quantity of suckers. A strong Queen may have half a dozen or more; these should all be removed except one or two near the base of the plants. The other two sorts named do not usually throw-up more than one or two suckers on each plant. The suckers should not be taken off until they are strong, say from a foot to 18 inches in length, as in their earlier stages they grow very much more rapidly on the plant than they do taken off and potted. The ancient system of drying the suckers for a week or more previous to potting them has become obsolete. It is not necessary to dry them for a day; our practice is to pot as soon as they are taken from the plant, and to plunge the pots in a brisk bottom heat at once, but not to water the pots for a week at least; by that time the young rootlets will be forming or formed, and the watering with tepid water encourages them to grow. We had some suckers of a Pine from Pernambuco which came to hand at midwinter; they were not in good condition, but with care we had no fear of their growing. They were potted in the usual way, and should not have been watered for two weeks; however, one of the men by mistake gave them water at once, and the result was, as expected—every one of them began to rot at the base, and the decay spread upwards, so that in a day or two the heart would have been reached. Instead of this they were taken out of the pots, all the rotten part was cut off, and the suckers potted as before. This time water was withheld for two or three weeks, and every one of those suckers made good plants.

Oranges.—The trees that flowered earliest have not set their blossoms so freely as they would have done if the treatment had been different. They were in a vinery where some of the atmospheric moisture was kept up by some fermenting manure on the ground. The ammonia from this was not strong enough to discolour the leaves, nor were the tender leaves on the Vines injured in the least; yet not only did the Orange blossom fall off in showers when the tree was shaken, but many of the young leaves fell off also. Of course the trees were removed at once to another house where the night temperature was from 60° to 65°, and the atmosphere drier. Here an improvement was immediately apparent, and other trees that were started in this house at once made good progress, nor did either leaves or flowers drop off. It is well to set the blossoms with a camel-hair pencil, as bees are not to be found at this season, and the air in the house is scarcely agitated. Syringing is discontinued when the trees are in flower, but they are freely syringed afterwards.

Figs.—The trees in pots are carefully watered until the buds open and fresh roots are formed. When in leaf the Fig takes a large supply of water, and will soon show signs of distress if the soil becomes dry, while it is not uncommon to see the trees become sickly from over-watering. The greatest danger arises from top-dressing the trees instead of repotting them. The surface compost may be quite moist when the soil underneath, which is quite full of roots, may be dry. It is bad management to top-dress Fig trees in autumn; they ought always to be turned out of the pots and repotted at that time. Another advantage obtained from repotting is that the tree has good drainage; not unfrequently this becomes quite choked-up in one season, and the Fig is very impatient of stagnant water at the roots. The trees are freely syringed, which causes the buds to start well, and wards off red spider. It is a great advantage to the trees if they can be plunged in a bottom heat of 85°.

PLANT STOVE.

Potting Ferns.—These in some instances had been growing in the pot for a longer period than was good for them, as the soil had become sodden, and nearly all the roots were dead, yet the fronds had not shown the effects of anything being wrong at the roots; but, of course, the effect would have been visible further on in the year. All the roots that were not sound have been removed with the surrounding soil, and the plants have been repotted in good turfy loam, peat, and sand in smaller pots than they had been growing in previously. Healthy free-growing species have been shifted into larger pots.

Deciduous species of Calanthe are starting into growth; they have been shaken out of the pots and have been repotted. The size of pot is a matter of taste; some growers use 11 or 13-inch pots or pans, and place a dozen or more bulbs in each. The most useful pots for our purpose are 5 or 6-inch, and two large or three small bulbs are potted in each. We drain the pots well, then place some very fibry turf over the crocks and fill up with the compost, which is turfy loam two parts to one part of turfy peat with a little rotted stable manure and sand added to it.

Thyrsacanthus rutilans is a most distinct plant of easy culture, its drooping panicles of scarlet flowers will soon be in full beauty. A mistake is made by retaining the old plants, which if neglected soon become leggy, whereas plants from cuttings struck now or early in March will form good-sized plants with plenty of foliage, and produce a score or more panicles of flowers 2 or 3 feet in length. Turfy loam and leaf mould is a good potting material, and cuttings struck now should by a series of pottings be in 9-inch pots by August or September. As the plant has been introduced from Central America it requires a high temperature. Our plants are grown in the Cucumber house.

Looking carefully over plants that had been bug-infested; the only way to thoroughly destroy this pest is by persistent hunting.

FLOWER GARDEN.

Now is the time that the greatest difficulty is experienced to find room for bedding plants; they are moved out of one vinery after another as it becomes necessary to start the Vines. Melon and Cucumber houses are also required for their respective occupants before the plants wintered in them can be turned out into turf pits or even into cold frames with any degree of safety; however, we have ventured to remove into cold frames plain-leaved Zonal Pelargoniums, Centaureas, Lobelias of the Erinus section, and any other subjects that will not suffer even if the leaves are slightly touched by frost. This has given us an opportunity to clear out the Melon house, which contained tricolor and variegated Pelargoniums; these have been removed to a heated pit, from whence the more hardy subjects had been taken. Cuttings of Verbenas, Coleus, Alternantheras, &c., that had been struck in a high temperature have also been removed to a cooler house, where they will remain a week previous to potting them off.—J. DOUGLAS.

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

MR. ORMSON (*J.*).—You have been misinformed. Mr. Ormson, if you mean Mr. Ormson, Horticultural Builder, King's Road, Chelsea, is now ready for consultation there. He was seriously ill, but is quite recovered.

BOOKS (*J. Milham*).—Don's catalogue has long been out of print. The "Cottage Gardener's Dictionary" states all that Don's catalogue does, and gives cultural directions besides.

DWARF KIDNEY BEAN (*E. H.*).—The bean you enclosed is the China Dwarf, or Robin's Egg.

MOWING MACHINES (*Capt. S.*).—They all work well if carefully managed. Write to any manufacturers who advertise in this Journal and tell them what you need.

BLUE CORNFLOWER.—I have often experienced the difficulty "A LITTLE SAVAGE" complains of. Messrs. Dimmick & Sons, Nurserymen, Ryde, Isle of Wight, always supply me with the blue Cornflower true, and will, no doubt, be happy to send seed to "A LITTLE SAVAGE." If not, I will send some of my own saving.—W. D. FOX, *Sandown, Isle of Wight.*

MILDEW ON CINERARIAS (*H. A. P.*).—Dust them and the Geraniums with flowers of sulphur. We do not remember receiving any specimens from you.

REMOVING LARGE CEDARS (*T. S.*).—We know of no one who lets on hire a machine for the purpose.

AJUGA REPTANS (*Marley*).—We do not understand what you mean. There is no variety of Ajuga reptans, and its popular name is Common Bugle. It is portraited and fully described in our "Wild Flowers of Great Britain."

PLANS OF FLOWER GARDENS (*J. G.*).—A new edition of the volume by the late Mr. Fish, with additions by Mr. Luckhurst, is printing.

RED AND PINK ROSES FOR EAST WALL (*E. H.*).—As you want continuous-flowering kinds, Hybrid Perpetuals would be most suitable. *Reds*—Glory of Waltham and Madame C. Joigneaux. *Rose or Pink*—La Ville de St. Denis and Souvenir de la Reine d'Angleterre.

CELERY WITH EARTHY FLAVOUR (*A Constant Subscriber*).—The earthiness is due to the soil employed for earthing being largely composed of decaying vegetable matter, and the remedy is to avoid it, employing sawdust or the Wortley Celery collar, so as to keep the earth from the stems. Salt will not make Celery tender, but it tends to make the plants less susceptible of injury from frost, and destroys slugs and worms.

ASTERS SOWING TO FLOWER IN JULY AND AUGUST (*Alpha*).—Sow the seed the third or fourth week in March in a mild bothed, admitting air so soon as the seedlings appear. Prick-off when they show the second leaves in pans or boxes of rich light soil, keeping them near the glass in the frame. Give air carefully at first, yet hardening the plants well off before planting-out in May.

APPLES KEEPING LATE (*Idem*).—Apples keep longest and most plump and sound in a cellar having a uniform low temperature, or any cool room not so dry as to cause shrivelling. For very late-keeping, place sound specimens in earthenware jars in silver sand, putting on the lid, stop with tape, and seal all round with pitch, placing the jars in a cool and damp rather than dry place. The sand may be removed with a brush. The fruit will keep in this way for a long time.

GERANIUM SEEDLINGS STOPPING—POTTING SEEDLINGS AND CUTTINGS (*Biccps*).—We should not stop the seedlings until the middle of March, and then cut them back to three or four eyes above the soil, keeping dry, and when they have broken turn out of the pots, loosen the sides of the ball, removing any old soil, and pot in the same or a slightly larger size of pot, watering carefully for a time, increasing the supply with the growth. The parts removed may be made into cuttings and potted, and in gentle heat, as

that of a hotbed, they will root freely. The cuttings will flower before the cut-down plants. Pot the cuttings about the middle of March, and put in the cuttings, but without a gentle heat they will not root freely. The proper method of growing Camellias is given in the "Greenhouse Manual," to be had from our office for 10*d*.

Orchids for Fern House (*J. T. S.*).—Masdevallia Harryana, Odontoglossum Alexandræ, O. grande, O. Bictonieuse, O. citrosmum, O. Pescatorei splendens; Coelogyne cristata major, Lælia superbiens, Epidendrum vitellinum majus, Oncidium crispum, Zygopetalum Mackayi, Cypripedium insigne, C. caudatum, C. venustum, and Calanthe vestita. Other plants to flower are Anthurium Scherzerianum, Aphelandra aurantiaca Roezli, Centropogon Luceana, Dalechampia Roezliana rosea, Eucharis amazonica, Franciscea calycina major, Hippeastrum pardinum, Imantophyllum miniatum, Pentas kermesina, and Vinca alba oculata. The highest temperature should be at noon or soon after, and the temperature in dull weather should be 5° higher by day than at night, with sun and air 15° to 20° above the night or minimum temperature may be advantageously allowed. For the temperature you require, fire will be required by day as well as night.

Cuttings of Poinsettias (*Rus*).—Put in the cuttings now, and give them a bottom heat of 75° to 80°, with top heat of 65° to 75°, or more from sun heat. A hotbed will answer very well. The cuttings should be taken from well-ripened wood.

Cydonia japonica Fruit—Seedling Orange (*Mrs. Henderson*).—The fruit of Cydonia japonica is not unlike a small Quince, but square not pear-shaped, and of no use. The trees require to be some age before they fruit freely, but the setting may be effected in young trees by fertilising the blossoms with a camel-hair brush. A seedling Orange will not fruit within five years, but seven or more years commonly elapse before they flower. The plant would be best grafted with a fruitful kind.

Heating Houses (*J. P. of York*).—If we understand you aright you propose to have four rows of piping in the first house or stove next the boiler two flows and the same of returns; and you want to know if the other houses can be heated from these pipes, using both flows and returns. Decidedly so. One of the flows may be taken forward through both houses, and return by a syphon beneath the flow, and will be the return to the boiler for the first house as well as the other two. The other flow pipe will return by a syphon and pipe beneath it to the boiler. You will by this, without further arrangement, always have heat in the two cooler houses as well as in the stove. This will not be necessary at times, and you will need valves upon the flow pipe just before it enters the house next the stove, which we apprehend is a greenhouse, and another before it enters the cool vinery, and these will enable you to work the whole separately or together. You will need also a branch pipe from the flow to the return pipe in the first and second house before the valve to allow of the water returning to the boiler, and this will enable you to work satisfactorily without any loss of pipiug.

Irregular Gardening (*G.*).—Your idea is not good. Glass structures require daily attention. We advise you to be content with out-door gardening.

Aughinbaugh Blackberry.—Miss Hall will feel much obliged for the name of a fruit-grower where she can purchase the 'Aughinbaugh' Black berry, raised in Californoia.

Rose Cuttings in Open Ground (*B. B.*).—The cuttings will now be forming roots, and may be left where they are until April, when they should be taken-up carefully and potted in small pots and placed in a cold frame for a time, being shaded from bright sun, and when they have rooted freely harden well off, and plant-out in the open ground or keep in pots, shifting into larger pots as required, and plunged in ashes in an open but sheltered situation. Instead of potting you may plant them out in an open situation in April, in rows about 2 feet apart, with 6-inch distance from plant to plant, watering if the weather be dry. In autumn they may be planted where they are to remain. Some of the plants after potting or planting will fail, as not all emitting incipient roots become plants.

Libonia floribunda (*A. B.*).—That is the name of the plant of which you sent us a flowering spray. It is a very pretty, free-flowering, greenhouse plant, and was introduced in 1864 from Brazil. It is a softwooded shrub, and of easy culture. It came to this country from German gardens.

Names of Fruits (*A. Bass*).—We regret we cannot identify the Pear you sent. It is quite worthless, and the best thing you can do, if the fruit are all like the specimen, is to graft the tree with a better sort. (*Arcturus*).—1, Easter Beurré; 2, Flemish Bon Chrétien.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 8.

BY T. C. BURNELL.

For the first fortnight of their lives chickens should be fed at least every two hours, and no amount of care and trouble expended on them will be too much if we wish to rear prize birds. Size is the principal point in a Dorking, and size is only to be obtained by breeding from the finest birds, and by feeding the chickens early and late on the best and most nutritious food. Chickens are awake with the lark; and as it is "the early bird which gathers the worm," we, too, must be up with the lark if we do not wish our chickens to be in the rear when the all-eventful show-day comes. If we happen to have a poultryman who can be depended upon we are indeed lucky, but such are very few and far between, and far better will it be to pay for a little knowledge and become experienced in time than to go on paying high wages to one who very likely knows but little more than yourself, and who will certainly teach you nothing. Two guineas a-week and more are now commonly paid to a first-class poultry manager, and there is but little doubt that if we can afford to keep a poultryman, the best are the cheapest in the end.

After the first day my chickens have whole groats as a staple food, varied with a little hard-boiled egg chopped fine and ground oats mixed very dry. In a week or ten days they will relish small wheat, and occasionally a little chopped meat may be given them as the egg is discontinued. The great point will be neither to let them eat too much at a time nor leave any, so that, if possible, they may always have an appetite at feeding time. If in the hot weather their appetite seems to leave them, a little gentian bark grated into the meal will be beneficial; but as chickens get older they do not require to be fed so often, and the interval between meals may be gradually extended till, at about four months old, they are fed about three times a-day. If new milk can be obtained they will much enjoy a drink of it the first thing in the morning; but too much coddling will only tend to make them delicate.

It will be a very wise course to weed out the chickens as early as possible, as the fewer there are the better they will thrive. Two or three in every brood may generally be selected for the spit without much trouble, as defective and crooked toes and sooty feet will never get any better. No rules can be laid down for certain, but a little experience will soon teach which chickens to keep.

The chickens should not be allowed to perch at night on narrow or crooked sticks, or they will most certainly become crooked-breasted. Some breeders keep their chickens bedded-down on straw or sawdust till their breastbones are fully formed, but this entails much trouble, and I have not found it essential; besides, some chickens have crooked breasts from the day of their birth, and nothing that we can do will then set them right. Till recently I was of opinion that crooked breastbones could be entirely prevented, but from conversations with some of the most careful breeders, and from my own experience, I am convinced that some cases are hereditary, and, like rickets in children, as long as we breed from such we shall never get rid of it. Undoubtedly birds occasionally receive prizes in spite of crooked breasts, but in my opinion a crooked breast in a Dorking, the table fowl *par excellence*, is quite as bad as, or worse than, a crooked leg or wry tail. A slight bend in the bone I would pass over, but a bird which has a large hollow in his breastbone I would not have for a gift, and in my opinion he should never receive a prize. If the chickens are given a flat plank of wood to perch on about 6 inches wide, with the sharp edges just planed off so that they cannot perch upon them, they will be obliged to roost on the centre of the board, and if this is not placed too high up we shall see very little of crooked breasts if the parent birds are not defective in this respect.

At ten weeks old the cockerels and pullets should be separated from one another, as by this means a good deal of trouble will be avoided, and the cockerels will not fight, especially if an old cock be left in charge of them. If a cockerel be taken away for three or four days for an exhibition or other purpose he should always be returned to his comrades at night, or a free fight will very likely be the result; but if the bird on awaking finds himself on his old perching place he will forget all about his absence, and will in all probability in the morning run out with the others as usual. This is very important, as with fifteen or twenty cockerels it would be quite impossible to find separate runs for them all.

I have before mentioned how necessary it is to train birds to a pen before sending them to a show, and this is especially the case with hens and pullets. If two hens are caught and placed in a small pen together they will be nearly sure to disagree, and one will peck the other almost to pieces, even though they have been bosom friends before. A good plan will be to first let them run in a small yard together where there are no other birds, and afterwards to put them in a smaller place, and thus to accustom them to one another by degrees. If after this one bird still remains obdurate, and insists on pecking the other, the only way will be to tie the offender by one leg to the side of the pen; but even this will sometimes not effect a cure, and the only way then to proceed will be to make up another pair. The plan of showing two hens in a pen together is now generally given up, though in my opinion it is a far better criterion of who has the best yard of fowls, and I think the yard which exhibits the largest number of noticed birds is more deserving of credit than that which exhibits one, even though this be the first-prize bird.

The Cup Bristol Hen.—The opinion that I expressed to Mr. Burnell and others, that Mr. Bartrum's cup hen was the same that I was first with at the Palace in 1873, was not intended to be conclusive, and I regret that Mr. Burnell, without referring to Mr. Bartrum first, stated as a fact what was merely a conjecture on my part, owing to the great similarity between the two birds. Having heard from Mr. Bartrum that he was not the purchaser of my hen I can only acknowledge my mistake. My hen was six and a half years old when exhibited at the Palace. I had bred from her that season, and when shown she was in good health and perfect condition. As I had her myself I can make no mistake about her age.—R. W. Beachey.

Fancy Poultry in Jersey.—The seventh annual report of the Jersey Poultry Society has just been published, by which it appears they have a good balance in hand. The Committee

speak strongly in favour of the single-bird system, which they have adopted with success for the last two years. The Society has a bright prospect before it, and we have noticed with pleasure the success of several of its members at the recent Dorchester and Portsmouth Shows. With such prominent fanciers in their ranks we feel sure that the quality of the birds exhibited at their next Show will not retrograde.

KENDAL AND NORTH-WESTERN COUNTIES SHOW OF POULTRY, &c.

(From our Correspondent.)

THE twentieth annual Exhibition of the above Show was held at Kendal, Westmorland, on the 11th, 12th, and 13th inst. The Show is very influentially supported, and from the number and value of the plate and money prizes which the Committee is enabled to offer, it ranks as one of the first in importance in the northern counties of Lancashire, Cumberland, and Westmorland. The Show was held in the large Albert Buildings, Kendal; and there were exhibits from all the first exhibitors in the United Kingdom, and no less than three hundred entries over last year's show. The Exhibition may be briefly summarised as containing 777 pens of poultry and Pigeons, 25 Cats, 345 Dogs —a goodly family to exist together under one roof for three days.

The choice feature in the poultry exhibits at Kendal is invariably the *Game* pens, and the various classes were largely represented by the best show birds in the kingdom. Game *Bantams* were also a large and splendid class; whilst the numerous entries in the Selling classes must have taken up much of the time of the Judges, as is attested by the many commendations made therein. *Geese* and *Turkeys* were very sparsely represented. *Ducks* were in fair numbers, and some very large and fine birds were shown, Mr. James Walker of Rochdale taking the lion's share of the prizes. *Dorkings*, *Brahmas*, *Cochins*, and *Hamburghs* were each full classes, and of very choice quality, whilst *Spanish* was a class of eleven entries.

In *Pigeons* the largest entries were those of Carriers, Owls, Barbs, Fantails, Turbits, Jacobins, and varieties. There were some very beautiful and choice birds exhibited.

The special prize lists for local exhibitors were well represented; but we think that, seeing the number of first-class exhibitors resident in Kendal and neighbourhood, this feature in the Show might be well abolished, for looking to the list of awards the local exhibitors appear to be well able to hold their own against all comers, even though at the Show this year there were Crystal Palace and other principal show winners present.

Cats were a choice though not large exhibition, though in what may be styled the Variety class there were twenty entries; but the other two classes only drew three entries each.

(From our Reporter.)

THIS Show, which attained this year its twentieth birthday, has long been recognised as one of the best of the northern shows. This year it followed the fashion and entered on the single-bird stage of existence, and the entries consequently were in most of the classes numerous and good. The Exhibition was held in the Albert Buildings, and the Judges were Mr. R. Teebay and Mr. Douglas. The Show opened on Thursday morning and ended on Saturday evening, which consequently necessitated the "Sunday business." We are really getting weary of openly condemning this system. The injury to birds, discomfort to exhibitors and their servants, and immense cost of food, gas, attendants, &c., must, we think, strike all clearly. The only way to check it is simply for exhibitors not to patronise those shows which include a Sunday; and really in these days all may pick and choose quite fastidiously, the number of exhibitions being so great. The Show seemed for the most part well and carefully judged, Mr. Teebay's classes especially giving much satisfaction.

Geese, *Turkeys*, and *Waterfowl* opened the catalogue. This always seems to us out of place. Mr. Walker was "all there" in the said classes, and won the cup with his Aylesburys, a truly fine pen. The winning Rouens were grand and well placed. In the Variety Duck class Mr. Burns had his Black East Indians in second, and that in a very army of Carolinas and Mandarins! His drake is rather large, but its colour is superb—as good as any we ever saw. He told us at Bristol we should not be disappointed when we saw it, and we were not. *Dorkings* made four good classes, and, for a wonder, Coloured did not win the cup. Silver-Greys mustered well, and were very good. 54 (Williams), a nice White cock. 62 (Crabtree), a splendid Coloured hen. Wonderful to say, *Brahmas* were only divided as regards sexes, and not in colours. This we were surprised at, for the Lights do muster so well everywhere. The cup went to a grand cock of Mr. Raines, though the first-prize hen must have closely pressed on him for this honour. 90 (Fox), disqualified for trimmed hocks. 100 (Newnham & Manby), a glorious Dark hen. 102 (Walker), a well-marked pullet. *Cochins* mustered well. The first Buff cock is an old friend, having won such an honour many times before. Second a good-coloured bird. Buff hens were a fine lot. We liked pen 123 (Leno), the Fakenham cup hen we believe, as well as the third. In Variety cocks a good Partridge won; second a fair White; and in hens the colours reversed the places. 142 (Woodgate) a good-coloured hen. 148 (Whitworth), ditto. There were also one or two good Blacks in this class. *Game* came to the front nobly. We have so often commented on the winners, or most of them, that we need do so no more. 240A, the cup hen of Matthews's, was not in the catalogue. This must have been a mistake, but we noticed the same at Nantwich, where Mr. Darby's Buff Cochins, which won second, could not be found in the catalogue. We hope secretaries will be as careful as possible to avoid these mistakes, as, although we know how they do occur by accident, some of the wicked world will try to make something out of it. These classes seemed very carefully and ably judged, and we congratulate the winners on winning in such classes, where it was no easy matter to do so. *Spanish* made up a dozen pens. The first and second-prize hens were old friends, and looked as blooming as ever. 262 (Whitworth) a nice pen. Friend "Elijah" seems to have a finger in every pie; we do not doubt he will get many a plum out of this his new venture. *Hamburghs* were a good lot; the winners' names tell us that—just the cream out of all the best yards in the north; but no class for Blacks. We were fairly amazed. We imagined this part of the world was their stronghold. Rectify this immediately, Messrs. Horne and Atkinson! The cup went to splendid Gold-spangles. We fancied we saw in pen 295 (Duckworth) the Hitchen Golden-pencilled cockerel. If we are right, it is a feather in the cap of Mr. Cresswell to have sold a bird worthy of being purchased by a north-countryman, and to be in the list in such company. After this came large Sale classes for the large breeds, which were well filled with more than ordinarily good sale-class birds. Game *Bantams* were large classes and well filled; so were the Black Bantams and the Variety classes. In the latter Laced were first and second, and Pekins third.

Now for just a word of grumbling. We think the catalogues were exorbitantly dear—1*s.* each! Very bad paper, poorly printed, and no prize list printed in the columns! As one exhibitor observed, it was "the dearest bob's worth he had ever had." We ourselves have seen (*e.g.*, Market Rasen) equally good catalogues for 2*d.* each, though not, of course, so large. We furnish full awards below.

DORKINGS (Coloured, except Silver-Grey).—*Cock.*—1, D. Gellatly, Meigle. 2, M. Raines, Bridge Haugh, Stirling. 3, C. Widdas. *Hen.*—1, Mrs. T. W. L. Hind, Kendal. 2, D. Gellatly. 3, G. Fox, Harefield, Wilmslow. *hc*, J. Walker; W. H. Crabtree, Levenshulme; D. Gellatly.

DORKINGS (Silver-Grey or any other variety).—*Cock.*—Cup, J. Walker. 2, J. Cunningham, Sandbrook, Dalbeattie. 3, Hon. Mrs. Howard, Levens, Milnthorpe. *hc*, E. Williams, Heallys Berriew, Montgomery; D. Gibson, Barrhead. *Hen.*—1, D. Gibson. 2, M. Raines. 3, Hon. Mrs. Howard. *hc*, W. W. Rutthdge, Storth End, Milnthorpe. *c*, J. Cunningham.

BRAHMA POOTRAS.—*Cock.*—Cup, M. Raines. 2, H. Lacy, Hebden Bridge. 3, Lady A. B. Pierse, Bedale. *vhc*, W. H. Crabtree. *hc*, M. Raines; W. Scholefield, Birkenshaw; H. J. Bethell, Sedgwick, Milnthorpe. *Hen.*—1 and 2, W. H. Crabtree. 3, C. J. Myers, Dunningwell, Broughton-in-Furness. *hc*, A. Ainslie, Carnforth; Newnham & Manby; J. Walker.

COCHIN-CHINAS (Buff).—*Cock.*—Cup, J. Walker. 2, G. H. Proctor, Durham. 3, J. F. Clarkson, jun., Fernerhalgh, Preston. *hc*, W. Mitchell, Birkenshaw, Leeds; H. H. Jones, Larkhill, Liverpool. *Hen.*—1, G. H. Proctor. 2, J. Walker. 3, R. Hine, Bedlington. *hc*, C. J. Myers; M. Leno.

COCHIN-CHINAS (Any other variety).—*Cock.*—1, T. Stretch, Ormskirk. 2, G. H. Proctor. 3, J. Walker. *hc*, W. Whitworth, jun., Longsight; W. H. Crabtree; H. Lacy. *Hen.*—1, G. H. Proctor. 2, T. Stretch. 3, R. Hartley, Berwick Rails, Millom. *hc*, R. S. S. Woodgate, Pembury; J. J. Waller, Kendal; R. Aspden, Accrington; S. Lawson, Preston.

GAME (Black-breasted and other Reds).—*Cock.*—Cup and 2, C. W. Brierley, Middleton. 3, J. Anderson, Blairgowrie. *hc*, T. Mason, Lancaster; S. Matthew, Stowmarket. *Hen.*—Cup, S. Matthew. 2, C. W. Brierley. 3, J. F. Walton. *hc*, T. Mason; G. C. Barnett; G. Sutton. *c*, R. Garnett.

GAME (Black-breasted and other Reds).—*Cockerel.*—1, T. Mason. 2, W. Boulton, Parkhouse, Dalton-in-Furness. 3, Miss M. J. Nelson, Cockshaw, Hexham. *hc*, Newnham & Manby, Wolverhampton; D. Harley, Edinburgh. *c*, G. Sutton, Bootham, Yorkshire; C. A. Wolff, Altrincham; W. Higgin, Ulverston.

GAME (Any other variety).—*Cock.*—1, J. F. Walton, Hornclife, Rawtenstall. 2 and 3, C. W. Brierley. *hc*, Miss M. J. Nelson; —Dobell, Farnsfield; J. A. Mather; E. Aykroyd, Eccleshill, Leeds. *c*, E. Bell, Burton-on-Trent. *Hen.*—1, E. Aykroyd. 2, J. A. Mather. 3, E. Wigwood. *hc*, J. Gelderd. *c*, W. Higgin E. Brown.

SPANISH (Black).—1, H. Beldon. 2, J. Leeming. 3, W. J. Purvis. *hc*, W. Whitworth, jun.; H. Wilkinson; R. Newbitt.

HAMBURGHS (Golden-spangled).—Cup, T. Dean. 2, J. Buckley. 3, H. Pickles. *hc*, Broadhead & Booth; G. & J. Duckworth (2); H. Beldon.

HAMBURGHS (Silver-spangled).—1 and 2, H. Beldon. 3, W. Barker. *hc*, J. Robinson.

HAMBURGHS (Golden-pencilled).—1, H. Beldon. 2, T. Dickson. 3, G. & J. Duckworth. *hc*, H. Pickles; H. Beldon. *c*, R. Myers.

HAMBURGHS (Silver-pencilled).—1, R. W. Bracewell. 2, J. Robinson. 3, H. Pickles. *hc*, H. Beldon.

ANY OTHER DISTINCT VARIETY.—1, H. Beldon. 2, R. Hawkins. 3, C. H. Smith. *hc*, G. D. Harrison; R. L. Garnett; R. Gladstone, jun.; J. Stainton; H. A. Clark; H. Beldon; Miss H. Robinson; T. S. Tate.

SELLING CLASS.—*Price not to exceed* 80*s.*—1, A. W. Crosthwaite (Dorkings). 2, Furness & Sudall, Rawtenstall. 3, W. Linton (Creves). 4, R. Nesbitt. 5, W. F. Addie (Game) *vhc*, T. J. Harrison (Cochins); W. Hargreaves (Brahmas). *hc*, R. L. Garnett (Crève-Cœurs); J. G. Milner (Houdans); C. R. Kay (Black Spanish); J. & T. Weeks (Cochins); —Ellsworth (Brahmas); Miss E. Hine (Brahmas); T. H. Hine (Cochins); T. J. Harrison (Black Spanish); T. Smart (Hamburghs); J. J. Waller (Cochins); G. F. Whitehouse (Brahmas); J. Moore; R. Youill. *c*, Mrs. T. W. L. Hind; A. Whitehead (Cochins); T. Cartmell (Cochins); G. Pounder (Dorkings).

SELLING CLASS.—*Price not to exceed* 30*s.*—1, R. Nesbitt. 2, T. J. Harrison (Black Spanish). 3, W. Cartmell (Cochins). 4, H. Beldon. 5, Mrs. T. W. L.

Hind (Dorkings). *hc*, J. Walker; J. Fawcett (Rouen Ducks); W. H. A. Miller (Brahmas); J. & T. Weeks (Cochins); R. Craig (Dorkings); T. J. Harrison (Black Spanish); J. W Fawcett (Game); J. N. Stainton (Cochins); T. W. L Hind (Brahmas); J. J. Waller (Cochins); G. F. Whitehouse (Brahmas); J. Brookwell (Aylesbury Ducks); Simpson & Dodd (Cochins); Furness & Sudall. *c*, J. Leeming (Black Spanish); C. H. Wolff (Game).

Game Bantams (Black-breasted and other Reds) —*Cock.*—Cup and 2, Miss M. J. Nelson. 3, E. Walton. *vhc*, W. F. Addie. *hc*, R. Braithwaite; W. Shenton. *Hen.*—Cup and 3, T. Sharples. 2, J. R. Fletcher. *hc*, R. Braithwaite; J. R. Robinson.

Game Bantams (Any other variety).—*Cock.*—1, R. Brownlin. 2, R. J. Hartley. 3, J. Winskill. *hc*, W. Higgin. *Hen.*—1, J. R. Fletcher. 2, R. Brownlin. 3, Miss M. J. Nelson. *hc*, W. Hodgson; R Brownlin; J. Leech.

Bantams (Black).—1, H. Belden. 2, Milner & Beanland. 3, Newsham and Manby. *hc*, R. H. Ashton

Bantams (Any other variety).—1 and 2, M. Leno. 3, H. B. Smith. *hc*, J. Peacock; H. Belden.

Geese.—1, J. Walker, Spring Mount, Rochdale. 2, O. A. Young, Driffield. *hc*, T. W. Brook, Grasmere.

Turkeys.—1, J. Walker. 2, W. Wykes, Leicester. *hc*, J. Brookwell, Wigan.

Ducks (Rouen).—1 and 3, W. Evans, Prescot. 2, J. Walker. *hc*, J. A. Mather, Dumfries; B. Parkinson, Dewsbury; J. Newton, Silsden, Leeds.

Ducks (Aylesbury).—Cup and 2, J. Walker. *hc*, Mrs. Wooton, Nottingham; W. Cannery, Bishop Auckland. *c*, J. W. Breckbank, Kirksanton; W. Wallace, Anchenbrain.

Ducks (Any other variety).—1, J. Walker 2, S. Burn, Whitby. 3, M. Leno. *hc*, J. Walker; H. B. Smith, Preston (3); R. Gladstone, Broad Green, Liverpool; M. Leno.

LOCAL PRIZES.

Dorkings.—*Chickens.*—Cup, A. W. Cresthwaite. 2, H. Arnold. 3,—Rattledge. *hc*, Mrs. T. W. L. Hind; —Rutledge.

Brahma Pootras.—*Chickens.*—1, G. Cartmel. 2, J. A. Dickinson. 3, G. Bethell.

Cochin-Chinas.—*Chickens.*—1, G. Cartmel. 2, J. Hine. 3, R. Cornthwaite. *hc*, W. A. G James.

Game.—*Cockerel.*—1, M. & J. Graham. 2, J. W. Fawcett. 3, R. Laycock. *Pullet.*—1 and 3, Exors. of G. C. Wilson. 2, M. & J. Graham. *hc*, J. Gelderd; T. Cartmel.

Game (Brown-breasted).—1 and 2, Exors. of G. C. Wilson. 3, T. & J. C. Parker.

Spanish (Black).—*Chickens.*—1, T. J. Harrison. 2 and 3, C. R. Kay.

Hamburghs.—*Chickens.*—1, T. Smart. 2, W. M. Mann. 3, C. Roberts.

Bantams.—*Chickens.*—1, Mrs. J. Winskill. 2, R. Braithwaite. 3, J. Winskill. *hc*, Smith & Davis.

Ducklings.—1, R. S. Willison. 2 and 3, G. Cartmel.

PIGEONS.

Carriers.—1 and 2, J. Walker. *hc*, W. Jackson; J. Stanley; H. Yardley; J. & W. Towerson.

Pouters.—1, H. Yardley. 2, J. & W. Towerson.

Antwerps.—1, H. Yardley. 2, J. Stanley.

Tumblers.—1, H. Yardley. 2, W. Brydon. *hc*, J. C. Adams.

Owls.—1, F. Steel. 2, H. Mawdsley. *hc*, D. M. Garside; E. Crook; W. Brydon; H. Yardley; S. Lawson.

Barbs.—1, J. Stanley. 2, J. E. Kendal. *vhc*, J. C. Adams; J. Stanley; H. Yardley. *hc*, J. Furness; H. Crosby; T. Pincock; Miss F. Seanor. *c*, J. C. Adams.

Fantails.—1, J. F. Loversidge. 2, H. Yardley. *hc*, J. Walker; A. Crosbie; F. Steel; Miss F. Seanor.

Turbits.—1 and 2, R. Thompson. *hc*, W. Tedd; H. Yardley.

Trumpeters.—1 and 2, J. & W. Towerson. *hc*, F. Steel.

Jacobins.—1, J. Walker. 2, S. Lawson. *hc*, W. H. A. Miller; H. Crosby; W. Brydon (2); F. Steel.

Any other Variety.—1, J. Stanley. 2, Miss F. Seanor. *vhc*, W. Tedd; H. Yardley. *hc*, D. M. Garside; H. Crosby; J. Stanley; W. Tedd (2); Miss F. Seanor.

CATS.

Black, White, or Black-and-White.—1, J. Just. 2, T. Lancaster. *c*, S. Airey.

Any other Colour.—1, E. Baxter. 2, Mrs. Hudson. *vhc*, N. Townson. *hc*, N Hutchinson; J. Ellis; Mrs. E. Alexander; I. Scatterthwaite; —Knowles.

Foreign (Any variety).—1, B. Hayward. 2, H. W. Clift.

Judges.—Mr. Richard Teebay, Fulwood, Preston; Mr. John Douglas, The Aviaries, Clunmber.

ST. AUSTELL POULTRY SHOW.

This very successful little one-day meeting was held in the Market House on the 13th. There were close on four hundred pens, and it seemed in every way a complete success. Mr. Hodson judged the whole of the Show, and his awards were most favourably received. Turner's pens were used, and the birds were well attended to, and the pens looked fresh and clean.

There were seventeen pens of *Dorkings*, of which the greater part were Coloured. The first-prize pen were good birds, but not over-large. We liked the third-prize pen too; they were well-grown chickens. The Whites were not a grand lot. We thought the Silver-Greys, which were third, worthy of second place before the second Whites, which were small and weedy. *Cochins* were peculiarly classified; Buffs and Whites having one class together, while Partridges had one to themselves. The cup Buffs were, we believe, the cup pen at Dorchester. They are large and fair in colour, but very coarse. The second prize went to a well-shown pair of old Whites, the cock superb in colour and of fine shape; the hen wonderfully leg-feathered and pure white, but a little narrow; still they were well second. Third nice Buffs. 23A (Winwood) a good Buff cock—hocked, but honestly shown. 17 (Waterman) in good condition, but cock looked naked about his hocks. In Partridges a nice pair of Partridge chickens were first, fair old birds being second and third. *Brahmas* made up eighteen entries only with two classes. We cannot conceive why these classes have so fallen off the last few weeks. Darks came first, and here we think was one of the few mistakes Mr. Hodson made. The second pen should have been undoubtedly first. In this pen we believe was the cock first Plymouth, with a nice hen. The other pens were fair. The Lights, though few in quantity, were good in quality; the first being an especially nice pair. *French* consisted of Crêves and Houdans. The winning Hondans were good, the second and third large Crêves. *Game* had three classes, and mustered well. The quality at Cornish shows is generally good. The cup went to good Brown Reds. As in Cochins Buffs always win, or generally, the cup; so in Game, the plate usually seems to go to Brown Reds. The Duckwings were good; first uncommonly so. *Spanish* brought a good class. We believe the first went to a pen which was unnoticed at Dorchester; it was a good hen with a fine cockerel. Second also good, and ditto third; both the latter hailing from Bristol. Altogether it was a capital class. *Polands* were fair. White-crested Blacks of good quality got in second between two nice pens of Silvers. *Hamburghs* had four classes. We really believe if our shows gave the Blacks a class, they would find they soon filled best of all, or certainly next to the Golden-pencilled. Golden-spangles were good, but the Hamburgh cup fell to besutiful Silver-spangles; still Mr. Barter's second-prize pen were admirable, and the third good also. Gold-pencilled were a nice lot, and came out strong. The first (Silvers) were beautiful; the cock's tail quite lovely and in nice condition. *Malays* and Indian *Game* came next. We do not profess to say what the latter are, for we never remember to have seen a pen of the "genuine article." First and third went to Malays; the latter we liked the best in the class by far, and the second to our would-be Indian friends. They looked somehow manufactured. Several other good pens of Malays were noticed. 174 (Elliott) we thought a capital pen. The Variety class was large and good. Nice Black Hamburghs won first, Minorcas second, and good Sultans third. 199A (Nicholls), a good pair of Silkies. Game *Bantams* made a large class, and the winners were well placed. In the next class the cup went to nice Silver-laced; second good Black Rose-combs; and third again to Laced. In Single cock class of any breed a good White Cochin cockerel won first; he reminded us of the bird which won second at the Palace very much indeed. Second and third went to Brown Reds; the third perhaps a shade the best. There were four large Sale classes, two being for the larger breeds and two for the smaller. There were some fair birds, but nothing out of the way good. Rouen *Ducks* were good, the winning pen good in colour and large; the second also nice birds. Aylesburys were few but good in quality; and *Geese* and *Turkeys* quite fair specimens for a local show.

There were not many Pigeons. *Carriers* were as good a class as any. *Antwerps* came out strong, and there were many nice birds among them. *Dragoons* only fair. *Fantails* and *Tumblers* good; and a capital Variety class finished this division, in which good Trumpeters were first and fair Owls second. We give awards below.

Dorkings.—*Coloured.*—1, J. H. Nicholls. 2, Major Carlyon. 3, B. C. D. Greenhill. *c*, M. Bawden. *Any other variety.*—1, J. H. Nicholls. 2, H. Matthews. 3, R. Wilkinson.

Cochins.—*Buff and White.*—1 and Cup, S. R. Harris. 2, R. S. S. Woodgate. 3, B. C. D. Greenhill. *hc*, E. Winwood. *c*, Miss O. M. G. Tremayne; H. Feast. *Partridge.*—1, W. H. Burt. 2, G. Liss. 3, G. Best.

Brahmas.—*Dark.*—1 and 3, G. W. Joyce. 2, T. H. Waterman. *hc*, F. J. Saunders. *c*, W. P. Rogers. *Light.*—1, J. H. Nicholls. 2, J. C. Baker. 3, E. Scammell. *hc*, H. Feast. *c*, J. R. Marriott; J. Nicholls.

French.—*c*, W. H. Copplestone. 2, H. Feast. 3, W. Browne.

Game.—*Black Reds.*—1, G. Goldsworthy. 2, W. H. Cardell. 3, F. Glanville. *c*, H. Feast; T. H. Lukes. *Brown Reds.*—1, Cup, and 2, W. T. Lovering. 3, F. Glanville. *hc*, H. E. Martin. *Any other variety.*—1 and 2, E. Martin. 3, E. Winwood. *hc*, R. Wilkinson; H. E. Martin; J. Phillips; E. C. Pope.

Spanish.—1, S. Burn. 2, Miss E. Browne. 3, Mrs. Tonkin. *vhc*, E. Winwood. *hc*, J. Bassett. *c*, S. R. Harris.

Polands.—1, T. Lecher. 2, G. Liss. 3, J. H. Nicholls. *hc*, Miss F. Solomon. *c*, T. Lecher; H. Feast.

Hamburghs.—*Gold-spangled.*—1, J. Carr. 2, N. Barter. 3, W. Webster. *Silver-spangled.*—1 and Cup, S. R. Harris. 2 and *vhc*, N. Barter. 3, Miss E. Browne. *hc*, J. Carr.

Hamburghs.—*Gold-pencilled.*—1, J. Carr. 2, G. Packham. 3, S. R. Harris. *hc*, P. Hanson. *Silver-pencilled.*—1, H. Feast. 2, *hc*, and *c*, N. Barter. 3, H. Stuttard.

Malay and Indian Game.—1, J. Bone. 2, S. R Harris. 3, J. Hinton. *vhc*, J. Blamey, jun. *hc*, Mrs. J. Partridge. *c*, S. Elliott, jun.; J. C. Baker.

Any other Variety.—1, S. Burn (Black Hamburghs). 2, J. R. W. Williams (Minorcas). 3, J. Nicholls (White Sultans). *hc*, H. J. Lonnon; T. Southerden; —Pearse; J. Nicholls. *c*, W. H. Tippett; J. H. Nicholls.

Bantams.—*Game.*—1 and 3, J. Mayo. 2, Hern & Hockaday. *hc*, J. Honey. *c*, Allen & Osborne; H. Feast; J. H. Nicholls. *Any other variety.*—1 and Cup, N. Barter. 2, J. H. Nicholls. 3, C. H. Poole. *hc*, S. Elliott, jun.; C. H. Poole; H. J. James; J. Pearson; J. Honey; Miss B. Stocker; E. G. Stocker. *c*, J. Honey; G. Holloway; J. Mayo.

Any Variety.—*Cock.*—1, S. R. Harris (White Cochin). 2, W. T. Lovering (Black Red Game). 3, J. Cock. *hc*, J. Bassett; Mrs. J. Partridge; G. Julian. *c*, J. H. Nicholls; W. P. Rogers.

Selling Class.—*Dorkings, Cochins, Brahmas, and French.*—*Cock.*—1, J. H. Nicholls (Cochin). 2, M. Bawden (Brahma). 3, W. H. Cardell (Partridge Cochin). *Hens.*—1, J. H. Nicholls (Cochins). 2, Major Carlyon (Dorkings). 3, J. H. R. Eddes.

Selling Class.—*Any other variety.*—*Cock.*—1, W. T. Lovering (Black Red Game). 2, G. Liss (Polands). 3, N. Barter (Hamburgh). *Hens.*—1, Mrs. J. Partridge (Indian Game). 2, Coon Bros. (Black Red Game). 3, F. E. Stocker (Minorcas).

Ducks.—*Rouen.*—1, H. Cardell. 2, W H Copplestone. 3, J. H. Hoit. *c*, W. Stephens; Hon. Mrs. Tremayne; J. H. Hoit. *Aylesbury.*—1 and 2, S. R. Harris. 3, W. S. Crart. *hc*, W. J. Reynolds

Geese.—1, Mrs. J. Partridge. 2, T. Yelland *hc*, R Nicholls. *c*, C. G. Pedlar.

Turkeys.—1, R. A. Roberts. 2, C. G Pedlar. *hc*, F. C. Ford; H. Hodge.

PIGEONS.

Carriers.—1, *hc*, and *c*, E. Burton. 2, F. Hayman. *vhc*, H. Yardley.

Pouters.—1, J Broad. 2, H. Yardley.

Barbs.—1, J. D. Mole. 2 and *c*, E. Burton. *hc*, H. Yardley.

Dragoons.—1 and 2, R. Woods. *hc*, E. Burton; G. Packham; J. Bacn. *c*, H. Yardley; J. A. Paynter.

Fantails.—1 and *c*, J. F. Loverside. 2, H. Yardley *hc*, G. H. Gregory.

Antwerps.—1, G. Colson. 2, H. Yardley. *hc*, F. G. Voysey; J. Baen. , F. S. Hockaday; M. Bawden.

Tumblers.—1, J. Broad. 2, G. Holloway, jun. *vhc*, H. Yardley.
Any other Variety.—1, J. Broad (Trumpeters). 2, G. Holloway (Owls). *hc*, G. H. Gregory; J. H. Nicholls. *c*, H. Yardley; J. C. Baker (2).
Selling Class.—1, E. Tremaine (Archangels). 2, J. D. Mole (Silver Owls).

[The report was accidentally delayed.—Eds.]

OWL PIGEONS.

Most emphatically, but with the good nature of a brother fancier, I protest against the remarks upon English Owls of "Bubo" in your ever-welcome paper. Keeping, as I do, both English and foreign, I cannot be said to be prejudiced in favour of either; but while admitting the beauty of the tiny foreiguer, there is to my mind no variety more handsome than a first-class really pure English Owl. I am aware some breeders have crossed the two varieties, but I think there is now an end of that mistake. There are of course two standards for Owls, as much so as for the grand Pouter and the graceful pigmy, or the aristocratic Game and its tiny image.

Is not your correspondent behind the times instead of progressing when he advocates only one class for Owls in place of two? For my part I am looking forward with great hope to the time when we shall have a class for each sex, and perhaps for each colour.

Just one hint to Mr. B. Improve one or all the varieties as much as you can; but don't throw cold water on anyone's hobby, and especially on that of—T. G. S., *St. John's Wood*.

CRYSTAL PALACE BIRD SHOW.

The twelfth annual Exhibition of Cage Birds was opened to the public at midday on the 13th inst. In the eighty-one classes for competition there were no less than 1494 entries. A somewhat new feature in connection with the Show was the class for show cages, in which thirty cages were entered. Several cleverly constructed cages were sent for competition, but they were far too complicated in character to meet the views of the Judges so far as being thoroughly adapted for show cages. Several were too gaudy and ill adapted for packing, and others were so constructed that, had they been adopted, they would have entailed too much trouble to secretaries and those immediately connected in packing and unpacking, and otherwise successfully carrying out bird shows. The first prize, a silver medal, was awarded to Mr. T. Alwin of Deptford for a cleverly made cage of moderate size, fit for a show-room either during daylight or gaslight, and of a suitable shape for packing. The second prize of 10*s.* was given to a light-made simply-constructed cage entered by Mr. W. Evans, Manchester; and the third prize to a cage entered by the Rev. V. Ward, Hythe, Kent. The principle upon which the latter cage was constructed was tolerably good, but it was somewhat insignificant in size, and had a slight fault of being rather too deep from front to back. An extra prize of £1 was won by Messrs. G. & J. Mackley, Norwich, for birds gaining the greatest number of points in classes 1 to 6. A silver cup was offered for competition in the Mule classes 30 to 33, which was awarded to Mr. J. Doel of Plymouth.

Mr. F. W. Wilson of the Natural History department and his staff are deserving of praise for their exertions. It must be very gratifyiog to Mr. Wilson to find the entries have increased three hundred over the preceding Cage Bird Show.

We shall continne our report next week. The following are the awards:—

Norwich (Clear Yellow).—1, R Whitaker, Darley Abbey. 2, G. & J. Mackley, Norwich. Extra 2, J. Calvert, Bootham 3, J. Athersuch & Son, Coventry. Extra 3, P. Flexney. *vhc*, S. Tomes; G. & J. Mackley; J. Athersuch & Son (3) *hc*, J. Doel; S. Tomes (3); T. Smith; Moore & Wynne; P. Flexney (2); W. O. Hayes; T. Fenn (2). *c*, G. H. Goulter; R. J. Pope; G. & J. Mackley (2); P. Flexney; J. Price; A Colman; J. Drake.

Norwich (Clear Buff).—1, J. Athersuch & Son. 2, G. & J. Mackley. 3, J. Caplin, Canterbury. Extra 3, — Radmore, Plymouth; J. T. Galey, Clapham. *vhc*, Rev. G. Herbert, Alcester; J. Clarke; Moore & Wynne (2); J. Athersuch and Son; A. Coleman; W. Walter, Winchester (2); G. Y. Collinson. *hc*, J. Doel (2); S. Tomes; T. Smith (2); G. & J. Mackley; P. Flexney; J. Athersuch and Soo; W. Evans; G. Y. Collinson. *c*, G. H. Goulter; J. Price; G. Y. Collinson.

Norwich (Marked or Variegated Yellow).—1 and *vhc*, J. Adams. 2, Orme and Ashley, Derby. 3, G. & J. Mackley. Extra 3, J. Athersuch & Son. *hc*, G. and J. Mackley; W. Bichards; W. & C. Burniston.

Norwich (Marked or Variegated Buff).—1, G. & J. Mackley. 2, Orme and Ashley. Equal 2, J. Athersuch & Son. 3, J. Caplin. Equal 3, S. Tomes. *vhc*, Moore & Wynne; G. & J Mackley; A. Colman (2); Orme & Ashley. *hc*, B. Whitaker (2); J. Adams; W. Richards; W. Walter. *c*, J. T. Galey; G. and J. Mackley.

Norwich (Ticked or Unevenly-marked Yellow).—1, J. Dennis, Croydon. 2, Rev. G. Herbert. 3, P. Flexney. Extra 3, G. & J. Mackley. *vhc*, P. Flexney; T. Newmarch. *hc*, J. Adams; A. Colman. *c*, J. T. Galey; A. Colman.

Norwich (Ticked or Unevenly-marked Buff).—1, J. Price, Pimlico. 2, J. Adams. 3, G. Y. Collinson, Norwich. *vhc*, J. Doel; J. Clark; W. Walter. *hc*, C. Arscott; G. & J. Mackley; J. Drake; G. Y. Collinson. *c*, W. R. Hovell.

Norwich (Clear and Ticked, high colour).—1, 2, and Extra 2, J. Adams. 3, W. Walter. Extra 3, J. Athersuch & Son. *vhc*, J. Doel; J. Adams (5); R. J. Pope; J. Athersuch & Soo (3); Orme & Ashley. *hc*, W. Havers; J. Adams (2); J. Athersuch & Son (2); G. Y. Collinson. *c*, S. Tomes; J. Caplin; W. Havers; Moore & Wynne; G. & J. Mackley (3); Atherauch & Son (3); G. Y. Collinson (3).

Norwich (Marked or Variegated, high colour).—1, G. & J. Mackley. 2 and *vhc*, J. Adams. 3 J. Athersuch & Son.

Norwich (Evenly-marked Crested Yellow).—1, — Radmore. 2, F. Woodward, Derby. 3, J. Tarr, Thornhill Place, London. *vhc*, G. & J. Mackley.

Norwich (Evenly-marked Crested Buff).—1, F. Woodward. 2, W. B. Hovell, Norwich. Extra 2, G. & J. Mackley. 3, J. & W. Waller, Finsbury. Extra 3, Moore & Wynne. *vhc*, G. & J. Mackley (3); Martin & Griffin. *hc*, R. B. Newsom; G. Cox. *c*, Mrs. H. T. Lewis; J. & W. Waller; G. Wones; Moore and Wynne; G. & J. Mackley (2); A. Colman (2); G. Cox.

Norwich (Ticked or Unevenly-marked Crested Yellow).—1, G. & J. Mackley. 2, Rev H. Caiger, Pimlico. 3, R. J. Pope, Brighton. *vhc*, F. Woodward; J. Adams; W. B. Hovell. *hc*, G. Cox.

Norwich (Ticked or Unevenly-marked Crested Buff).—1, G. & J. Mackley. 2, G. Y. Collioson. Extra 2, R. Hawman, Middlesborough. 3, A. Colman. Extra 3, F. Woodward. *vhc*, G. & J. Mackley (2); G. Y. Collinson; G. H. Goulter. *hc*, J Caplin; Rev. H. Caiger; J. Tarr; A. Colman; W. Corden; J. Goode; G. Y. Collinson. *c*, J. Tarr.

Norwich (Clear, Grey, or Dark Crest, irrespective of colour).—1, G. & J. Mackley. 2, J. Clark, Derby. Extra 2, Martin & Griffin, Northampton. 3, W. B. Hovell. *vhc*, W. Havers; Moore & Wynne; G. & J. Mackley (3); W. B. Hovell. *hc*, F. Woodward; S. Tomes; J. Tarr; Mrs. F. Nicholson; G. & J. Mackley; A. Colman (2). *c*, S. Tomes; S. Moffatt; Brown & Gayton (2); J. Tarr; Mrs. F. Nicholson; G. & J. Mackley (2); G. Cox; Martin & Griffin; W. Corden; J. Goode.

Belgian (Clear and Ticked Yellow).—1, S. Tomlin, Wainfleet. 2 and 3, J. Doel, Stonehouse. Extra 3, T. M. Reid, Halifax. *vhc*, Rev. H. F. Hamilton; J. Rutter (3). *c*, T. M. Reid; J. Rutter.

Belgian (Clear and Ticked Buff).—1, 3, and Extra 3, J. Doel. 2, Rev. H. F. Hamilton, St. Nicholas Vicarage, Chard *vhc*, Rev. H. F. Hamilton; T. M. Reid; J. Rutter. *hc*, V. Sandford; J. Rutter (2). *c*, H. Davies; V. Sandford.

Belgian (Variegated, irrespective of colour).—1, 2, 3, and *vhc*, J Rutter.

London Fancy (Jonque).—1, J. & W. Waller. 2, W. Brodrick, Chadleigh. 3, J. Price. *vhc*, T. Mann; J. & W. Waller. *hc*, J. Price; J. McMillin.

London Fancy (Mealy).—1 and 2, J. & W. Waller. 3, T. Mann, Langton Road, London. S.E. *vhc*, J. Price (2). *hc*, C. Willmott.

Lizard (Golden spangled).—1 and Equal 2, T. W. W. Fairbrass, Canterbury. 2, Clemmson & Ellerton, Darlington. 3, S. Bunting. *vhc*, T. W. W. Fairbrass; S Bunting; G. Tuckwood. *hc*, R. B. Newsom; Cleminson & Ellerton. *c*, Mrs. J. Chinery; Rev. V. Ward.

Lizard (Silver-spangled).—1, T. M. Reid. 2, 3, and *vhc*, T. W. W. Fairbrass. *c*, R. B. Newsom; G. Tuckwood; B. Harrison.

Lizards with Broken Caps (Gold-spangled).—1, 2, Extra 3, *vhc*, and *hc*, T. W. W. Fairbrass. Extra 2, S. Bunting. 3, Clemmson & Ellerton. *c*, C. Hibbs; G. Tackwood.

Lizards with Broken Caps (Silver-spangled).—1, 3, and *vhc*, T. W. W. Fairbrass. 2, G & J. Mackley. *hc*, C. Hibbs; G. Tuckwood; Rev. V. Ward.

Yorkshire (Clear, Marked, or Variegated, irrespective of colour).—1, 2, and Extra 3, L Belk. 3, S. Tomlin. *vhc*, G. & J. Mackley; J. Wilkinson. *hc* and *c*, R. B. Newsom.

Cinnamon (Jonque, high colour).—1, 2, and 3, J. Adams. *vhc*, C. Torond; J. R Navlar (2). *hc*, J. & W. Waller (6). *c*, J & W Waller (2); W. Corden.

Cinnamon (Buff, high colour).—1 and 2, J. Adams. 3, G. & J. Mackley. Extra 3, C. Torond. *vhc*, C. Torond; J. & W. Waller (2). *hc* and *c*, J. & W. Waller.

Cinnamon (Jonque).—1, J. Caplin. 2, R. Poole. 3, J. Bexson. *vhc*, S. Tomes; Moore & Wynne; Cleminson & Ellerton; J. & W. Waller (2); J. Bexson. *hc*, J. R. Naylar. *c*, Moore & Wynne; G. & J. Mackley; A. Dixon.

Cinnamon (Buff).—1, J. Adams. 2, Moore & Wynne. 3, J. Bexson. *vhc* Moore & Wynne; J. Adams; G. & J. Mackley. *hc*, J. R. Naylar; J. & W. Waller; J. Bexson. *c*, W. W. Johnson; N. Walker (2); J. & W. Waller (3) R. J. Pope; Martin & Griffin.

Cinnamon (Marked or Variegated, irrespective of colour).—1, L. Belk. 2, J. Wilkinson. 3, S. Tomes. *vhc*, G. & J. Mackley. *hc*, W. & C. Burniston.

Any other Variety of Canary.—1, G. & J. Mackley (Yellow Lancashire Coppy). 2, T. Curtis (Lancashire Coppy). 3, S. Tomes (Marked). *vhc*, W. Selkirk (Scottish Don) (2); G. & J. Mackley (Yellow Lancashire Plainhead); J. Stevens (Lancashire Coppy). *hc*, Misses E. & J. Baxter (Scotch Fancy).

Goldfinch Mule (Evenly-marked Yellow).—1, 2, and *hc*, J. Doel. 3, R. Hawman. *vhc*, Major C. H. Fisher; G. & J. Mackley; J. Wilkinson.

Goldfinch Mule (Evenly-marked Buff).—1, 2, and Extra 3, J. Doel. Extra 2, S Bunting. 3, J. Stevens. *vhc*, R. Poole. *hc*, R. Poole; Hampton and Chamberlain. *c*, G. Butts.

Goldfinch Mule (Any other class of Yellow).—1 and 2, J. Doel. 3, J. Caplin Extra 3, S. Tomlin (2). *vhc*, J. Goode *hc*, J. Doel; J. Bexson.

Goldfinch Mule (Any other class of Buff).—1, 3, and Extra 3, J. Doel. 2, Misses E. & J. Baxter. Equal 2, A. Boatwright. *vhc*, Major C. H. Fisher; G. and J. Mackley *hc*, J. Mount.

Goldfinch Mule (Dark Jonque).—1, R. Hawman. 2, Moore & Wynne. Extra 2, G & J. Mackley. 3, Hampton & Chamberlain. *vhc*, W. Selkirk; J. Athersuch & Son; J. Goode; J. Bexson; Moore & Wynne. *hc*, J. Bexson; R. Hawman. *c*, M Flynn; W. & C. Burniston.

Goldfinch Mule (Dark Mealy).—1, G. Cox. 2, S. Bunting. 3, Moore and Wynne. *vhc*, G. F. Hedley; G. Cox. *hc*, Brown & Gayton; J. Reeks. *c*, T. Muldoon; J Reeks.

Linnet Mule.—1 and 2, J. Spence. 3, J. Stevens. *vhc*, H. Thompson, jun.; G. Cox *hc*, G. & J. Mackley; F. Stiston; S. Cook. *c*, S. Newing.

Any other Variety of Canary Mule.—1, R. Hawman. 2, T. Alwin. 3, Misses E. & J. Baxter. *vhc*, P. E. Pearce. *hc*, G. & J. Mackley; E. Gilbert.

Six Norwich Canaries in One Cage (Irrespective of colour).—1, Mrs. M. Judd. 2, 3, and Extra 3, G. & J. Mackley. *vhc*, W. Walter; J. Bexson.

Six Lizards in One Cage (Irrespective of colour).—1, T. W. W. Fairbrass. 2, S. Bunting. 3, Cleminson & Ellerton.

Six Goldfinch Mules in One Cage.—1, J. Doel.

Finch Mules (Any other variety).—1, J. Brown, jun. 2, J. Doel. 3, E. Sandell. Extra 3, J. Reeks. *vhc*, J. Calvert; Misses E. & J. Baxter. *hc*, E. Sandell. *c*, Mrs. M. Priseman (2); J. Goode; E. Sandell (2).

Bullfinch.—1, Major Edwards. 2, J. Drake. *hc*, J. Goode; T. Newmarch. *c*, G. Cox; E. Gilbert; Cleminson & Ellerton; Fellingham & Wiogfield.

Goldfinch.—1, J. Doel. 2, R. Hawman. *hc*, R. J. Troake; T. Willsher; J. Drake; G. T. Harrison; S. Bunting. *c*, G. Cox; T. W. W. Fairbrass; E. H. Sweeting (2); J. Irons.

Chaffinch.—1, T. Alwin, Deptford. 2, Fellingham & Wingfield. *hc*, Miss N. Mohr. *c*, W. R. Alwin; Misses E. & J. Baxter.

Linnet.—1, R. R. Cannon. 2, Clemmson & Ellerton. *hc*, Misses E. & J. Baxter. *c*, S. Bonting; J. Stephens; Mrs. Furneaux.

Redpole or Siskin.—1, T. Newmarch. 2, G. & J. Mackley. *hc*, Fellingham and Wingfield. *c*, W. & C. Burniston.

Skylark —1, Mrs M. Judd. 2, N. Walker. *vhc*, T. Willsher; W. Walter; T. Newmarch. *c*, J. Drake; J. S. Benton; Fellingham & Wiogfield.

Robin.—1, G. Cox. 2, Miss N. Mohr. *hc*, Major Edwards; H. B. Tilney.

Blackbird.—1, R. J. Troake. 2, G. & J. Mackley. *hc*, W. R. Alwin. *c*, J. Battershill.

Song Thrush.—1, T. Newbold. 2, A. W. Sweeting. *hc*, R. J. Troake; A. Colman; Madams Gallo; C. J. Watson. *c*, F. Glazier.

Starling.—1 and 2, Miss E. Hawkins. *hc*, G. Cox.

Jackdaw.—1, Dr. E. Waller. 2, E. Todd.

British Birds (Any other variety).—1, W. H. Allcorn. Equal 1, Miss N. Mohr (2); J. Young. 2, T. Willsher. *hc*, Rev G. Herbert.

Blackcap.—1 and 2, C. Varetti. *hc*, O. A. Watts. *c*, Miss N. Mohr.

Nightingale.—1, O. A. Watts. 2, — Lilley. *hc* and *c*, H. B. Tilney.

Any other Variety.—1, H. B. Tilney (Yellow Wagtail). 2, N. Walker (Titlark). Equal 2, O. A. Watts (Lesser Whitethroat).

FOREIGN BIRDS.

Widah Birds.—Prize, E. H. Sweeting.

Cardinal (Redheaded).—Prize, Mrs. A. Sambrook. *vhc*, J. Drake; E. Hawkins. *hc*, T. Daniels.

Nightingale (Virginian).—Prize, W. Walter. *vhc*, G. Billet. *hc*, E. Hawkins. *c*, T. Newmarch.

Waxbills (Any variety).—Prize and *vhc*, T. Newmarch. *hc*, E. Hawkins. *c*, Mrs. M. Judd.

Sparrows (Java).—Prize, W. Walter. *hc*, E. H. Sweeting (2). *c*, Mrs. Furneaux.
Sparrows (Diamond).—Prize, Mrs. A. Sambrook.
Doves (Barbary or Ring).—Prize, T. Newmarch. *hc*, W. Travis; W. C. Clark; J. Loutchford; — Kingston. *c*, W. Travis.
Love Birds.—Prize, Mrs. M Judd *hc*, T. Newmarch.
Parakeets (Australian Grass)—Prize, Mrs. H. Beattie. *hc*, T. Newmarch; J. Drake. *c*, E. Hawkins; T. Newmarch.
Cockatiels.—Prize, Mrs. W. C. Drummond. *hc*, W. Walter. *c*, J. Groom.
Small Parrots or Parakeets (Any other variety),—Prize, Mrs. W. Mostyn. *vhc*, Mrs. W. C. Drummond. *hc*, J. Yallop.
Parakeets (Australian or Broad-tail)—Prize, T. Newmarch.
Parakeets (Ring-necked or Indian).—Prize, J. Drake. *vhc*, C. Torond. *hc*, H. Cross; F. Saunders. *c*, W. T. Fitcomb; W. Walter; S. Cook.
King Parrots.—*vhc*, S. Bunting. *hc*, J. Drake. *c*, Mrs. W. C. Drummond.
Parrots (Green or any other variety of large, except Grey) —1, S. J. Wade. 2, Mrs. Scott.
Parrots (Grey).—1, Mrs. Segrave. 2, Mrs. W. Huskinson. *hc*, F. H. Cudd. *c*, Hon. and Rev. F. Dutton.
Cockatoo (Any other variety).—Prize, T. Newmarch. *hc*, A. Vicars.
Cockatoo (Leadbeater or Rose-breasted).—1, W. Walter. 2 and *hc*, J. Battershill.
Cockatoo (Lemon or Orange-crested) —1, M. George. 2, Mrs. W. H. Wyeth.
Foreign Birds (Any other variety).—1 and Extra 1, E. Hawkins. 2, J. Drake. Extra 2, Mrs. E. Cross; C. W. Gedney; E. Hawkins. *hc*, Mrs. M. Judd; J. Drake; W. Walter; Madame Gallo; Miss W. Pope; E. Hawkins. *c*, J. Drake; W. Walter (2); Madame Gallo; J. Groom; T. Newmarch (3).
Extra Prize to the winner of the most points in the first six classes.—G. & J. Mackley.
Silver Cup for the greatest number of points in classes 30, 31, 32, and 33.—J. Doel.

Judges.—*Canaries:* Mr. G. J. Barneshy, Mr. A. Willmore, Mr. R. L. Wallace. *British and Foreign Birds:* Mr. Harrison Weir, Mr. J. Jenner Weir, assisted by Mr. F. W. Wilson.

PURE WATER.

"Water that is fresh and pure
Gives to life what will ensure
Health, growth, productiveness!"

The importance of a plentiful supply of pure water for live stock cannot be over-estimated. To quench thirst is not the ultimate end or only purpose of water. The desire that is created for drink is occasioned by a feeling termed thirst, similar to a desire for food through a sensation of hunger. These are but the demands of the inner being, the act of satisfying such but a physical exertion, while the article drank enters into the composition of blood, bone, and flesh, maintains a greater per-centage than other component parts, and is one of the essentials of life.

In a pure state, water (as it is indispensable) sustains existence; while, if impure, it, like a poison, affects the entire system, occasioning many diseases that are attributed to other causes through the attachment of so little importance to the vital necessity of using the pure aqueous fluid.

Pure water may be considered just as essential to life and growth as is pure air, and upon the advantages of a free circulation of air medical authorities have written volumes, attributing so much to it as to believe its condition sufficient to make a person sick, cause death, alter body and mind; while with water the influence must be decidedly greater.

The tendency of water to absorb noxious effluvia is one great reason why it becomes unfit for drinking purposes after standing close to such impurities; and there is no greater source of unhealthfulness than where there is allowed to accumulate decayed vegetable matter or animal excrement, particularly with that of the feathered creation.

All gaseous contagious matter are substances in a state of decomposition, and water in the presence of such gases being an absorbent, soon becomes turbid, or, so to speak, putrefies by the process of decomposition, which is completed in the water. It so remains unchanged, unless subject to the filtering process it undergoes in the earth, when vegetation, having a stronger affinity for such gases, extracts them from the water, and it again becomes pure and fit for drinking purposes.

Furthermore, the vitality and productive qualities of live stock are increased or diminished through the effects (resulting from the nature) of the article which becomes the means of their productiveness; in an egg, for example, the white contains 53, the yolk 79 per cent. of water, and it reasonably follows that the quality of the egg is dependant upon the nature of its largest constituent part.

Small bodies of water when left exposed to the sun's rays lose their freshness and satisfying qualities; and with fowls there is either too much drank, causing intestinal diseases, or too little to enable a sufficient moistening of their food to ensure a proper digestion, either of which retards the functions of the organs, and interferes with the health and profit of the stock.

Vessels used in watering stock should receive a proper cleansing before being used a second time; if not, any impurities that may remain in the previous surplus supply, or that may adhere to the sides of the vessel, will taint the fresh water, and in time cause a smell that will be objectionable.

Rain water should not be permitted to accumulate so as to be accessible for drinking purposes for stock, as it contains the impurities of the atmosphere, which being very acceptable and beneficial to plant life, are just the contrary to animal existence.

It is the belief of the writer that many of the diseases incident to poultry are due to neglect in providing them with pure water; particularly do I believe such to be the case in the majority of instances where chicken cholera prevails. One writer has attempted to account for the contagious nature of this and other fatal distempers by saying that unhealthy fowls will impart to the water from which they drink their particular disorders, and that other fowls that may drink afterwards become similarly affected; but this is not accounting for the first cause or origin of such fatalities, and hardly seems possible; but the infection of such diseases could reasonably be imputed to the vitiated state of the water consumed.

The omission to furnish fowls with suitable drinking water is one of the worst features of cruelty to animals. It is a neglect that is decidedly adverse to success, hence tends to diminish individual fancy for fowls, and works detriment to poultry interests. Those whom we occasionally hear say that "there is no profit in poultry" are not qualified to have the management of the same, and in their attentions may be classed with the thriftless and neglectful parties who keep fowls that get drink when it rains.

Let every owner of live stock, among other attentions, see that such are supplied with a sufficient amount of pure water, and they will not have occasion to regret that the said stock are not as profitable and thrifty as they might be.—(*American Fanciers' Journal.*)

LIGURIAN BEES.

For two or three years I have been under the impression that all thoughts as to the superiority of Ligurian bees over the common sort have been fast dying out. I have never believed they possess any superior powers or qualities, and therefore have been rather pleased to think that all earnest apiarians would soon settle down with the conviction that the common English bees are in no sense inferior to any other sort yet discovered, and that the apiarians would commence to give them ample scope for the development of their breeding powers and industry, and store room enough for honey, instead of seeking novelties; for if profit or honey be the aim of bee-keepers, they will find in the end that the pursuit of novelties is very unsatisfactory and costly. For many years I have been waiting and looking out for evidence of the superiority of Ligurian bees. I have seen almost all that has been published in this country in their favour, and much that has been written and spoken in America, but never have I seen anything that proves they are better in any sense than the common English bees. Almost all that has been written and published in their favour has come from breeders and importers of Ligurian bees. For many years we have had some opportunities of seeing Ligurians at work and examining their hives, and never once have they furnished us with evidence of any superiority at all; and so far as I have read the discussions on the relative merits of Ligurian and common bees in the annual conventions of American bee-keepers, the weight of disinterested evidence was certainly not in favour of Ligurians. Some years ago I cut a letter touching this question from the *New York Tribune*, and sent it to the late Mr. Woodbury. The writer had tried Ligurians for some years, and so far as honey-gathering went the trial was a comparative failure. He said they were good breeders but poor honey-gatherers.

Last year I heard of a lady in the north of Scotland who gives prizes every autumn for the heaviest swarms, and that Ligurians had carried off the laurels for one or two seasons. From inquiries I have made the report seems to be correct. We have also the fact before us, already recorded in the *Journal of Horticulture*, that Mr. George Campbell had last year a gross weight of 373 lbs. from a stock hive of Ligurians and its swarms. Mr. Campbell is a very intelligent and able apiarian, and the season in Aberdeenshire, where he lives, was very favourable for honey-gathering; he has in two or three private letters to me expressed his opinion that the Ligurians are better than the common sort of bees. He says that the Ligurians fill larger hives, and fancies that the breeding powers of the English bees can be improved by crossing or culture. Two swarms of common bees in the same country went together last year, and gathered about 40 lbs. more than Mr. Campbell's first swarm, which was 126 lbs., the united swarm gathering about or above 160 lbs. In the heavy swarm there does not appear any deficiency of the breeding powers of the queen, and we well know that hives a little larger than Mr. Campbell's have been filled elsewhere by simple swarms of common bees. Still, he has the fact of 373 lbs. gross weight before us, and I can remember but one instance of common bees doing better than, or even as well as this.

Is there no way of testing by a public trial or competition which sort of bees is the best? Is it not possible to have a Derby day in the apiarian world without a manifestation of temper and ill-feeling? I think it can be done. Surely no right-minded apiarian would object to a fair and honourable contest between English and Ligurian bees. Though my old

servants are prodigious favourites, I shall not be hurt at all by knowing that other people have better servants, possessing greater powers of locomotion, of work, and of endurance. The person who shall give me satisfactory evidence of this will be looked on as my friend and benefactor. It is not bald statements we want, but the evidence of facts. The intelligence of England will do homage to such evidence.

May I venture to ask the apiarians of Great Britain to help in promoting a fair trial of strength this year, according to a programme which may be suggested by some one and fully considered by the public? Many would be much pleased if the Bee-keeper's Association would take up this matter heartily. I was much pleased to read a letter from the Hon. and Rev. Mr. Bligh (I think he is the Chairman of that Association), suggesting the offering of large prizes for the greatest quantities or weight of honeycomb obtained from any kind of hives or system of management. I am of opinion that the acting Committee will command the general respect and confidence of bee-keepers if they move in that direction, and endeavour to reward and publicly notice the greatest, most exemplary, and encouraging successes in bee-keeping; and thus the best kinds of hives and the best systems of management will come to the front, and be known throughout the land. Prizes, I think, should be offered for the heaviest hives and the heaviest swarms (hives filled by swarms), managed under any system; as well as for the greatest produce of honeycomb from one stock. In some parts of Great Britain there is a great demand for run honey, and very little for honeycomb. The bee-keepers there, like Mr. Campbell, enlarge their hives by eking instead of supering. If a great prize could be raised and offered for the greatest results, not excluding a mother hive and its swarms, exhibited in their entirety, a great step would be taken to enlighten the country as to what bees really can do under favourable circumstances and good management. The expenses of carriage in this last case would be very great if the competitors lived at a distance, and therefore large prizes only would tempt them to compete. I believe with the Hon. and Rev. Mr. Bligh, that a few grand prizes offered for the products of able and comprehensive management would be more attractive and create a greater interest in the exhibition than swarms of supers, which he terms "fancy goods," the prizes for which may be carried off by mere novices in bee-keeping. Acting on broad and open principles the Committee will be amply supported and encouraged.

I have to say in conclusion that I trust the suggestions of this letter will be read in the spirit in which they are written, and that in the event of an arrangement being made for testing the powers of Ligurian and English bees, I shall gladly lend a few swarms of the latter sort to any respectable bee-keepers who may undertake to enter into the contest. I am too old now to engage actively in this kind of work.—A. Pettigrew.

OUR LETTER BOX.

Dorkings' Toes Swollen (*R. Walker*).—There are two causes, either of which may account for the disease in the feet of your Dorkings—fighting through wire netting, or living entirely or partly on a level or plain surface. If, however, neither of these exists with you, we should advise constant bathing, and a cold water bandage applied as soon as the swelling is observed. We have known similar instances where the toe is very large.

Fowls for Egg-laying (*Blox*).—Houdans or Dark Brahmas. Begin with a cock and four hens, increasing the number if you find your accommodation sufficient.

Dorking Cock Dying Suddenly (*J. E. M.*).—It died of a blood-vessel ruptured on the brain.

Brahma Pullet Moping (*C. R. M.*).—We should think the pullet is suffering from overfeeding. Three daily meals are ample. First, meal mixed with water; next, kitchen scraps or maize; evening, meal again. We advise you, if she is alive when this reaches you, to give a good dose, a full tablespoonful of castor oil. Feed sparingly with warm gruel, and repeat the oil after twelve hours. She is, we should think, suffering from fat, and she will not be better till she has got rid of it. You must not imagine we are wrong if when you take up the bird you find the breastbone comparatively sharp, and the body dry and thin. It will only be an additional proof it is suffering from internal fat, which impedes the action of every organ, and will certainly cause death unless it is got rid of.

Hen-coop (*P. C.*).—The door is formed by the four centre bars of the front, which slide-up as in most other coops. The tray at bottom does not slide out, but the coop is placed over it. No doubt the tray could be made to slide-out at the back, but it would soon get out of order, and would be liable to catch the chickens' legs when being drawn-out. It can be readily cleaned from the front without removing the hen. (*E. J. P.*).—The one Mr. Lingwood employs is not manufactured by anyone for sale. Any carpenter could make one if shown the drawing and the dimensions which we have published. (*Several Correspondents*).—Price about 14*s.* each; but it would of course depend on the carpenter if he charged less for six. Any carpenter could make them from the drawing.—T. C. Burnell.

Blood in Eggs (*Filex*).—We think your birds are overfed, and are suffering from internal fat. We should reduce their allowance of food, especially any heating or artificial part of it, and bring them to a simple meal and crushed corn diet.

Rabbit Management (*Pro Bono Publico*).—Sawdust does no harm on the bottom of a Rabbit-hutch. Does kept in a healthy state and well supplied with green food, and with water two or three times per day, will not eat their young. Feed your doe well, and do not let her have more than four or five young to rear. They will fatten from the teat. Kill those you do not intend to rear at six weeks old, and you will say they are second only to a prime chicken. The buck is probably injured. If it were not hard as bone, it would be probably a cheesy tumour. It could be removed, but it would come again. The first point of a Flemish giant is size. They should have heavy dewlaps and lop-ears. They cannot be too heavy.

Bees Dying after Cold Weather (*W. P.*).—It is quite impossible, without further knowledge of the circumstances of your hives, to do more than guess at the reason of the death of so many bees out of two of your hives, or of the total loss of the other. During a prolonged frost there is sure to be a great accumulation of dead bees in the hives, and yet the mortality is probably not much greater than takes place under other circumstances, only in mild open weather bees carry out their dead continuously from day to day. Of course, when they cannot move out, the corpses drop down and lie in heaps below till the weather is mild enough to allow the bees to carry them away. We should hope from the fact that those dead were outside the hives, that these stocks will be found all right by-and-by. As for the third stock, they must have been in a poor way before the frost; but what may have been the cause of their ruin we cannot tell, unless it be that their queen had failed them in the early autumn. We should advise you carefully to put by this stock in some dry and cool place out of reach of the bees till you have an early swarm to put into it.

REMARKS.

10th.—Fair, though not bright morning, the day of the same character. A very slight fall of fine snow about 5 P.M.

11th.—Dry but rather dull all the day; snow and rain after 9 P.M.

12th.—Very wet morning; damp disagreeable day; finer at night.

13th.—Very dark and damp all day, sometimes raining heavily, but only for a time; not fine at any time.

14th.—Damp but fine-looking in the morning; rain before noon, and it fell more or less nearly all the remainder of the day.

15th.—A most beautifully bright day and night; bright sun in the day and equally bright moon at night.

16th.—A very bright fine morning and forenoon, though preceded by a white frost and very slight fog; the after part of the day rather less fine. Rather windy at night.

Much warmer than last week, but almost sunless until Monday, when it was very powerful.—G. J. Symons.

COVENT GARDEN MARKET.—February 17.

There is so little change here, it is not worth notice.

From observations taken near London during forty-three years, the average day temperature of the week is 48.7°; and its night temperature 33.7°.

THE PREPARATION OF SOIL FOR POTTING PURPOSES.

A FAIR amount of success, in a quiet way, in cultivating plants usually found in a gentleman's garden enables me to speak practically on the matter of soil-preparation. Too often—in fact it is the case generally—the practice is to bring to the bench the different soils required and mix them at the time of potting. I do not submit that by this plan good plants have not been grown, for the best of all reasons—that I have so grown them; but this very fact enables me to speak more forcibly of the advantages of mixing the soil some months previous to the busy potting season. By this practice I have always found the saving of labour considerable, and that a great amount of potting could be done much more satisfactorily and expeditiously than when I had to add to it at the time the trouble of mixing the soil.

At that busy period every moment is precious, and plants, mayhap, are suffering injury for the want of potting when an opportunity can scarcely be found for the work. That is every year the case with hundreds of gardeners, who have more duties to perform than time and means to perform them. All such will find the previous mixing in a large heap of the soil for the season an aid and assistance throughout the year. The present is a very good time to accomplish this work. My own practice for some years has been to find a day or days for soil-mixing as soon as the work of winter digging has been completed. This has generally happened in February, when dry sunny days have come which enable the work to be better performed.

But it is not only as a saving of time that the work of previous soil-mixing is recommended, but it is because, as a rule, the plants themselves will flourish more satisfactorily. I cannot exactly say why that should be so, but many years of experience have proved the fact to my own satisfaction. I have mentioned fine weather as a desirable concomitant for doing this work. This is very essential, in fact it is absolutely necessary. In damp muggy days the soil goes together wet and clammy, and when such is the case it can never turn out for use in a free, clean, healthy state. If possible it should be put together in a state somewhat drier than would be desirable for immediate use, as in that case it embodies an infinitely greater amount of air which is so essential to its sweetness, and it is certain, as the washerwomen say, to "give again," and turn out several degrees more moist than when it was put together. That is a very important point to be attended to in doing the work well. Then there is the other side of the question—when mixed it must be sheltered from excessive wet.

In all places where a great amount of potting must be carried out a soil shed is a very necessary convenience. This generally-forgotten structure should never be overlooked in planning the arrangement for the satisfactory performance of this primary branch of a gardener's duties. Where this permanent roof for soil-shelter is not afforded, an artificial covering must be provided. I have found nothing better for this purpose than newly pared turves. These, if taken from the roadside or pasture ground, and cut 2 inches in thickness and a foot or more square, as is most convenient, form an effectual covering for mixed soil, protecting it alike from extreme wet and the drying effects of excessive heat. In a word, if put together in the right condition it will always be in good order for immediate use by this plain turf covering. My plan is to place the turf grass downwards, beginning at the bottom of the heap, and let each surrounding layer overlap the layer below, after the manner of slating a building. The turf, too, after it has served its purpose as a protector, is then ready for another purpose. By exposure to the sun of summer and the frost of winter it is thoroughly aërated and perfectly sweet, and on being knocked into pieces forms the base of a future heap of soil to be again covered by a further supply of fresh turves.

But all have not turf for covering, and the next best material is straw. Give the heaps a very sharp angle, and thatch the same as a corn stack, and the soil is as safe beneath the covering as the corn. It is, moreover, quite neat in appearance when carefully done. The protection of soil for potting purposes is of more importance than is by some imagined, and hence it is adverted to as a point of practice which should not be neglected.

Now, it may be surmised that a heap of soil cannot be mixed which will be adaptable to all plants. That would be a very natural supposition, but is destitute of force sufficient to detract from the real usefulness of the work in question. Most people have at some time or other noticed the routine of a public dispensary, or the surgery of some eminent surgeon, and have no doubt seen the one huge bottle from which nine-tenths of the applicants are supplied as the bulk and basis of their several mixtures. Precisely on this principle the ready-mixed soil store is recommended: it is provided as the foundation of what is required for everyday use.

Now the prevailing nature of this want is loam. Add to that, if it is not rich, one-third of old pulverised manure, one-sixth of lumpy charcoal if it can be had, one-fourth of sharp sand, more or less as the strong or light nature of the loam will suggest, and one-twelfth of soot. Mix that thoroughly, and in a few months, and until the store is exhausted, there is no lack of soil for all the ordinary softwooded plant-growing purposes of the garden. A boy can be sent with a basket or a man with a barrow, and there is no uncertainty as to what either may bring. If the mixture is too heavy, as for Primulas, it is easy to make it lighter; and if not sufficiently rich, as for Chrysanthemums, it is easy to make the necessary additions. These, with Pelargoniums, Fuchsias, Cinerarias, Calceolarias, all sorts of greenhouse annuals, and numberless other plants, will grow to perfection in soil from this one great prepared and protected store. It will be found in every respect infinitely preferable to mixing the soil on the day of potting, which takes up valuable time, and is

not so good for its purpose as when previously mixed and incorporated. For young plants peat and leaf mould can be added at the time if it is required, but it is not at all necessary that it be mixed in the heap for using in the large quantities which a general collection of established plants need.

It has long been my practice at this season of the year to set apart a portion of time for soil-mixing, and I cannot, as the year rolls round, look back with greater satisfaction to any other work or preparations that I may have effected. It is work of which I have felt the benefits during every week, and often every day in the week, of the whole summer. I do not hesitate to advise all who have not done so to set about a similar mixing of potting soil at the first convenient opportunity, being confident they will find the advantages of the plan to be great, and possibly of more value than they can at the present moment appreciate.

Many plant-lovers, and especially amateurs situated in the vicinity of towns, experience considerable difficulty in procuring a supply of soil suited to their wants. They read about turfy loam, roadside trimmings, and hedge-bottom parings, which only makes them feel their wants the more keenly as none of this coveted soil is within their reach. With those who have means the difficulty vanishes—indeed there is no difficulty, as they can purchase all they want; but many another cannot do this, yet cherish their friends, the plants of their dwellings, and know not what to procure for their sustenance. Such must turn to the flaky surface soil of any ordinary garden or field. This the frost has purified, and the dry winds of spring have drained of its moisture, and it is in a condition to grow most ordinary plants well. This soil collected when dry—scraped off the surface just as deep and no deeper than the frost has penetrated—is the best substitute for turfy loam that can be recommended. Broken bones and oyster shells will keep it porous and afford a long-wearing stimulant; and when the plants are in active growth and the pots are filled with roots, and yet a further push is necessary, a thimbleful of guano sprinkled on the surface of a 6-inch pot and watered-in, will add a richer hue of health to the foliage and give substance and colour to the flowers. This repeated once a-week will do much to compensate for any original poverty of soil, and will show that a plant can after all be assisted to grow and afford pleasure without the assistance of the gardener's sheet anchor—turfy loam.

These notes—the outcome of actual practice in town and country, where soil was plentiful and where it was scarce—are commended to gardeners and amateurs at a period of the year when the detail of practice may be useful to both.—A Practical Gardener.

A SELECTION OF VEGETABLES FOR EARLY SOWING.

Those having the use of a hotbed for Cucumbers, &c., at this time of the year will have no difficulty in finding enough to fill up the spare corners with if they look over their seed packets. By a judicious selection of varieties, and sowing at the proper time, the season of many useful vegetables may be considerably lengthened.

Brussels Sprouts can scarcely be sown too early. I have more than once found that those sown on a hotbed in February lasted quite as late in the following spring as those sown in April, and they commence bearing much earlier. They are never too early; Brussels Sprouts are always in season if they can be procured. They must be pricked out under handlights or some kind of shelter before they commence to get drawn, or they will be useless. I have not found anything better than the imported seed as supplied by our principal seedsmen. It is of the greatest importance to have seed of a good stock.

Early London Cauliflower well repays for treatment similar to the above. If sown early and pricked out on a little bottom heat, the plants will be very little behind those sown in autumn and protected through winter, and will be far less trouble and probably of better quality.

Bath Cos and Tom Thumb Cabbage Lettuce sown now, and pricked out under glass, will be fit for use in May, before the autumn-planted ones are scarcely over. The Cabbage varieties turn in quicker than Cos, and Tom Thumb is the earliest amongst them and one of the hardiest. Why does everybody recommend White Paris Cos and its varieties for summer? They are not equal in quality to the Green Paris Cos when well blanched.

Red Cabbage sown in a frame in spring is much better than when sown in autumn, the heads being smaller, and consequently there is less waste.

Veitch's Autumn Giant Cauliflower is a splendid vegetable for autumn, but during the last two seasons, and especially the last, I have found it of the greatest service in August. It was sown in a frame in February and planted out early, and when the dry weather came at midsummer Autumn Giant had fast hold of the subsoil, and the hot weather exactly suited it. Walcheren, on the other hand, just planted, could not even exist. No amount of watering at the root would save it; the parched atmosphere quickly dried up its tiny leaves almost as completely as if they had been in an oven. Could they have been potted and protected for a few days before planting-out they might have succeeded; but there was quite enough to do in most gardens last midsummer without potting Cauliflowers.

Tomatoes cannot be sown too early. I sow in January in heat for the principal summer crop. If afterwards checked it will not harm them, provided they are kept clear of insects. The earliest variety is Orangefield Dwarf Prolific, and the best is Hathaway's Excelsior.

Early Celery.—I find the best is Sandringham White; but no white variety in my opinion can compare with a good red, such as Major Clarke's or Leicester Red, for quality. The first week in April is the time I sow my main crop of Celery; it is then ready to go out quite as soon as the weather is fit for it, and it never receives a check.

Scarlet Runner Beans.—By a little scheming I have been able to gather these out of doors for two or three seasons by the first week in July—once even by midsummer day. The Beans are sown three in an 8-inch pot in April and kept under glass; after they have made three or four rough leaves they are pinched back, and kept continually pinched at every joint as fast as they make growth till a little before the time of planting-out in June, when they are more in the shape of Gooseberry bushes than ordinary Scarlet Runners. They have stakes placed for them to run up; but they never grow so strong as later-sown ones, and they are in full bearing in a very short time after planting. I have them much earlier than I have ever been able to produce Dwarf French Beans outside, for which in my opinion they are more than a substitute.

Early Carrots.—Those who have to produce these cannot do better than stick to the Dutch Forcing, or French Forcing I believe it is now called.

Peas.—For those who want quality I have not yet seen anything so good as Little Gem. If grown near to a south wall it comes into use as quickly as the earliest of the round varieties, for these being taller cannot be grown in such a position without injuring the occupants of the wall.

Potatoes will scarcely come in under the above heading; nevertheless, I wish to say that the old Ashleaf is still the earliest good Potato. Royal Ashleaf and Veitch's Improved Ashleaf are of better quality and much more productive than the old favourite, but they are not so early by a fortnight, and they are stronger growers.—W. Taylor.

DEUTZIA GRACILIS AND ITS CULTURE.

What is there amongst our early-flowering plants more useful or more graceful than the Deutzia gracilis, with its stems covered with snow-white blossom? It is excellent for bouquets, and most enlivening amongst the green-foliaged plants in the conservatory. It ought to be more grown than it is. No plant can be more simple to manage. To keep up a succession of bloom from Christmas to the end of February pot early in November three dozen young plants in clean well-drained pots; for soil using two parts loam, one of leaf mould, and a little rotten stable manure and sand. Place them on ashes in a cold pit or frame; give plenty of air, but do not water them for a week after they are potted, as the soil turns cold and wet, and afterwards sour. About the beginning of December take one dozen of them into a temperature of 60° to flower at Christmas. In the middle of the same month bring in a second dozen to flower through January, and in this month bring in the last dozen to flower through February. When they have done flowering place them on ashes in an open situation outdoors to grow and ripen their wood, keeping them well watered, and when the plants become too large divide them.—W. Dongson, *Metchley House Gardens*.

Growing Hyacinths in Moss.—I have in the greenhouse an ornamental wire basket, in which I put six Hyacinth bulbs on 2nd January last, and to see them now I think you would say

that is surely the place to grow them. The bulbs have produced beautiful spikes of flower and splendid large green leaves, while the roots have made their way through the moss at least 3 inches, and which cannot be less than 10 inches from the bulbs. Evidently they are now receiving support from the moisture of the house. Now, I think this basket filled in this manner would do very well for hanging in rooms, with a few small Ferns planted inside of the rim, which is circular, to hang over, and a glass saucer or other kind suspended under the basket to hold the water, and which would at the same time supply the roots with moisture.—WILLIAM LAURIE, *Gardener, Lynnwood.*

NOTES RELATIVE TO THE POTATO.

IN the olden times before the discovery of the art of printing, to be able to read and write—a scholar in fact—was to be subject to suspicion and contempt—suspicion of dark dealings with those mysterious powers which dwell in the cloud that always envelopes dull ignorance. But while we smile at such folly it should not be forgotten that we too are not altogether without our failings—failings which lead to the adoption of theories that are unsound, and pursuits which often prove vain. One such, and in the pursuit of which considerable ardour has been manifested, is a blight-proof Potato, another is a cure for the Potato blight, both of which are perfectly unattainable, as was clearly set forth in the Journal about a year ago.

The futility of the trials of so-called blight-proof Potatoes which were then about to be undertaken under the auspices of the Royal Agricultural Society was strongly insisted upon; the result of those trials fully demonstrated the truth of assertions not lightly made, and based upon close observation and sound practical experience. The search for a blight-proof Potato has been abandoned, but researches are still going on which can answer no practical purpose, and can only serve to throw some light upon the action of certain natural phenomena, which, however interesting to philosophic minds, is a matter altogether wide of the important question, How shall we obtain a full crop of sound Potatoes?

That the Potato disease is caused by excessive moisture in the soil, or to put it more plainly, by the showers that generally occur sooner or later after the growth of the tubers has ceased and the process of ripening begins, is an incontrovertible fact long ago recognised by practical men. In many instances this knowledge has induced those who were able to grasp its full significance to strive to bring the crop into a suitable condition for lifting before the recurrence of the evil. Why a measure so simple in itself and so thoroughly efficacious has not sooner obtained a full and general adoption is owing, I think, to ignorance of the nature of the Potato itself.

Now, a Potato tuber possesses such astonishing vitality that it will not only make a strong growth, but will also yield young tubers, very small it must be granted, but of perfect form and with the organs of reproduction perfectly developed without any extraneous assistance other than is afforded by atmospheric moisture. This fact is undoubtedly of little value in itself, but is sufficiently remarkable to lead one to inquire if the economy of the Potato was capable of nothing more than this, for the phenomenon which I have described is in reality precisely similar to that which takes place in a living plant. For example, a Grape Vine will produce strong shoots clothed with foliage and bearing incipient fruit bunches entirely from stored up sap without any assistance from its roots. Nor does the analogy cease here, for both Potato and Grape Vine fail to make further progress without the assistance of new roots fed by a nutritious soil.

By careful examination it was found that immediately after a tuber had ceased to grow it might be separated from the haulm, without any interference with the process of ripening or deterioration in quality. The only blemish is in the somewhat unsightly and ragged appearance of the skin, which becomes broken from contact with others when taken up in its immature condition.

The action of Nature to remedy this rubbing of the skin is wonderfully prompt, a fresh skin of considerable thickness being formed within twenty-four hours after the storing of the Potatoes. Here is a question involving other questions for physiologists. One can understand something of how a ripening process can take place by oxidation, and by the combination of crude matter to form the starch or mealy substance so much appreciated in a good Potato after the tubers are taken up, just as of Apples and Pears after they are gathered form sugar.

It has been well said that "Nature knows no limits in her great laboratory, having combinations to play upon such as we are only just beginning to understand," and I should be glad to know more of her action in this instance. How is the second skin formed? Of course the substance is derived from the juices of the tuber: am I to suppose, then, that the juice which flows from the wound becomes hardened and converted into a substance resembling the skin by the action of the air? Or is there circulation, or rather a movement of its juices among its tissues, taking place after it is separated from the haulm? It may be said that the fact of the subsequent ripening process would imply something of the kind. Ripening, however, is simply one, or a series of chemical changes. Many fruits ripen after they are gathered, but if the skin sustains any damage decay invariably follows.

There are one or two other matters connected with this part of the subject concerning which I am somewhat in the dark, and which I will also propound in the form of questions, in the hope that those who possess the advantage of greater experience or ability may be able to enlighten me. The first question which I will ask is this—Is the blight infectious? That is to say, if we put a diseased tuber among others that are sound are they likely to become affected? Judging from my own experience I should certainly answer, Yes.

Then, if a crop is taken-up in showery weather and stored in a somewhat damp condition, are the tubers more liable to suffer from blight after they are stored than if they had had the advantage of a dry sunny day; or are they at all susceptible of blight after the storing? Here again I am constrained to answer, Yes. But then there remains an impression that those tubers which apparently have failed from either of such causes had in reality become tainted before they were separated from the haulm, and if so all subsequent care would be quite useless.

These matters are, I think, of the very greatest importance. Believing as I do that the blight is incurable, and that it is only to be met successfully by timely culture and by taking-up and storing the crop while it is sound, anything affecting the measures taken to that end for good or evil merits the closest inquiry and attention.

An inquiry into the history of the Potato and its culture reveals the fact that our knowledge of the subject is very little in advance of what was known forty years ago. New and improved sorts were then sought after with an avidity quite equal to that of the present time; nor was there less ability and intelligence displayed in the raising of new kinds from seed, the necessity for doing so being understood as perfectly then as now. A writer in the "Quarterly Journal of Agriculture," in stating his reasons for raising seedling Potatoes in 1833, says—"The Potato, in common with all other cultivated productions of the vegetable world, has a tendency to degenerate in proportion as the means to prevent its doing so have been neglected. Nature, however, has provided for the permanent health as well as the productiveness of her offspring in the seed contained in the berry which the plant produces from its stalks." In little more than another decade—that is to say in 1846, the year of the great blight, we find that the evil of excessive moisture and heavy retentive soil were as clearly understood as they are now. In an interesting account of the blight and its effects in the seventh volume of Allison's "History of Europe," it is stated that "the disease was much more violent in the western parts of Great Britain than in the eastern, and in rich and highly cultivated localities than in those more recently brought into cultivation, or where the soil was poor. From Aberdeen to Inverness, where the soil was in general sandy or gravelly and a great part of it had been newly brought into cultivation, the disease was unknown; but in the west Highlands, abreast of this district, it was all but universal, and had almost totally destroyed the crops." This statement will be doubly significant to those who are aware of the considerable excess of the rainfall in the western districts to that in the eastern.

In giving this quotation from Allison I do not, of course, intend to infer that a poor soil is at all preferable to a rich one for Potato culture; that would be simply absurd. The rich alluvial soil in the neighbourhood of Peterborough and Wisbeach is most wisely devoted to the growth of Potatoes, because it is in that district that the rainfall sinks to a minimum, and the natural conditions are therefore precisely those

which experience shows to be most advantageous to its culture. There is a similar deposit of soil on the west coast, in the neighbourhood of Southport and Blackpool, but it is very certain that the excessive rainfall renders it an unsuitable district for extensive Potato culture.—Edward Luckhurst.

THE CULTURE OF THE CHINESE PRIMULA.

Being requested to communicate my mode of culture of this indispensable winter-flowering plant, I with some hesitation comply, feeling as I do less confidence in writing about the plant than growing it. My plants, which commence to flower in the autumn and continue all through the winter months, are produced as follows:—

In order to have strong blooming plants early the seed should be sown not later than the second week in April. I procure a clean seed pan and drain it well, and fill with light sandy soil. The surface is made very level by the gentle pressure of a smooth piece of wood. This is watered, and a few hours after the seed is sown thinly and covered very slightly indeed with the finest of soil. The seed pan is then covered with a square of glass and placed in a gentle bottom heat. The soil is not watered for a few days, or until the surface shows signs of becoming dry, and then the greatest care is exercised, and water fully as warm as the soil is given. The moment the seedlings appear the pan is brought close to the glass, and the glass covering is propped up very slightly, to be increased by degrees until totally dispensed with. As soon as the seedlings can be handled they are pricked out in pans of leaf mould and silver sand 1½ inch apart.

When the plants grow and touch each other they are potted singly in 3-inch pots, and are kept growing in a genial temperature. When these pots are filled with roots, yet before becoming pot-bound, the plants are shifted into 6-inch pots; these are the blooming pots. The soil for this final shifting is composed of good leaf mould three parts and thoroughly decayed manure one part, to be well mixed with sharp sand. I use no loam, finding the plants flourish much better without it. The plants are still grown in gentle heat until they become established, and by that time the temperature will permit their removal to a cool pit or frame.

In the summer months they require abundance of air, and are the better for a little shade in bright weather. It is a good plan to remove the lights entirely on clear nights in summer for the benefit of the dews, which are very refreshing. Throughout the season they are watered with great care, and excessive moisture avoided. By this treatment splendid plants are obtained, which will be a mass of bloom in November and continue so for six months.

I never pinch out the first flower buds, which is a common but mistaken practice; it is the first and prime source of decay, which often becomes virulent and causes the death of many plants when just reaching perfection. By never pinching out the first blooms I am seldom or never troubled with this common annoyance or disease.

If sown earlier than the time named the plants are apt to be coddled and be made tender unless plenty of house room is provided, which is not always the case with those who grow Primulas. My advice, therefore, is not to sow until towards the end of April, and by the time the plants become large and take up much room the cool frames are ready to receive them; the natural temperature will then permit of their removal without any check, which at all times is most prejudicial.

Very early sowing to gain time is often a sure way to lose it, on account of succeeding checks the plants receive, and which cannot easily be avoided. By somewhat later sowing the plants have a better opportunity to grow without hindrance, when they will quickly make up for a few weeks in spring, which are seemingly lost, but not really so, as they are more than regained in the end by the healthy vigour of well-constitutioned plants with sturdy foliage and massive trusses of bloom.—J. Christie.

Acres of Orchards, Nurseries, and Market Gardens.—In 1874 the land returned as used also for orchards was 145,622 acres in England, 2994 in Wales, and 1910 in Scotland. The separate returns for land used by market gardeners for the growth of vegetables and other garden produce show in 1874 an acreage of 34,689 for England, 477 for Wales, and 2741 for Scotland. An increased demand for fruit and vegetables is stated by some of the collecting officers to have led to the extension of orchards and market gardens in the neighbourhood of towns. For land used by nurserymen for the growth of trees, shrubs, &c., the returns for 1874 show an acreage of 9245 for England, 630 for Wales, and 1868 for Scotland.

GRAPES.

As the planting season will soon be at hand for the above, I would like to mention three sorts which I find receive but scant favour with some. Mrs. Pince is with me a very fine Grape, and grows large bunches and colours well; the flavour, too, is excellent. I think the main cause why many do not succeed with it is that they do not give air enough to it. The next is a most delicious Grape, though according to gardeners' notions a bad colour, being a reddish purple; it is large in berry, thin in skin, and carries a light bloom—I refer to the Muscat Champion. The third is the Madresfield Court Muscat, smaller than the foregoing, but a really good variety, and is hardy, ripening without heat, and colouring beautifully. I shall plant three more of this. I have pulled up all my Lady Downes' in favour of Mrs. Pince, which I think far superior. —Harrison Weir, *Weirleigh*.

A VISIT TO MESSRS. VEITCH & SONS' NURSERY, CHELSEA.

This is a right royal establishment in the world of horticulture; replete with home plants of every class and for every purpose, and rich in many rare plants of other lands, it is at all times capable of affording interest to the visitor. For the information of those who may have not yet seen this celebrated nursery it may be described as a town of glass, having its streets, alleys, by-paths, and squares, conveniently arranged for the well-being and comfort of its inhabitants, both of the floral kingdom and also for the world of humanity. To attempt to enumerate the glass structures would be superfluous, while to describe the contents of each would, considering the space at our disposal, be a sheer impossibility. We therefore confine our notes to a few examples which were the most striking on the day of our visit, beginning with the

Camellias.—The principal collection of these is arranged in broad borders along each side of a lofty glass structure about 100 feet in length. The path between this avenue of Camellias is broad and well suited for promenade, which is in fact a walk of great beauty at the present time. The largest plants are planted-out and established in a soil of peat and loam, the latter apparently predominating. They are in excellent health, with bright wood and glossy foliage, free alike from dust and insects, yet covered with their thousands of beautiful blooms. Many of these plants are from 8 to 10 feet in height and 6 to 8 feet through, well furnished from the ground, growing as freely as Laurels, and blooming as profusely as Roses. There are also some excellently-grown specimens in tubs, and smaller but equally healthy plants in pots.

The largest-sized bushes consist of the oldest varieties, and many of these, it must be conceded, are not surpassed in quality and effect by newer introductions. The old Alba plena, for instance, is still one of the best, if not altogether so, of the double pure white varieties. The specimens of this fine old sort are very telling. A fine plant is also seen of Fimbriata, with its beautifully serrated petals. In its way this long-established favourite has still no equal. Amongst the reds Imbricata still holds its own by its easy growth, free-flowering property, and good quality of its marbled blooms. Mathotiana is not yet surpassed by its velvety richness; while the single kinds, as Donckelarii, Conspicua, Tricolor, &c., are still as showy as ever, and such sorts as Marchioness of Exeter, Cup of Beauty, and Countess of Orkney will continue to be good when many of their followers, newer varieties, may be heard of no more. The individual blooms of new kinds may be, and undoubtedly are, beautiful, but some of them are of straggling habit, others of weakly growth, and some are shy in blooming, which detracts from their general value.

The few varieties we will now enumerate as amongst the best seen in flower may be relied on as possessing general excellence. Beginning with the whites we make bold to head this list with Alba plena, seconded by Fimbriata. Ochroleuca is a white-flowered of fine build, but old blooms occasionally show a yellow eye. Mrs. Cope is a chaste and refined flower, and the plant of compact habit; Jenny Lind is a perfect bloom, mostly of the purest white, smooth, and of fine sub-

stance, yet occasionally a touch of pink breaks out of the petals: this is a variety of sterling merit, habit, foliage, and blooms being alike good. Jubilee (there is also a continental red one of this name) is attractive, its flowers being a blush white, and foliage very superior. Teutonia—white, delicately touched with pink—is a very excellent variety, while Countess of Orkney of the same type should be in every collection, as also should Cup of Beauty. Of more decided colouring on a white ground is Princess Frederick William of Prussia, which is carnation-striped and mottled, is of excellent habit, with the fine twisted foliage of Imbricata. Of even more decided markings is Comtesse Lavinia Maggi, a flower of stout build and very attractive, yet lacking the refinement of some other varieties.

The best of the darker-coloured kinds are Imbricata; Mathotiana; Leopold I., good colour, with shell-like petals and vigorous growth; Reine des Fleurs, compact, free, and of fine substance of petal; Jeffersonii, a high-coloured variety, and attractive by the white bar down the centre of each petal. Clio vera is a nice flower, of a bright pleasing colour. Reticulata plena is perhaps the richest of all, carrying blooms of great substance and good form. It is distinct in foliage from every other variety, and is of vigorous growth. This is suitable for a large specimen or for covering a wall.

The pink and rose-coloured varieties in bloom were not numerous. The best of these was Augustine superba: this appears identical with Succoi nova, which has a host of aliases, and is perhaps the best proof of its worth. Henri Faure is a good deep-coloured variety in this section, and the plant possesses a free growth. General Lafayette is a free-flowering kind, but its crimpled petals add nothing to its beauty. Last, but not least, is Comte Nesselrode: this is a comparatively new variety, and is undoubtedly good. These are the best of the collection seen in bloom, and all are worthy of general cultivation. Besides these large plants other houses are filled with Camellias, ranging from half-specimens down to handy plants in 4 and 5-inch pots. The entire collection is healthy and well grown. The next most striking feature in the establishment is the collection of

Nepenthes, or Pitcher Plants. These quaint flowers hang from the roofs of the houses like a cloud of gigantic spiders. They are grown in home-made baskets, such as are used for Orchids, and the pitchers are suspended over the sides in great profusion. The cleanliness and health of these plants are remarkable, and their interest to visitors is always very great. One of the most free and attractive kinds raised, we believe, in this establishment is N. intermedia. This is clearly a variety of great merit, and the stock is both large and good. We also noticed N. hybrida and hybrida maculata as distinct and fine; N. lausta of remarkable texture of foliage and pitchers; the well-known N. Rafflesiana, and the pretty N. Sedeni. A number of seedlings with miniature pitchers were very interesting, and gave promise of developing into new varieties of distinct and sterling merit. We would now briefly glance at the

Orchids, noting a few in bloom at the time of our visit. Of these were the varieties of Phalænopsis—grandiflora, amabilis, and the ever-charming Schilleriana. The young stock of these is very large, and as an instance of their free-blooming character we noted some throwing-up spikes while only in thumb pots. The curious Angræcum sesquipedale was in flower, also good plants of the useful Cœlogyne cristata were covered with blooms. Attractive spikes of tha free winter-blooming cool-house Orchid Odontoglossum Alexandræ were plentiful, and by way of contrast the richly-coloured O. triumphans showed to advantage, while O. pulchellum, so charming for cut blooms, had a profusion of spikes. Oncidiums were represented by cheirophorum, the richly-scented speciosum, and a newer one, splendidum, which was rightly named. This is really splendid, the sepals being yellow and brown, and the labellum of the richest, yet soft, orange. It is unquestionably one of the finest of the entire group, and may well close our notes on this interesting tribe of plants.

We observed in the Orchid house a blooming plant of the beautiful Bromeliad Tillandsia Lindeni. The flowers of this variety are of the richest and purest blue imaginable; they are of large size, borne on a spike about 18 inches in height. To just one other plant we would draw attention, altogether different in character to the preceding—viz., Boronia megastigma. This is a greenhouse plant, with foliage as small as that of the most delicate Heath, and from the axil of every leaf is a round bead-like flower, brown outside and yellow inside. The plant is literally studded with these globular miniature blooms, but these are not half its attraction, the chief interest of the plant being its remarkable perfume. We pause to examine the powerful yet familiar odour. Imagine a huge bunch of Cowslips freshly gathered from the pasture, and the breath of these much intensified, and we give a fair representation of the perfume of this curious and interesting plant. By just one specimen in a greenhouse or sitting room the vernal scent of the old meadow flower is provided in the depth of winter. On this account it is a plant which ought to become popular.

We can only say in conclusion that the stove plants, Ferns, Palms, &c., were extensive and good, the hardwooded collections healthy, the Cyclamens in quantity and quality not easy to be forgotten, and the whole establishment in good order and systematic keeping.

ERANTHIS HYEMALIS, OR WINTER ACONITE.

Mr. Robson has (page 93) seasonably drawn attention to this worthy spring gem, which studs the ground with its golden blossoms at the most dreary period of the year. This plant is almost akin to air and water—so common as to be almost overlooked, yet indispensable. Added to its innate beauty the Winter Aconite has a most accommodating nature, and, when once established, the best bit of advice in Mr. Robson's paper is that summed-up in the three words, "let it alone." It will flourish anywhere, and spread and cover almost any portion of any garden in town or country. It never looks so bright, however, as in the dark places of the earth, and if anyone has a spot whereon nothing else will grow, let him try the Winter Aconite. The best way to get a stock is to sow the seed as soon as it has ripened. It is best sown in drills in light soil in a shaded part of the garden, to be transplanted in showery weather where it is required to become established, and then—let it alone. As a shrubbery or woodland plant of diminutive growth it has no equal, and when seen covering the ground by the acre it is a perfect sea of gold. At Coleby Hall, near Lincoln, the plantations are one dense mass of this lowly plant, and are more cheerful and enlivening than can be imagined by those who have not seen it in quantity. It is worthy in all such places of being grown by the acre all over the land.—Ex-Visitor.

GROWING CARROTS FREE FROM THE MAGGOT.

To produce an abundance of this essential culinary root is an easy matter, but to produce such roots clean and free from the grub is a question which has baffled many of the best gardeners of the day. Being a great believer in the old adage that "nothing succeeds like success," I would, for the benefit of all whom it may concern, place on record a mode I have found to be highly satisfactory.

On the principle of beginning fair, I first make the frank acknowledgment that I am indebted to my cottager friends for the first inkling of my success in Carrot-growing. I have always taken great pleasure in examining the cottage gardens in my neighbourhood, and candidly admit that I have thereby gained not a little information in useful vegetable-culture. I have also on many occasions had the pleasure of judging their produce at local shows, and in doing so have been struck with the particularly fine Carrots their garden plots have produced.

On investigation I found these Carrots were invariably grown on the Onion beds of the preceding year. I determined to try the same plan, and immediately the Onions were cleared off trenched the ground deeply, giving it no manure whatever. But as soon as the trenching was done I gave the ground a good drenching of sheep dip, at the strength of 2 ozs. of dip to three gallons of water. This dose I repeated a fortnight before sowing the seed. The result is an excellent crop of Carrots, many of them (Altrincham) 2 feet in length, while those of my neighbours were a total failure. All the Carrots are quite bright and free from speck.

I communicate this, knowing the difficulty many gardeners experience in raising good crops of high-class Carrots. I may add that before adopting the plan I could scarcely raise a perfect root, one season the crop being an absolute failure, while now I have an abundance of fine Carrots, and that is my authority for recommending the mode.

But some may ask, "What is sheep dip?" I cannot say of what the liquid is composed, but it is used largely by farmers

for washing the sheep to rid them of the vermin, and I have no doubt that what kills vermin on sheep will also destroy any of the pests that affect the Carrot and other roots, and prevent much injury by underground maggots. Some of these compositions are marked "poisonous," and some "non-poisonous." The kind I use is non-poisonous. It is known by the name of McDonghall's sheep dip, and is sold by agents in all the principal towns of Britain. I believe it is inexpensive, and I have proved it is effective. I also know that others have tried it with the same good result as myself.—J. D.

ROYAL HORTICULTURAL SOCIETY.

I AM not going to fish in these very troubled waters, and by doing so expose myself to a midshipman's allowance—"more kicks than ha'pence;" the most appropriate thing about the concern being their "maze," out of which it requires more ingenuity than I possess to find my way. But I just wish to point out how a class of persons, without whose aid the Society could not stand one moment, has been treated—I mean exhibitors. We have now arrived at the end of the second month of the year, and yet not one penny of the prizes due to us for 1874 has been paid! And when one takes into account the expense to which many of us are put in vans, horses, men, &c., all of which we have to pay for at the time, it seems extraordinary for a great Society, which has the Queen as its patron and no end of titled people belonging to it, to act in this strange and unbusiness-like manner. Nor is this all: the Council (who must have known when they did it, or if they did not they ought not to be there) issued in the autumn a schedule for 1875, in which they advertise a series of shows, amongst them a Hyacinth Show. Now it is well known that exhibitors of this flower are not like those of many others; they have to purchase their bulbs every year, and I for a certainty know many who did so, with the sole idea of exhibiting at South Kensington, and yet here in February a notice is sent out that the Hyacinth Show is abandoned! I do not blame the Council for not having one—that is their business, but I do blame them that they should have ever announced one; it is trifling with exhibitors which will bring its own Nemesis. I know one of their largest exhibitors, not in this only, but in many things, who vows he will never send anything again, and I fancy this will be the case with many.

I see there are four shows abandoned, and this is so managed that, with the exception of the Carnation and Picotee, every florist's flower is cut out. Auriculas (for Auriculas on May 12th is a farce), Pinks, Pansies, Tulips, Dahlias, Gladiolus, and Hollyhocks are as completely shut-out from their schedule as if they never existed. Is it not possible that the Committee of the Metropolitan Floral Society can be induced to extend their operations? They have announced a liberal schedule for the first and three last flowers above named, but can they not occupy ground which now seems cleared away for them, and come out strongly as a Society that has a status of its own, hold its own exhibitions, and by a generous treatment of exhibitors give a stimulus to floriculture?—AN EXHIBITOR AT THE R. H. S.

LITTLE HEATH MELON.

As I see the above variety of Melon in so many seed catalogues highly enlogised, I think it but right to record my experience of it. I grew nice fine-netted and handsome fruit, and I must say that I felt "in high feather" regarding their beauty until I tasted them, when I found that a little piece of each was too much, both my gardener and myself agreeing that they were not only not nice but nasty. Hitherto I have grown Turner's Gem, Golden Queen, Queen Emma, and Beechwood; the difference between these and the above as regards flavour was indeed great. No more Little Heath Melon for—HARRISON WEIR, *Weirleigh*.

THE WEATHER AT NICE.

WE read a great deal in the papers of the cold weather prevailing all around us, and in the *Times* of Wednesday there was a letter from a correspondent at Naples, giving a very poor account of the weather in the south, and saying that there they had ice 1¼ inch in thickness. We therefore think this must be a peculiarly well-favoured place, for though once or twice the thermometer has been just down to the freezing point, and we have seen very thin ice, we have nothing like the severity described at other places. A comparison between the minimum and maximum temperature at Kew and Nice during the recent cold weather gave an average of 10° in favour of Nice. There has been snow both at Cannes and Mentone, but it has only been seen in the distance from this place.

The Sparmannia africana is still flourishing out of doors. Nice supplies a great quantity of flowers and vegetables not only to the surrounding districts, but also to Paris and other large cities. Magnificent bouquets are sent by railway to Royal and other parties for weddings and special occasions. Orange blossoms have been recently sent to England, and arrived in two days quite fresh for the marriage ceremony. The wild spring flowers are becoming numerous, including Anemones of various colours—cernua, coronaria, and hortensis. The showy Almond trees are now in full flower.—EDWARD COPLAND, *Nice, February 20th*.

OUR BORDER FLOWERS—PENTSTEMONS.

WE have to look far back in the past for the introduction of this, one of our choicest families of border flowers, for it was in 1753 that Pentstemon pubescens was introduced. They are a race of plants that present to us a variety of attractive features. Some are prostrate and some of upright habit; all are more or less brittle, and suffer much from being blown about by the wind if not secured. They are a very accommodating family, yet their diversity of habit requires for them different treatment. Great improvements have been made in this family since the introduction of Pentstemon gentianoides, which was carefully tended as a greenhouse plant. P. coccinea and alba were once looked on as wonderful additions to our gardens as summer bedding plants, and when pegged down and carefully stopped they continued long in bloom, and gave us much satisfaction.

The Pentstemon has now become quite a florist's flower, with long lists of varieties enumerated in catalogues. They are easily increased by seed or division, but the choicest of them are best raised by cuttings in the autumn. I have found them succeed well in the following manner: Take as many 6-inch pots as may be required, and drain them well; cover the drainage with half-rotten leaves or moss, then fill up the pots to within an inch of the top with sandy compost, finishing with an inch of pure sand. Insert the cuttings round the edge of the pot, and place in a rather shaded situation out of doors, but preferably under glass, and water sufficiently, yet not so as to cause them to damp-off. September is a good time to put in the cuttings, which strike freely, and make good plants for potting or planting-out in spring. They should be wintered in a frame quite safe from frost.

Some kinds are increased by division, which is best done after the blooming period. They are useful where cut flowers are in demand, and succeed in good loamy soil. They seed freely—indeed often sow themselves. These seedlings can be taken up and preserved if thought desirable, and by that means a new colour may be introduced; but to obtain good varieties the best flowers should be impregnated and carefully tended, and a reward will follow. I would suggest as advisable that prizes be offered for Pentstemons at our horticultural exhibitions.—VERITAS.

ONIONS ALL THE YEAR ROUND.

FOR the last ten or twelve years I have tried various sorts of Onions—Nuneham Park, White Spanish, and other varieties, and I think none so good as Sutton's Improved Reading. It is large in size, good shape, mild in flavour, and one of the best keeping Onions in cultivation—that is, if it is stored away properly. I tie them in wreaths and hang-up in a dry cool place. I have grown it for the last six years, and by properly drying before wreathing have had Reading Onions for the table until the autumn-sown ones have come in. Last spring two Onions were left on the strings, and to my great surprise I find that one has grown a green top only 1½ inch long, the other being quite sound. So I think its hanging so well from 1873 to 1875 is quite sufficient to prove it one of the best keeping Onions in cultivation, and I do not think that there is an Onion to equal it.—R. WALKER, *Waingroves, Derbyshire*.

PELARGONIUM SOCIETY.—The following new members since last list was published have joined the Society:—Mrs. Carter, Faversham; W. H. O. Sankey, M.D., Cheltenham; T. Kibble,

Tunbridge; H. G. Quilter, Aston, Birmingham; Miss Skipworth, Derby; James Veitch & Sons, Chelsea; F. Campion, Red Hill; J. F. West, Reigate.

DEVICES IN AUTUMN LEAVES.

An exquisite transparency may be made by arranging pressed Ferns, Grasses, and autumn leaves on a pane of window glass, laying another pane of the same size over it, and binding the edge with ribbon, leaving the group imprisoned between. Use gum tragacanth in putting on the binding. It is well to secure a narrow strip of paper under the ribbon. The binding should be gummed all around the edge of the first pane, and dried before the leaves, Ferns, &c., are arranged; then it can be neatly folded over the second pane without difficulty.

To form the loop for hanging the transparency, paste a binding of galloon along the edge, leaving a 2-inch loop free in the centre, afterwards to be pulled through a little slip in the final binding. These transparencies may either be hung before a window, or, if preferred, secured against a pane in the sash.

In halls a beautiful effect is produced in placing them against the side lights of the hall door. Where the side lights are each of only a single pane, it is well worth while to place a single transparency against each, filling up the entire space, thus affording ample scope for a free arrangement of Ferns, Grasses, and leaves, while the effect of the light passing through the rich autumnal colours is very fine. Leaves so arranged will preserve their beauty the entire winter.

An exceedingly pretty standing for a lamp can be formed of eight oblong transparencies (made of glass and autumn leaves as described) tacked together with strong sewing silk, so as to form an eight-sided hollow column. To hide the lamp candlestick the screen should be lined throughout with oiled tissue paper, either white or of a delicate rose colour.—(*American Horticulturist and Journal.*)

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

Epidendrum syringothyrsis. *Nat. ord.*, Orchidaceæ. *Linn.*, Gynandria Monandria.—"A very tall and handsome species, which flowered in Mr. Veitch's fine Orchid collection in May, 1868. It is a native of Bolivia, where it was collected in 1866 by Messrs. Veitch's collector, the late Mr. Pearce, and is evidently a member of the immense section to which E. evectum belongs, and of which the type is the long-known E. elongatum, *Jacq.*, which latter is one of the earliest cultivated tropical Orchids. From all its congeners that are known to me it differs in the great size of the dense-flowered raceme, which, from its general resemblance to that of the Lilac in form and colour, has suggested to Professor Reichenbach the specific name of syringothyrsis. Its nearest ally is E. porphyreum, *Lindl.*, a native of Peru, which has a panicled inflorescence."—(*Bot. Mag.*, *t.* 6145.)

Lilium canadense, *var.* parvum. *Nat. ord.*, Liliaceæ. *Linn.*, Hexandria Monogynia.—Colour of flowers orange and pale yellow. "The variety parvum inhabits a wide range of the mountains of Western America from British Columbia southwards, and appears to vary extraordinarily in stature and in the size of all its parts. Our specimen was sent from the fine collection of Messrs. Barr & Sugden, with whom it flowered in June of last year."—(*Ibid.*, *t.* 6146.)

Veronica pinguifolia. *Nat. ord.*, Scrophulariaceæ. *Linn.*, Diandria Monogynia.—Flowers white, with purple anthers. "The shrubby Veronicas of New Zealand are a prevailing feature throughout the islands at all elevations, and in almost all situations. Upwards of thirty species have been discovered, including some of remarkable beauty, of which V. speciosa and V. salicifolia, with their numerous varieties and hybrids, are the only ones well known in cultivation, except the less attractive V. elliptica, one of the earliest cultivated greenhouse shrubs of the southern hemisphere, and which inhabits New Zealand, Terra del Fuego, and the Falkland Islands. Amongst the least conspicuous of this group is the present plant, which is a native of considerable elevations (3000–5000 feet) in the Nelson and Canterbury provinces of Middle Island of New Zealand. V. pinguifolia has been cultivated for several years both at Kew and in Mr. Isaac Anderson-Henry's garden near Edinburgh, where it was first raised from seed. It has stood in the open air throughout the winter without protection at Kew, and flowers in midsummer."—(*Ibid.*, *t.* 6147.)

Fourcroya Selloa. *Nat. ord.*, Amaryllidaceæ. *Linn.*, Hexandria Monogynia.—Flowers white and green. "I am not aware that it has flowered anywhere but at Kew, where two individuals in the spring of last year sent up flowering scapes, which, pushing rapidly upwards, were allowed to protrude through the roof of the succulent house, and expanded in magnificent panicles in September. They continued flowering till November, and formed bulbils in the branches of the panicle as well as flowers. At the same time three other fine plants of the same class flowered in the same house, and required exit through the roof—namely, Agave americana and two specimens of Dasylirium acrotrichum. F. Selloa is a native of Guatemala, and has long been cultivated at Kew, where it was received from the continental gardens."—(*Ibid.*, *t.* 6148.)

Senecio macroglossus. *Nat. ord.*, Compositæ. *Linn.*, Syngenesia Superflua.—"A remarkably handsome plant, and one fitted for dwelling-room culture, its Ivy-like glossy leaves being evergreen, its large yellow flowers produced in midwinter, and its habit well adapted for a trelliswork. I have indeed heard of either this or an allied species being cultivated in drawing-rooms abroad, and trained round the walls beneath the ceiling. Like most Cape plants it wants very careful watering and plenty of fresh air. It is the largest-flowered species of the enormous genus to which it belongs, and which contains nearly one thousand species, and the flowers remain for a considerable period in perfection. According to the 'Flora Capensis' S. macroglossus extends from the Keiskamma river (west of Algoa Bay) to Natal, but the only specimen we have that precisely agrees with the cultivated plant was collected by Mr. Sanderson on the Palmiet river, immediately to the east of Table Bay in the Western Cape district.

"It is cultivated in the succulent house at Kew, where it is trained upon one of the rafters, and forms a very ornamental feature, blossoming at Christmas; it was raised from seed sent by Mr. Sanderson in 1868."—(*Ibid.*, *t.* 6149.

Erythrotis Beddomei. *Nat. ord.*, Commelyneæ. *Linn.*, Hexandria Monogynia.—Flowers deep crimson. "A singularly beautiful little plant, and one easy of cultivation, discovered by Col. Beddome, F.L.S., on dry bare rocks, at an elevation of 3–4000 feet, in the Myhendra mountains of South Travancor, from whence he sent seeds to Kew, where plants raised from which flowered in December last. It appears to me to be a new genus, closely allied to Cyanotis, but differing in its prostrate habit, inflorescence, the arrangement of the bracts, perfectly free sepals, and filiform style, without an inflation below the stigma.

"Erythrotis Beddomei is a stove plant, but well adapted for a warm conservatory during summer, when it may be trained over the pots and made very ornamental; the colouring of the under surface of the leaves is however very variable, and pales much in winter."—(*Ibid.*, *t.* 6150.)

Pear—*Souvenir du Congrès.*—"This remarkably fine French Pear was raised by M. Morel, and appears to have been a seedling from Williams's Bon Chrétien, which it resembles in some respects. The tree makes a fine and prolific pyramid. We have to thank both Mr. Dancer of Chiswick, and Messrs. Rivers & Son of Sawbridgeworth, for specimens, the latter being the largest as well as the best in quality, and measuring about 10 inches in circumference. The fruit is large, obovate or bluntly oblong-pyriform, with an uneven lumpy or slightly furrowed surface; stalk oblique, stout, set on with scarcely any depression, its base surrounded by a patch of russet; eye small, nearly closed, set in a moderately deep russety hollow; skin clear yellow where shaded, flushed and indistinctly streaked and blotched with bright cherry red on the exposed side. Flesh white, fine-grained, very juicy and melting, with a brisk vinous flavour and agreeable aroma. The tenderness and juiciness of the flesh are very remarkable, and the fruit is very handsome. Mr. Dancer's fruit, tasted on August 19th, was scarcely up to the mark in flavour; and we notice that some of the continental growers regard it as only second-rate; but a better ripened sample from Messrs. Rivers, tasted on September 3rd, proved to be excellent."—(*Florist and Pomologist*, 3 s., viii., 37.)

Cultivation of Tropical Fruit.—We understand that a company has been formed for the cultivation of tropical fruit, and is in treaty for a tract of 640 acres of land at Biscayne Bay, at the south-eastern extremity of Florida. This tract was a military post during the Florida war, and has growing upon it a large number of fruit trees—viz., Banana Plantain, Cocoa Nut, Orange, Lime, Lemon, Bread Fruit, Date,

Guava, Mango, and others too numerous to mention. The capital of the company will be $10,000, $7000 of which is already subscribed. Frost never reaches this place; the climate is delightful winter or summer, and perfectly healthy. —(*California Horticulturist.*)

THE SMALL-BIRD QUESTION.

As the small-bird question has again turned up I may perhaps be allowed to say a few words on the subject, not limiting my remarks to sparrows alone, but to the whole family of small birds, of which sparrows are not always the most numerous nor the greatest delinquents. In the present instance we will class them with other small birds. I formed a conclusion on this subject years ago, and I have not seen nor heard of anything to induce me to alter the opinion then stated. Let us now take a peep into Nature's book and see the working of the matter in all its bearings, giving the birds their due for all the useful purposes they fulfil, and contrariwise for all the mischief they do us. Taking the whole matter into one view, we may rest perfectly assured that an All-wise Providence sent both birds and their food in due proportions into the world together, balancing the whole with a nicety which we have no chance of imitating; nay, on the contrary, there is no question but man, more especially in the highly civilised parts of the world, has very much destroyed this balance, and in the case of small birds let us see how this has been done.

If we look into the mode that Nature has adopted to reproduce the various species of living objects that occupy the world we shall see that the smallest, and those that furnish food for beings larger than themselves, increase the most numerously. That is a wise and beneficent law, and is exemplified by birds only in common with other animals. This law is essential to preserving a due balance, founded on the natural principle of supply and demand.

The preservation of game has altered the intention of Nature considerably; the birds of prey, usually so called, whose duty it was in a great measure to thin and weed out the superfluous small birds, have themselves been persecuted almost to entire annihilation, hence the whole family of the little warblers have multiplied out of proportion to their uses; added to this there has been a good deal of sympathy created in their favour by those who are not suffering by their depredations. Such kindly sympathisers think themselves aggrieved because the farmer or gardener destroys some of them in retaliation for the injury they do him. This injury is great, especially in country places where woods and other means of cover give the birds every encouragement to multiply, and where the assiduous gamekeeper has taken the pains to destroy all hawks, owls, magpies, and other birds of a larger kind that either make the smaller ones or their eggs their daily food. This has tended to augment the number of small birds beyond what is necessary; and although the denizen of a city, whose early morning walks may be enlivened by the song of these harbingers of spring, and forthwith rushes to print in their behalf, ought at all events to allow those who suffer from them to give an opinion as well, or rather they as losers ought to have a decided claim for recompense, which can only be done by waging war on the aggressor in spite of a feeling of sympathy which has been thrown into the case and against bird-destruction.

By the extirpation of carnivorous birds and bird-destroying animals by the gamekeeper, the preponderance of small birds is but a natural consequence. These flourish in the home preserves, where a gun is seldom heard, and as a matter of course avail themselves of the luxuries of horticulture. And here, unfortunately for the cultivator, they seem to be fonder of seeds and fruit than of insects. Newly-germinating seeds of sweet green Peas appear to suit their tastes exactly, while amongst fruits the thrushes and blackbirds are most audacious and persistent marauders. Neither is netting effectual. In some way or other the birds will be in. I have known upwards of twenty birds a-day taken from under nets which were considered birdproof, and how many escaped could never be known. I daresay there are those who would advocate the setting at liberty of these caught birds, on the grounds of humane and kindly feeling, and as a protest against cruelty. Their testimony is, however, only one-sided, and the charge of cruelty is at best a morbid one, seeing that they have not suffered any injury. It is not attempted here to be denied that small birds have a duty to perform in the economy of Nature, as have also mice, rats, snakes, wasps, and the like, over which no one, as far as I am aware, has yet thrown the cloak of protection; but when the balance between one class and another is so effectually broken as it is between the small birds and their natural enemies, tomtits, chaffinches, sparrows, and the like abound in greater numbers than are required: hence the reasonable source of complaint.

With regard to the question of birds devouring caterpillars and insects in general, there seems a great difference of opinion on the part of those competent to give one; and the matter would resolve itself into the question, Are gardens which are much infested by birds more free from insect pests than others in populous districts where sparrows are the only birds to be met with in any number? My own opinion would be that birds only look after the caterpillar and insect family when they have young, and I am not sure that they always do that. In this immediate neighbourhood Filbert and Cob nuts are extensively grown, and no class of tree suffers more from the caterpillar than these do; and although there is a difference of opinion about the utility of birds in helping to clear them of these pests, by far the greater number of growers—and they are an exceedingly observant class—assert that the caterpillar-destroying birds are very few indeed. Pains have been taken to shoot several and examine their crops without any token of a caterpillar inside. A friend of mine made a good many experiments of this kind at a time when his plantation was almost denuded of foliage by these vermin, and when he as well as others were employing all the women and boys they could collect together to pick them off by hand. The cost of this handpicking is immense.

Now, if the friends of the feathered creation could train their pets to accomplish this task, it is needless to say what a saving of labour and expense it would be. I cannot at this moment call to memory how many bushels of caterpillars I have heard of being gathered in one season from one plantation, but certainly it was measured by bushels, and yet this was in a neighbourhood abounding in birds of most kinds. So greatly did small birds abound, that the cultivation of Gooseberries has been in some cases discontinued in consequence of the injury done to the trees by the buds being picked out just as they were beginning to swell and start into growth. This evil was so great some years ago that many Gooseberry plantations were done away with, all but one particular kind—a rough yellow one that ripens early, but not large, its buds when in a young state being much smaller than those of the generality of Gooseberries, and consequently less cared for by the birds.

But Gooseberry buds are not the only buds that suffer at such times. Plums are equally laid under contribution, and the wrathful remarks of growers who see a fine tree disfigured by such means may be justly placed in the scale against all the evidence of those who gain but do not suffer by the mischief these lively marauders so quickly accomplish. To listen to these songsters in early morn is charming enough, both to the dwellers of the town and the country fruit-growers; but as the latter are the only sufferers in the case, they can hardly be blamed for taking the law into their own hands. The mere wanton destruction of fruit would seem the aim of the offender rather than satisfying hunger. The birds pick from each and spoil the whole, and pick at a point, too, the best to hasten the fruit's decay. It is all very well to say they may be kept off with nets and such like; it is only those who suffer most that know the difficulties in such cases.

It is needless adding more on this question, which if open to discussion ought to be taken in hand by those who have suffered most by them, as well as by those who think they have benefited by their presence. Mere admirers ought only to have a secondary place, as they ought not to be too urgent in advocating their hobby where it is at another one's expense, as has been shown above.

In conclusion, I would not have it inferred that I am an enemy to small birds where they exist in moderation, as I am fully sensible of their utility, and have no doubt but they will do good in Australia and other countries to which many are being taken. It is only where they are encouraged to a degree disproportioned to the wants of the neighbourhood, and when cultivation has limited the supply of food Nature originally intended them to partake of, as the seeds of wild plants and the like; then I say let a part of them be destroyed. —J. Renson.

I hold a different opinion to Mr. G. Abbey's "boy of fifteen," who asserted that sparrows feed their young on caterpillars,

for the reason that I have opened many young birds and found, instead of caterpillars, wheat, rice, and bread. Still, I believe that they eat some insects, as I have seen them catch moths and pick green fly off the Rose trees. Still, I do not think the good they do compensates for all the injury they commit. Sometimes they will attack the Gooseberry bushes as soon as the leaves drop off, and strip the trees of buds until they are not worth a farthing. Some people say they save us the trouble of thinning the fruit; but I would much rather thin them myself, for the sparrows always take the finest buds which would have produced the largest fruit. I have also been so close to them as to see them pick the buds and shell them, and drop the husks on the ground. I have further seen them pick off the Plum buds. They will sometimes take them until the ground under the trees is entirely covered with husks; they will also take the Red and White Currant buds to the extent of destroying the entire crop of fruit. As to the Peas, Mr. G. Abbey says the sparrows are never so happy as when the Peas are in bloom, but I think they are happier when the early Peas are just through the ground and they can nibble them off from end to end of the row. Linnets I have never seen take the buds, but have seen them visit the Radish and Cauliflower beds and pull up the seeds when just pushing through the ground. I think therefore that Mr. G. Abbey is mistaken in linnets being rapacious bud-destroyers.

Mr. Abbey asks, Why does the sparrow frequent our gardens during the breeding season, as its place is in the farmyard or the barn? The answer is, that at this particular season farmers are employed otherwise than by thrashing, and therefore there is little or no seed for the birds to pick up near the farm buildings. The reason why it follows the footsteps of man is because it finds a certain amount of food about his habitations, such as crumbs of bread swept up and thrown among the ashes and other household wastes, as Green Peas and Potato parings, which the birds are very fond of.

If the sparrows eat so many insects and caterpillars, how is it that fields in the country do not become eaten up with these pests, and over which the sparrow never flies from year's end to year's end? Mr. Abbey says that the whole of its life is devoted to the service of man; I say that a great portion of its life is devoted to the destruction of fruit buds and Green Peas. A dusting of lime is recommended to save the buds, but I find several dustings fail to do so. I am inclined to think the sparrows in Mr. Abbey's garden are different to those in mine if they never take the buds. I have no prejudice against sparrows, but simply state that I have seen them at their destructive work. Instead of regarding them as gardeners' friends I look upon them as amongst our greatest enemies, and I say with Mr. Allcock, Kill every sparrow you can.—R. Walker, *Derbyshire.*

I have been asked to give my opinion as regards sparrows in the garden. I am a general lover of birds, fruit, and flowers; and being in a neighbourhood where there are woods, copses, and hedgerows, I have the pleasure of seeing very many of the former. There are but three birds which visit my garden I would like less of: these are bullfinches, blackbirds, and sparrows. The first I would rather not have one of if I could avoid it. I know of no good the bird does. It is not only a bud-eating bird, but a bloom-bud-eating bird, taking the bloom buds in preference.

Of the blackbirds I like a few, but they are sad fellows for picking holes in the Pears and Apples when nearly ripe, so as to entirely prevent their keeping; yet they do a great deal of good.

As for the sparrows, the only time they are of use is when they have young. But what destructive fellows they are! In the spring they go to work on my Gooseberry bushes in a most unmerciful manner, and the ground underneath is strewn with the buds. Granted, cover them with net. Very well: then look at my Pinks with the crowns picked out; look at my Crocus, the yellow ones, with the blossoms flung here and there; my Cowslips, my Primroses, also so served: these I cannot net over. Then think of the Radish seed, the Turnip seed, the young Peas, the Currant bloom, and other things which I cannot call to mind. No: I would rather, for my peace of mind as a gardener, be without the sparrows. Give me starlings for grubs and caterpillars. It is indeed wonderful the quantity they eat. I have made holes for them to breed in, and I have several pairs; thrushes in swarms at times. Nightingales, blackcaps, titmice, hedge sparrows, robins; all the soft-billed birds, even chaffinches, and greenfinches, and linnets, I like to have; but no, not sparrows. I must agree with some of your contributors that fond, very fond, as I am of birds, I would rather not—much rather not—have many sparrows about if I really wished to enjoy my garden.—Harrison Weir.

[All that can be said for or against small birds being tolerated in a garden, has now been said.—Eds.]

EUCHARIS AMAZONICA CULTURE.

A correspondent, "G. P.," has written in reference to this plant in last week's Journal. I cannot remember writing to any contemporary about it, but can say that it flowers three times in one season from the same bulbs, and has done so for many years. The minimum temperature in the house where it is grown is 65°. The potting material is substantial turfy loam, with a little manure, leaf mould, and sand added. As the plant likes copious waterings the drainage is good.

When the plant has done flowering only sufficient water is given for a few weeks to prevent the leaves from flagging, when they again receive a liberal supply. We have several plants, the largest must have nearly fifty bulbs in the pot. Some of the plants have been tried in cooler houses, but they succeed best in the higher temperature.—J. Douglas.

THE EFFECTS OF OPEN BRICK-KILNS ON THE SURROUNDING VEGETATION.

Observing a short paragraph in a recent number of the Journal on the above subject, I imagine a little further information may not be devoid of interest. I have, to my cost, had some practical experience of the deleterious effects of the sulphurous fumes from open brick-kilns upon vegetation generally, and upon certain trees and shrubs particularly, and record the following facts. First with respect to distance. I have known some things injured at a distance of 300 yards or more, young Larch for instance; and almost all the Pine tribe when in their most active growth, say about the middle to the end of June, and more especially after rain or when the air has been loaded with moisture, have been injured most seriously at this distance.

I have had the leads of Larch entirely killed when young and succulent at 400 yards from an open kiln, but to do this the current must be direct and concentrated. Of course it depends upon the currents, and at such a distance many escape, although apparently in the direct current. How to explain this I never was able, except on the supposition that some plants were more vigorous than others and less susceptible, for I invariably noticed the weakly ones suffered the most.

I have had two actions against an owner for damage done by his kilns, and have gained both. These kilns are all open —*i. e.*, on the old principle, and the fumes given off from such were very considerable, and the sulphurous acid, or vapour of sulphur, being considerably heavier than the atmosphere always has a tendency to fall, and not, as some people imagine, to rise as ordinary smoke; and although the kilns are situated on a higher level than my nursery, the injury was nevertheless done.

The trees injured by the fumes at a distance of from 170 to 300 yards were Plums, Thorns (double pink more especially), Cherries, Spruce Firs, Balm of Gilead, Tea and Noisette Roses, Golden Yews, Pinus excelsa, and Weymouth Pines, Beech, &c., all when in their most active growth and when in a soft and succulent state. On the contrary, Apples, Laurels, Peaches and Nectarines, Arbor Vitæs, Pears, some strong-growing Hybrid Perpetual and other Roses, Privet, Limes, Elms, Hornbeam, Hollies, Cedars, Cypress, Junipers, Oaks, Planes, &c., when growing in the same quarters, and in some instances 100 and 150 yards nearer the kilns, and yet in the direct line from the kilns, have not even suffered to the extent of a damaged leaf.

This is certainly very extraordinary, and why they should be able to stand the fumes I cannot explain, but such I know from experience to be the fact. I do not say that all these trees are proof against the effect of sulphur fumes; but what I do say is this, that at a given distance—say 150 yards—what is strong enough to injure very materially a Plum tree or a Fir in active growth would pass over a Laurel or an Arbor Vitæ, or an Apple tree still in the same succulent state, and not visibly injure it in the slightest. To explain such phenomena is beyond my power, and could only be done by close

observation and scientific inquiry. Perhsps chemistry might do much towards making clear to us what now is enveloped in mystery.

I find also that Peas, especially the early ones, suffer greatly. I had a crop of Ringleader sown for seed totally destroyed—at least so far injured when about 6 to 9 inches high that they never recovered. They appeared as if a hot blast from a furnace had passed over them, browning all the leaves and cutting off the young growth, so that the weeds got master, and the crop was ploughed-up.

Mangold Wurzel and Turnip planted for seed also suffered; but Potatoes much nearer the kilns did not show the slightest trace of injury. Of Corn crops I have found Barley the most susceptible of damage, and have traced the browned and blanched flag to a yard in a line where the current has passed over the crop; and at the time of cutting, the Barley was shorter and the ears smaller than those parts of the field unaffected.

I may just add that the owners of other brick-kilns, from which I have also suffered, deemed it advisable, to put a stop to further damages, to build a new kiln and erect a shaft about 70 or 80 feet high. This they have done, and I am glad to say that since then I have not experienced any annoyance nor noticed any injury; so at any rate it is preventible.—Charles Pennell, *Lincoln Nurseries.*

EARLY POTATOES.

At the January meeting of the Fruit and Floral Committee of the Royal Horticultural Society, Mr. Batters, gardener at Chilworth Manor, Romsey, exhibited a very fine sample of new Potatoes, which took some members of the Committee by surprise. Before giving any award the Committee was desirous of knowing how these had been produced, and the following is Mr. Batters' reply. We need hardly say that upon being informed of the skilful way in which the new Potatoes were produced the Committee at once awarded them a cultural commendation.

"The variety is Rivers's Royal Ashleaf, dug from open ground, June, 1874. They were laid thinly in a spare upstairs room, and on October 2nd were potted in 32-sized pots. Placed first on the back shelf of a Melon house, they were afterwards removed to the back shelf of a cold house on October 20th, being then 9 inches to a foot in height. They remained in the cold house until November 24th, having plenty of air during the day, and then removed to a small Fig house, through which a little piping runs on its way to early Vines. I shifted a few into larger pots at this latter date (November 24th), but found no benefit from the shift.

"I sent the first dish to my employer's table on January 1st, 1875, about the average size of those sent up last week. My employer and her guests told me they were beautiful, and not at all close. I potted another lot this month, January 23rd, and another yesterday. I find one can accommodate a dozen or two pots when one cannot command a frame, and you can also imitate summer with the soil better in pots than in a pit.

"I am trying Vegetable Marrow from cuttings put-in in autumn. With your permission I will communicate the result by-and-by.—J. Batters, *Chilworth Manor, Romsey, Hampshire.*"

PACKING FLOWERS.

I observe in your issue of February 18th a description of a plan of packing flowers to send by train or long distances. I have the produce of gardens and glass houses sent up to London each week, and my hampers and boxes leave the house in the country at eight o'clock one morning, and after jogging in a country cart eight miles to the nearest station reach London at twelve o'clock the next day, thus passing twenty-eight hours closely shut-up. After many unsuccessful attempts I have at last adopted a plan which succeeds perfectly. My carpenter has made two common deal flower boxes 8 inches deep, with two trays each, which fit into the inside by a very simple contrivance, and leave space between each of 3, 2½, and 2½ inches. Upon these trays the gardener lays as many flowers as he can without putting one over the other, and when they are unpacked and have been in water for a few minutes they are as fresh as if newly gathered. Camellias, Roses, splendid double Hyacinths, Orchids, and Ferns, carry in this way most satisfactorily. The carpenter has put hinges and a lock with two keys to each box, and painted the address in full on the outside, and I have now for a few pence weekly the full enjoyment of all the flowers grown 150 miles away. I venture to recommend this plan to others, as it is in every way desirable to keep as much as possible *en rapport* with establishments which are frequently left for eight months out of the twelve without the supervision of the owners. I adopt also the same plan for fruits and butter, leaving the vegetables to be sent in a common hamper, altering the dimensions of the boxes and the spaces between the trays to suit the different articles put inside.—A Constant Reader.

CULFORD HALL.

Culford Hall, the seat of the Rev. Edward Richard Benyon, is about four miles N.N.W. from Bury St. Edmunds. The estate includes the five parishes of Timworth, Ingham, Wordwell, West Stow, and Culford, and exceeds in extent 12,000 acres. The land varies in character, but is mostly light, upon a subsoil of gravel or chalk. This manor appears to have been given at an early period to the Abbey of St. Edmund, but afterwards became the property of the Bacon family. The Hall is a large handsome mansion, and was built in 1591 by Sir Nicholas Bacon, and passed with the estates by marriage into the noble family of Cornwallis. It was purchased about the year 1823 from the executors of the last Marquis by Richard Benyon de Beauvoir, Esq., uncle of the present proprietor. It is surrounded by a park of some five hundred acres in extent, which is remarkably well wooded, containing fine specimens of ancient Oaks, Elms, Beeches, Horse Chestnuts, &c. It is also embellished by a fine piece of artificial water on the south side of the Hall; this is formed by a tributary of the river Lark, and was designed by the celebrated landscape gardener Repton, and its skilful disposition gives evidence of the talent of its designer. At about a quarter of a mile west from the Hall the water is spanned by an extraordinary massive iron bridge, which was erected at an enormous cost by the first Marquis of Cornwallis on his return from India. The chief approach to the mansion was made to cross the river by way of this bridge. But the principal entrances are now in the village of Culford.

The church stands in the pleasure grounds a short distance from the Hall, and is exceedingly neat and ornamental in appearance, being built of flint, with facings of Caen stone. It is furnished with a square tower of very chaste proportions. It was rebuilt in 1856 on the site of a former church, which was of great antiquity, and contained many ancient and interesting monuments to different members of the Bacon and Cornwallis families, all of which have been carefully preserved. It is worthy of mention that the present proprietor of these estates has, since he came into possession of the property, rebuilt or restored the church of each of his five parishes, and has also built an entirely new one for the benefit of the inhabitants of the northern portion of the parish of Culford, which is five miles in length.

The conservatory stands near to the Hall, and has a small flower garden and fountain in front of it; while in the rear of the structure, and communicating with it, is an exotic fernery containing fountains, waterfalls, &c.; and a wilderness or hardy fernery occupies a position near to the gardens.

In the grounds are some good specimens of the Cedar of Lebanon, the Deodar Cedar, Wellingtonia gigantea, Picea Pinsspo, Irish Yews, &c. The gardens are situated on the east side of the Hall, and at a distance of some 500 yards from it. They contain upwards of eleven acres, and slope gently to the south, and are surrounded and intersected by brick walls of various heights. These gardens also contain about 1500 yards of Yew hedges, which vary in height from 4 to 12 feet. The principal walks are 10 feet wide, and the walls are pierced where necessary by circular arches of the same width.

There are a considerable number of glass structures of various kinds—viz., two span-roofed orchard houses each 90 feet long, 20 feet wide, and 12 feet high, chiefly devoted to the culture of Peaches, Nectarines, and Cherries. A lean-to Fig house, 220 feet in length; 200 feet of wall, on which Apricot trees are trained, and dwarf standards planted in front of them at a distance of 5 feet from the wall, and so arranged that a glass roof is placed over them when the trees begin to bloom, and taken off when all danger from frost has passed. By this means a crop of fruit is always secured. The ripening of the fruit of the standard trees succeeds that of the trees trained to the wall, and by this means the season of this useful fruit is greatly prolonged. There are also a greenhouse 30 feet long, a plant stove, Melon house, Cucumber house, and Strawberry house; an early Peach house, two small vineries

for early forcing, planted chiefly with the Black Hamburgh and Muscadine varieties—one for late Black Hamburgh Grapes, one for Muscat of Alexandria, one for West's St. Peter's and Black Alicante, one for Lady Downe's and Mrs. Pince, and one house which contains various sorts, together with pits used for the purpose of forcing early Potatoes, Asparague, &c. We will now add the notes of another correspondent.

Being in the neighbourhood of Bury St. Edmunds, I took advantage of the opportunity to spend a few hours with Mr. Grieve, the head gardener to the Rev. E. R. Benyon, so well known to the horticultural public by his skill in crossing Pelargoniums of the Zonal section, especially the Tricolors. On first entering the kitchen garden the visitor is struck by the way it is laid out, and the method of training the Gooseberry bushes. Very stout poles are inserted in the ground at the base of each bush, to which the trees are trained in the pyramid fashion. A whole quarter is devoted to the bushes, and ample space allowed between the rows to allow of gathering the fruit with facility. The quarters of the garden are divided and subdivided by Yew hedges; these are regularly furnished throughout, and have been clipped and trained with mathematical precision. This is certainly a very pleasing arrangement so far as effect is concerned, but its advantages are doubtful. The hedges may shelter some crops, but they occupy much space, and would not do where ground is valuable.

There are likewise extensive ranges of glass houses in the kitchen garden. The first range we enter is a Muscat house and Peach house. Some excellent Muscats were still hanging on the Vines; the bunches were small, but the berries possessed that high golden colour indicative of good cultivation

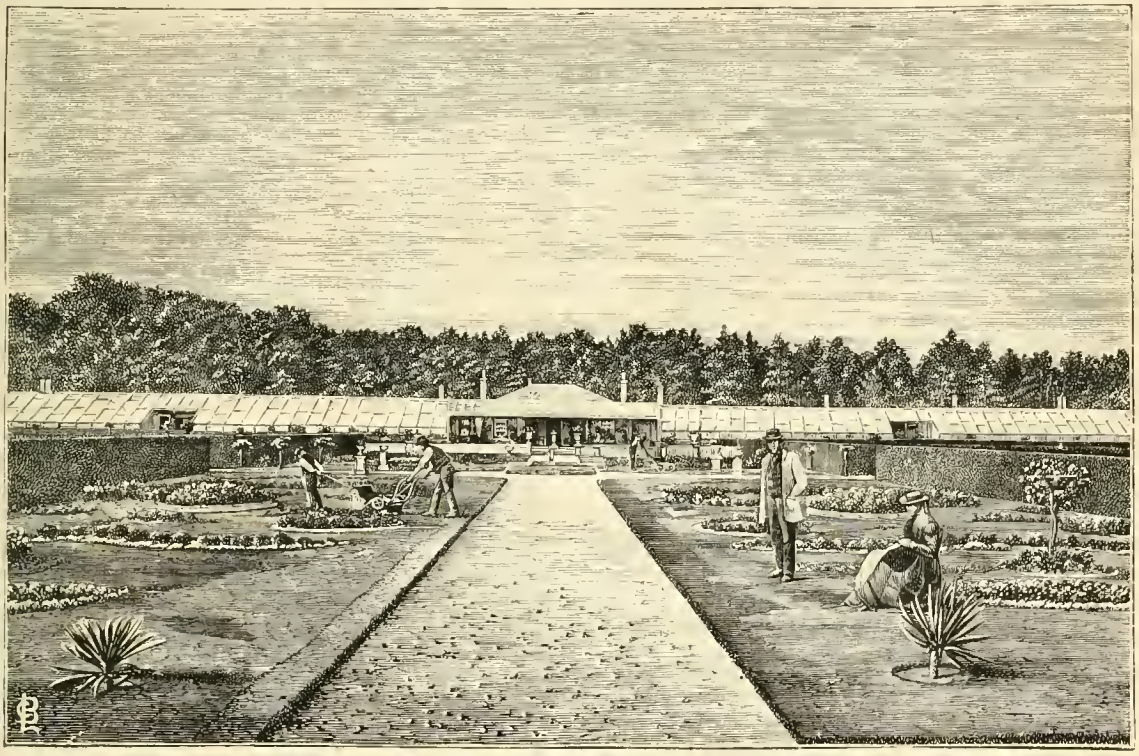

Fig. 43.—The conservatory and flower garden at culford hall.

Mr. Grieve cuts his spurs back close to the main stem, not caring to cut to a good eye, which soon causes unsightly spurs to form, but which is the sure way to get large bunches. Most interesting to me were the two fine orchard houses. There is a bed in the centre, which is planted with one row of Peach trees 6 feet apart. The side borders are planted with Cherries, all the trees being trained in the bush or pyramid form. From some cause Cherries do not succeed in the open air at Culford, but excellent crops are obtained in the same house with the Peaches. Some cultivators experience difficulty in getting Cherry trees to set their fruit; but this need not be, if only the atmosphere can be dry and air admitted night and day. Black Hamburgh and Royal Muscadine Grapes are grown over the passages from Vines trained to wires near the glass; these two sorts are the very best that can be planted in such position. Another orchard house is devoted to Peaches and Nectarines planted out and trained to a trellis overhead. The training was different from anything I had previously seen. It may be styled cordon training: main branches are trained either horizontally or vertically, and the side growths roughly spurred back after the manner of Vine rods. A large number of varieties are grown. I inquired which were the best Peaches, and they are Noblesse, Belle de la Croix, and Grosse Mignonne; and for early forcing, Royal George. Nectarines—Elruge, Imperatrice, and Pitmaston Orange. Mr. Grieve does not grow Pine Apple, but it is certainly superior to all of the orange-fleshed sorts.

Decorative plants are trained to the back walls in some of the houses, notably Habrothamnus elegans, which was plentifully covered with deep rose-coloured flowers. Begonia insignis, one of the very best for winter flowering, is much grown. Amongst the bedding plants wintered in these lean-to vineries were a large number of standard Zonale Pelargoniums, single and double-flowered. The plants are trained to a clear stem of 3 or 4 feet high; the heads are trained to a circular wire, and the plants supported by a stout stick when they are planted-out in the beds. These plants, many of them ten years old, are very useful for planting in the centres of beds and as single specimens on a lawn. Of bedding Pelargoniums the best white-flowered variety is a hybrid raised at Culford named Dolly Varden; it is a cross between a bronze Zonal and P. peltatum elegans. Bronze Harry Hieover is the best for small beds. Culford Rose and Culford Pink are both very useful varieties for vases, especially the former. Bridal Wreath, another hybrid Ivyleaf, is a favourite here.

The vineries contain the Vine described and figured in the Journal (see page 583, No. 718) from which the bunch of Golden Champion was cut from a cane of Trebbiano. I did not see the bunch hanging, but those who did see it had no doubt whatever but that it was Golden Champion. It has also been found that Muscat Hamburgh succeeds remarkably well worked on the Froutignau stock. In the Lady Downe's house, where a very large crop was hanging, were a few rods of Mrs. Pince's Black Muscat, which is much liked for its good flavour, but it

does not keep nearly so well as Lady Downe's. The Vines are trained on the double-rod system. A large house is devoted to Fig culture, the trees being trained to a trellis fixed under the glass and also against the back wall, the varieties most approved of being Brown Turkey and Raby Castle.

In the stove the beautifully-marked leaves of many different varieties of Coleus had an excellent effect. A fine specimen of Adiantum farleyense was noticeable. The old Centradenia rosea floribunda was flowering very profusely, and an excellent plant it is for decorative purposes during the winter months. In the greenhouse Coronilla glauca is largely represented; it will thrive under ordinary treatment, and is very useful either for cutting or decorative purposes. I also noticed a very handsome specimen of what seemed to be Clianthus puniceus, the Glory Pea of New Zealand, but it was of a much more robust growth than is commonly seen. It is evidently a variety of the species, and has been named Magnificent. The Clianthus is a good pot plant, but to see it in all its glory it should be planted in a conservatory border. The coolest treatment suits it, and if kept free from red spider by daily syringing when it is making its growths it will soon make a large plant or bush 12 feet high, which when loaded with clusters of its large crimson Pea-like flowers is an object of great beauty. I noticed in the conservatory a number of well-flowered specimens of Salvia splendens; their numerous spikes of brilliant scarlet flowers were very attractive. There was also a good stock of healthy plants of the double white Primula sinensis. This is rather a difficult plant to keep through the winter, but the flowers are useful for cutting, and they also remain in good condition on the plant for a very long time. Attached to the conservatory is a fernery under glass; it is formed of artificial rockwork, the Ferns being planted in nooks in prominent positions, where a sufficient depth of mould can be obtained; the groundwork is principally composed of Lycopodium denticulatum. I noticed the following Ferns:—Adiantum scutum and A. cuneatum, Nephrolepis exaltata; Lygodium scandens, the climbing Fern; Cibotium spectabile, &c.

There is a neat flower garden in front of the conservatory, but the principal part of the bedding-out is done at the kitchen garden. A series of beds have been laid-out in front of the gardener's cottage, which has been erected about the centre of the hothouses. The plants had all been cleared from the beds at the time of my visit, but under the management of such a master as Mr. Grieve they are no doubt worthy of Culford. —J. Douglas.

THE LATE MR. DOWNING'S AURICULAS.

A writer in one of your contemporaries, in an appreciative article on the Auricula some time ago, said that he thought there was something in the flower that seemed to fascinate the grower, and that it was the last fancy that clung to a florist in his declining years. I believe it is true. There are no florists, I believe, so mad as Auricula-growers; there are none who give so much personal care to their pets as they do, and it is the last thing they relinquish. Mr. Lightbody gave up his Pinks, Tulips, and Ranunculuses, but he still kept his Auriculas; and although Mr. Downing had been a celebrated breeder of shorthorns—so much so that one animal of his breeding some years ago sold for £1700 by auction—yet they were given up. He had his garden and greenhouses, but the care of these was relegated to his gardener; but his Auriculas he repotted and cared for himself. I never had the pleasure of meeting him; we have corresponded, and his letters were those of a kindly and enthusiastic lover of flowers.

I should suppose that his collection must have been certainly one of the largest, if not also the richest in the kingdom. It comprised a row of four three-light frames containing very nearly a thousand plants in 24's, and another pit 48 feet long filled with seedlings. Every variety in growth of any value was to be found here, and many of them in large quantities. He had grown them for thirty or forty years, and was as enthusiastic over them as ever. He had many seedlings of which he thought highly. All this fine collection was disposed of last week. A large number of the lots (which were put into too large quantities to suit amateurs) were bought by our great southern Auricula-grower, Mr. Charles Turner of Slough, and the others by nurserymen, only one lot, I believe, having been bought by an amateur.

Mr. Downing's illness was of very short duration, and his death quite unexpected. Although never an exhibitor, yet we see he was a most enthusiastic grower of this fine flower; and we are sorry to miss from the roll-call of the Auricula-lovers one who, with a fine property and with everything at his disposal for any fancy he might indulge in, yet to the last never deserted the flower which he had wooed in his early days as to many of us have done, and which exerts so strange an influence over us even to old age.

I am indebted for these few facts to Mr. John Gray of Hagley near Stourbridge, who was a friend of Mr. Downing's and also an enthusiastic Auricula-grower.—D., *Deal*.

JOTTINGS ON LAST YEAR'S GARDENING.

No. 4.

Radish.—Long Scarlet Short-top is the only one of the long-rooted kinds grown after the first sowing in spring, Wood's Frame being shorter and earlier. The best of the Radishes grown last and previous years is White-tipped, Olive-shaped, or French Breakfast, it being of very quick growth, very tender, and mild flavour. Olive-shaped Scarlet differs but little, except in being finer in colour and of quick growth. The Olive-shaped are the best of Radishes, either for outdoors or forcing. The red and white Turnip kinds are also good, but stronger in flavour than the Olive-shaped. Sown in August (third or fourth week) the Olive-shaped will be fit to draw in October, and, protected from frost by mats or straw in severe weather, they will be in good condition the greater part of the winter. Californian Mammoth was sown at the same time as the last of Olive-shaped, August 31st, and came to nothing. The seed was evidently sown too late, but the Olive-shaped are good now—end of January. The first outdoors were drawn on April 30th, in 1873 on May 8th.

Rampion.—This root seems to be coming into favour, and requires to be sown in April for autumn use, and in May for storing to keep over the winter. By some the roots are preferred to Radishes. The roots last year were small.

Salsify.—This was fine, and the frequent call for it shows it was relished. It makes, I am told, a nice dish. It was first used on November 12th.

Scorzonera.—More nutty-flavoured than Salsify. It is a good vegetable for winter, but it was a complete failure. In 1873 the first dish was sent in December 30th (it is ready in October), and last February 26th, 1874.

Savoy.—Tom Thumb is the earliest, and may be planted a foot apart. Drumhead is best, but not so hardy as Dwarf Green Curled. The first was cut December 7th (Cabbage was abundant until then), and last January 31st.

Seakale.—Raised from seed it made less growth than usual last year; generally by one year's growth plants were fit for forcing, but this year they were no use, the small crowns of the former year's sowing far surpassing the seedlings. It is taken up for forcing, but some is covered with pots and comes on naturally. The pots are put in the Mushroom house about a hundred every fortnight, commencing last year November 9th, and continuing until March 13th. Before Christmas twenty to twenty-one days are required from putting in the roots to cutting the Kale, while roots put in after are ready in a fortnight. It was first cut December 8th, and in use until June 16th.

Spinach.—Despite the drought it did well. A rich soil makes up for want of moisture, and for Spinach it can hardly be too much so. Summer or Round is best for spring and summer sowings; Prickly the best for winter; Flanders is a good winter sort with round seed. The Prickly sown about the 10th of August comes-in in October, and lasts in condition until the spring sowings come in.

Tomato.—Hathaway's Excelsior is a smooth ribless variety; Early Prolific not so desirable as Orangefield Dwarf. Tomatoes do no good here outdoors.

Turnip.—Early Snowball and Early White Stone or Six-weeks were both good. Orange Jelly for winter has no superior. After the first sowings, which are best made on a warm border, an open situation on a north border is desirable. Chirk Castle Black Stone is an excellent keeper, and its flesh being white is by some preferred to Orange Jelly. Turnips, with Carrots and other soup ingredients, are expected throughout the year.

Vegetable Marrow.—The season being warm these did well, but under the first moist weather in early autumn the plants succumbed. Custard invariably does badly. The Short-jointed Long White is the best of the Marrows.

Rhubarb.—Johnson's St. Martin's, a fine improvement upon the small Scarlets. The stalks are red inside as well as outside. It is as early and productive as any, and better

flavoured. Next to this I like Linnæus, which forces better than Royal Albert, and is larger, but the palm for forcing must be given to Johnson's St. Martin's. For general use Victoria is recommended. Monarch is the largest; it has a monstrous leaf and thick and green stalk.

Shallots could not stand the drought and were small. The large kind is not so good as the small one. Potato Onions, with Garlic, maggoted and were severely mildewed.

Jerusalem Artichokes are much used. They are easily grown if the soil be good and light.

Potatoes.—Very little or no disease. Crop good, quality of earlies good, but the late kinds indifferent. There has been little addition made to the number of kinds, for the simple fact that the old ones are so good. Sandringham, the old and true Ashleaf, is earlier by a week or ten days than Myatt's Prolific Ashleaf, and commences to grow much earlier in store than any of the Ashleafs, the eyes not unfrequently proceeding from a shoulder or knob. The Royal Horticultural Society say it never blooms, which it does with me every year, and always did for the last thirty years, as I have seen it by the acre on the sandy loams abutting the warp of the Ouse. Mona's Pride I have given up, being better served by Myatt's Prolific and Veitch's Ashleaf. The latter has a dwarfer haulm, and is very prolific and of excellent quality, coming into use at the same time as Myatt's Prolific.

To succeed those I grow Lapstone, which upon our light soil is excellent alike in cropping and quality. Bryanstone Kidney is later than Lapstone, has large fine-shaped tubers, very prolific, and of excellent quality. It is a desirable kind. Rector of Woodstock I had last year for the first time, and it is very prolific; the tubers though not large are numerous and of a good, useable, even size, flattish round, with a white smooth skin, and the eyes not sunk but level with the skin; altogether a very handsome tuber. The quality is said to be excellent, but I am so pleased with its appearance that all have been saved for seed. The haulm though robust is only of medium height, and no more spreading than an Ashleaf. It ripens-off in good time, coming-in about the same time as Lapstone. Victoria is grown to succeed those aforenamed, and does not do so well as the others, the haulm becoming much too strong, and the quantity and quality of crop suffer, and disease appears. It is, however, a heavy cropper, and the quality is good. Those are the dependant kinds, with Walker's Regent for winter, which is a good cropper, large, and excellent in quality. We still keep a few of Hundredfold Fluke (Suttons'), which has never had disease; Red-skinned Flourball (Suttons'), immensely large, and not had disease; Excelsior, Willard, Late Rose, Early Rose, and three nameless sorts, one flattish round, a rough skin, boiling very floury; a piebald round kind from Belgium; and a rose kidney. Many kinds have been discarded as either coarse, poor croppers, or indifferent in cooking qualities.—G. Abbey.

SEAKALE AND RHUBARB TUBS.

On reading Mr. J. Wright's notice of this, to him, new invention I was led to exclaim, "Nothing new under the sun!" It is now more than twenty years since I saw the same sort of boxes used by Mr. W. Thom at Newtondon, near Kelso, N.B. Probably he still uses them. Mr. Thom's boxes were made in the same way, but instead of being narrower at the top they were of the same width throughout. I think this an improvement, especially for the Rhubarb, as even with the wider top I found it difficult to get the sticks out without breaking them; and being kitchen boy at that time I had some experience of burrowing amongst the wet dung and leaves. I also remember that the boxes were fitted with a lid, in the centre of which was a round hole about an inch in diameter. This was to allow of the escape of any steam that would find its way from the fermenting material into the box, and by pushing the fore finger through it the lid could readily be removed.

In this neighbourhood a much cheaper and quite as convenient an article is the flour barrels which are sent to this country from America. They can be bought at any flour mill for a small sum—from sixpence to one shilling each. One end is always out when they are bought, the other end must also be knocked out. A cross piece of wood is then nailed on to the lid, which projects an inch or so over to prevent it from falling into the barrel. We have long ago given up this system of forcing Rhubarb and Seakale.

The flour barrels are still used, but in a very different way. The Rhubarb is first dug-up, and then packed as close as possible in the bottom of the barrels, with the crowns up of course. A little mould is then put in, but not so much as to quite cover the crowns. They are then removed to a vinery, Mushroom house, or anywhere where a high temperature is kept up. Rhubarb can be obtained much quicker and with far less trouble in this way than by wheeling a lot of fermenting material to the plants. Of course those who have not forcing houses must get it in the old way still.—J. Douglas.

I am glad to have drawn attention to this useful and simple home-made article, as it may bring that, or something better of the same nature, into general use. This would be an advantage to many who have Seakale to force and neither pots to cover it with nor a Mushroom house or other warm structure in which to introduce the roots. Other cultivators have, it seems, long used similar boxes, but I know they are not general, not nearly so much so as the unfortunate conditions of the many who are neither provided with pots nor houses, but who are expected to force these vegetables. As to their originality, I was careful not to commit myself on that point, as so many "original" things have been used "years ago" when their utility becomes known. That, however, is a very secondary matter. The main point is, Are they useful? As seen at Burghley they were serving their purpose admirably. I simply recorded that fact, and "wondered that something of the same simple and effectual nature had not been in use long ago." That such has been adopted and answered well is only confirmation of their usefulness. I will wonder again—this time why my friends imply that I mentioned them as "original," when I did nothing of the kind. But, thanks to Mr. Gilbert, the box is before the public. Those who have proved it worthless will of course not use it, while those who have no pots are provided with an example of a very good substitute, and if by the aid of these boxes they secure produce equal to that of Mr. Gilbert they will have good cause to be satisfied.—J. Wright.

TROPÆOLUM MINNIE WARREN.

As the time is at hand for preparing for the summer decoration of flower borders and beds a few words about this plant may not be out of place. I have an idea that this Tropæolum is not so much cultivated as it ought to be, and I recommend a trial of it to those who have not grown it for bedding purposes. For ribbon borders or for clumps in the herbaceous borders I think this variety cannot fail to give satisfaction. I have used the plant with great success, and visitors never failed to take note of it as a desirable addition to their own collection of bedding plants.

The plant is of compact dwarf habit, with foliage of light green and creamy white colours. The flowers can either remain or be picked off, as the circumstances may dictate. It contrasts well with many of our bedding plants, but more especially those having dark foliage.

I find that an old stove plant or two kept through the winter will furnish a good stock of cuttings for striking in the spring, which they do freely in a sandy compost, and placed in a gentle bottom heat. If potted-off when rooted, and encouraged to grow freely, they make good plants by planting-out time. Cuttings will also strike in early autumn in a shady pit without bottom heat, and may be wintered in the store pots. I have not proved whether this variety can be raised true from seed. It will grow freely in any ordinary garden soil.—H.

NOTES AND GLEANINGS.

An International Horticultural Exhibition will be opened at Cologne during the present year under the patronage of the German Empress and the Crown Prince. The General Committee has issued a circular inviting all who take an interest in the progress of gardening to contribute to the Exhibition. It is to comprise all horticultural plants and productions (with the exception of Vines and Grapes, which are excluded, owing to the possibility of introducing the Phylloxera vastatrix), also working implements, machinery, as well as collections of any kind connected with rural life and the development of garden culture.

—— Lady Cullum died suddenly on the 16th inst. at her residence, Hardwick Hall, near Bury St. Edmunds. She was the widow of the Rev. Sir Thomas Gery Cullum, Bart., who died in 1855. She delighted and had great taste in gardening, and this may be appreciated by a reference to our views and

descriptions of the dressed grounds at Hardwick published in this Journal so recently as January 21st and 28th. In all her plans she was aided by her head gardener Mr. D. T. Fish. It is stated that she had been talking with him, and giving directions for the planting of that funereal tree the Cypress just previously to the seizure, which almost immediately proved fatal. We extract the following from the *Bury Free Press* :—

"Few things are a higher testimony to character than the length of time that dependants cling to and serve the same employer with the unstinted measure that love gives. Judged by this standard her ladyship stands out as a model employer. Mr. Samuel Barrett may be said to have been at Hardwick all his life, Mrs. Peat for thirty-four years, Miss Woodfine for nearly a quarter of a century, Mr. Fish twenty years, and some of the under servants and labourers for terms equally long or longer. As a patron of horticulture Lady Cullum has long stood pre-eminent. Assisting her husband, the late Sir Thomas Cullum, in all his undertakings to beautify and adorn Hardwick, her ladyship has gone on always adding to the extent of the gardens and enriching their beauty. Her last work—in which she was busily engaged only a few minutes before the attack that terminated her useful life—was determining the site, with Mr. Fish, for a few more ornamental and rare trees. The Bury and West Suffolk Horticultural Society is under the deepest obligations to her ladyship for her cheerful readiness to grant the use of her grounds on all occasions when required; and even this season Lady Cullum had the generosity to offer Hardwick to them should the Bury and Thetford Railway not be open in time to allow the Society to hold their summer fête at Ampton."

NOTES ON VILLA AND SUBURBAN GARDENING.

The snow that has fallen within the last few days, and the slight frosts we have had with a very cold northerly wind, will prevent vegetation from advancing too rapidly, and thereby be an advantage; it has for a time also prevented the progress of some work in the kitchen garden, to which when the opportunity arrives the amateur must turn his attention. I allude to the following crops :—

Jerusalem Artichokes.—Where these are grown the tubers should be planted at once similar to Potatoes, and not less than 2 feet between the rows, but allow 6 inches more if space can be spared. A deeply cultivated soil is necessary for them, although it is usual to plant on one of the worst spots in the garden, which is a mistake, because this vegetable is as profitable in yield as a Potato, if not more so, inasmuch as it is not subject to the disease. It is a custom to allow the bed to stand for several years without replanting. This, too, is a mistake, for then the tubers degenerate in size, and being an ill-formed tuber there is great waste in preparing for cooking. They should be grown as large as possible, and this is best done by making a bed annually and encourage them by manure and good cultivation.

Parsnips.—These may be sown as soon as the ground is workable on the surface. This being a deeply-rooted and exhaustive crop for the ground, the soil should be rich and deeply dug or trenched; but I presume the trenching of the ground has been done some time ago, the advantages of which have been previously stated. The sort known as Hollow-crowned is usually grown, but this in rich soils is liable to canker. I grow this and the Student, a somewhat smaller-growing sort, but a good shape, and so far as I have seen is free from all disease.

Potatoes.—To succeed those in frames a crop of the Early Ashleaf may be planted on a warm border. I advise also the planting of Myatt's Prolific at the same time, which for an early and reliable sort outdoors is not beaten yet, and one succeeds the other. There are now many excellent sorts for general cropping which must be noticed when the time comes for planting, but my idea is, that for small gardens a good-cropping Potato such as Myatt's Kidney must not be set aside without a weighty consideration.

Carrots.—Sow a small space in a warm corner, in rows 1 foot apart, of the Early Horn kind, and take care that they are dusted with lime and soot as soon as the young plants appear, or they will be eaten-off by slugs in a single night. Sometimes they are eaten-off before they are really out of the ground. A good preventive is to mix lime and soot in the soil before sowing the seed, working it up with a rake. A few Radishes may be sown between the rows, the same as if in a frame, so that they can be pulled off without interfering with the Carrots.

Spinach.—A capital summer vegetable and quickly comes in for use. Sow a crop now between the rows of Peas or Broad Beans. Except for winter use it is scarcely necessary to take up a separate piece of ground for it, as it is a crop which is soon cleared off.

Turnips.—At the end of the month sow a piece of ground with Early Stone and White Dutch; the one succeeds the other when sown at the same time. It is just possible that some of these will run to seed, but a vegetable of this kind is generally required as early as possible; therefore, if only a few dishes can be secured they are worth all the trouble. As soon as the crop is up and fairly started into growth another of the same sorts should be sown. The first crop may be on a south border, but those sown during the summer should be put on a partially shaded piece of ground.

Onions.—First determine the size of bed required for these, and the first opportunity sow one half, and the other half at the end of next month. Choose a fine day with a dry surface to the soil, put the rows about a foot apart, and if the soil is rather light tread the seed in with the foot before raking over the surface. Autumn-sown Onions are more vigorous growers, and if they are now standing thick in the bed enrich a piece of ground with manure and prick-out as many as are required. Do not plant these too deeply, but just so that the roots are well fastened in the soil.

Peas.—Of these another crop must be sown as soon as the others previously sown are fairly above ground. At this time of the year my plan is to sow both a tall sort such as Champion of England or Emperor of the Marrows, and Yorkshire Hero, Veitch's Perfection, or McLean's Premier. The dwarf sorts are great bearers, but do not last so long as the tall sorts; moreover, they come in for use before the others, which gives a succession if all are sown at one time.

Broad Beans.—Plant a few rows at a time to keep up a succession, as they soon get old in the pod. There is a sort named Hardy's Pedigree Windsor spoken very highly of, which might be safe to try with some of the old sorts; but I do not advise anyone to depend upon any new vegetable until it is tried with others, for the safe reason that if it should fail there is a vacancy in the supply.

The above is the principal of the main cropping to be done at present, but there are other things in the way of small seeds to be sown now. These include a few seeds of Cabbage, Cauliflower, Brussels Sprouts, Celery, Dwarf Ulm Savoy (a small sort for summer use), Lettuces, Radishes, and Snow's Winter Broccoli. If sown out of doors choose a dry sheltered spot for them, and mix lime and soot with the soil before sowing; afterwards lay some slight protection over the surface, and take it off when the seeds are just coming out of the ground—that is, if the weather is favourable. But if glass protection can be spared it will be best to sow Celery in a box or pan, also Lettuce, Radish, and other small rather tender seedlings in soil made-up for the purpose and covered with the glass.

Parsley is always wanted in every garden, and a good breadth of it should be sown now. The seed may be sown broadcast, but for small gardens it is much preferable to sow it in rows by the side of walks, so as not to take up so much space.

Cauliflowers under handlights must frequently have the glasses taken off to keep the plants dwarf and hardy. Stir the soil among them, and dust with lime if necessary. Fill-up Cabbage plantations with plants from the store bed sown in autumn, and likewise move the earth among them. Other crops that have not had the benefit of the earth being moved for a long time, will be the better if the first stirring be done with a three-pronged hoe, which would leave the soil beneath in a better condition than if done with a draw hoe.—Thomas Record.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

As soon as the surface of the soil is dry enough the Dutch hoe will be run through the rows of Strawberries, not so much to kill weeds as to aërate the ground. It is best to go over the ground first and pick up the largest weeds by hand. The hoe is kept at work amongst the plants, so that not a weed is to be found by the time the flower trusses are thrown up. A comparison is sometimes made between our present system of annual renewal of the beds, and the old one of allowing the same plants to occupy the ground for half a score or more years. Late in autumn or during the winter months the beds or quarters received their annual dressing of manure, which was dug or forked-in between the rows. In soils unsuitable to the Strawberry many plants died annually, and the rows had to be made up with young plants. The same old system of Strawberry culture prevails in many good gardens at the present time. "D., *Deal*," writing last week, has gloomy forebodings about his own prospects of a crop this year. If his soil is light, and he continues to work on the three-years system, many of his plants will die the second year, and, as he says, be "very spotty" the third. It used to be so in the soil at Ilford, but since commencing the one-year system we never fail to secure a regular crop of fine fruit. It is necessary to prepare the plants annually in small pots as early as the runners can be had.

Raspberries have had some rich manure forked-in between the rows, taking care not to injure the roots. One portion of the plants are trained to a single stout stake driven into the ground,

and to which four or five canes are tied, the plants being in rows 3 feet apart and 4 feet between the rows. This is an old method of training, and it is still practised by many good gardeners. The other method of training is certainly preferable, and is the same as that described by "D., *Deal*," last week. The same distance of 4 feet should be allowed between the rows; but we put the plants only 18 inches or 2 feet apart in the row. The wire to which the canes are tied should be tightly strained by being fixed to strong permanent supports at each end of the rows. Raspberry plants ought to be planted in the best soil, and a shady position answers better for them than one exposed to sun.

FRUIT AND FORCING HOUSES.

Vineries.—The earliest house is now in flower, and the berries seem to be setting very well. The temperature is always kept a few degrees higher when the Vines are in flower, nor is it well to allow the evaporating troughs to be filled with water, although the Grapes set better in a moderately moist atmosphere than they do in a dry one. A celebrated grower of Muscats stated that he always found the berries set best when he sprinkled the bunches with water through the rose of a water-pot when in flower; this he did every day. Others syringe the Vines daily when they are in flower. We do not approve of either method. All we find necessary to assist in setting is to give the branch a gentle tap with the hand about twice a-day; the paths and surface of the borders are sprinkled with water once a-day at least. We have had very cold winds from the east, with little or no sun. At such a time the ventilators must be opened very cautiously—a narrow opening about half an inch wide at the highest part of the roof is all that can be done, and this about four hours at mid-day. The growing shoots are usually tied down in their places by the time the Vines are in flower, and very little attention is required after the berries are set, as Vines that are bearing a full crop of Grapes do not make much growth.

Succession houses are having the growths stopped and trained. Only one growth is allowed to each spur, but it is best to allow two to remain until one has been brought down to the wire. This is only necessary when the shoot to be trained is in an awkward position, and there is danger of it snapping in the course of training. All the growths should be brought underneath the wires, and, for the sake of appearance, all should be trained if possible at the same angle. The latest houses are being prepared by washing the wood and glasswork, washing and painting the Vines with the usual compost, removing the surface soil and dressing with a rich compost.

It was recently stated that the latest Grapes were cut and the end of the branch to which the bunches were attached inserted in water. Some persons do not yet understand how this is done. Our plan is very simple. The glass bottles used are clear, so that the water can be seen as it diminishes, and can be refilled again without running it over. A string is tied to the neck of the bottle to fix it in a slanting position by tying it to a lath just over the fruit-room shelves, the bottom of the bottle being allowed to rest on the shelf. Those who wish to put their Grapes in a room that is not furnished with shelves will find a very suitable contrivance in a Grape rail invented by Mr. Kemp, gardener to his Grace the Duke of Northumberland. The bunches on this are arranged in rows one above another.

CUCUMBER AND MELON HOUSES.

Seldom have we experienced such unfavourable weather for the culture of the above. By a low temperature with absence of sun the leaves grow flimsy, so that it is necessary to throw a slight shading over the glass to save the leaves if the sun shines for a few hours. Too much moisture in the atmosphere is to be avoided at this season. All the vapour required in the atmosphere can be obtained from water sprinkled on paths, walls, &c.

Just a word here on sowing Cucumber and Melon seeds. If they are sown in a frame over a hotbed it is best to plunge the pot in the bed when the violent heat has subsided. The young plants that are pricked-out should also be plunged in the bed. Many persons follow the same practice in heated structures with plants 3 or 4 feet removed from the glass, and the result is that they become drawn. Our plan is to sow the seeds in bottom heat, and as soon as they vegetate to place the pots on a shelf within a foot of the glass. In this position the seed-leaves are firmer and the stem shorter and stouter. As soon as the seed-leaves are freely developed the plants are potted-off singly, the stem being covered almost quite up to the leaves during the operation of potting. After this they are again placed on the shelf near the glass.

GREENHOUSE AND CONSERVATORY.

When outside operations cannot be performed either with satisfaction to the employer or justice to the workman, there is generally plenty to do indoors. Washing scale and the filth made by it from Orange trees, Camellias, &c. We had much trouble with a large plant of Lapageria rosea in the stove. It became infested with bug, but was thoroughly cleansed and placed in the greenhouse, where the plant soon covered a large wood trellis; and here, though the house was open night and day for six months, the bug increased so much that the trellis had to be destroyed, and one of wire substituted. As the insect has but little shelter now, it can be kept under by syringing the plant every day when it is in full growth.

Put in cuttings of Tree Carnations. The small side growths from the main stem strike better than the stronger ones. Gross main growths will take a long time to form roots, and some of the difficult sorts refuse to root at all. The cuttings strike best in loam and leaf mould with a little sand added, and a thin layer of sand should be placed on the surface of the pot, plunge in bottom heat, and place a square of glass over the cuttings; it will rest on the ends of the labels, and is better than enclosing the cuttings in a handlight. The cuttings will not damp-off if the house is kept up to say 55°.

Removed successions of Roses, Hyacinths, Tulips, Lily of the Valley, Hoteia japonica, Deutzia gracilis, Dielytra spectabilis and other plants to the forcing houses. We find the Lily of the Valley succeed best when the pots are plunged in a gentle bottom heat. When the temperature of the house is rather high to begin with, the flowers of the Lily are thrown up before the leaves, whereas when the roots are in a higher temperature than the house this does not occur. No time should now be lost in tying and training all specimen hardwooded plants; if this is delayed many of the best buds, which are usually the most prominent, are broken off.

FLOWER GARDEN.

With the thermometer falling several degrees below the freezing point, and rising but little above it by day, tender plants put out in cold frames have not had a fair chance, yet they do not show any signs of distress. They are well covered at night. Cuttings that have been recently struck are removed from warmer houses to the heated lean-to pits. Florist varieties of Carnations have not had a good time of it; they do not suffer from cold, but damp and cold together sometimes cause the leaves to become spotted with a brown fungoid growth. These leaves must be cut off, or the plants are much injured. A few of the more tender varieties have suffered from this fungus. We do not know anything that will stop its progress. No rain should be allowed to fall on the plants late in autumn or through the winter months.

Pruned one portion of the Roses before digging the borders. The usual advice given in pruning Roses is to cut the weakest growers back very close, those that make medium growths not quite so closely, and to leave the strongest growths the longest. The shoots ought to be well thinned-out, and the growths to be cut well back, especially the Hybrid Perpetual sorts.—J. Douglas.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

Secretaries will oblige us by informing us of the dates on which exhibitions are to be held.

TO CORRESPONDENTS.

*** All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

Books (*J. M. Pebmarch*).—The price of the "Cottage Gardeners' Dictionary is 6*s.* 6*d.*, by post 7*s.* 2*d.* The names are accepted.

Garden Plans (*Delta*).—The book is reprinting, and will be soon published. It contains exactly what you need.

Grasses for Lawn and Pasture (*Mrs. D. L.*).—We recommend you to purchase "Laying-down Land to Permanent Pasture, &c.," by M. S. Sutton, F.R.H.S, &c. It is published by Messrs. Longman, and the price is only one shilling. It contains not only information relative to Grasses for all soils, but portraits of them, a geological map, &c.

Treatment of Vines in Pots (*A Novice*).—Allow only one growth from each spur, and when the shoots have grown enough pinch the point out two

leaves beyond the bunch. It will require a large supply of water when it has made strong growth. Water must be applied carefully at present, but the Vine must not suffer. We do not syringe our Vines after the buds are started, but a moist atmosphere is essential to healthy growth.

Wall-tree Protection (*Bill Bob*).—The blossom buds on our wall facing west are not sufficiently advanced to be injured by frost. They may be kept back by shading the trees with some protecting material in sunshiny days. The shading should only be used when the sun shines on the wall. It would not be desirable to keep the trees, as you suggest, in the dark. As soon as the flowers show signs of opening, the canvas could be used to protect the trees from frost at night, rolling it up in the daytime. Louise Bonne of Jersey is a free-fruiting variety.

Lime for Clayey Soil (*T. N.*).—You will not render it friable so as to be good garden soil unless you pare and burn the top spit of the whole plot, the ashes dug-in and the manures you name applied at the same time. Lime at the rate of one hundred bushels per acre would not be too much for such a clayey soil.

Dressing for American Blight (*K.*).—Spirits of petroleum applied with a brush to the parts infested will destroy it, or the whole tree may be done over with it, omitting, however, the buds; or boiled linseed oil applied cold with a brush will answer, keeping it from the buds, especially after they have begun to swell. Another cheaper and thoroughly efficacious remedy is to mix with a pint of gas tar a pint of dry powdered clay. Form the whole into a paste by adding by degrees a gallon of warm soft water. Apply with a brush to the parts infested, and, in fact, the whole tree except the buds; also bare the roots and examine them, as this pest descends and feeds upon them in winter. The composition should be thoroughly brushed into the crevices and angles. Apply the dressing warm, yet not over 120°.

Cowslips for Meadow (*K*).—The best plan would be to sow it with seed, which may be had of any principal London or provincial seedsman, and for a large quantity a special price would be quoted. A pound of seed distributed evenly over the field in March or early in April would give you a nice sprinkling of these pretty plants. You may, however, have some this year by removing the plants just when they are beginning to grow. Take up with some soil about an inch from the plant all round, and about 2 inches deep, and replant in your pasture. The work is best done with a knife.

Earthenware Pipes for Heating (*Wm. White*).—Glazed earthenware pipes have been used for heating by hot water, the joints being first stopped with tarred rope rammed-in tightly, yet taking care not to burst the sockets, and then make good with Portland cement. They are, however, liable to breakage, and are bad radiators of heat. Cast-iron water pipes are better, and not very much more costly. The others have answered satisfactorily, having an iron pipe for joining to the boiler.

Cutting Seed Potatoes (*J. C. B.*).—Nothing is gained by cutting into very small pieces, and we should not cut them more than to have each set about 1 oz. weight. You may, however, cut each Potato into as many sets as the Potatoes have eyes, reserving a portion of tuber to each, and then rub them in quicklime. Very large crops are had by the cutting to single eyes, but for general crop it is not to be advised; for your purpose we should advise the single sets.

Seakale Planting (*F. E.*).—Your bed 7 feet wide will contain three rows of plants, you blanching them on the ground. Stretch a line along the centre of the bed, and put in three plants in a triangle, allowing 4 inches between the crowns, and these triangles of plants should be 2 feet apart, and 2 feet from the centre row on each side. These can readily be covered with pots for forcing and blanching. The plants are best one year old.

Connover's Colossal Asparagus (*Idem*).—It is a good kind and large, fully as good, if not superior, to the Giant.

Early and Late Strawberries (*Idem*).—*Early:* Black Prince, Early Prolific, Sir Joseph Paxton, Vicomtesse Hericart de Thury, Keens' Seedling. *Late:* President, Dr. Hogg, Cockscomb, Hélène Gloede, and Anna de Rothschild.

Dahlias (*W. R. C.*).—The colours of the Dahlias are—Arbitrator, fawn, suffused purple, yellow at base; James Cocker, purple; Leah, golden yellow, tinted purple; Earl of Radnor, plum; William Newman, not known; William Lund, crimson maroon; John Standish, bright red; Julia Davis, yellow; Miss Turner, white, rosy tip; Maid of Essex, pale ground, tipped purplish rose; and Lady Gladys Herbert, white edged crimson. As to arranging them in a border we should have them in order as follows:—Maid of Essex, Julia Davis, Earl of Radnor, Miss Turner, James Cocker, Lady Gladys Herbert, John Standish, Leah, and William Lund. If you cannot find out what William Newman is, then have it, with Arbitrator next, or perhaps you can improve upon this arrangement.

White Bedding Plant with Dell's Beet (*An Amateur*).—The best of all is the one you have discarded—viz., Centaurea candidissima. The next best is Cineraria maritima raised from cuttings. If the Cineraria grows too tall it may be kept low by stopping. Chilian Beet is of no use, and white Stocks equally unsuitable. Soil growing Beet will grow Centaurea well.

Cerastium Propagation (*Idem*).—The beds edged with this and grown too large and weedy should be taken up with about 3 inches of soil and laid on one side. The ground should then be thoroughly forked over, breaking it up fine, and removing every particle of root of the Cerastium and other weeds. After this give a good dressing of fresh soil, and manure or leaf soil, and divide the Cerastium; put it in, each single stem with its root (an inch or two) about 3 inches apart every way, and 3 inches less each side than you wish the edging to be. Do this in March, and cut off the tops about an inch above the ground, watering if the weather be dry.

Melon for Cold Garden Frame (*Idem*).—Any Melon you may sow in a frame in May ought to have a little bottom heat to give the plants a start to bring them up quickly, well rooted and growing, and the seed should be sown early in the month. With no heat except from the sun you may ripen Little Heath Melon successfully; but Meredith's Hybrid Cashmere will not do well in such a situation unless the season be unusually hot.

Melons in Frame (*F. J.*).—The space you have at command will answer admirably for soil for Melons, which should be strong loam moderately enriched and firm. Little Heath would suit, it being raised in a frame in gentle heat, and put out when having three leaves. Train the vine—one from each plant, planted 2 feet apart—at about a foot distance from the glass, and do not stop it until it has reached to within a foot of the top, then take out its point. You will have side shoots; stop these one joint beyond the fruit. Impregnate the flowers, keeping a rather dry atmosphere when in flower and until they begin to swell, then keep more moist and water freely until the fruit is full-sized, then diminish the supply. Keep dry when ripening. Allow four fruit to a plant. Weak liquid manure may be given after the fruit commences swelling. Tomatoes would not succeed in 10-inch pots in the open—at least not well; but if warm they may swell the fruit to fair size, and they will ripen in a warm room. Lay the seeds flat.

Learning Drawing, &c. (*W. A.*).—In every suburb of London are night schools where you could obtain the instruction you desire. The other questions will be answered next week.

Gathering Comte de Lamy Pear (*G. C.*).—Gather the fruit as soon as it will part from the spray easily if lifted a little above a horizontal position. It is ripe in the course of October usually.

Arbor Vitæ Trees Dying (*R. T.*).—The trees by your description we should say had been cut by easterly winds rather than by blight or dryness of soil. They may recover, but it is rarely that they do. Remove the soil around the trees as deep as the roots and as far as the branches extended, and replace with a compost of turfy loam chopped-up fine, a third of leaf soil, and a fourth of well-rotted manure, well mixed, giving a thorough soaking of water in early April and again in May.

Improving Patchy Lawn (*R. B.*).—Give a thorough scratching with an iron rake in March, and a top-dressing of rich compost with an eighth part of lime incorporated, failing this a dressing of wet rotted manure. Early in April rake well, clearing off any rough portion of compost, and with an early prospect of rain sow over it Cynosurus cristatus, 7 lbs.; Festuca durinscula, 4lbs.; Festuca tenuifolia, 1lb.; Poa nemoralis sempervirens, 3lbs.; Poa trivialis, 2lbs.; Trifolium repens, 6 lbs.; and T. minus, 2lbs., in mixture for one acre. Roll well after sowing. Do not cut very close for a time after sowing—not until the growth is good, but keep well rolled.

Peach Trees Gumming (*F. Johns*).—Gumming arises principally in trees under glass from the looseness of the soil with too much richness, which causes a free sappy growth and long-jointed wood, but it not unfrequently results from too close tying of the branches and shoots to the wires. The remedy in the first case is to prune but little and to water moderately, making the soil firm as possible, so as to induce slow growth and short-jointed wood; and the other is to tie loosely, affording space for the shoots to swell. To prevent abrasion it is well to have a ligature of the tying material between the wire and shoot. Nothing will stop the gumming after it commences to issue, but judicious treatment will generally prevent it.

Pteris tricolor from Spores (*H. N.*).—Half fill a pot with crocks, and over this place rough sandy peat, filling to the rim; finish with about an inch thickness of sifted peat, with a fourth of silver sand intermixed, pressing firmly. Water well, and let stand to soak-in for a few hours, then water again and again. After the third watering brush the spores of the frond on to the surface, distributing equally, and cover with a bell-glass just fitting within the rim of the pot and resting on the soil. Place in a warm house in a shaded and moist position; stand the pot in a saucer, which is always to be kept full of water. No water will be needed on the surface, but it must be kept constantly moist. When the young plants appear, which will take some time, tilt the glass a little on one side at night, keeping close by day, increasing the opening as the plants advance in growth, removing it gradually after the plants throw-up fronds. Guano is not kept by us in time as formerly.

Inarching Muscat on Black Alicante (*A Constant Reader*).—The operation may be satisfactorily performed, but both do well on their own roots, and as a late-hanging Grape, Black Alicante is the better of the two. We have seen Grapes of both kinds upon the same Vine, the lower half Muscat of Alexandria, and the upper half Black Alicante. What is the variety of Bougainvillea you have in a pot in the stove? Not knowing the kind, we might advise, but advise wrongly.

Manuring Meadow (*D. D.*).—Distribute the horse droppings evenly next month, and break small, or bush-harrow, after rain; and at the end of March or beginning of April, but only in moist weather, dress with phosphate guano at the rate of 2 to 3 cwt. per acre.

Draining Gravelled Sweep (*F. J. C.*).—Stone drains, or, what would be better, drain pipes or tiles, 2-inch being large enough, laid across your gravel, nowhere less than 15 inches deep, as you will have the pressure of carriages. These 9 feet apart, and filled-up level with clay and stones so that the water will pass off by the stones to the drains, will give you, we think, freedom from surface water.

Levelling Ridges—Heading Trees for Grafting (*W. J. J.*).—The ground ought to be forked over thoroughly in dry or frosty weather. It will not do to level with a rake, it would sink unevenly. Cut off the heads only a few days before grafting—a week at most. Red-skin Flourball Potato is at best a watery kind. They are best steamed with their skins, but baking is a preferable mode of cooking.

Climbers for Roof of Fernery (*Agapanthus*).—Your house will only be suitable for greenhouse climbers. The most suitable would be Lapageria rosea and L. alba, Tacsonia Van Volxemi, Bignonia jasminoides floribunda, Cistus antarcticus, Cobœa scandens variegata, Habrothamnus fascicularis, Mandevilla suaveolens, and Passiflora Comte Nesselrode. Unless your house be large the Tacsonia and Passiflora would be sufficient for the roof-covering, as they will cover a large extent of surface, but we should also have the Lapagerias. If you have any bare wall that you wish to cover, Ficus repens would do so admirably.

Climbers for North Wall—Old Asparagus Transplanting—Fig Tree Full of Wood (*Winton*).—For the north wall besides Ivy Cotoneaster microphylla, but it will not cling without nailing, and we only know two others that will—viz., Ampelopsis Veitchii and A. hederacea, both deciduous and pretty, but not equal to Ivy, the finest of all green or variegated leaf-covering for a wall. Asparagus ten years old is not worth transplanting. Younger plants would do better and be more enduring. Thin out the long bare branches of the Fig tree at the close of April, or when it is beginning to grow. Cut these as near the base of the tree as you can; but whilst seeking to prevent overcrowding, cut away as little young wood as possible, for the more of that removed the more will there be produced afterwards, and the more growth the less fruit.

Plants for Rockwork (*W. H. S.*).—In the sunny parts or slightly shaded, Sempervivums arachnoideum, californicum, globiferum, and montanum; Sedums acre, atropurpureum, anglicum, glaucum, Nevi, kamtschaticum, pallidum roseum, and Wightmannianum; Saxifragas affinis, Aizoon, ceratophylla, joniperiana, oppositifolia, palmata, pectinata, umbrosa elegantissima Ferns in shade—Allosorus crispus, Asplenium adiantum-nigrum, A. trichomanes, A. viride, Athyrium corymbiferum, Blechnum spicant, Cystopteris fragilis, Lastrea Filix-mas cristata, Lomaria alpina, Polypodium vulgare cambricum,

Polystichum angulare proliferum, Scolopendrium vulgare, vars. corymbiferum and crispum.

Plants in Tubs for Lawn (*Idem*).—Yucca recurva is very graceful and good, and so is Laurustinus kept in neat form by cutting after flowering. Sweet Bay is also very handsome.

Pruning Roses (*Idem*).—Cut them at once to three or four eyes, the strongest least, and the weak growers cut-in more closely—to two eyes if the wood be very small.

Colorado Potato Beetle (*Amicus*).—We have not occupied any space with notes on this insect, because there is little more chance of its being introduced into this country from America than there is of its rattlesnake. It infests the haulm of the plant, and until the haulm is imported we shall probably remain unattacked, for although the larvæ descend into the earth, this is specially removed from all imported Potatoes.

Roses Louis Odier and Admirable (*Kittie*).—Louis Odier is a Bourbon, or rather a hybrid Bourbon with Noisette blood in it. It is still to be found in many of the Rose catalogues of the larger firms. We do not remember Admirable. The Sedum will do for carpet bedding, but the colour is not pronounced enough, and it is difficult to say what species it is from the small specimen enclosed. It is not too late to plant Manetti stocks, as the season is backward and nurserymen may still have a supply. We do not recommend budding on old overgrown stocks, but they may be kept to get cuttings from in the autumn.

Rose Moss de Meaux (*Hamlet*).—We cannot, we fear, aid you to obtain the Moss variety of the old Rose de Meaux. Can any of our correspondents and readers help the Prince of Denmark?

Lime, Salt, and Soot as a Manure (*Subscriber, Wolverhampton*).—One bushel of salt, one bushel of soot, and two bushels of lime are good proportions. Double those quantities will not be too much for 64 square yards.

Insects (*West Cumberland*).—The very minute white insects sent in damp earth (and asserted to be attacking and destroying the roots of various vegetables, Cabbage, Broccoli, and Brussels Sprouts which have stood over the winter, the roots of which are now swarming with these insects and in a state of decay), are one of the smallest known species of Thysanura, or Springtails, named Lipura ambulans, *Burm.* (Podura terrestris nivea of De Geer, &c.). They feed on decaying, not on healthy, vegetable matter. Your plants must have been injured by some other cause, possibly the severe cold, and thus become liable to the attacks of these little creatures. Your ground, too, probably wants thoroughly cleansing.—I. O. W.

Names of Fruits (*S.*).—The best specimen is Josephine de Malines, and the other Beurré d'Aremberg. We have not heard of Tobolsk Rhubarb for some years, but if you get Linnæus you will have an improvement on it.

Names of Plants (*T. W. C.*).—We cannot name plants from leaves only, we require a flower as well. (*Mrs. Carlisle*).—Garrya elliptica. The points of the leaves have been frostbitten. In our twenty-second volume is a drawing and many relative particulars.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 9.

BY T. C. BURNELL.

Deformities and Diseases.—Prize fowls, to a certain extent, are reared in an artificial manner; the result is that deformities and diseases are more frequently found in them than in hardily-reared farmyard stock, though the latter are often thought to be more perfect than they really are. Not many farmyard fowls would stand being scanned by a critical eye, while, from what I can find out from farmers, they lose very nearly as many fowls from death and disease as we do among our own more highly reared stock. Anyone thinking of becoming an exhibitor will do well to make himself acquainted with the most common defects, so that he may not be taken-in when buying, nor waste entry money in sending out birds which he ought not to expect to win.

A Crooked Breast can be easily found out by passing the hand along the breast bone. If the bone is badly curved or indented the specimen should be rejected, as the defect is often hereditary, and will nearly always prevent such a bird from winning in the show pen.

Crooked Back, though sometimes apparent, can often only be ascertained by handling. The best way to proceed is to allow the weight of the bird's body to rest on one hand with the legs hanging down, while the other hand is passed down the back. If the spinal column rises in the middle it is called *hump-back;* if the spine is twisted, *wry back;* while if a lump is found on one side of the body higher than the other, the *hip bone projects.* The latter deformity often causes the tail to be held on one side, called *wry tail;* but this latter will in a young bird sometimes proceed from weakness and inability to hold the tail upright, but it should always be regarded with suspicion. A *squirrel tail* is when the tail is carried right over the back and almost touching the head. The latter is a great eyesore, and as well as the preceding malformations is most surely hereditary.

Bumble Foot is an enlargement or inflammation of the feet or toes. It is not peculiar to Dorkings, but is found in all large breeds, and I have seen several cases of it in the yards of one of the largest and most successful Brahma breeders in the south of England. Sometimes it occurs owing to a thorn or stone being driven into the sole of the foot and occasioning inflammation; but these cases are rare, and I am convinced it is generally an hereditary complaint, like gout in the human subject, and the only way to get rid of it is to ruthlessly blot out every specimen diseased this way, or at least not to breed from them. My old Dorking cock, cup at Birmingham and second at Crystal Palace in 1873, up to his death at nearly four years old, never showed the least trace of bumble foot, nor have I ever found it in any of his chickens; while, on the other hand, a fine bird which I bought cheap to breed from, thinking that a bumble foot would be no detriment for the purpose, threw chickens which showed corns on their *upper* toes when many of the birds were not six months old. The mischief generally begins by a corn growing in the pad of the sole of the foot, and this often proceeds no further. To prevent accidents though, it will be better to pick this out with a blunt penknife, after first soaking the foot in warm water. Occasionally a little blood may appear, when it will be better to apply lunar caustic to the hole, as is frequently done to stop the bleeding from a leech bite. There will be far less chance of blood flowing if the operation be performed in the moulting season, when the blood flows principally into the newly forming feathers. If a toe should become enlarged from any cause, accidental or otherwise, the swelling may be reduced, if not of too long standing, by the daily application of tincture of iodine with a camel's-hair brush.

Cramp occasionally occurs in damp yards. The sufferer should be placed alone in a dry house or pen, and be bedded down in hay or straw, till he recovers the use of his legs. I do not believe that any physic will do good, and patience is all that is required.

Diarrhœa is occasionally troublesome; it is caused by some irritating substance lodging in the intestine. A large tablespoonful of castor oil is the best remedy, as that will remove the evil. With little chickens a meal or two of boiled rice sprinkled with powdered chalk will prove sufficient in most cases; or small pills may be made up of prepared chalk and chlorodyne, only using sufficient of the latter to consolidate the chalk. Each chicken to receive one twice a-day. This is troublesome, but those who will not endure trouble will not succeed in chicken-rearing.

Gapes.—Little chickens often fall victims to this disease. A small and tenacious worm is developed in the windpipe, which the chicken endeavours to dislodge by repeatedly gaping or opening the mouth, and this symptom gives the name to the disease. A simple remedy is to administer a small pill of pure camphor to each chicken daily. The best preventive is never to allow young chickens to drink stale or impure water.

Relaxed Crop cannot be cured by any medicine, unless perhaps when it first makes its appearance. It is a great eyesore, but when once established cannot be remedied, and so the only plan is to put up with it. If a fowl swallows any hard substance too large to pass into the gizzard, the proper course is to cut open the crop with a penknife and remove the offending matter; the wound should be made no larger than necessary, will bleed very little, and will rapidly heal. I consider slack crop to be hereditary, and by repeatedly breeding from birds with this defect we could doubtless soon produce crops in fowls relatively as large as those of Pouter Pigeons.

Roup has rightly been called the scourge of the poultry yard. It generally proceeds in the first instance from a bad cold, but when a case is once established in a yard the germs of the disease are carried in the air and breath. The disease generally becomes apparent about the third day of infection, till then it is latent. Preliminary symptoms are sneezing and rattling in the throat, but occasionally one eye will become suddenly closed. When the running at the nose appears the disease is developed, but sometimes birds will run at the nostril without any previous warning. In every large poultry yard there should be a hospital pen in some out-of-the-way corner, where sick birds may be placed on the first appearance of illness, not only for their own comfort but to prevent contagion. If a roupy bird has once been placed in this pen it should afterwards be kept for roupy birds alone, and should be periodically limewashed. In bad cases of roup, especially in old birds, the eyes close, the head swells, the discharge from the nostril and mouth becomes thick and purulent, and death soon supervenes. If the affected bird is not very valuable it should be killed on the first appearance of the disease, and buried to save the other fowls, as the disease is very contagious. The discharge from the nostrils proceeds from the mucous membrane of the back of the mouth and throat, and the only other disease to which it is analogous is glanders in the horse, the latter being equally infectious. The moment the disease appears Condy's red fluid (principally permanganate of potash) should be added to the drinking water till it becomes of a pinky colour; and chloride of lime should be sprinkled about freely, and both precautions should be adopted through the whole yard. The only internal remedy which I have found effective—and I have tried them all—is a mixture of copaiba and oil of cubebs, in the proportion of four parts of the former to one of the latter, the dose to consist for a large fowl of twenty minims of the mixture made up in the form of a gelatine capsule; or copaiba capsules alone will do. A Dorking cock would require at least three capsules, or about sixty minims, in the day to effect a speedy cure. In addition to this, the bird's throat,

month, eyes, and nostrils should be sponged out daily with a strong solution of Condy's fluid, to correct the fetor of the discharge and to promote more healthy action. I have not known the above remedies to fail, and may claim some little experience, as last autumn I bought ten old farmyard fowls purposely to experiment on. I shut them up in an old wood house at a cottager's with a bird in the most advanced state of roup, her eyes being nearly closed, and the discharge from her nostrils most offensive. They had no water to drink, but moist meal twice a-day, and on the fourth day eight out of the ten had a running at the nose, and the others soon followed, and several of them rapidly became worse. I commenced the treatment above recommended on the eighth day, and before a week was over the whole were cured, including the hen which introduced the disease. The shed where these birds were confined was thatched at top but open at the sides, and consequently the foul air blew away. I think this a better plan than shutting the birds up in a close stuffy pen.

Shell-less Eggs with Dorkings are invariably caused by the hens being too fat. Starve the birds for a day, and then feed them principally on vegetable food to reduce the system.

For all slight indispositions I give a large table-spoonful of castor oil. Fowls will stand as large a dose of aperient medicine as a human being, and the reason why medicine is not generally effective with them is that sufficient is not given.

Zinc ointment is very useful for wounds or cuts.

CUPS AT THE OXFORD SHOW.

An article in this Journal (page 128) signed "An Exhibitor Misled" is calculated to mislead your readers as to the quality and value of the cups awarded at the late Oxford Show.

The cup in question and one other in the Game classes were presented by two of the patrons of the Show, and were advertised in the schedule and reprinted in the catalogue, with the other cups, as a silver cup value three guineas. The week following the close of the Show I gave a list of the successful exhibitors for the presentation cups to the silversmith, who informed me that the donor of the cup for fancy Ducks had personally chosen a handsome silver-plated jug value £3 15*s.* (twelve shillings in excess of the prize offered), and had ordered it be engraved. It will be seen from this that we had no choice in the matter—to use a homely phrase, "we could not look a gift horse in the mouth." On the 30th of last month I received a note from the exhibitor requesting the name and address of the silversmith who supplied the jug, as he was informed it was a plated article. I gave him the information, at the same time describing to him why his prize was not silver.

In answer to what course "An Exhibitor Misled" should adopt, I think it would have been best to have written to me again, stating his requirement; and as we were unintentionally in error in publishing that this cup was silver, I have no doubt we should have settled the matter to his satisfaction. With the above exceptions all other cups were silver, and for which we paid full value. The bill I beg to enclose for your inspection.—Joseph King, *Hon. Sec.*

[The silversmith's receipts are for silver cups.—Eds.]

REPORTS ON POULTRY.

As I am myself an exhibitor, though not of long standing, possibly some may say that I am merely anxious to appear in print, and am not sufficiently acquainted with my subject to authorise me in venturing an opinion upon it. In answer to this objection I can only say that all I would aim at is to have justice shown to each and every poultry exhibitor, and this, I think, can scarcely be looked for so long as a reporter be at the same time an exhibitor.

I have no wish to be offensive or personal in my remarks to any single reporter, believing as I most sincerely do that they try to do their duty and give an unbiased opinion, but what I think is that too much is asked of them—of human nature. I would say, Is not the old proverb, "Every mother considers her own crow the blackest," fairly applicable to reporters who are at the same time exhibitors? for are they not naturally disposed to consider their own birds superior to those of anyone else? and feeling in their own hearts convinced of this fact, they report accordingly. How often in the report of a poultry show does one read, "We consider the judging very indifferent;" "We cannot understand how such and such a bird came to be placed first;" "We think the prize ought to have fallen to this one or that one;" "We think pen 30 (Smith) ought to have had first prize;" "We could not help admiring pen 306 (Smith), and pen 23 (Smith) we consider as good as any in the show, the bird superb," &c., *ad infinitum.* The outside public or those who are not behind the scenes, and others who cannot afford to go to many shows, but who strive hard to add a little to limited income through rearing poultry, are obliged to depend upon the reports upon the different shows which they read in the papers, and are not, of course, aware that the reporter is very possibly the owner of the very bird he praises and brings to the fore, while other good birds are passed by without comment. Now, if poultry shows are to flourish, and people are to continue either for profit or pleasure to exhibit poultry, they must have confidence in those whose duty it is to report on their birds. And it is also my belief that editors have a great deal of power in their hands, and exhibitors would experience ten times the pleasure and confidence in exhibiting which they do were they convinced that unfair and partial judgments and deceptions of all kinds were exposed in the columns of that paper. If I might be allowed I would suggest that reporters should either be—

First, Gentlemen who had once been poultry fanciers, but no longer exhibitors.

Second, That the judge himself should write the reports. Could this be managed fanciers would be better able to know what style or class of bird the judges preferred.

Third, Gentlemen who are still exhibitors, provided they do not exhibit at the same show they report on, or if they do their names should be attached to the report.

Before closing this letter I should like to draw your attention to the annoyance caused to secretaries and exhibitors by the want of some good practical method of fastening on the labels and fastening the hampers. We occasionally hear of birds being removed from hampers altogether, or taken out for the purpose of disfiguring them by plucking their tails or removing their leg-feathering. It would be a great boon to both secretaries and fanciers could some simple method be invented to prevent the possibility of these unpleasantnesses occurring. I am now working out a simple plan which, if it prove feasible, will put a stop to rascalities of the above-mentioned kind.—Gerald F. Talbot.

THE POULTRY-KEEPER.—No. 31.

PLUMAGE OF CUCKOO FOWLS.

The Cuckoo feather is so called on account of the resemblance in the colouring and arrangement of the tints to those which

Fig. 44.—Hen's Feather.

cover the bird of this name. The feathers are bluish black, more or less dark, softening by half tints on a white ground, and coming again at little intervals nearly equal, and because of the length of the feathers from the down, which is of a clear greyish blue as far as their ends.

RAILWAY LIABILITY FOR NON-DELIVERY OF FOWLS FOR EXHIBITION.

Warminster County Court, February 15th.—*Joseph Hinton v. Great Western Railway Company.*—This was an adjourned case from the last Court. The plaintiff claimed for damage sustained through defendants not conveying two cases of poultry in time for the Monmouth Poultry Show in October last. Plaintiff's claim consisted of entrance fees (6*s.*), railway carriage (8*s.*), and damage or deterioration of fowls, making up a total of £2. Mr. George Ashpole of Monmouth proved the non-delivery of the birds, and also said he judged the Polish class. There were only three pens. He opened the plaintiff's baskets, and examined the Polands. They would have taken first prize easily, and must have run close for the prize for the best pen in the Show.

The Company admitted that they received the fowls in time for the 10·48 A.M. train on 13th October, but contended that they could not have delivered them earlier than they did—viz., half-past twelve on the following day. Three points in defence were—1st, that it ought to have been stated the time Mr. Hinton

wished the fowls to be at Monmouth, and the object of sending them; 2nd, that no delay was caused by the defendants; 3rd, that plaintiff had not, in his correspondence or particulars, made any claim for deterioration, and could not now set up that claim. With regard to the first point the plaintiff stated, in reply to the Judge, that the two cases had printed labels addressed "The Secretary, Poultry Show, Monmouth." This, the Judge stated, using a little common sense as well as law, ought to have been sufficient intimation of the time and object. With regard to the second point, there were three routes from Warminster to Monmouth, one which the plaintiff had correctly marked out, one by Swindon and Gloucester, and one by Cardiff and Neath. The Judge requested that these routes might be marked out in the same way as the plaintiff had marked out the other route. Much time was then lost in the attempt to mark out the two routes. In one there was but slight difference in the time of arrival with that suggested by the plaintiff; but with the other, it was shown that the baskets would be taken from Portskewet *viâ* Cardiff and Neath to Monmouth, arriving there at 12 30 on the day of the Show. By this route the baskets were taken one hundred miles or more out of their way. The poultry had been judged, and plaintiff's birds, it was proved by Mr. Ashpole's evidence, were not removed from their hampers at all, and there remained more than fifty hours without water. The Judge ruled that this was against all commou sense, and that seeing the Company's traffic was increased largely by these exhibitions, and that they well knew birds despatched to them were valuable, they were bound to take the shortest route unless otherwise specified. It was suggested that the decision as to the route of parcels was left to the discretion of the guards. His Honour said this custom was a most foolish one, and was likely to lead to endless litigation. If the directors acted so, they must take the consequences of their servants' acts.

With regard to the third point, the Judge ruled, that although plaintiff had been without professional services in drawiog his particulars, they were, however, framed in general words as to entitle him to claim for deterioration, that being, in fact, a substituted claim for anticipated prizes.

His Honour, Mr. Gaillard, in delivering judgment, said he must allow the plaintiff the carriage and entry fees. He had greater difficulty in aettling the amount of damages; but as such a detention without food or water was very likely to prove injurious to the specimens, he considered that if he made the order for 30*s*., inclusive of the railway carriage and entry fees, it would meet the merits of the case. Judgment for 30*s*. with costs was accordingly given. Towards the end of the case a cock, apparently under the window of the Court, as if in anticipation of the verdict, commenced crowing vigorously. This caused considerable amusement, and perhaps by some was considered a favourable omen.—(*Warminster Herald.*)

THE MEALY POUTER.

I am sorry that I have been prevented from sooner acknowledging the manly avowal of Mr. Huie on the above. With Mr. Laurie I am delighted to see the Mealy elevated to the dignity of a standard bird. It was a necessity of his position in the late controversy, and had the public avowal only been made a little earlier Mr. Huie would have saved himself the "rub" at Kilmarnock Show, which I am glad to see was taken as it was given. No old custom ought to shackle the conviction of any judge, the qualifications for which office Mr. Huie so lucidly tabulated in a recent number; and though he is not the Pigeon fancy, he cannot forget that he is a representative member of it, and that it is perfectly competent for representatives to carry out reforms obviously desired by their constituents.

Mr. Huie's reasons are very comprehensive and well put. His second might be amended as follows:—"The Mealy in itself is a standard colour, not being produced by crossing colours." No founding could thus be made on his concession with regard to standard-marked Chequers, &c., which are confessedly cross-bred colours. Just one other rub with Mr. Huie in connection with this controversy.

Bearing in mind his definition of a Pouter, we cannot see how he can consistently exclude badly-marked standard colours from the class which we prefer to call the "Any other Pouter class," into which he admits Splashes. He may tell us to exhibit them with their demerits in the standard classes, which simply means keep them at home. Now, as the object of this class is to maintain the standard, these birds ought not to be so treated. Surely a standard-marked Blue can be more easily bred from a badly-marked Blue bred from Blues than from any cross whatever. The latter demands knowledge, experience, and patience, and young fanciers, though willing to grasp the results of others, will not attempt it for themselves. Take the probable case of two birds in a loft, to all appearance Blue Splashes; but one is a chance throw from Blues, and the other a cross from White. Is it not strange that the one can be shown and the other not? Besides, I would advise those who consider badly-marked birds of little value to go and try to purchase one good in the essential points from any of our noted breeders, and, failing a bargain, to note the birds he has paired-up for breeding.

Their admission into any class other than the standard would, of course, raise the question as to what are the disqualifications in the standard classes. The solution of this question, which appears perfectly possible, would excite much interest among Pouter fanciers, and I sincerely trust Mr. Huie will give us the benefit of his experience on the subject. To begin, I append a list of disqualifications gleaned from observatiou of the work of most of our best judges. It does not pretend to be complete, and may not be correct. I invite both completion and correction.

1. Radical faults.—*a*, Thin limb, or limb not covered to the toes; *b*, Limb so flagged as to hide shape and length.

2. Birds too dark.—*a*, Limbs body-coloured, splashed or not splashed with white; *b*, Total want of moon; *c*, Coloured flights; *d*, Chequer marks in body colour.

3. Birds too light.—*a*, Want of distinct band of body colour between moon and white of vent; *b*, Colour on back splashed with white; *c*, White in tail.

Passable faults more or less serious: Want of bib, ringneck, snip, want of one or both rose pinions, body-coloured feathers in moon, and white limb splashed with body colour.—D. McNaught, *Kilmaurs.*

THE PRESENT STATE OF THE PIGEON FANCY.

I agree so far with your correspondent of February 11th, that English Owls are a degenerate lot compared with Africans, but there is one property they have, not to be found as far as I know in any other fancy Pigeon—viz., colour, which will prevent them meeting with the summary disposal your correspondent suggests; I allude of course to the Powder Blue, one of the most striking and beautiful colours among fancy Pigeons. To produce this colour in conjunction with all the points to be found in the best white foreigners should be the aim of the Owl fancier. It will take a long time to do it; but in the meantime, while the native bird is being fined down, the Owl should have two classes at shows as at present, divided, not as now for Foreign and English, but first a class for the best Owls of whatever colour, and second for the best Powder Blues. I think I can detect of late the foreign element in winning natives, but at the same time the loss of powdering, a proof to my mind of the means used. The author of the "Treatise on Pigeons," inscribed to John Mayor, Esq, is the first to mention the Powder Blue in Owls. He says, "The Blue ones should have black bars across the wings, and the lighter they are in colour, particularly in the hackle, the more they are valued."

The Dragoon fancy seems in a curious state at present. I have always regarded it as a fancy unworthy of support, and have been astonished and disappointed to find that a breed absolutely and without dispute a bastard strain, should monopolise the attention of breeders to the exclusion of high-class and Toy Pigeons, and to such an extent that only lately as high as £30 have been given for a single bird of this breed.

Carriers are Black, Dun, and Blue. It should be the ambition of the stout-bird fancier to try what he can do now in Yellows, Reds, and Whites. The latter were fifteen years ago to be had very good, and some of the Yellow and Red Dragoons, as they are called, might be advantageously used as the foundation of a strain of Carriers of these colours.

The only true criterion to judge a fancy Pigeon by is to see a perfect specimen, if not in life then on paper, and consider if there is anything about it truly original and distinct or not. By such a standard the Dragoon will not stand; neither will the Short-faced Antwerp.—J. C. Lyell.

THE ENGLISH OWL PIGEON.

I am much obliged by "Bubo's" appreciative praise. It is always pleasant to be approved. He and I agree about the Barb, but I fear we do not agree about the English Owl. I could better do without the foreign Owl than our bird of long lineage, and which existed here in great beauty upwards of a hundred years ago. If the word degenerate is to be used, the African Owl is the one to which it might be applied. The English bird is a fine noble fellow, with a capital pair of wings of which he can make excellent use. He is to the African what the well-bred flying Tumbler is to the Almond. The crossbred ones are less apparent at our shows than they were. I fear the Powder Blue has been grievously injured by the cross. I would on no account discourage the exhibition of the English Owl. Bred true and fine he is a grand bird. Then my eye can wander on and see with pleasure the little Africans, appreciating their petite charms. Breeders, strive for the Powder Blue Owls. I wish "Bubo" every success with his little Africans, but wish as heartily English Owl breeders as great success with their birds.—Wiltshire Rector.

Poultry-yard Account-book. By Hugh Piper. Groombridge and Sons, Paternoster Row.—This is a very useful account-

book, for it enables to be easily recorded and referred to the eggs laid daily, the amount received for produce, eggs sold, fowls and chickens sold and the amount received, the value of feathers and manure, eggs, &c., fowls used in the household, amount of expenditure, fowls and eggs purchased for sitting, cost of food, rent, and labour; number of hens sat and dates of sitting, the number of eggs, number of chickens hatched, reared, &c.

ITALIAN OR LIGURIAN BEES.

The fashions are, as we all know, irresistible, happily only for the time pending the introduction of something new. Mr. Pettigrew, in his interesting article on Ligurian bees, has touched upon one of these fashions in the apiarian world. I am one who was smitten with the prevalent epidemic some ten years ago or more, and since then I have never been without the Ligurians (or, as they ought more correctly to be called, "Italian Alp bees") in my apiary, either pure or hybrids. I have them still, and although I believe within a radius of seven or eight miles nobody keeps them consciously, they are to be found in all directions, having no doubt escaped from my apiary in swarming seasons, and established themselves in those of my neighbours.

I quite hope with Mr. Pettigrew that we may have, in consequence of his appeal, some detailed results of the trial of these bees by persons in every part of the country who have had a lengthened experience of them. I will contribute my mite towards the desired result by narrating my own experience as far as it goes. I must say as far as it goes, because of late years I have not gone in for honey to any extent, owing to the small sale there is for it in our neighbourhood, and the trouble attending the manipulation of any large quantity. In former days, when I measured my honey by hundredweights, it was so far too much of a good thing that I have of late years kept down my stock to very moderate limits, and have been content with tens instead of hundreds of pounds; and this change in my aspirations was about synchronous with the establishment of the Italians in my apiary, so that I really am not qualified to speak in any very positive fashion as to the superiority of one race over the other in respect to the production of honey. I must say, however, that if there has been a difference it has, I think, been in favour of the Italians, which certainly have given me more honey than the old black bees, but this may have been accidental. At the same time I must add that the Italians have proved themselves extraordinarily prolific.

The breeding powers of the queens in my possession, particularly the hybrids, have been greatly in excess of anything I had ever experience of before; and this ought, by all the rules of bee management, to insure a good honey harvest wherever it is to be had. Indeed, I have found this fecundity quite a nuisance, as they have multiplied to such an extent in hives as to have occasioned an excess of swarming, and compelled me to try to check it by artificial means, to which I may attribute a good deal, probably, of my non-success of late years in harvesting honey. So far my experience agrees with the writer in the *New York Tribune*, who said "they were good breeders but poor honey-gatherers."

Mr. Pettigrew proposes to "test by a public trial or competition which sort of bees is the best." If this could be done with fairness and perfect impartiality in any one season it might be well to try it, but I am not sanguine as to any satisfactory results coming from it; for it is simply impossible to put two hives of bees into the race of competition, however apparently equal they may have been at starting, and predicate of them that they shall maintain their course on like terms to the end. The queen of one or the other will go her own independent way, and baffle by the eccentricity of her proceedings the most reasonably probable hopes of the trial-mongers.

What we want is the honestly recorded experience of bee-keepers in all parts of England, Scotland, and Ireland, giving in detail the results of their personal experience during the more or less considerable period of their acquaintance with the Ligurians. Surely we want no more to enable us to form a judgment! Hundreds of people are keeping or have been keeping them for years. We do not want the testimony of salesmen, but of those who have been buyers of the article in question.

So, apiarians of England, out with your facts, and tell us what you think of these foreigners; but let nobody venture an opinion who has not kept them at least five years. No less time is required to authorise a trustworthy judgment; and creditable to the *Journal of Horticulture* it will be to have contributed its quota to the fair settlement of this question.—B. & W.

OUR LETTER BOX.

Dorkings with Brahmas (*An Old Subscriber*).—The Brahma pullets being in the same yard with a Dorking cock and pullets would in no way interfere with the purity of the latter's progeny.

Eggs Soft-shelled (*E. S.*).—The hens may be too fat, or they have not a sufficient supply of calcareous diet. Lower diet and a heap of bricklayers' limy rubbish are the remedies.

Kendal Show.—Mr. Mashy informs us that No. 100 was not a hen, but a pullet hatched very late in 1874.

Incased Feather of Barb (*W. Hartley*).—The feather you sent us is called an incased feather. Some high-bred birds moult these frequently. The cause is delicacy of constitution. We had a most beautiful Scotch Fantail that moulted every one of her tail feathers in this way, and her tail looked like a bunch or fan of porcupine quills. The internal remedy is good food, gravel, salt, green food, change of diet, and warmth. The external cure is as follows:—Rub gently with your nail the top part of the case day after day, and the feather will come out; but only rub the dry part of the case—as soon as you reach what is soft or bloody stop. Then a few days after another bit of case will be dry. We have done this frequently, and got all the feathers of our Fan's tail free in this way. The worst plan is to draw the feather, for a weaker will succeed. If you can give your bird her freedom, flying and the sun and air will do wonders. The worst part of your Barb hen's disease is her softness and looseness of body feathers. This looks like feather-rot and consumption, of which there is not a positive cure; but a spoonful of cod-liver oil may do her good, given each day. Or a nicer plan is to give her the oil in capsules, which you can get of a first-class chemist.

Hives (*G. S.*).—Write to Messrs. Neighbour, Holborn, and tell them what you need.

REMARKS.

17th.—Rain early; fine forenoon and till 3 P.M., after which time there were frequent showers.

18th.—Fair in early morning; very fine forenoon; but rain in the afternoon, and very heavy hail shower about 6 P.M.; fair at night.

19th.—Fair, but very cold, snowing heavily between 12 and 1 P.M., and continuing to do so more or less all day.

20th.—Snowing fast in the forenoon and early afternoon; fair evening and night.

21st.—Fair all day, at times very bright, but the snow still on the ground, except where fully exposed to the sun.

22nd.—A bright sunny day, but the snow still lying unmelted.

23rd.—Fair and rather bright, but not nearly so much so as yesterday, still very cold, and the snow not yet gone.

Temperature rather lower than last week, except in sunshine, where very high readings were obtained, the sky having been more free from cloud than for some months, and the wind north-easterly.—G. J. Symons.

COVENT GARDEN MARKET.—February 24.

The markets are fairly supplied with late home-grown sorts of Apples, but Pears are nearly over. The best there is to be had now are Easter Beurré from the Continent and from California, the latter being of excellent quality. Vegetables are good and sufficient for the demand, importations from the Channel Islands and contiguous parts of France being a great help. Potatoes still show a considerable amount of disease, but there are plenty offered.

From observations taken near London during forty-three years, the average day temperature of the week is 49.1°; and its night temperature 31.7°.

PRUNING AND MANAGING OLD APPLE TREES.

THE appearance of many of the old Apple orchards in Kent often conveys to the observer that no great pains are taken with their management. At first sight they are suggestive of a careless mode of treatment, or, indeed, neglect, whereby the trees, which had originally been fine standards, by being left to themselves present nothing but a mass of shoots or branches apparently so overcrowded as to be of little use for fruit-bearing. Such trees, the observer might imagine, reflect no credit on the cultivator, and the probability is the looker-on, if in the habit of using the saw and knife, would like to show his skill in putting the trees in order. The surprise on seeing these old orchards so apparently neglected is the greater by the carefully tended crops of vegetables, &c., in the gardens contiguous, and consequently he will perhaps inquire why the Apple trees are allowed to get into such a wild and unsightly condition where everything else betokens that no trouble or expense is spared to render them all that could be desired. We should not, however, hastily conclude or unreasonably condemn, for inquiry into the matter will educe the fact that there are plenty of fruit-growers whose aim is to have trees clothed with this dense growth—growers, too, whose living depends upon the fruit they grow, and who in point of cultural information, as well as spirited enterprise, are not excelled by any other class in the kingdom.

Now these growers are able to give a reason why such trees are not pruned. I admit this reason may at the first fail to carry conviction with it, but yet in time the feeling will be forced on the mind of the inquirer that custom or prejudice is not the cause of what he thinks is the omission of necessary pruning.

By observing the practice of the neighbourhood and noting the results, and by taking evidence of the owners of these orchards, it is more than possible that he will eventually become a convert to the custom he first of all condemned, especially when he hears of the many examples of failures by those who thought they were going to reform a system they did not fully understand. Thus first impressions are not always correct.

Now to be more explicit, let us suppose a gardener from a midland county suddenly removed to a charge in Kent, and, in addition to his other duties, an orchard on grass be put under his care. This may consist of a mixed collection of Apple and Pear trees that are evidently past their best, but still large trees more or less overgrown with moss, and their tops a thicket of boughs, with comparatively few shoots of the previous year's growth of more than a couple of inches in length. Most likely the first impulse would be, if it be the winter season, for the ladder, saw, pruning hook, and knife to be all vigorously applied. The firstfruits of this effort would be a load or two of faggots, and a survey of them with some distant friend brings out the expression that the trees are in something like bearing condition. But the old smock-frocked native shakes his head dubiously, and repeats what he has before asserted—"It will never answer, master," and is even not disconcerted when there is a fair crop the first year, which often happens. But by-and-by it is found out that the old man's warnings have not been all in vain, for the trees seem to dwindle away, and the produce of them becomes indifferent. The trees after all are not made young again, but in many cases their dissolution has been hastened, and the whole affair ends in disappointment. This matter, which has been enacted over and over again, is worth examining more fully to consider the causes which lead to such a result.

Let us take the Apple, and inquire into its history. We find that, like ourselves, it has its allotted time, which also, like that of ourselves, is prolonged or shortened according to circumstances. It has its youthful and matured period as well as its old age. When it approaches the latter stage there is, probably, more analogy between it and ourselves than we often take into consideration; and who amongst us at that declining period would like to lose a limb? yet we unmercifully amputate the old tree. But old trees, like old humanity, much rather benefit by generous assistance in the shape of food or other requirements.

Stimulants given to the root, but these not to an extreme amount, yet sufficient to reanimate and create an additional growth, would be the rational way to treat the tree, and with that it is possible the duty of gentle, not vigorous, pruning might be permitted. The most likely way, however, to render those severe amputations unnecessary is to look over the trees more frequently and do a little at a time, and not allow them to get into that condition which seems to call for such severe measures. When trees become old it is the rule in this neighbourhood not to prune them at all, but when they seem no longer profitable to destroy them, and plant others. These are planted, if possible, on another site. If it be on grass, the orchard is renewed by degrees; but if on tillage, there is usually a clean sweep at once, and a new orchard placed elsewhere.

Now, in the above remarks on the impropriety of severely pruning old fruit trees, I am not putting forth any peculiar notion of my own. On the contrary, I confess having become, to a certain degree, an unwilling convert to the practice; for it is no easy matter to contest an opinion with those who have spent a long life in fruit-growing, and have arrived at such a conclusion, as almost everyone has by whom I am surrounded, many of them being extensive fruit-growers. One of the most strenuous opponents to pruning old trees told me he had upwards of twenty thousand bushels of Apples last year. His trees were pruned rather freely, being young, but after arriving at a certain stage pruning is discontinued altogether, unless it be the removal of some branch that interferes with the growth of something else, or in some way or other requires shortening. Beyond this little or no cutting takes place with the old trees during the last half-dozen or more years of their existence. Experience has shown, although the crop immediately following the

cutting may be pretty good, the result afterwards is rarely satisfactory, and in consequence is rarely adopted by experienced hands.

In mentioning this I expect to be met by the remark, "What unsightly-looking trees they must be!" I confess some really do assume that aspect, but it is not for long, as when such trees cease to bear fairly good crops of fruit they are destroyed, which is better than waiting for the recovery of an old worn-out tree. When we have the example of those whose living depends on making the most that can be made of the plot of ground they hold, we may be sure they are not likely to be far wrong. Possibly, however, it would be better for the grower for private consumption not to cut the whole down at once, but to leave some for immediate supply; and more especially we would recommend him not to prune all the trees too severely at once. If he takes the trouble to ascertain the quantity and quality of the fruit the unpruned and pruned trees respectively bear, say, for the first four years or more, he will then be able to form an opinion whether the views narrated are correct or not.

In closing this article I need hardly say that the bulk of Apples grown in this neighbourhood are on standard trees with stems sufficiently high for cattle to graze under their heads. These trees when planted are rarely cut until the following year, but are always tied to one or more stakes, the stakes being continued for some years, and each succeeding winter the trees are pruned, all the shoots being shortened, and attention paid to the intended shape of the head. This reduction of the head is the more necessary to enable the stem to strengthen, which it would not do if the head were allowed to take its full unmolested growth. In a general way it is about four years before the tree is fairly capable of being left alone, and if the ground be in grass a sort of cage or frame to keep off cattle is often used as a means of tying it to for a year or so longer; but some pruning is done every year for some time, after which it may receive a look-round every third year, and possibly at longer periods, until tokens of old age creep on, after which no further mutilation takes places. The tree is then supposed to be past all improvement that can be given to it in that way; but I may repeat here what I stated at the first—that it is still influenced by kind and generous treatment at the root, and a load of dung tells its tale in a far more efficacious way than by the use of the knife and saw.

A friend of mine, whose orchard is of considerable extent, old me that he often treats an unhealthy tree to a little manure, which is spread over the ground, and the treat is duly appreciated and becomes visible to all. Those, therefore, who have recently come into possession of an orchard of old unsightly trees had better consider well before they undertake any serious mutilation, while at the same time the wheelbarrow or dungcart may be safely put in force. The removal of the moss by which the trees may be covered may be fitly treated of in another chapter.—J. Robson.

RAISING GLOXINIAS FROM SEED.

Now is the time to sow Gloxinia seed, not that it will vegetate better or the seedlings grow more freely than at any other period of the year, but because plants that are raised now can be brought to a considerable size and in fine bloom within a period of six months; and by bringing them on in succession, selecting the strongest plants as each batch is taken from the seed pans, an abundance of fine flowers may be had from August till the end of the year. The cultural process is very simple.

Half-fill a pan with broken crocks, filling-up to within an inch of the rim with fine soil consisting half of silver sand and half of peat or very old leaf mould well mixed, press the soil gently, spread the dust-like seed carefully over the surface; put no soil upon it, but cover it with a sheet of glass laid upon the top of the pan. Place it in the lively temperature of a hothed or early vinery, and moisten the surface of the soil occasionally with tepid water. This must be done carefully so as not to disturb the seed, and the glass replaced till the plants form a leaf or two. If the pan is plunged in bottom heat it will, of course, accelerate the germination of the seed, but that is not indispensable.

When the plants are large enough to handle prick them singly into 2-inch pots in soil like that in the seed pan. Do not, however, attempt to pot the whole of them at once, a few rampant fellows always take the lead. These should form a first batch to be followed by relays of others as they gain size, thus forming a succession for the coming autumn. When the roots reach the sides of the small pots the plants are repotted into 4 or 5-inch pots, in which they produce their first flowers. The soil used for the second pots is of a much stronger nature, and consists of turfy loam, old manure, and sand in about equal proportions.

A shaded position, precisely such as the stage of a vinery affords, suits them admirably. Frequent syringings, a plentiful supply of water, and some guano water or other liquid manure when the flower buds become visible, comprise the remaining points of importance. Care should also be taken to afford each plant ample space for the full development of its beautiful foliage, which under the favourable treatment indicated attains an extraordinary size, quite concealing the pot and forming a noble mass of green, and when it is crowned with its twenty or thirty buds and open flowers we have an object of such great beauty as to be suitable for almost every purpose to which a pot plant can be applied.

I have now upwards of two hundred corms which were raised last year very much after the manner I have described. They are a very fine lot, many of them measuring 3 inches in diameter. In the seed pans there are probably as many more, nice plump corms about the size of a large pea, and admirably adapted for a late autumnal display.

The whole of them are from a single packet of seed; most of the flowers were good, and many of them were of such excellent form and colour as to afford an ample stock for future purposes.—Edward Luckhurst.

ROSES.

"M. H. B." will be in despair. We have had no Rose food for several Journals. It is said that Oxford is so learned because "so much learning is taken there and so little is brought away." This may be applied to rosarians. They are a learned body because they keep their learning to themselves! They seem to be of the same opinion as a crabbed old Latin author, whose words translated would say, "Learning is no good to you if you let others know what you know." This is ungenerous. The Egyptians are a hieroglyphic nation, and they represent an incommunicative person by a dark lantern, having light within but giving no light without!

I have but little light at present in the matter of Roses, but I will communicate something, which is at any rate better than nothing. A beggar once told me, upon my saying I would give him nothing, "There is no taste in that 'ere article, and you could not give me much less, sir."

I said in my last article that I had on trial on weak stocks Peach Blossom, Diana, and St. George, and that I hoped to be able next year to report favourably of them. I have five plants of Firebrand on Briars, which being planted last spring could not in such a torrid summer be expected to be sufficiently established to test the Rose. The blooms were good for the season. The colour is that of a red-hot coal without any shading at all. It is quite distinct and of cupped form. Pierre Seletsky is a much better Rose than "D., *Deal*," has allowed. It is a good grower, hardy, and with very smooth and very stiff petals—important points. Madame Lacharme has grown well, but the fierce sun burnt-up the first blooms before expansion, and it did not give a second series. I have the following novelties on strong Manetti stocks, or comparatively strong stocks, and they have withstood the severe winter admirably:—John Harrison, Gould Veitch, François Courtin, Olga Marix, Hortense Mignard, Madame Bucheter, Mdlle. Alexis Michaut, and Madame Nachury. Let us hope that we shall find among them a nugget or two! There are a good many blanks to a prize, but still it might take a rosarian half a lifetime to raise as good Rose as one of the worst sent out yearly.

People do not generally know how difficult it is to raise a Rose as good as the parents, or better than and distinct from the Roses which we already possess. It is not enough for a new Rose to be good unless it is better than and distinct from Roses in the same line of colour. I am sure we are much obliged to the foreign and English raisers for procuring for us such a beautiful lot of Roses as we possess, and I for one cannot bring myself to use such harsh terms as I have heard occasionally applied to them. The Roses (except the summer Roses and Tea Roses) that I have lately given a list of, may be seen here in full bloom from July 12th to 14th, in great beauty in my frontage, lawnage, and in three other gardens, lining every walk in double or treble lines of six per sort in alternation of colours, or in beds of twelve to twenty per sort,

which last mode is very effective. I thank the raisers from my heart. The Tea-scented Noisettes, a noble race, Maréchal Niel, Triomphe de Rennes, Gloire de Dijon, and Céline Forestier commence in May and never cease till severe frost stops them. The three last are the best, most abundant, and latest bloomers.—W. F. Radclyffe, *Okeford Fitzpaine*.

ROYAL HORTICULTURAL SOCIETY.

March 3rd.

Fruit Committee.—Henry Webb, Esq., in the chair. Mr. Sherratt, nurseryman, Knypersley, sent a large branch of Kumquat bearing fifty-six fruit. The tree from which this branch was taken is said to be the only specimen existing in this country. It is the Citrus japonica. Henry Webb, Esq., exhibited a dish of Mandarine Oranges grown at Cannes, the flavour of which was very excellent, and for which a letter of thanks was awarded. Charles Reily, Esq., The Priory, Tonbridge Wells, sent two fruit of Cayenne and one Queen Pines, which were considered very good fruit considering they were represented to have been grown under disadvantageous circumstances. Mr. A. Archer Moss, Chadwell Heath, Essex, sent a seedling Apple, which was not considered of sufficient merit. Dr. Hooker sent an enormous root of Batatas edulis, grown in Madeira, which weighed 15¾ lbs., and for which a letter of thanks was awarded. Mr. Pottle, gardener, Sudbourne Hall, Wickham Market, sent a vegetable called Cabbage Broccoli, which is used as a Cabbage during winter, and in spring throws out a number of Broccoli Sprouts. The Committee asked that it be exhibited again later in the season when the sprouts are developed. Mr. Ransley Tanton sent a seedling kidney Potato, called Premier, which was recommended to be grown at Chiswick. He also exhibited samples of tobacco paper and ground bones, both of which were very good.

Floral Committee.—R. B. Postans, Esq., in the chair. We have but very little to notice here, the only group of plants with any pretensions to a show being the Spiræas from Mr. H. B. Smith of the Ealing Dean Nurseries. These comprised two dozen forced plants of S. japonica from home-grown roots. They were healthy and good, and merited the vote of thanks which was awarded.

Mr. Green, Holmsdale Road, Reigate, exhibited a small plant of Masdevallia melanopus. This is a new species discovered by M. Roezl, and is diminutive, curious, and pretty. The plant is not more than 3 inches high, and has three spikes of bloom. The flowers are whitish with dark purple spots and singular yellow horns. This is a cool-house Orchid, the plant having been subjected to a temperature of 45°, and was in perfect health. It is interesting, and received a botanical commendation.

A nice well-bloomed plant of Cœlogyne conferta was sent by Mr. May, gardener to J. S. Bockett, Esq., Stamford Hill, and a vote of thanks given. A fine spike of Dendrobium nobile was sent by Mr. Stevens, gardener to G. Simpson, Esq., Wray Park, Reigate, and a vote of thanks awarded.

A small plant of Primula sinensis was brought by Mr. C. Hart, Beaufort House, Lee, having two distinct colours, both in leaf-stalk and flower. One half of the plant may be described as red, and the other half white. A pip of pure white was striking as being set in a truss of rosy pink blooms. The probability is that the peculiarity will not be constant and perpetuated by seed, as these plants are of a sportive character. It is not at all unlikely, however, that the plant as it grows larger will throw-up trusses of white as well as of coloured blooms, and is worthy of preservation.

SEAKALE POTS.

Can Seakale pots be dispensed with? They can, on condition that other appliances can be had. Twenty-five years ago I found in use boxes in the room of Seakale pots; they were rough three-quarter-inch boards nailed firmly together, 20 inches square inside measure and 15 inches deep; a square piece of board or slate formed the lid. The boxes had two coverings of gas tar, and were put away in a dry loft till wanted. After being used they should be cleaned, and every two years they should have a coat of tar, and then I cannot say how long they will last. I found them more convenient than pots, for, be as careful as we may, pots are broken. It may be said that wood rots too, but I used them for thirteen years and left them in good condition. I never knew what they cost, but that would not be a very serious item, as the wood was home-grown and the boxes home-made.

With such appliances pots can be dispensed with, but I know that all Seakale growers have not wood nor yet carpenters, and it is not easy to conceive the makeshifts some of our craft are driven to under pressing circumstances. Tea chests, firkins, bottomless boilers, and the like have been resorted to, to have Seakale in useable condition. I commenced my career in a market garden where, in the forcing of Seakale and Rhubarb, pots and boxes were dispensed with, and I saw as good Seakale grown then, which is forty years ago, without those aids as I have seen since with them. Instead of pots we used to procure sticks of the required length and insert one end in the ground, bend it over the crowns, and stick the other end in the ground. Five or six such sticks give the idea of a bee hive. A little dry litter placed round them before the fermenting material is applied keeps the Kale clean, and furnishes us with a useful substitute for a Seakale pot.—H.

ROYAL HORTICULTURAL SOCIETY.

Although we have abstained hitherto from expressing any opinion upon the present state of the Royal Horticultural Society, we have not been passive observers of what has been going on. The great difficulty we feel, in common with all true friends of the Society, is in coming to a clear perception of what ought to be done in the present crisis. The present agitation is merely a repetition of what has often taken place before, and is a contention between two parties—one the Non-horticultural, and the other the Horticultural. The former are the pleasure-seekers apart from horticulture, and the latter the pleasure-seekers in connection with horticulture.

It will naturally be supposed that those who derive pleasure from the pursuit of horticulture have the best claim to be heard in the councils of a horticultural society, and it is a contention for the establishment of this claim which has given rise to this as well as to former agitations. Those gentlemen on the present Council who took part in displacing the old Council, told the Fellows that the interests of the Society had been sacrificed to the Royal Commissioners, that its funds were diverted, and that by transferring the management to them it could be shown that the income of the Society was not only sufficient for all its requirements, but that a large surplus ought to be secured. Those who know anything of the present state of the Society know how fallacious these statements have turned out to be. Here they are, at the end of the second year of their management, with a new debt of £5000 added to the old one of £50,000, and the prizes of last year we believe still unpaid. We are willing to believe that those who made those statements and who have administered the affairs of the Society during that period were mistaken, and that they regret the present state of affairs as much as any of the Fellows can do. But we would ask how it was, that knowing the low state of their finances, they permitted a schedule to be issued only a couple of months before the annual meeting, in which inducements were held out to horticulturists to exhibit at nine exhibitions during the present year, and when they met the Fellows they announced their inability through lack of funds to carry out their programme?

It is quite evident that this crisis is the most severe through which it has been the ill fortune of the Society to pass. It has survived many, and we trust it may yet survive this one; but the conditions now are very different from all the others. It has become apparent that the income is wholly inadequate to the expenditure, and that expenditure, too, made with every regard to economy. It would be impossible to carry on the Society and to furnish the necessary attractions with a diminished expenditure, for if they are curtailed the subscriptions of the Fellows will naturally drop off. It is to be borne in mind that it is not from a spirit of loyalty to horticulture that the large income of the Society is obtained. There are some Fellows as exacting as Shylock, and they demand their rights and privileges come what may of horticulture.

It appears to us to be a question of some importance just at present for the Council to consider what is to be done. Of whomsoever the Council is composed this one fact they will have to face, and that is the insolvency of the Society. There is no blinking the question. The lease is passing away, and instead of the debenture debt being reduced, and the annual expenditure of the Society thereby diminished, there it remains in all its original integrity with £5000 additional. For our part we do not see how the Society can go on unless the Council take immediate steps and apply to the Royal Commissioners to relieve them: that is the proper course to be taken, and the sooner they take it the better. Meanwhile between this and the adjourned meeting, which is to be held next Tuesday, let the Fellows take these matters into their serious consideration

and be present at the meeting, so as to support any course that may be devised for saving the Society and for preserving its legitimate functions.

GERANIUMS LAST YEAR.

Though somewhat late in the season I send you a few notes of Geraniums grown last summer, and first I may say that I quite agree with your correspondent "C. S. B." in the Journal of August 20th, when he speaks so highly of Waltham Seedling, for I certainly find that there is no dark scarlet variety to equal it; also with regard to Beauty of Calderdale amongst the bronzes, which is the freest grower of any that I have tried, though Mrs. Longfield with me is nearly if not quite as free. "C. S. B." also speaks of Mrs. Upton, which with me is no mere pigmy, but grows most vigorously. Pink May Queen I find to be exquisite for pots and indoor culture, but comparatively useless out of doors.

With regard to Vesuvius, which "C. S. B." and also Mr. C. P. Peach speak so slightingly of, and say they mean to grow it no more, I can only say that I can find no other bedding Geranium that can approach it, much more equal it. It is one mass of bloom, and a bed of it is perfectly dazzling to the eye. It may be that the soil here suits it better than elsewhere, for I do not find that it is at all apt to shed its petals with hot sun or wind, which Jean Sisley (in other respects a splendid bedder) certainly does.

For pot culture I find Mrs. Wm. Paul, Donald Beaton, and Masterpiece to be amongst the best. The last-named is an enormous trusser of the Nosegay variety, and is the very best that I have grown for blooming in pots all through the winter. Amongst the older varieties I find few to come up to Indian Yellow and Sutton's Scarlet Perfection as bedders for lasting well in bloom all through the season.—E. C., *Oakham.*

FORCING STRAWBERRIES.

After reading Mr. Taylor's note on Strawberry forcing (page 135) I wish to say a few words as to my mode of culture, and to recommend, in preference to that of layering the runners in their fruiting pots, to layer them on the ground where they are growing, from plants of the previous summer's planting, whilst there is vigorous growth in them.

As soon as rooted take them up at once and pot them in their fruiting pots. I use the 48's, and find better results than from pots of a larger size. As to soil, I use a good part rich friable loam, a little leaf soil, and one-third well-decomposed cow dung. After potting they are set in the shade a few days to recover from any little check they may have received, and then take a place in the frameyard well exposed to the sun and air. They are stood about 1 foot apart, and well supplied with water during the summer.

On the approach of heavy autumn rains they are put in cold frames, placing the pots on boards to stop their rooting in the earth. This shelter assists them to mature the crowns, which are very stout and good this year. They are now in a vinery throwing up some fine large bloom.

As to red spider, I can only say if they exist at all they have not much chance to prosper, as I have a bed of fermenting dung and leaves in the house, which I well know is a capital antidote. It is, however, always favourable to the increase of the red spider when you see the fruit with the hard green patches alluded to by Mr. Taylor. In my experience this want of swelling is partly owing to the want of proper watering, as of course they should not want for a good supply of water till they get their fruit of moderate size. A good preventive of red spider is to water with liquid manure alternately, and withhold when the fruit shows colour. My plants were in a cold frame till the first week of January, and then introduced to a house of cool temperature for a week or more.

I am of the same opinion as Mr. Taylor as regards the plants being placed on pieces of turf when on the shelves, although I have not experienced it myself, not being able to find time for many such little requisites.—C. M., *Morville House.*

Leeds Horticultural Show.—"An Exhibitor of the R. H. S." complains of the withdrawal of the Hyacinth Show from the series of the Royal Horticultural Society's shows, and I ask him and other intending exhibitors to read the advertisement in your columns of to-day of the spring Flower Show at Leeds. If successful it may be followed by other season shows, which it is hoped may become annual. The schedule is extensive and the prizes good. The room in which the Exhibition will be held is admirably adapted for such displays, and I am sure any plants sent for exhibition will have every care taken of them.—J. B. Stead.

HEATING BY GAS-HEATED BOILER.

From one or two letters which have appeared in our Journal I venture to think that a little information with regard to warming a greenhouse by means of hot water heated by gas may be interesting and useful to some of your readers who, like myself, live in a town and delight in doing a little in flower-growing. My house is on the west side of a street running north and south or nearly so, and the town itself is celebrated for the quantity of rain, and I might safely say smuts; nevertheless, I can manage to grow many things well enough to be pleasing. My walled-in garden is 42 feet square, and against the west wall I have, with the aid of my late coachman, erected my lean-to greenhouse. Of its structure I need not say a word beyond giving dimensions. It is 18 feet 9 inches long, 8 feet wide, 6 feet 6 inches high in front, and 9 feet 6 inches high at the back. In continuation and at the same elevation is the potting house, a wall dividing the two. In the corner of the potting house stands a little boiler heated by gas, which during the late very severe weather was quite powerful enough to do all that was required.

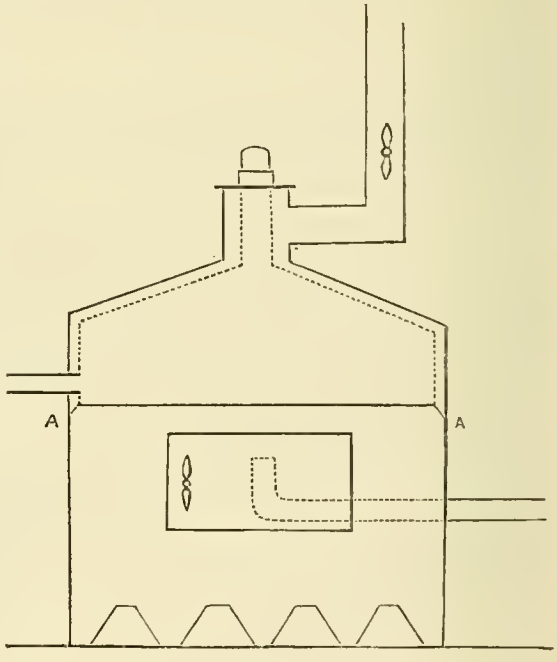

Fig. 45.

I question if the shape of the boiler is a great novelty, because I put on paper the same design as the man who made the boiler had done, without any consultation about it; but the burner, which is in my humble opinion the great cause of success, is invented by Mr. Sharp, in the employ of Mr. John Garner of Wood Street, Liverpool. The accompanying sketch (fig. 45) of this boiler will, I think, be interesting, as it is so compact. The boiler itself is made of copper and the case of sheet iron, the fine being of zinc. The latter ascends perpendicularly through the roof and has a small revolving cap on the top, or the down current extinguishes the flame in very boisterous weather. The boiler rests on a small iron rim, A, A, in which are punched a few holes, and through them the gas vapour passes over the boiler to the flue. The pipes attached to the boiler for flow and return are 1-inch, and the pipes in the greenhouse are 3-inch; a flow and return being taken along the front of the house and the same at the back. The length of the 3-inch pipes is therefore 75 feet. The 1-inch pipes lead to them across the end of the house.

I have said nothing about consumption of gas, but now I will say a few words on that point. I cannot give the quantity this one boiler has consumed for this reason. The first boiler I had made on this principle was very small—only 10 inches in diameter, overcase and all, and which was to heat a forcing pit; and so marvellously did it answer that I had the larger size made for the greenhouse precisely on the same plan. I have kept the gas burning constantly under both these boilers since the 10th of November, 1874, to the 18th of January, 1875; and the meter shows that they have consumed between them 26,800 feet of gas at 4*s*. 3*d*. per 1000—£5 12*s*. 10*d*. worth, or at a cost of 1*s*. 7¾*d*. a-day—a price I should have to pay a man to look after a fire, besides finding the coal. I have two burners under my largest boiler, a small one and a large one: the former I shall use when the weather is mild and I want but little heat, and the latter when the weather is frosty.

I shall be glad to answer any inquiries through your valuable paper, or show my little wonders (for such I consider them) to anyone of your subscribers who would like to see them.—J. W.

NOTES RELATIVE TO THE POTATO.

In the Journal of February 25th, pages 157-8, Mr. E. Luckhurst gives some notes under the above heading, and as everything relating to the growth of the Potato must be interesting, especially now when we are thinking of planting our 1875 crops, I beg to dissent from some of Mr. Luckhurst's premises. After quoting from Allison to show that greater blight existed on rich soils than on poor ones, the writer says, "In giving this quotation from Allison I do not, of course, intend to infer that a poor soil is at all preferable to a rich one for Potato culture; that would be simply absurd."

Here I beg to differ from Mr. Luckhurst, and as one ounce of practice is worth a ton of theory I should like to ask him how he accounts for the fact that in the district of Lonsdale North of the Sands, North Lancashire, which is surrounded by a tidal bay, close to the lakes, and where the rainfall is the greatest in England, the Potato crop is the soundest in the United Kingdom! Here we attribute it, rightly or wrongly, to the nature of the soil, our Potatoes being mostly grown on poor sandy lands, and chiefly with nearly dry farmyard manure. Our farmers hold that the lighter the manure the sounder the crop. For many years the staple sort was the Fluke; but in process of time this variety became worn out by disease, and we are now almost wholly growing Scurries. Last year's crop was the largest and least affected with disease of any we have had for the last twenty years, as is instanced by the fact that good, sound, wholesome Potatoes are selling in our markets at 6*d*. per stone of 14 lbs.

My own opinion has long been that rich soils and rich manures are the greatest friends to the Potato blight, and in support of this I may instance the experiments made by a friend in a garden, who has also held the above opinion. Year after year he has planted with the smallest possible modicum of light dry manure, taking care to select his seed from Potatoes grown on poor sandy soils, and has constantly taken up prolific sound crops, though the tubers themselves are not so large as those of his neighbours. At the same time the latter, their gardens adjoining his, and the soil of precisely the same nature, have been planting with the richest manures they could procure. The result has been that their crops are invariably diseased, some years so much so as not to be worth lifting.

I do not profess to treat of the Potato blight on scientific grounds, but experience confirms me in the belief that much of the disease is due to our behaving too well to this useful root. We have pampered it with overfeeding until we have rendered it delicate and liable to decay.

If anyone wishes to test the truth of my observations, let them take the top off a few rods of old grass land, procure some hardy sound seed Potatoes, and plant them entirely without manure, and I will guarantee a good crop free from disease, and of the finest flavour. If the seed be the remnant of the previous year's diseased crop, of course the trial would not be a fair one. We cannot reasonably look for sound crops from diseased seed, for in this way the disease is mainly propagated.

I have said that the 1874 crop of Potatoes has been the heaviest and most free from disease of any that we have had for many years; and lest any of your readers should fancy that we have had an exceptionally dry year, I may say that our rainfall in 1874 was 54.45 inches, and that rain fell on 207 days. In May we had 1.83 inch; June, 1.08 inch; July, 2.86 inches; August, 9.32 inches.

The general impression seems to be that the Potato disease is due to atmospheric causes. To this I would reply, Is our atmosphere changed from what it was prior to 1845? Were not the same causes in operation prior to that year as now? This theory is accepted simply because it takes the matter out of our hands. It is a non-preventible cause, and takes from our shoulders the responsibility of providing a remedy. My impression is, that although the remedy is a difficult one, yet we have a remedy.

To the introduction and general use of artificial and rich manures the disease is due. Year by year we have weakened the constitution of the Potato by over-indulgence in good living, and as it has taken something like thirty years before the effete invalid has reached the full state of corruption, so it will take many years of united—and to be effective it must be united—retrogression to bring it back to its original state of hardihood and health.—Beta.

MEALY BUG.

Though we often hear of plans for getting rid of this horrible insect, I should from observation very much doubt if it ever is entirely eradicated from any collection of plants on which it has once been established in any force. Where from previous neglect it has once gained a firm footing, it appears to require constant care and labour to keep it down, but I much question if it ever is quite got rid of so as not to appear again. Can any of your readers say if such is the case to their knowledge? I cannot help thinking that in new houses it would be far better if people would take care to avoid its introduction than inquire how best to combat it. It is now nearly thirty years since I made up my mind never to grow mealy bug whatever else I grew, and having as much glass as most persons in the nursery business, I can say what everyone cannot say—that I never have grown it. Knowing how impossible it would be to prevent its introduction, I gave strict orders that any bought-in plant should be carefully examined, and for a time kept as much as possible by itself, and that if any trace of mealy bug was seen on it, it should be at once burnt whatever its value. Few years have passed without a plant or plants being burnt, but the whole value of such plants has been very small, whilst if this pest had once been established in my houses it would have taken the labour of an extra man or two to keep the plants clean. Now it is a great pleasure to enter a house 100 feet by 30, where almost every pillar has Stephanotis growing up it, and say you will find no mealy bug anywhere here. Prevention in this case is better than cure.—J. R. Pearson, *Chilwell*.

CULTURE OF THE HYACINTH IN GLASSES.

Being desirous of assisting, however limited may my power of doing so be, I beg to tender a few remarks, quite as much to solicit as to furnish information. It is not to be wondered at that so much uncertainty should exist by the culture of Hyacinths in glasses. Many are the inquiries from ladies why the Hyacinth so often fails. The atmosphere of the hall and room is so variable—sometimes close and stifling, often subject to draught, and always much drier than plant houses; these conditions and neglecting to change the water are the chief sources of Hyacinth failures.

The Hyacinth glasses are so well known that I need not describe them, but I may just mention that in selecting glasses always choose coloured ones and with the lower part the widest, to allow the roots to have plenty of room. The glass ought to be at least 9 inches long, with a cup at the top to contain the bulb; they should be filled with clean soft water just up to the neck, but not to touch the bulb.

The time to do this depends upon the wishes and wants of the cultivator. If desired early they should be put into the glasses as soon as the bulbs arrive from Holland. When they are so placed, and at whatever time, they should be put into a dark cold room for twenty to twenty-five days to cause the root to be formed previously to the bloom bud appearing. Examine them occasionally and remove gently any scales that may be decaying, but be very careful not to injure the young roots, which will soon be seen breaking through the skin at the base of the bulbs. One drop of spirits of hartshorn put to the water of each glass, changing the water every week and adding the same small quantity of the hartshorn, is beneficial. They should be brought into full light of the window,

but even then if possible avoid a window facing the midday sun, or one in a room where there is a fire. If these precautions are attended to it will induce a gradual growth, and consequently a much stronger foliage and finer bloom.

When the roots have nearly reached the bottom of the glass there will be at the extremity of each a covering of mucous matter. This soon stops the absorbing power of the roots by which the food of the plant is conveyed to the leaves, when the plant is injured and often the whole set of roots are destroyed. To prevent this the roots should be drawn carefully out of the glasses, and in a wide vessel partly filled with clean soft water the roots of the bulb should be placed, drawing them carefully through the hand, yet using a gentle pressure. This should be done two or three times until the roots appear quite clean. The glasses in the meantime should be thoroughly washed-out and wiped clean and dry, then gradually work the clean-washed roots into the washed glass before putting-in any water. If the roots are numerous it will be found necessary to twist them round and round till they reach their old quarters and the bulb rests on the neck of the glass. Now fill the glass with clean soft water and replace it in the window. Once washing the roots will be sufficient to carry the bloom through. The regular changing of water will be all that is required.

After having bloomed the bulbs should be taken out of the glasses, preserving the roots, and lay them in a border. A slight watering will be necessary, and they will ripen the bulb and the leaves will gradually turn yellow and decay. They should then be taken up and keep them dry and cool until the middle of October, then plant in the borders.—J. H., *Gardener to Lady Caroline Legge.*

PROTECTING SEEDS FROM BIRDS.

For the information of your readers who believe in the services of small birds, and do not therefore care to kill them, I suggest the following simple mode of protecting Peas and other seeds. I have adopted it, and know that it answers well. Take a lath and cut from it three pieces, 1 foot, 6 inches, and 3 inches long respectively, then fasten them by nailing or tying in the following form. Place them at intervals of about 6 feet along the rows of seed, and stretch fine twine along the sticks, fastening it at the points *a*, *b*, *c*. The five lines thus made will frighten the birds, and prove as effective a protection as wire at 9*d.* a-yard. Seven lines are better than five.—P.

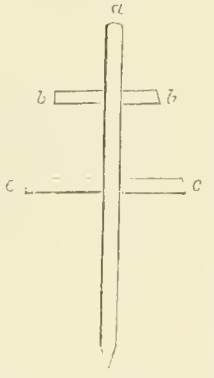

Fig. 46.

FLOWER MISSIONS.

Having read the deeply interesting paper on the "Flower Mission" in your *Journal of Horticulture* for December 24th, 1874, I am inclined to think your sympathies are in favour of this beautiful work among the sad, and sick, and poverty-stricken inhabitants of our great city. With considerable success the ladies have carried on similar missions in Scotch towns. I believe Miss Stanley has a successful one in Westminster. In connection with one mission last year we saw the wonderfully softening influence the little flowers exercise even in the lowest courts, where without flowers it would be well nigh impossible to venture.

It is my desire this year to organise a regular flower mission for the east end of London, with lady workers at one or two central depôts. The great hindrance is the expense of carriage; but I think the railway companies might be influenced to convey them for the flower mission free, and I hope to write to them, but I thought a strong influence could be brought to bear on them by sending copies of your paper on the subject to them. My object in writing to you, then, is to ask if you have any old disused numbers containing the account which you could let me have for this purpose.—E. A. H.

[We regret that we have no copies such as "E. A. H." asks for, nor do we think that railway directors would need such a detail. The humane object need only be stated, and requires no advocacy. The secretaries would in most cases give the necessary aid. Any assistance we can render will be most willingly afforded.—Eds.]

CUCUMBERS, SUMMER AND WINTER.

Much has been written on Cucumbers, their mode of culture, &c., but nothing has been said as to how long the plants will last after being planted out in the house.

The winter Cucumbers of your correspondents hitherto have been planted in the autumn. I will treat on plants that were struck and put out in the spring, and answered for summer, and also continued through the winter. I had charge of a small Cucumber house in a former situation under Mr. J. Batters. I went there in January, 1872, and a plant was covering half of the trellis in the house. This plant had been bearing since the preceding February, or nearly twelve months. The same plant with two top-dressings of old mushroom-bed manure carried as good a crop of handsome and healthy fruit through the following summer and winter as the young plants of spring, 1873, which were planted soon after I went to the place. It would no doubt have continued another season had not the woodwork given way on which the soil wherein it grew rested, thus compelling us to have repairs made good with new materials.

The pit in which the Cucumbers were planted was 12 feet by 6. Three rows of 4-inch pipes ran the length of the bottom of the pit, and 3 feet above the pipes was the framework on which the soil rested. Only 4 inches of soil was used, with the exception of the ridge which was 8 inches in thickness. The variety grown was Telegraph, raised from cuttings taken off about the middle of February; these were inserted in a pot under a bell-glass and placed in a good bottom heat, and when struck potted-off singly into 60's previous to being planted out in the house.

The soil both for potting and planting was warmed previous to being used: this was composed of loam mixed with a little old mushroom-bed manure and a small portion of leaf mould. A ridge was formed and the plants put in, and when the roots began to show through the surface the rest of the soil, 4 inches thickness, was placed over them. With this small amount of soil, and always warm water, occasionally liquid manure, and two top-dressings of old mushroom-bed manure, these plants flourished and bore an abundance of handsome fruit free from disease of any kind. I should state that an aperture was made in the wall of the pit facing the pathway; this was closed with a shutter, so that on very cold nights we could leave the space open, and so let the heat into the house. There being only one 4-inch pipe round the front of the house, which returned into the pipes underneath the bed, we had great difficulty in keeping the house at the proper temperature through the winter season, it often being as low as 60°; and but for the aperture before mentioned, even with a flow and return pipe at the back of the house we should not have succeeded so well as we did.

Plenty of warm water at the roots was a point of much importance, and a standing order was to never use cold water, but to keep the plants clean, the fruit thinned-out regularly, and never allow the foliage to become overcrowded. This practice will always produce Cucumbers both summer and winter, the plants being well established and more capable of bearing through the winter season than those planted in the autumn. Telegraph I find to be the best winter Cucumber for general purposes, it has few superiors, being productive and good.—F. H. F.

THE LILY OF THE VALLEY.

This plant is so well known by all, and I think I may say is such a general favourite with most people, that it needs no praise from me. It is prized by all lovers of sweet flowers, and is much sought after by dwellers in both town and country. To such I address the few remarks I have to make on the forcing of this ever-welcome Lily.

How often do we see it in both large and small gardens as soon as it has served its purpose—that is as soon as it is out of bloom, cast out of doors as if unworthy of better care? Its fate is often to be taken from the greenhouse and pitched at once behind some north wall, exposed to cutting winds and occasionally may have to submit to 10° or 12° of frost. This I must call barbarous treatment. But I may be asked, "What are we to do with all these forced roots after blooming? We have so many other things to attend to that we can-

not possibly find room for all." Very true; but I would say, Do as I do, make an effort, and you will soon find the truth of the adage, "Where there is a will there is a way." When they have finished blooming I let them remain under glass to finish their growth. It is true they do not get the best position in the houses, but are stood by the sides of pathways, or, in fact, anywhere, so as they get light and water. I am fully sensible of the difficulty of finding room for such things at this important season of the year, when every inch of space is valuable. But how many places are there where room could by a little forethought be had—room suited to the simple requirements of Lilies, and preferable to a withering north aspect out of doors? My plan is, when out of bloom, to stand them in a late vinery or Peach house, to remain there say to the end of May, or whenever bedding plants are turned out to harden.

The reason I make these remarks is to correct an erroneous idea that they will not force a second year, and therefore by some they are considered as useless. Beyond question that is a mistaken idea, as I shall presently show; but let it be understood that I do not write for the purpose of crying down the practice of buying-in fresh clumps every year—nothing of the kind, for I never seem to have sufficient, although we buy-in annually. Then why take further trouble if they can be bought-in yearly? The reason is that I find, as a rule, that old plants reasonably cared for—that is, plants from two to three years old, serve me better than the newly imported clumps. For some years I have ceased to force the latest importation the first year, but simply let them bloom in their own season in a cool house.

Every batch of roots received is labelled with the date of the year and the time of potting, and at this present time I have a pot dated 1872 containing thirty-two spikes of blooms. When I attempted to force the newly imported clumps it was rarely they did much good the first year; but when they have been gently forced a year or two and allowed to finish their growth under glass they scarcely require forcing. We had them in bloom early in January with but a very slight forcing, which I could never manage so early with the newly imported clumps. After turning them outside they get water with other things as they require it until the foliage dies down, then they are simply turned on their sides for a period of rest. I commend this plan on account of its utility, efficiency, and economy, as, of course, no gardener ought to incur a larger expenditure than is needful in the discharge of his duties.—G. R. Allis, *Hartsholme Hall.*

DALKEITH.—No. 1.

Dalkeith is a small parish of Mid-Lothian, lying on the banks of the North and South Esk rivers. Adjoining the town is Dalkeith Park, the seat of the Duke of Buccleuch. It is easily reached by rail from Waverley Station, Edinburgh, and the gardens are only a few minutes' walk from the station of Dalkeith. A very brief outline history of the place is appended; to treat at length, however interesting it might be, would supplant much gardening lore of paramount moment. Dalkeith Palace was erected about the beginning of the last century. It is a large square structure, in which the Corinthian order of architecture is visible. The site was previously occupied by the old castle of Dalkeith, which was a place of considerable strength, and withstood some sieges. Its first occupants were the Grahams, afterwards it became the seat of the Douglas family, succeeding in turn to the Mortons, one of whom was Regent of Scotland and resided here, subsequently ending his life on the scaffold. On this event the castle appears to have been considered public property. Eventually the estate came into the possession of the Buccleuch family, and has been held by them for upwards of two centuries.

The park is a noble piece of ground of about 8000 Scotch acres; its surface is gently undulated, and is broken by the rivers above mentioned, whose streams unite about half a mile below the house. The South Esk has a romantic appearance by the overhanging wood, its twin sister coming more into the open day, but has pleasing walks on its banks, from which we obtain glimpses of the town and church of Dalkeith. The park is well timbered with old Oaks and other valuable trees. There is nothing elaborate in the style of the ornamental grounds—that is, they contain few artistic landscape touches.

Passing through these grounds from the kitchen gardens to the Palace we follow a winding walk along the brink of a steep slope on the north side of the river Esk to the Montague Bridge. This bridge, with its noble arch which spans the bounding river below, forming at its base a small cascade (to be figured in a subsequent issue), is an attractive feature of the place. This bridge carries the principal carriage drive from Edinburgh to the Palace. The massive old pile, which has weathered so many storms, is situated on a steep promontory overlooking the river. On its north-east sides the old sandstone walls are clothed with a rich and luxuriant growth of Ivy, reaching occasionally to the eaves, which are upwards of 60 feet high; this adds much freshness and beauty to the plain and weather-beaten exterior. On the south-west front the walls are destitute of covering, and the architecture is more broken. This front is approached by a fine sweep of carriage drive (fig. 47), and overlooks a prospect of simple rural beauty rather than of pretty gardenesque touches, which would mar by their artificialism the natural boldness and dignity which characterise the demesne. A broad grassy terrace and wide gravel walk extends from the base of the Palace to the top of the slope, some 50 feet high, running down again to a smooth mossy lawn lying in the bottom of the valley a few feet above the level of the Esk.

The slope is covered with an even growth of Portugal Laurel, pruned-back annually to a height of about 2 feet, and irregularly interspersed with ornamental trees and shrubs, giving a very pleasing effect, and forming the best of all coverings for such a high terrace slope. We may remark that evergreens of most kinds grow here with great luxuriance, and are seldom or ever injured by frost. The plantations are a perfect jungle of Holly, Laurel, Box, Yew, Ivy, &c.; and even Rhododendrons thrive well, considering the dry nature of the soil. We follow the drive away to the left through a wide-spreading grove of fine old trees, noting the great height (over 100 feet) and size of many of the Beeches, Limes, Sycamores, and Chestnuts, and entering a small enclosure through which the South Esk river flows we soon arrive at the circular conservatory.

This is a richly-designed piece of architecture, and, as a specimen of elaborately-cut stonework, said to be unequalled in the kingdom; but the site being low and shady and out of the way its effect is comparatively lost, and consequently there is no effort made to keep it filled with such a display of flowering and other plants as one would expect to find in such an imposing and richly carved structure. It is chiefly filled with plants that can be comfortably left to themselves for a time in a greenhouse temperature, and amongst others we noticed several fine specimens of Tree Ferns, Palms, Rhododendrons, &c and a good-sized specimen in fine condition of the beautiful Japanese plant, Eurya latifolia variegata. Leaving the conservatory we notice on the surrounding lawn some fine specimens of ornamental trees, particularly three Cedars of Lebanon, with clean straight boles 10 to 12 feet in circumference, and 15 to 20 feet high, branching into massive limbs and wide-spreading heads, forming a very distinct feature with the deciduous trees clothing the adjacent slopes. There are here also a specimen of Salisburia adiantifolia over 40 feet high, Magnolia conspicua 24 feet, a Weeping Ash nearly 50 feet which sweeps the ground, and a fine old spreading tree of the Hemlock Spruce.

Retracing our steps towards the Palace we pass in front of it, regretting that time will not permit of a closer inspection of it and its rare and valuable contents, which by the kindness and liberality of his Grace the Duke of Buccleuch are freely open to the public on certain days of the week; the surrounding pleasure grounds being also thrown open at the same time, a boon highly appreciated by the inhabitants of the busy crowded towns and villages in the neighbourhood. Just before leaving the grounds we pass on the left the private chapel of the Buccleuch family, a massive and elegant structure, built about thirty years ago, in which full Episcopal service is regularly held for the benefit of the neighbourhood, whether the family are resident or not.

Returning to the kitchen garden enclosure we will proceed to note the contents of the very extensive glass structures for which Dalkeith has long been so deservedly famous, and will confine this paper chiefly to the plant-growing department, deferring a notice of the fruit ranges to a future occasion. I am not aware that Dalkeith is generally regarded as a "plant place," yet it has good claim to this distinction, and it is not too much to say that, well as the fruit-growing department is conducted, the plants merit equal note and observation. Hard and soft-wooded plants are alike well grown. Entering the

Heath house we find large old specimens of the following standard kinds:—Ericas ampullacea, Aitoniana, Turnbullii, Retorta major, Austiniana, Jacksonii, Elegans, Marnockiana, Masconi major, Fairrieana, florida, ventricosa of sorts, tricolor of sorts, Cavendishiana, Spenceriana, Lambertiana rosea, Savillii major, Exquisite, Amabilis, &c.; such a collection of large plants as is seldom met with now-a-days. There is also a good collection of smaller plants of all the best sorts growing-on to replace the large specimens, many of which will soon be past their best.

The whole collection gives evidence of skill and attentive care in keeping these aged plants in the good condition they undoubtedly are. The next house is devoted to the culture of Camellias. The plants were in the perfection of health, and demanded inquiry as to the outlines of culture which gave such satisfactory results. The house is a good roomy structure, upwards of 60 feet in length and 25 feet wide. It has a ridge-and-furrow roof of opaque glass, which at once renders shading unnecessary, and preserves the blooms a long time in beauty. Along the centre of the house is a row of fine plants of the old Double White, still unsurpassed for general usefulness; and on each side of them are good healthy plants of such useful sorts as Imbricata, Lady Hume's Blush, Jubilee, Donckelaari, Cup of Beauty, Duchess of Buccleuch, Elegans, American White, Bealii, Duchesse de Berri, Countess of Orkney, Fimbriata, &c. These are all planted-out and growing luxuriantly in a border about 2 feet deep of pure and rather light turfy loam. From this house the supply of Camellia flowers has to be kept up from November until May, so that the house has to be treated on the cool system during that period—that is, a minimum

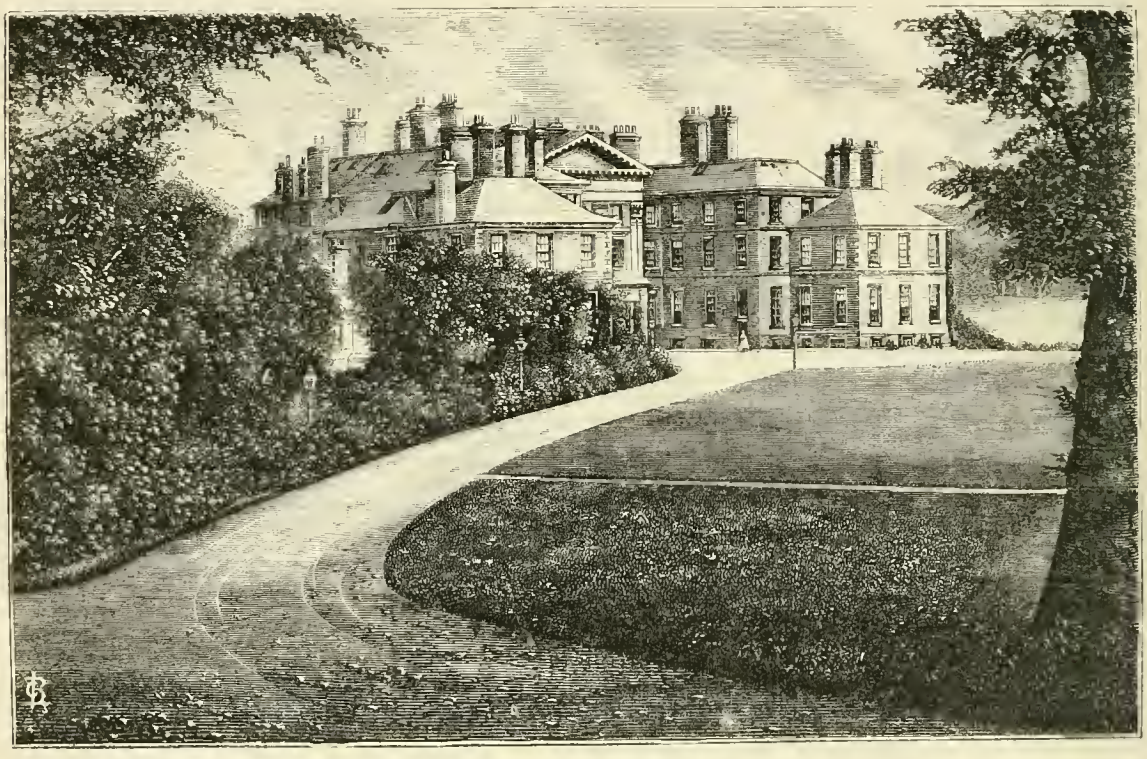

Fig. 47.—Dalkeith palace—south-west front.

night temperature of 40°, and plenty of air on at all times when the state of the outside temperature will permit of it, cold draughts being carefully avoided as being very injurious to the flowers. After the demand for cut blooms is over early in May any left are taken off, the plants gone over, pruned, and carefully cleaned, the surface of the border scraped clean, a top-dressing of light turfy loam given, the house thoroughly cleaned, and then kept close to cause the plants to make their growth freely, and set their buds as quickly as possible. Heat is applied to keep up a night temperature of 65°, and the plants receive a thorough drenching overhead from the engine every day, the supply to the roots being also liberal at this season. They make rapid growth, and the buds begin to show early in July, when more air is gradually given and the fire heat reduced, till by the end of the month the house is again cool, but kept regularly syringed and watered as long as the warm weather continues, after which the syringe is discontinued, and the watering carefully attended to for the remainder of the season. Manure water is occasionally given when they are in full growth and in full flower in early spring. By such means the plants do well, bear fine crops of flowers, and never drop their buds. A few plants of Maréchal Niel and Gloire de Dijon Roses are trained to the rafters, where they do well and flower freely; also a few Passifloras, Tacsonia Van Volxemii, &c.; but they are all kept within bounds, and not allowed to overcrowd or interfere with the health of the Camellias.

The next house in this range is the Orchid house; if anything, too large for most Orchids. It is span-roofed, 55 feet long and 23 feet wide, with a wooden stage in the centre, and a wide stage outside the path all round. There is a fair collection of Orchids on the middle, front, and end stages, and on the back stage a collection of stove Ferns. Most of the popular and useful sorts of Orchids are grown, the Vandas being particularly fine, comprising several good plants of such sorts as Vanda suavis Veitchii, the best of the suavis section; V. tricolor, Dalkeith variety, a very fine if not the best variety of tricolor, and the original plant of which is a splendid specimen, about 6 feet high and nearly as much through; V. insignis, V. teres, &c.; also a fine plant in a tub of the best tall variety of Sobralia macrantha, and many large specimens of Dendrobiums, Oncidiums, Zygopetalums, Cypripediums, Phajus, Lycastes, &c., and a good plant of that grand Orchid Angræcum sesquipedale with six bloom spikes.

The Ferns on the back stage are chiefly grown for table and house decoration, and consist of all the best varieties for that purpose, with a few specimens interspersed, such as Adiantum trapeziforme, cuneatum, macrophyllum, formosum, Neottopteris nidus, &c., all doing well in this shady part of the house. Behind the Orchid house and entered from it is the fernery, containing some good specimens of Tree Ferns sadly cramped for want of head room, and a good variety of smaller Ferns requiring a moderate temperature, including some nice plants of Todea superba, pellucida, and Wilkesiana, the rare Ceterach

aureum, and Platycerium Wallichii; also a very large specimen of Todea arborea, with a stem over 8 feet in circumference, evidently some centuries old. Platyceriums, "Bird's-nest Ferns," Niphobolus, and others are growing nicely on blocks of wood with a little sphagnum, and hung against the wall with pretty effect. Returning through the Orchid house we notice a fine specimen of that best of all basket Ferns, Goniophlebium subauriculatum, with fronds drooping down 7 to 8 feet; also, suspended in baskets from the roof are some healthy young Pitcher-plants of the best sorts.

The next house in this range is a span-roofed stove, 30 feet long by 23 feet wide; we find it filled with a good collection of foliage plants, such as best sorts of Palms, Crotons, Marantas, Anthuriums, Dracænas, Caladiums, Alocasias, &c., all grown with a view to the usefulness during winter and spring for decorative purposes. Here we also noticed a good plant of Adiantum farleyense, with a healthy lot of younger plants growing in 6-inch pots for table decoration, for which they are in demand, and are very graceful, but do not stand it well, one night being generally sufficient to so injure the fronds that it takes weeks to recover them. Here also is a good plant of Cochliostema Jacobiana, which produces its curious and showy flowers all the year round, never being long without a spike or two expanded.

We now take a look into two houses 150 feet in length and about 12 feet wide. The first we enter is a greenhouse, and is filled with a varied lot of plants, such as Cinerarias, Amaryllis, Heliotropes, Primulas, Mignonette, Pelargoniums, &c., the next being used as an intermediate house, and in which were growing nice lots of standard Epiphyllums, Poinsettia pulcherrima, Euphorbia jacquiniæfolia, Begonias, Gesneras, &c., all grown for winter and spring-flowering. Leaving this we pass a long pit with a north aspect, filled with the usual sorts of bulbs in pots, to be moved by-and-by into the forcing houses as required to keep a regular supply in flower during the season. They are plunged in ashes, just covering the pots, and in severe weather sashes covered with thick roofing asphalt are put over them, but always pulled down in mild weather, and by this means the bulbs never get drawn, and thrive well with the smallest amount of care. In this yard are also situated the frames for forcing and protecting vegetables of all the usual kinds required in such an establishment, the Seakale and Rhubarb being forced in a lean-to shed close and dark, and heated with hot water. This shed was built specially for the purpose, which it answers well.

Our notes of this great and good garden are suspended on the threshold of the fruit department, which holds higher rank in the horticultural world than the ornamental features and products of the establishment. Our notes will be continued in a future number.—J. Wright.

LITTLE HEATH MELON.

I am sorry that Mr. Harrison Weir has disparaged Little Heath Melon, and I think incorrectly. If I could grow Scarlet Gem or Beechwood, most certainly I should not grow Little Heath (and I do not think anyone would for a moment compare them); but the advantage of Little Heath is that you can grow it in a cold pit with only a small quantity of manure, and indeed after you have grown Potatoes, and that you can thus have a very decently flavoured Melon, which I have found Little Heath to be. Nasty I have certainly never had it. A man who can have his haunch of venison may disparage plain mutton, but those who cannot get the former find the latter very decent eating.

I have made one omission in giving names of Strawberries grown, and that is President, which I have found most excellent in all circumstances, and amongst these I hope to try this year La Grosse sucrés.—D., *Deal.*

BULBOCODIUM VERNUM.

Mr. Robson has recently called attention to the welcome early-flowering Eranthis hyemalis, or Winter Aconite. Not nearly so well known as this, but which will assuredly and deservedly come into favour, is the plant named above. Coming into bloom simultaneously with the Snowdrop and Eranthis, it is a most valuable addition to our early flowers; rich in colour, dwarf in habit, and perfectly hardy, it is in all points a suitable companion to these.

Belonging to the natural order Melanthaceæ, in common with Colchicum, Veratrum, &c., the character of Bulbocodium vernum will be easily understood by those not yet acquainted with it by comparison with Colchicum autumnale, usually but improperly called the Autumn Crocus (this is Crocus sativus, or the Saffron Crocus), to which it bears a strong resemblance, but its colour—a bluish purple—is deeper and richer.

The directions for its culture are of the simplest nature possible; for where the Crocus and Snowdrop will grow Bulbocodium will thrive also: hence place the bulbs in good ordinary garden soil in groups of three, four, or five, as the case requires or taste directs, in a line with the Snowdrop and Eranthis, and then let them alone. When the flowers and foliage have died-off other plants may be inserted by the side of, but not planted on them, otherwise great injustice is done to the plant.

Like the Snowdrop and Crocus, the bulbs may be taken up once in two (still better in three), years for multiplication of stock and for giving the individual bulbs more room. This is a small trouble, but it will be amply repaid.

Following close upon, and in favoured spots simultaneous with, the above are Scilla præcox and Crocus reticulatus, the earliest and best of the yellow Crocuses. What a glowing array of colour and beauty is furnished by these five humble plants for the decoration of the garden in the earliest of spring days, when every moment of sunshine is so precious to the gardener and so enjoyable after the dreary winter weather! Yet how often are these plants subjected to the grossest ill-usage! It is surprising that it should have to be recorded, but it must be, and accompanied with strong and earnest protest—the foliage of these plants after the flower has passed away is frequently torn or even wrenched off, or hoed off before it has completed its natural functions, to make way for some jaunty successor.—A. H. Kent.

KNIGHT'S MONARCH PEAR.

"D., *Deal*," wishes to know other growers' opinions of the above-named Pear. I can fully confirm all he says respecting it. I had two trees of this variety, one a wall tree trained on a west wall, and the other a bush tree double-grafted on the Quince; this I rooted-up three years since. Previous to reading "D., *Deal's*," article I had cut all the branches back of the wall tree to engraft with a more satisfactory variety. The upper half of the tree I grafted with Huyshe's Prince of Wales about six years since, which always bears a crop of fruit of the finest quality. The fruit of the lower branches—the Monarch—drop-off a month before I gather the Prince of Wales. I have only a few days since thrown all the crop of Knight's Monarch Pears to the rubbish heap, they being shrivelled and worthless. My soil is a rich deep hazel loam on a dry open subsoil, on which Pears bear abundantly both on the Quince and the Pear stock.

The following varieties I find to be good here. Those I have marked with an asterisk are the best.

*Doyenné d'Eté, pyramid.
Jargonelle, bush.
*Beurré Giffard, espalier.
*Beurré de l'Assomption, wall.
*Bon Chrétien (Williams), bush.
Madame Treyve, espalier.
*Louise Bonne of Jersey, pyramid.
Fondante d'Automne, espalier.
*Beurré Hardy, pyramid.
Doyenné Bossouch, bush.
*Marie Louise, espalier.
*Marie Louise d'Uccle, pyramid.
Conseiller de la Cour, wall.
*Thompson's, wall.
Baronne de Mello, pyramid.
Alexandre Lambré, pyramid.
*Prince Consort (Huyshe), espalier
*Huyshe's Prince of Wales, wall.
*Doyenne du Comice, pyramid.
*Beurré Bachelier, espalier.
*Orpheline d'Enghein, espalier.
*Zephirin Grégoire, pyramid.
*Winter Nelis, wall.
L'Inconnue, espalier.
*Easter Beurré, bush.
*Joséphine de Malines, wall.
*Bergamotte d'Esperen, wall.
Olivier de Serres, espalier. (This Pear has ripened with me the past two seasons in January, and is soon rotten at the core. According to catalogues it should keep until April.)

—G. A. T., *Uppingham, Rutland.*

EUCHARIS AMAZONICA CULTURE.

I find no difficulty in flowering this plant twice a-year, but I think that is as much as can be done with an individual bulb. I think that where they are flowered three times a-year it may be from side bulbs that had not previously flowered. I would not, however, say that it cannot be done. I potted some on the 21st of July last, giving them a liberal shift. I put five bulbs in a pot (some 12-inch and some 9-inch pots), according to the size of the bulbs, and we have had a regular supply from Christmas until the present time. I had four spikes from every pot, with five and six blooms to each spike. I think the above is a proof that they do not want to be pot-bound to flower them. Of course I would not recommend them

to be potted each time they are flowered, as of course the soil cannot be impoverished in the time, but I would say, Pot as soon as ever they get potbound. The following is the treatment I would recommend.

After they have done flowering shake out the bulbs and put four round the outside of the pot and one in the centre, choosing pots according to the size of the bulbs, using rather a rich compost—three parts loam, one part leaf mould, and one part dung, with a dash of sand, taking care that the pots are well drained. After potting give a good soaking with tepid water, and place them in a light position in the stove for about two months, watering very sparingly until they are nicely rooted, then remove them into a cool house where they can have plenty of light and air, watering them only just sufficiently to keep them from flagging. Here they must remain for at least six weeks. Take them from the cool house, according to the quantity required at a time, and plunge them in a nice bottom heat, keeping the top heat at ordinary stove temperature. In three weeks to a month you may expect to see four spikes generally from each pot. After flowering treat the same as after potting. One thing I would mention, and that is, never give liquid manure until you see the flower spike.—C. E. S.

NOTES AND GLEANINGS.

We have received from Messrs. J. C. Wheeler & Son of Gloucester, samples of that delicious winter Apple Ashmead's Kernel. They are now at this late season quite plump and fresh, and the flavour is not to be surpassed. Planters ought to make choice of this in any collection they may form. The name is sometimes, but very erroneously, written Ashmead's Colonel and Colonel Ashmead's—a mere corruption of kernel, which is synonymous with Pippin, which signifies a tree raised from the seed or pip.

—— We learn that Mr. A. McKenzie of Alexandra Palace and Park, having pretty well completed the outdoor works and glass structures there, is prepared to take commissions in landscape gardening and the improvement of landed estates. We trust that Mr. McKenzie's engagements on private properties will not deprive us of his services in a public capacity, for his admirable work on the Thames Embankment and elsewhere constitutes him an important public benefactor. It is satisfactory to learn that, although now enabled to enlarge his sphere of operations, he will continue on the official staff of the Alexandra Palace Company.

—— A National Horticultural Show is to be held in the Gardens of the Manchester Botanical and Horticultural Society from the 14th to the 21st of May. The prizes are very liberal.

—— We have received the announcement that an International Horticultural Exhibition is to be held at Cologne this year from the 25th of August to the 26th of September, in the grounds of The Flora. It is to be under the auspices of the Empress and the Crown Prince. The programme is a very full and rich one, and embraces every branch of horticultural industry. We believe it is intended to form a committee in this country, the arrangements for which we shall announce as soon as they are completed.

—— It is known that Sir Alfred Slade, Bart., and the Hon. R. W. Chetwynd have resigned their seats on the Council of the Royal Horticultural Society. It is to be hoped that no undue haste will be shown in filling up these vacancies, but that the Council will wait and see what direction is given to the present movement consequent on the disorganised state he Society is unfortunately in.

NOTES on VILLA and SUBURBAN GARDENING.

As soon as the weather will allow of it, and the soil becomes workable, proceed to complete the planting of autumn-sown annuals immediately. Sow also patches of hardy sorts in the open borders, and if they should not come up freely and well there will then be time to make another sowing.

Hollyhocks.—Where these are in request now is the time to plant them out in their blooming quarters. I allude to those plants raised from seed or cuttings last August, and which, if strong, may be expected to bloom well during the summer. Those who are fond of raising their plants from seed, and can procure seed from a good collection, should sow the seed early in April, either in boxes in gentle heat or on a prepared bed outdoors. The seedlings should afterwards be planted thickly in a well-prepared nursery bed, and encouraged to grow by every means, and in due time many of these will flower and their quality can be decided upon as to whether they are worth retaining for future cultivation. By this means much trouble and disappointment will be spared; but, on the other hand, for first-class varieties, one cannot do better than go to those who make their cultivation a speciality and secure plants.

Dahlias.—These may now be started in gentle heat by setting the roots upon some light earth and covering them with the same material. They push out their shoots at the crowns, and may be divided into two or more plants as may be desired, with a tuber attached to each, and be potted. The above plan is applicable to those living northwards, but in the southern counties there need not be any such pains taken with them, for the roots can be planted in the bed where they are to flower. The latter part of April or the beginning of May is a good time, but when the shoots come up they will need a slight protection, as the Dahlia is a very tender plant.

Carnations, Picotees, and Pinks.—These beautiful flowers should be grown in every garden, and as extensively as space will permit. Their flowers are always welcome, and appropriate for button-holes, bouquets, or in vases, and they possess the quality of lasting almost as long as any flower grown. Those who have a stock of young plants in pots under protection may now let them have more water than formerly, and if they are named sorts pot in pairs, which will make a much better show than if single. A suitable soil is three parts rich loam, but as fresh as possible, the remainder rotten cow manure and leaf mould. After a short time they will thrive outdoors if stood upon a bed of coal ashes so that worms cannot get in, but they will need a slight protection during severe weather. Those which were raised from layers last year and have remained in store pots all winter, must now have more air to prepare them for finally planting out, but meanwhile the beds or places where it is intended to plant them should be well prepared. The Carnation likes a fresh soil, and if the bed has grown similar plants before, the soil should be taken out and have new added, so as to give them every chance. A stagnant site and very heavy water-holding soil should be avoided.

Some amateur gardeners pride themselves in raising seedlings of these as well as other florists' flowers, which is a very interesting occupation. The seed should be sown in boxes in heat, or they may be sown on a mild hotbed this month, and covered with a handlight; when well up they should be pricked out into nursery beds, and afterwards planted in a well-prepared bed. They will make fine plants by the autumn, and will stand the winter very safely. The next season they will flower, and any that are good and worth growing for cut blooms should be marked, and the layers rooted from them at the proper time, while all the remainder may be dug up and thrown away.

Chrysanthemums.—Propagate these as soon as possible. It is a first-rate plant for town gardens, and will thrive in the smoke better than most plants. Strike them now, and pot them on till they are sturdy plants. After once or twice pinching back select those to be grown-on in pots. Those for planting-out will grow by the sides of the house, or, if employed to decorate a walk in the autumn, they will answer well if planted-out in May. They will be the better of being stopped once or twice after that; but those in pots will need stopping up to the beginning of July for the large-flowered sorts, and the Pompons or small-flowered section not after the middle of June.

Pansies.—Stir the soil among those in beds, and give a top-dressing of manure, and no doubt they will require shelter from bad weather. Those who have a stock of young plants in frames of the Belgian sorts should now pinch out the leading shoot, in order that they may break previous to planting-out in beds or borders where they are to flower. They are very pretty, and will flower nearly through the summer if kept pegged down, manured, and not allowed to suffer from the want of water.—Thomas Record.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

The prevailing winds during the last week have been easterly, and the weather has been quite winterly throughout. Snow fell on two days equivalent to rainfall of 0.35 inch. It has been lying on the ground nearly all the week, owing to the extremely low temperature. The thermometer has fallen several degrees below the freezing point, on one occasion 10° of frost being registered. Under such adverse circumstances but little work could be done. We wheeled a good dressing of manure on to a piece of ground that required to be trenched; this kept the frost out of it and allowed of its being finished. In districts where the rainfall is deficient, much summer labour may be saved by trenching as much as possible of the ground during winter when other work is not pressing. Even if a good dressing of manure cannot be obtained, the ground is loosened and the roots thereby enabled to penetrate freely downwards. Our ground requires to be heavily manured, and this can be applied the more readily during the operation of trenching.

The system pursued here is to dig out two spits and to shovel the loose earth out after each. This is wheeled to the further

end of the ground. The bottom of the trench is then forked-up to the depth of 9 inches, and a good dressing of manure is put in. One spit and the loose earth from the next trench is put over this and another dressing of manure given, which is covered by the bottom spit and shovelling, and the operation is complete. In clayey soils with a stiff clay subsoil it is very desirable to work-in some stable manure during the operation. Sandy soils receive more benefit from cow manure. On the 26th the snow had cleared off on borders sheltered from the north-east and exposed to the sun. The ground was then in fair condition for planting a few second early *Potatoes*. Dalmahoy is the best as regards flavour, it is also the most certain cropper. Early Don has been tried this year. It has been more recently introduced, and has fully borne out the high character sent with it. It has, however, one serious fault—viz., its susceptibility to disease, which will always tell against its general cultivation. The earliest Potatoes are not planted-out yet, they having been planted in boxes and placed in a cool house to await more favourable weather.

Pricked-out *Cauliflower* plants that were raised on a hotbed some time ago. The soil used is light and not rich. It is necessary to be careful that any early vegetables sown under glass do not receive any check by removing them from one frame to another. We used to sow Celery for the earliest crop in boxes, and place them also on the hotbed; but the plants raised in this way invariably ran to seed, so that it has been discontinued. In clayey soils the plants would not have this tendency.

Peas have started away freely; but the young and tender growths seem to have received a check from the frosts. The usual protectors of galvanised iron wire netting have been placed over them to prevent the attacks of sparrows. Very often the seedsman is blamed for supplying bad seeds, when the sparrows had cleared off the plants directly the seed leaves have been formed. Lettuce, Radish, and all the Cabbage tribe are eagerly watched by them; even Onions are torn-up for mere amusement, as they drop the plants on the ground.

FRUIT AND FORCING HOUSES.

Pineries.—With increased light a higher temperature may be kept up both in succession and fruiting houses—that is, if the fruit which is now swelling is required early; otherwise a very high degree of temperature is not necessary, because equally good fruit can be obtained in a night temperature of 60° as in one of 70°, and as a rule the better-flavoured fruit is grown in the lower medium. One matter requiring more care than is usually bestowed upon it is the bottom heat. While this can be kept up to about 85° or 90° it is much better not to interfere with the bed, as turning it over has a tendency to raise it unduly. Up to 100° there is no danger of injury, but when the bottom heat rises over this the roots are sometimes injured. Many persons use test sticks for the bottom heat, but this is too uncertain to be recommended, and in all cases a thermometer specially adapted for the purpose should be used. If in any case the bottom heat should rise over 100° the pots must be raised in the bed to about half their depth, and gently shaken from one side to the other to form a space all round the pots. It is the safest practice to have the pots in a medium too low than too high, as, if the roots are not destroyed by the heat, the excitement is injurious. All our houses at present are kept at a night temperature of 65° except the sucker house, which is usually a few degrees lower. We have on previous occasions alluded to ventilation as being very important in this department. Pines do not show the effects of deficient ventilation so readily as some other plants, but they feel it quite as much, and show the effects ultimately in the leaves being drawn up instead of having that stocky sturdy appearance that well-grown Pines have. A little weak manure water is used for those that have fruit in its earlier stages swelling.

Peach Houses.—The stoning period, especially if the houses are forced early, is usually thought to be one of danger to the fruits, as at this time they are supposed to drop off; but when they are in vigorous health, and the roots sufficiently supplied with moisture without being overdone with it, not one will drop off. In forcing houses there are other agents at work that may at any time cause a check which would have similar results, such as neglecting to give air when the sun was acting strongly on the glass, or allowing draughts of keen frosty winds to blow through the house; but the careful cultivator is vigilant when extreme caution is required, and his trees are not likely to suffer. Even with pot trees, which are more liable to suffer for lack of moisture at the roots or from sudden changes of temperature, out of hundreds that we have grown during a series of years the small proportion that have had fruit drop during stoning are not worth notice.

A high temperature must not be kept up at stoning time. From 55° to 60° is quite high enough if the weather is cold. When stoning is completed, which will be as soon as the fruit takes the second swelling, the syringe may be vigorously applied, and the minimum temperature may be 65°, rising to 80°, or even 85° by day, shutting the house up early in the afternoon, and syringing the trees at the same time. The details of Peach management are comparatively easy: The growing shoots must be tied down to the wires, and they must not be too thickly placed; syringe daily, and fumigate with tobacco on the first appearance of aphis.

FORCING HOUSES.

In the pits or houses devoted to forcing plants for greenhouse or conservatory decoration it is necessary to maintain a genial temperature; 55° at night is quite high enough, taking care that there is a sufficient degree of moisture in the atmosphere. Most hardy-flowering shrubs of a deciduous character do better if the roots can be plunged in a mild bottom heat. Most of the Dutch bulbs—Hyacinths, Tulips, &c., are placed on shelves near the glass; in this position the leaves do not become drawn. Nothing looks worse than to see the leaves of a Hyacinth hanging down over the side of the pot before the flowers are fully expanded. Dielytra spectabilis is a very beautiful hardy herbaceous plant, and well adapted for forcing. Its long drooping spikes of pendulous bright rose-coloured flowers have an excellent effect in the greenhouse. A succession of strong healthy plants is kept up by striking a few cuttings annually. These can be obtained from plants growing in the open border; the shoots will soon be pushing through the ground, and must be taken off in a young state, potted singly in small pots, and the pots plunged in a gentle hotbed; they will soon form roots, when they must be gradually hardened-off and planted in the open border, or in beds of rich soil. The second season they will form fine large plants for forcing. Roses have not been so much infested with green fly as usual, but the bud worms have been numerous; they are readily detected by the leaves sticking together or curling up, and should be destroyed before they have time to spoil the buds. The house should be fumigated if green fly appears on any of the plants.

PLANT STOVE.

The last plants of Poinsettia pulcherrima have been removed, and placed where the pots can be kept dry, until it is time to cut the plants down. Achimenes and Gloxinias are grown in most places where stove plants are cultivated. The last named are the greatest favourites. We have shaken the corms of the latter out of the pots and repotted them, and placed the pots near the glass in the stove. Turfy loam, turfy peat, a little rotted manure, and some white sand answer well as a compost. The corms are potted in small pots at first, and after the plants have started freely they are repotted. Specimen flowering plants are not potted at this time; but those that are grown for their foliage may be potted at any time, for as the leaves constitute the beauty of the plant, it must be kept in vigorous growth to prevent them having a sickly appearance. Training climbers on the roof: as these are now starting into growth they must be looked over, and those most liable to be attacked by bug, such as Stephanotis floribunda, Hoya, &c., carefully washed. There are some climbers never attacked by this terror of the plant stove, and of these the best are the Allamandas and Clerodendron Balfourii; therefore, it would be well to plant such in preference to those that are invariably attacked.—J. Douglas.

TRADE CATALOGUES RECEIVED.

Harrison & Sons, Leicester.—*List of Choice Seeds.*

Hender & Sons, Bedford Nursery, Plymouth.—*Catalogue of Bedding Plants, Fruit Trees, &c.*

C. Sharpe & Co., Sleaford.—*Descriptive Catalogue of Farm Seeds.*

J. Coombes, Enfield, Middlesex.—*Catalogue of Cuttings of Geraniums, &c.*

Messrs. F. & A. Dickson & Sons, Chester.—*Catalogue of New and Select Farm Seeds.*

TO CORRESPONDENTS.

Books (*A. C.*).—Our volume of "Garden Plans, and How to Plant Them," is printing.

Contractor's Rights (*St. Clare*).—It is not possible to quote any general rule, but it is certain that a contract to lift old piping and relaying new does not entitle the contractor to carry away the old piping unless there is a clause in the agreement entitling him to do so.

Mr. Jesse (*A Lady*).—He died at Brighton in March, 1868, aged 88. There is a memoir of him in our No. 357, published April 9th of that year.

Salt, Soot, and Lime (*Agricola*).—They may be sown mixed or separate. The lime does not set free any ammonia from the soot, all being solid substances; and under any circumstances there is only about one part of ammonia in a thousand of soot.

Various (*D. Drake*).—The plant is Sweet-scented Coltsfoot (Tussilago fragrans). We never grew Little Heath Melon. Sow the Ten-week Stock for summer-flowering. The double Tulip petals decaying before fully open is probably caused by night frosts.

Cucumbers and Melons in Greenhouse (*E. H. E.*).—They will succeed if your house be kept warm—in fact, converted into a stove, as it may be during the summer months, by giving air moderately, and closing early so as to husband the sun heat. The plants will not answer trained to the side walls, but should have the shoots at 15 inches distance from the glass trained to a trellis, or at least be in such a position as to have abundance of light. Turfy loam light rather than heavy for the Cucumbers, and strong loam for

the Melons and firm, adding to each a fourth of well-rotted manure, and well incorporated. The soil should be a foot deep. Sufficient moisture may be kept up by frequent sprinklings of the paths, walls, &c., morning and evening, and the plants will require water so as to keep them from flagging. No stated times can be given for watering, as it depends upon the weather, growth of the plants, &c. Having no hotbed your best plan would be to ask some neighbour to raise the plants for you. If you raise your own sow in small pots and cover with a handlight within the house. When they have two or three rough leaves plant out, but it would be better to raise the plants in a hotbed, and transfer to the house when the plants are sufficiently grown. The boxes ought to have holes in them, and to be efficiently drained. The temperature should be 60° to 65° at night, 70° to 75° by day, with a rise from sun heat to 85° or 90° with air. (*J. F. S.*).—They will succeed fairly grown together, and require pretty nearly the same treatment, only the Melons must not be wetted overhead when setting, and when ripening they require to be kept dry both at the root and overhead. Read's Scarlet-flesh is the best of that section. Meredith's Hybrid Cashmere Green-flesh, and Golden Gem, are very handsome and good. They will answer well, particularly as your house is heated. Little Heath is the only kind we recommend for growing without heat.

Trailing *versus* Bush Ivy (*J. K.*).—The common and all Ivies that trail or climb are distinct from the bush or tree Ivies, the latter not climbing but forming tree or bush-like heads. They are for the most part varieties of the climbing kinds.

Lonicera aureo-reticulata (*Idem*).—It flowers in this country against a warm wall. The flowers are not unlike the common Woodbine, but are white and fragrant.

Echeveria metallica from Seed (*Idem*).—It may be raised from seed without a hotbed, being sown in pots or pans, and placed in a greenhouse, keeping moist, but the process is much slower and less certain than in a hotbed.

Camellia Leaves Variegated (*J. F. Smith*).—The leaves are very healthy, even the yellowest one. We do not know what will cause the plant to lose its variegation, it being a result in your case not of weakness but of vigour. Probably less rich soil and restricting the root action would give you a remedy, but in this we have no certain data. We have one or two plants affected in a similar manner, they, like yours, being very vigorous. We shall not pot them for a year or two, as we had some similarly affected, and by not treating so liberally as before the leaves have resumed their normal state.

Fumigating Greenhouse (*S. E.*).—Once a month will, as a rule, be often enough to fumigate a greenhouse, except under special circumstances, when it may be more frequently resorted to. In case of a severe attack of aphides, or when the pests have been allowed to get a-head, it is desirable to fumigate on succeeding evenings, and again in about a week if there are any insects apparent.

Beet Woody (*Idem*).—It may be a consequence of too early sowing of the seed, the plants having run or begun to seed, and the roots are hard, woody, and of bad colour; or it may be a consequence of growing in poor soil, its woodiness being accelerated by the drought of last summer. Richer ground and not sowing until the beginning of May ought to give you tender roots.

Lining a Cucumber Bed (*W. W.*).—There are but two ways, one to place the hot dung against the sides of the frame all round, the other to line from the bottom placing it against the sides, and this like the other should be of at least half-sweetened, as a safeguard against rank steam finding entrance to the plants.

Pruning Newly-planted Pyramids and Standards (*Idem*).—Do not prune the spurs, but cut the side shoots to within half an inch of their base, and shorten the leading shoots to 6 or 8 inches, but they may be cut less or more according to strength and required form of the tree. The leading shoot of the tree should be cut back to 13 inches. The standard trees we should cut back at least one-third the growth of last year, and the side shoots to within half an inch of their base, leaving the spurs entire, and shortening the leaders of the branches one-third their length. If they have nothing but young growths shorten them about a third, and thin out if the shoots cross each other or are crowded.

Red Spider (*Idem*).—It is one of the greatest pests to the gardener, being very small, scarcely visible to the naked eye; but when a plant is much infested by them the leaves present on the upper surface the appearance of being scorched. The colour varies; sometimes it is yellowish, at others brown, but generally a dull red. It may be found at most times in greenhouses and hothouses, especially those which have been kept hot and dry, mostly located on the under side of the leaves, feeding on their juices.

Wages at Market Garden (*W. A.*).—The wages vary with the locality, but in most cases a suitable man for rough work could be had for from 18*s.* to 21*s* per week, with lodging, or a house if a married man. An allowance for those in money is usually 2*s.* 6*d.* weekly. If you require labour for glass it will be for a good man at an advance of the wage quoted.

Pruning Neglected Orchard Trees (*Idem*).—Thin-out the weak and old branches, especially where very crowded, and those which cross each other, but do it to only a moderate extent—a little each year until they are comparatively thin. Severe cutting often results in exuberant growth. See what Mr. Robson says this week.

Depressing Hot-water Pipes (*W. P. H.*).—It is practicable to depress the pipes of No. 2 house 18 inches below the level of No. 1 house, but the pipes in No. 2 must not be depressed and again be raised to the level of the No. 1 house pipes. When once the water sinks to a lower level it should be taken by a gradual decline to the boiler. Neither will it answer to depress the pipe on entering No. 2 house, and after going along it again rise to the return of No. 1 house; but by having it as a return pipe in No. 2, and removing the return of No. 1, putting it so low as to act for the return of both, you may heat your second house satisfactorily, having an air pipe at the highest part of the flow in No. 1 house. By your projected plan the circulation would be impeded, but would, nevertheless, act in a sluggish sort of way, only you would need an air pipe at every rise just where the depression occurs, for nothing but air in the pipe will stop the circulation of the water.

Constructing Removable Greenhouse (*L. F. O.*).—If you place bricks on the surface of the soil, and then the wooden frame resting on the bricks, but not fastened to them or to the back wall, you could remove the house. In our "Greenhouse Manual" are fuller instructions for erecting a removable one.

Forced Crocuses Failing (*A. G.*).—The most likely cause of their failing is bringing in too much heat, they having also been kept much too wet. They require very gentle forcing, and to have a light airy position. The small corms formed above the old ones may be put out outdoors where they will attain a size for flowering. Lilacs, Azalea pontica, and Kalmias do not answer for forcing two years together. They require a year's rest. The Lily of the Valley may not have flowered because it had no flower buds, or it may have been brought on too rapidly.

Camellias and Azalea indica (*Idem*).—The Camellias which have made good new growth in heat ought to be continued there until the wood is well ripened and the buds set, after which they should be removed to a cool house, and kept cool and airy. If in small pots they may be repotted, taking care not to disturb the ball but merely loosening the sides, and warming the soil before use. Keep the Azaleas in heat until they are in flower, and then remove to a cooler house, returning to heat again after flowering, and keep in it until the growth is complete and the ball set, then place in a cool house. Bouvardias should be pruned after flowering, kept rather dry for a time, and in a moderate temperature, and when starting into fresh growth should be encouraged with a moist heat and be fresh potted, and after a good growth is made they should have a light airy position in a cool house.

Urine and its Ammonia (*C. Y.*).—One pound of sulphuric acid to 100 lbs of urine; it forms sulphate of ammonia. Seven pounds of sulphate of iron, or 14 lbs. of sulphate of lime might be substituted for the sulphuric acid.

Insect on Vines (*An Old Subscriber*).—The beetle injuring the young Vine shoots is the Curculio picipes, or Dark Weevil. Spread a sheet beneath the Vine, go at night with a lantern and shake the Vine. The weevils then feeding will fall upon the sheet.

Apricot Sucker (*Orleans*).—Your Apricot sucker with a straight stem of five-years growth will be a good stock for any of the Plums. If you want the tree for a dwarf-trained tree you must graft low, and for a pyramid it must also be worked low—about 6 inches from the ground. Grafting should be done just when the stocks are beginning to grow. If you bud them, July is the best time.

Ferns for Stove Fernery (*Eda*).—Moderate growers are Adiantum concinnum latum, Asplenium formosum, Davallia decora, D. parvula, Goniophlebium lericeum, Lomaria Herminieri, Niphobolus corymbifera, Platycerium alcicorne major, Platyloma flexuosa, Pteris cretica albo-lineata, P. tricolor, Polypodium pectinatum, Nothochlæna trichomanoides, Platycerium grande, Lastrea elegans, Drynaria diversifolia, Davallia dissecta, Blechnum nitidum contractum, B. cognatum, Asplenium fœniculaceum, Adiantum tenerum, Adiantum peruvianum, A. Santæ-Catharinæ, and A. tinctum. Where you have space you may introduce Adiantum Capillus-Veneris and A. assimile, both of which grow freely, and are very useful for cutting. Ferns for hanging baskets are Adiantum setulosum, Cheilanthes alabamensis, Davallia dissecta, D. decora, Drynaria quercifolia, Goniophlebium subauriculatum, Microlepia hirsuta angusta, Nephrolepis davallioides, N. tuberosa, Polypodium appendiculatum, Pteris scaberula, and Asplenium caudatum. Foliage plants are:—Croton Johannis, Dracæna Weismanni, Ficus Parcelli, Maranta rosea lineata, Paullinia thalictrifolia, and Aralia Veitchi.

Names of Fruits (*Beta*).—We regret not to be able to name the Apple you have sent.

Names of Plants (*J. E. S.*).—Sparmannia africana. (*Ignoramus*).—No doubt a Composite, probably a Helichrysum, but your description is insufficient. (*T. Edmonds*)—3, Polypodium 'hastatum;. 4, Nephrolepis acuta; 5, Adiantum Capillus-Veneris; 6, Adiantum (specimen insufficient); 7, Æschynanthus sp.; 8, Specimen insufficient, it may be an Hypoestes. (*Chesterfield*).—1, Parmelia saxatilis; 4, P. physodes; 2, Cladonia rangiferina; 3, Evernia prunastri.

POULTRY, BEE, AND PIGEON CHRONICLE.

DETENTION OF SHOW BIRDS ON SUNDAY.

Some readers may think that we are never wearied of remonstrating on this topic; we are not, and we have strong hopes that many committees which have been in the habit of including a Sunday in their show time will in future try to avoid it. Of course all will not, still we shall never tire of systematically showing-up such shows in our reports. We know the evil consequences must be, and are, great both to man and bird.

We are at a loss to know why committees will include a Sunday. We will put monster exhibitions like Birmingham and the Palace out of the question for the time, and only refer to smaller shows. We find repeatedly exhibitions held on the Friday and closing at 10 P.M. on Saturday, or held on the Monday in addition, and so on. Doubtless, if we asked the secretaries of these shows why they managed their dates so badly, we should have touching pictures drawn of such and such a show clashing, or Saturday being an early-closing day, or Monday the market day, or that by having such a date all the birds can come on from such and such an exhibition, and so on. These reasons may appear all very good, but they do not do away with the fact of a Sunday being so frequently included. The extra gain brought by the Saturday people or the marketers we should think was nearly consumed in the extra expenses which Sundays must entail—rent, gas, food, feeders, &c. The cost of these for a single day is no small item in a show's expenses, as we have good reason to know.

Then for the exhibitors' servants who so often have to stay out all the days of a show; surely to them the Sunday must be a hard time. What have they to do? Maybe they are in a strange town and know no one. We can only say they hardly have any alternative but to sit about in the public houses. We do not think it is fair to them to have to spend their Sunday away from home.

For the birds themselves it is often destruction. We can quote case after case of birds which have been totally ruined

for exhibiting and breeding by their long incarceration at a show and the excitement it causes, and the Sunday to them is only an extra day in which to come to harm.

Thus much for the evil. Now for the reason. We believe the reason why Sundays at many shows are included is simply to make the dates fix in with another show to avoid them clashing, and so causing both shows, or one of them, to come to grief. Exhibitors soon learn what birds are likely to beat them, and when two shows occur on following days they think, "Oh, Mr. So-and-so will be sure to send to one, and as I do not know which I shall not enter at either." Of course here we speak of the general run of amateur exhibitors, and after all without them the committees would often look queer when the reckoning-up day arrives. If this is the cause, one way out of the difficulty would be for committees to make their exhibitions more district or county shows. We are sure this would answer well. Kent has many such shows, and they do well. People who would not otherwise exhibit will send to their county show, and the exhibitors of the district know they have more chances of prizes, and enter accordingly.

There is no doubt but that there are too many open shows. The fact of their being open to the United Kingdom does, we know, keep local and county exhibitors from patronising them. Whereas if the competition were restricted to the county or district the committee could make such a choice of days as would answer all purposes without the Sunday being included, and their entries would be more, for they would get dozens of entries from those who would otherwise not have sent one bird. We merely mention this as a suggestion, which we have long thought would be one way out of the difficulty.—Amicus.

THE EXHIBITION DORKING.—No. 10.

BY T. C. BURNELL.

The Dark Dorking.—Amongst the different breeds of Dorkings, the Dark or Coloured Dorking, on account of its superior size, has always been the favourite. This variety was originally called the Grey Dorking, then the Coloured Dorking, and now is generally known by the name of the Dark Dorking, to distinguish it from the Silver-Grey variety.

The first and most important point in a Dorking is the shape. Most beginners are apt to think that five toes on each foot, and a freedom from leg feathers and crest, are all that are required to make a good bird. Not so; it is the peculiar shape which makes the Dorking, the square, deep, and massive body, and the full chest. The breast bone should be long and deep to allow plenty of room for putting on flesh, as it is the Dorking's breast which gives it its pre-eminence for the table. The back should be very broad and flat at the shoulders, and should gradually narrow to the hips; the legs should be short and stout, and with plenty of bone, as the leg is a good criterion of frame and capacity for putting on flesh; the thighs should lie close to the body, and not be carried atilt-wise, as in the Cochin. The above points apply equally to all Dorkings.

I will now state what is generally considered requisite in a show bird of the Dark variety, and first for the cock: Head of a good size, eye large and dark in colour, earlobe red, wattles long and pendulous, comb either single or double. If the comb is single it must be perfectly upright, quite straight, free from any excrescences at the sides, and evenly serrated with about six or seven sprigs; if rose-shaped (double) it should be close and firmly fixed on the head, square in front, flat at the top with the exception of numerous little sprigs, the sides straight and even, and the whole comb narrowing behind into a distinct point. The comb in either case should be of a good size, but without the least tendency to coarseness. Rose-combs in Coloured Dorkings have lately become very scarce in the show pen, and not more than a dozen pens, I think, have been seen at the Crystal Palace Show for the last five years. They are evidently not popular, the reasons doubtless being that they are more difficult to find in perfection, t.. they invariably become coarse and ungainly in the second year, and that they are more open to being tampered with than the single combs, this latter in my opinion being a serious objection.

Rose and single-combed birds may be bred together, and a proportion of both will be found in the chickens; but this plan should be avoided if possible, as coarse and ugly combs are sure to be the result, and neither comb will become fixed in the strain. In a pen of birds for exhibition of course the combs must match; if a rose-combed cock and a single-combed hen were shown together certain disqualification would be the result. Sometimes we find a bird with a comb something between the two—that is, a single comb in the front part expanding into two combs as it were in the middle, and joining again at the back, so as to form a large hollow. These "cup" combs as they are called will not now pass muster, and are only fit for the farmyard. The neck hackle should be very full, and should fall naturally, the feathers not twisting over one another or rising in a hump behind the neck; tail very large and full, with the feathers unusually broad and arching, and the saddle hackles very plentiful; legs short and perfectly straight; toes, five on each foot, the fourth and fifth or hind toes being very distinct, and each growing separately from the leg, the fifth toes turning upwards; the front toes long, straight, and well spread, and the spurs set well inside the leg, in fact almost pointing at one another.

Formerly the colour of a Coloured Dorking cock was immaterial, but of late years, since a separate class has been made for Silver-Greys, this is not the case. The hackle should be clouded or striped with black, and not be white as in the Silver-Grey. The saddle, too, should be clouded, and the shoulders of a darkish tinge. The accompanying illustration (fig 48.), drawn from a cockerel of my own breeding, gives a very good idea of the colour required in a Dorking cock to match the Dark hens which are now so fashionable. A cock will pass muster if he is not so darkly striped in the neck hackle; but a Coloured Dorking cock with almost white hackle and shoulders is not the proper mate either for the show pen or breeding for a Dark hen, any more than a Silver Duckwing Game cock is a match for a Brown Red Game hen. To a critical eye one is quite as objectionable as the other.

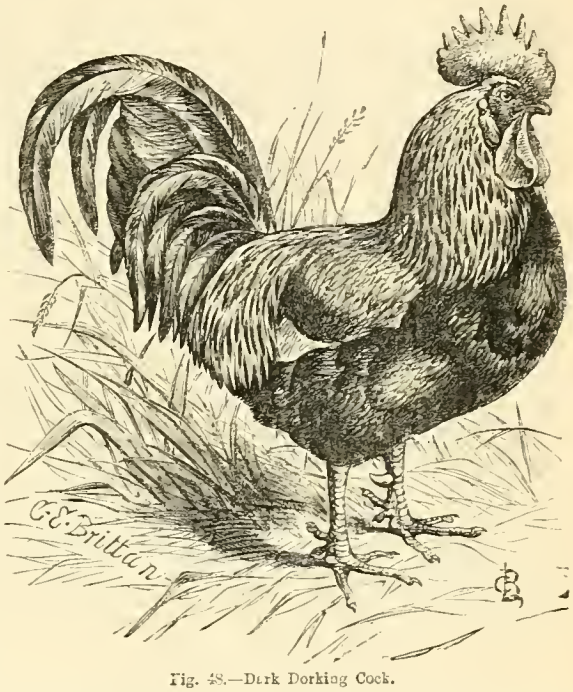

Fig. 48.—Dark Dorking Cock.

Occasionally we see cocks showing a good deal of red or chestnut on the shoulders. These will pass with a Dark hen and often breed very good pullets, but they are not so suitable in my opinion as cocks only showing black and grey. It is commonly thought that white in the breast or tail is a bad point. This is a mistake, and arises from confusing the colours of the Dark and Silver-Grey varieties. A little white in the breast of a Dark cock or on the thighs is no detriment, nor is white in the tail; in fact, I have never seen a really good Dark cock without white in the sickle feather, a "gay" sickle as it is termed. My first-prize cock at the Palace and first cockerel at Birmingham this year both had white in the sickles, as also had my second Palace and cup Birmingham cock the year before, and I have yet to learn that it is any disadvantage. Of course, a very white breast or tail is a disadvantage; but it is no disqualification if a bird is good in other respects, and often appears after a moult in a bird which was previously quite free from it.

I have said a good deal about the white in the tail, as the only results of rejecting gay-sickled birds would be to reduce the size of Dorkings by making the choice of show specimens much more difficult, or else to introduce the plucking-and-trimming system, which is such a curse to many other breeds. The colour of the legs and feet should be white; the colour of the flesh and skin of a fowl is always of the same tinge and colour as the feet. So in the Dorking, which is essentially the table fowl, it is very important that this should be white.

I have now mentioned most of the necessary points, and to assist beginners will now mention the most common defects. Many Dorkings have undoubtedly been crossed some time with other breeds, such as Cochins or Malays, but such crosses can nearly always be detected. Long legs and deficiency of chest

are certain signs of a cross, as also are yellow beaks and toe nails. A small tail, too, should be looked upon with suspicion, as a large and flowing tail is inseparable from a pure-bred Dorking. The comb in the cock sometimes falls to one side or lops behind; both these are signs of lack of condition or health, and are ruinous in the show pen, as also is a bad twist or bend in the comb, though a slight turn or "thumb mark" in the front is not so important as in a Spanish cock. A crooked leg is not at all an uncommon defect, and should be carefully looked to in buying a bird; but the feet as a rule are where the most attention is required, as not only are corns found under the feet, but the hind toes are frequently badly set on. The big front toes too often curve inwards, and the front toes are sometimes set too close together instead of being well spread. These two last are bad defects. Spurs are found outside too high up, or at the back of the leg. This blemish is fast becoming common, and requires to be looked to. Any dark tinge or sootiness in the feet is certain disqualification, as also are feathered legs.

AN EARLY AND CONSTANT SUPPLY OF EGGS.

The following question has often given rise to anxious thought and consideration:—What is the best food to produce an early and constant supply of eggs at the smallest cost? Ground oats, barleymeal mixed with fine pollard, poultrymeal, ground maize, &c., have each and all had a fair and patient trial as soft food for morning feeding, with whole buckwheat, barley, maize, oats, &c., for the last feed. The result has never been satisfactory. This last autumn I have been feeding some bullocks on wheat with white peas ground and mixed together as their principal food, with the best possible results; and when I made up my pens of fowls this season I determined to use the same kind of mixture (ground wheat and peas), giving it to them as their morning feed, made as stiff as possible overnight rather than just before feeding. This practice is founded upon the same principle as pastry made the day previous to baking is better than that made and put into the oven immediately. For the last feed I give the fowls whole wheat.

Now for the result. They have exceeded my most sanguine expectations in giving me an early, abundant, and constant supply of eggs beyond anything I have before experienced. During the severe weather of December, when the ground was covered with snow, I think I had more eggs laid than usual. Another result of early eggs has been a brood of chickens on the 31st of January, and they are doing remarkably well in an open coop on the ground, and fed in the same way as the fowls.

In conclusion, I now come to the cost. Rivett wheat can be bought at 38*s.* per quarter of 504 lbs., white peas at 42*s.* per quarter of 504 lbs., grinding 3*s.* per quarter; consequently I purchase a food under 10*s.* per hundredweight containing 18½ per cent. of flesh-forming substances. If these facts interest your readers I will tell them how I built my fowl house, the kind of run they have, &c.—J. P. Miller, *Enfield.*

HOUDANS AS LAYERS.

I have always advocated this breed as good although not as very early layers, but I am utterly at a loss to account for mine this year. I have not had (February 27th) one egg from them as yet. I have thirteen birds—seven old hens (that is, of 1873), and six pullets of various hatchings in 1874. My house is warm, they have a good run of five acres, are in capital condition, and yet this is the state of the case. Besides these I have four common barndoor hens for sitting, and every one of these is laying. Can anyone explain the cause of this? Is it to be attributed to the cold and wet season? for if so it interferes a great deal with one's estimate of the value of the Houdan as a layer. Last year at this time I had an abundant quantity of eggs, and now not one. I see symptoms of some of them approaching the laying season—combs enlarging and turning red, &c., but it is rather hard to have to wait until March for them. Has any Houdan breeder any similar experience, or can any "cunning man" give any solution of the puzzle?—D., *Deal.*

MELTON MOWBRAY SHOW OF POULTRY, &c.

On September 25th, 1862, Melton held its first Show of poultry. We have before us our second volume, in which we find a full account of that Exhibition; after that the good people of Melton went to sleep and slumbered quietly, dreaming we hope pleasantly. This, however, was not to go on for ever like our friend the brook, for after a time they awoke and once more set to work over a poultry show. The Exhibition which closed on Friday evening last was their first winter Show, and we congratulate the Committee on their Exhibition. It was held in the Corn Exchange, a room admirably adapted for the purpose in every way. 328 pens of poultry, Pigeons, and Rabbits of more than ordinary quality made a smart little Show. The entry fees amounted to £2 or £3 more than the prizes given, which was a good beginning, and we hope the Show consequently paid well, and that the schedule for next year will be more extensive and the prizes larger. The Rev. G. F. Hodson awarded the prizes, and his judging gave in most cases great satisfaction. In looking over the prize list of this Show held last week, and that in 1862, we can only find one name occurring in both, we allude to Mrs. Woodcock of Rearsby, and that lady exhibited then as now Buff Cochins. We like to hear of people adhering to their first loves; but this utter absence of the same names in two shows held barely thirteen years apart shows how great changes do occur in the poultry fancy.

Dorkings came first on the list, six pens; nothing first-class. The winning pen, however, was of good Coloured birds. *Cochins* came next with two classes. In Buffs the winners were all good. We thought the third-prize pair might have gone in between the first and second, but there was not much wrong. 10 (Winwood), a good cock; 12 (Woodcock), a nice hen. In Cochins of Any other variety Whites won first. They were wonderfully good and well shown. We never remember seeing a better pair for colour. Second and third-prize pairs were good, and several other capital pens were in this class. Dark *Brahmas* made a good show. The first-prize pair we liked immensely; second and third also good. We should have liked to have seen a few high commendations in this class. In Lights the first were well ahead. With the exception of the winning pens this collection was poor. *Game*, Black and Brown Reds, mustered well, and the quality was very good. We liked the third-prize pen very much, and thought it might have stood higher, though the first and second were both smart pens. 48 (Bell) contained a capital hen. The Variety Game class was poor, and only first prize was awarded. *Spanish* were admirable; the winners well placed and really good. Spangled *Hamburghs* mustered seventeen pens, first going to capital Golds and second to Silvers. Pencilled Hamburghs were good, especially the Golden. *Houdans* were one of the best classes in the Show. The first-prize pen truly grand, and in admirable condition; second also good. 119 (Valance), a grand hen. We preferred this pen for third place almost. Of the six noticed pens four came out of Kent. Game *Bantams* were good, Mr. Anna' second and third-prize pairs were cheap at catalogue price of £2 2*s.* each. In the Variety Bantam class Laced were first, good Blacks second and third. 148 (Woodcock), good Japanese. The "refuge" was a very large and varied class. Splendid Crêves were first and third, and good Golden Poles second. 153 (Kew), lustrous Black Hamburghs; 155 (Cross), a grand Crêve hen; 161 (Lias), fine Silver Polands; 162 (Richardson), good Malay cockerel. The Selling classes were large and the quality very fair, good Game, Cochins, and Spanish winning the chief prizes. *Turkeys* and *Geese* were small but good classes. Rouen and Aylesbury *Ducks* capital, the former as usual the most plentiful.

Pigeons were only small classes. Mr. Yardley sent a good team of birds. One of the best classes was the *Archangels*, and we were glad to see a class for this most beautiful breed, which generally gets such bad treatment at the hands of show promoters. The first pair were lustrous, and a bargain at £2 2*s.* *Fantails* were good, both prizes going once more to Newark. *Jacobins* only a poor lot. The Variety class was admirable. There were twenty-one pens of really good birds. The winning *Trumpeters* were fine, but for second place we should have gone to 272 (Allen), Yellow Dragoons. There were some cheap pairs in the Sale class also. The awards were as follow:—

Dorkings.—1, W. H. Crewe, Etwell, Derby. 2, J. Rippin, Melton Mowbray. 3, S. W. Hallam, Whitwick, Leicester.

Cochins.—*Cinnamon or Buff.*—1 and 2, Mrs. Allsopp, Worcester. 3, H. Feast, Swansea. *hc*, Mrs. Woodcock, Leicester. *c*, E. Winwood, Worcester. *Any other variety*—1, R. S. S. Woodgate, Pembury. 2, C. Wilson, Langar, Elton. 3, Rev. R. Storey, Derby. *hc*, A. F. Faulkner, Thrapstone; P. Passmore, Northampton; H. Feast. *c*, Mrs. Goodall, Melton Mowbray.

Brahmas.—*Dark.*—1, Dr. J. Holmes, Chesterfield. 2, L. C. C. R. Norris, Trumpington, Cambridge. 3, J. H. Turner, Sheffield. *c*, J. Gunn, Coalville, Leicester. *Light.*—1, R. E. Horsfall, Grassendale Priory. 2, C. Wilson, Langar Elton. 3, N. Feast.

Game.—*Black or Brown Reds.*—1, W. T. Everard, Hatton Grange, Ashby-de-la-Zouch. 2, J. Mee, Ashby-de-la-Zouch. 3, J. Jenkins, Eltham. *hc*, E. Bell, Burton-on-Trent; J. Jenkins; J. Stokes, Melton Mowbray. *Any other variety*—1, E. Bell. 2 and 3, Withheld.

Spanish.—1 and 2, — Allsopp. 3, E. Winwood, Worcester. *vhc*, M. Brown, Ab Kettleby, Melton Mowbray. *c*, M. Brown; S. W. Hallam, Whitwick.

Hamburghs.—*Gold or Silver-spangled.*—1, Mrs. Blakeman, Tettenhall, Wolverhampton. 2 and *c*, S. W. Hallam. 3, J. Ward, Ashby-de-la-Zouch. *hc*, T. H. Turner, Sheffield. *Gold or Silver-pencilled.*—1 and 3, C. Judson, Peckham. 2, S. W. Hallam. *hc*, A. F. Faulkner, Thrapstone. *c*, J. Ward.

Houdans.—1, W. Dring, Faversham. 2, F. Lake, Rodmersham. 3, S. W. Thomas, Sketty, Swansea. *vhc*, W. H. Crewe, Etwell, Derby. *hc*, W. Cutlack, jun., Littleport, Ely; Mrs. K. R. Valance, Sittingbourne. *c*, R. A. Boissier, Pensburst.

Bantams.—*Game.*—1, G. Bell, Burton-on-Trent. 2 and 3, T. W. Anna, Clapham. *hc*, J. Richardson, Loughborough. *c*, Herne & Hockaday, St. Austell. *Any other variety.*—1, Mrs. Wootton, Mapperley. 2, R. H. Ashton, Mottram, Manchester. 3, Wingfield & Andrews, Worcester. *hc*, Mrs. Woodcock. *c*, J. T. Hinks, Humberstone; Mrs. Wootton.

Any other Variety.—1, W. Cutlack, jun. (Crève-Cœur). 2, G. W. Boothby (South Golden Poland). 3, W. Dring (Crève-Cœur). *vhc*, Mrs. Cross, Brigg (Crève-Cœur). *hc*, M. Kew, Market Overton (Black Hamburghs); G. Lias, Par Station (Silver Poland); J. Richardson, Loughborough (Malays). *c*, J. Bailey, Melton Mowbray (Black Hamburgh).

Selling Class.—*Cock or Cockerel.*—1, Mrs. Allsopp (Cochins). 2, W. & J. Honey (Stanstells Game). 3, M. Kew, Market Overton (Malays). *hc*, J. H. Turner, Sheffield (Brahma); T. Wild, jun., Burton Lazars. *c*, W. Boothby (South Golden Polands); J. T. Parker, Northampton; H. Yardley, Birming-

ham; J. F. Hinks, Humberstone. *Hens or Pullets.*—1, W. S. Black, Saxby (Game). 2, Mrs. Allsopp (Spanish). 3, Mrs. Nicholson, Sheffield (White Cochins). *hc*, E. Snell, Barrowden. *c*, G. W. Boothby (South Gold Poland); H. Yardley; C. Ridge, Melton Mowbray; S. Pollard, Sleaford.

Turkeys.—1, J. Rippin, Melton. 2, E. Snell. 3, M. Kew.

Geese.—1, M. Kew. 2 and *hc*, J. Rippin. 3, J. G. Barker, Holwell.

Ducks.—*Aylesbury.*—1 and *c*, Mrs. Wootton. 2, W. H. Crewe. 3, E. Snell. *Rouen.*—1, Miss E. Wingfield, Market Overton. 2 and *hc*, I. Wright, Cold Overton. 3, T. H. Turner. *Any other variety.*—1, H. Yardley. 2, Hon. Mrs. Molyneux. 3, S. Black.

PIGEONS.

Carriers.—1, L. Allen, Southwark, London. 2 and *hc*, H. Yardley.

Pouters.—1, L. Watkin, Northampton. 2, J. Atkins, Bedford. *c*, H. Yardley.

Tumblers.—1 and 2, H. Yardley.

Fantails.—1 and 2, J. F. Loversidge, Newark. *hc*, E. Snell; W. Gamble, Thorpe Satchville.

Jacobins.—1, W. Hasledine, Gartree Hill. 2, S. Lawson, Preston.

Archangels.—1, H. Brown, St. Austell. 2, W. Latham, Melton Mowbray. *hc*, H. Yardley; Wingfield & Andrews.

Any other Variety.—1, W. Gamble, Thorpe (Trumpeters) 2, T. Chambers, Northampton. *vhc*, H. Yardley; L. Allen, London (Yellow Dragoon). *hc*, W. Tedd, Erdington (Black Magpies, Red Magpies, and Blue Swallows); F. F. Pulley, Oxford (Ice and Magpies); H. T. Hinks, Humberstone; F. S. Barnard, Tottenham; — Hardstaff, Melton Mowbray (Ice). *c*, H. Yardley; H. H. Brown, Melton Mowbray (Ice).

Selling Class.—1, J. Osbond, Northamptoo (White Dragoon). 2, F. Sabbage, Northampton. *hc*, H. Yardley; F. S. Barnard, Tottenham (Magpies); W. Gamble Thorpe; R. Gill, Melton Mowbray (Trumpeters). *c*,—Andrews, Melton Mowbray; W. Gamble (Trumpeters).

RABBITS.

Greatest Length of Ear.—1, Mrs. Pickworth, Moulton Marsh, Spalding. 2 and *hc*, F. Canner, Leicester.

Heaviest Weight.—1, C. Payne, Melton Mowbray. 2, W. Haseldine, Gartree Hill.

Any Variety.—1, W. Priestman, Melton (Silver-Grey). 2, H. J. Hinks (Silver-Grey). *hc*, F. Canner (Dutch); A. W. Whitehouse, Northampton (Silver-Grey).

BURNLEY POULTRY SHOW.

The first annual winter Show was held in the Literary Institution on Saturday last, and proved by far the most extensive of any that has ever been held in Burnley; and considering the amount of money offered, the energy and management of this small knot of fanciers have received such appreciation at the hands of the exhibitors as seldom falls to the lot of a committee, many of the classes counting near fifty entries each; and it is but fair to state that few of the old fanciers of the district would venture to put their shoulders to the wheel, and the affair was managed almost entirely by new beginners. On account of the entries being greater than was anticipated the building proved far too small to allow sufficient room for the large number of visitors, and it was with great difficulty that the birds could be examined on account of the crush; and the pens, which were Turner's, being placed two tiers high, the light in the lower stage was anything but good.

There were seven classes for poultry, *Game* heading the list, and the class a pretty good one; the first and medal for the first four classes going to capital Black Reds. The second were Brown Red chickens, the cockerel grand in all points, but the pullet a little faulty in condition; the third being Piles, the cockerel in this pen being a fine substantial bird. *Brahmas* were also a fair class, Darks winning in all cases, Mr. Pickles' three pens being empty. *Hamburghs* were mixed classes, the Spangles in one and Pencils in the other. In the first Silvers were first and third and Gold second, the first being a pen good all round. In Pencils Silvers won all the prizes, and these were really good, Golden proving very poor. *Bantams* had two classes, the first of which was for Black and Brown Red Game, Black Reds winning first and second, and Brown Reds third, the latter grand in colour, but a little faulty in eye. In the next class Piles were first, Duckwings second, and Piles third, the first of rare quality; and the cup for the best cock in the Show was awarded to this bird, but proving to be the property of the donors it was very generously declined by Messrs. Bellingham & Gill, and subsequently awarded to the most perfect La Flèche cock we have ever seen. The gold medal for the best pen in the last three classes going to a good old pen of Buff Cochins shown by Mr. Walker in the Variety class; the second in this being La Flèche; and third Dark Grey Dorkings, the only fault of which was a squirrel tail in the cock. Many excellent pens of Polands, Spanish, Black Hamburghs, and Bredas being highly commended.

In Pigeons the *Carrier* cocks were a grand class, the first a Dun in prime condition, very good in style, carriage, beak, and beak-wattle, but a little short of eye-wattle; second a very large and much younger bird, that must some day reach the summit of the fancy if no ill befall it; and third a good smart Black; twelve others being noticed. Hens were a very good class, many birds of extraordinary merit losing only for want of condition. The first, a Dun good in every point, won also the cup for the best bird in the Show, Antwerps excluded; the second was a grand Black. By some mistake two Yellow Dragoons were shown in this class. In *Pouters* the first was Blue, in fine order and good show trim; the second Black, and third Blue; several good Whites showing badly. *Barbs* were not a good class although numerous, the first a grand Dun cock, a little out of order; second a Black, in good bloom; and third a Dun hen. Short-faced *Tumblers* were very good, almost all being noticed, the first an Almond cock all the way from Scotland, very good all round, and most beautifully broken in feather, this being claimed at the catalogue price of £8 8s.; second came a very good Blue Baldpate; and third a Kite of extraordinary head properties, and very small. Long-faced Tumblers were not good as a class, but the winners about perfect; first a Yellow Mottle, second Black Bald, and third Red Mottle. *Jacobins* were a grand class, the first and second Reds being extraordinary in hood and chain; the third Yellow, also very good, but a little rough on one side of the rose. Excepting the winners the *Turbits* were poor, the first Blue, second Red, and third Silver. Excepting the noticed birds the English *Owls* did not come up to our expectations, and only the first was really good in all points. Short-faced *Antwerps* were a grand display of thirty entries, and we may venture to assert that this class, as all the Antwerps, are coming to be better understood, for few birds were shown but that were of some degree of excellence, and this county and the neighbouring one of Yorkshire being the strongholds of the variety, the competition was very keen indeed. In the above-named class the first was a Silver Dun, perfect in all points except the eye, which seemed to have faded since the bird was shown at Bradford in October last; but let this be as it may, they are certainly faulty now. The second lost a little in the frontal part of the head, and was also Silver Dun; the third was also a Dun, and we noticed one Blue Chequer with a grand head and colour, but sadly out of condition. Long-faced Antwerps were not so numerous, but much more even in quality, and mostly noticed. The first was a grand Red Chequer, second Blue Chequer, and third a Red Chequer hen. Few of the Short-faced of 1874 were up to the requirements of the standard, many being too long; but the Red hen to which the first award was made was a grand specimen; the second was a very promising Silver Dun cock; and third also a Dun. There were seventy-eight entries in the two classes of *Dragoons*, but we failed to find half dozen of the so-called London Fancy. There were a good lot in old birds; most of the birds were noticed, but some of these were too long, being near 1¼ inch from the centre of the eye. The first was a Blue hen of grand proportion and colour; second a Blue cock, a little too long and strong, but good in all other points; equal second a Red cock; third and equal third were Blue cocks; twenty others being noticed. The young birds of last year were badly placed as regards the light, and the awards were made with difficulty, the first going to a handsome Yellow, and the second and third to Blues. In the Variety class the first was a Foreign Trumpeter, second a Black African Owl, and third a Fairy Swallow. In the Selling class the first was a very cheap Silver Dun Antwerp, second an Agate, and third a Red Jacobin. There were some likely birds in the class for Homing birds, but none that fairly answered the requirements of that variety. The point cup was won by Mr. Sefton with twenty-four points.

Canaries had a few classes, but there were not large entries, the winners in the Clear *Norwich* classes being of the highly-coloured variety. In *Belgian* there were but four entries in two classes, but the first-prize birds were very good, and considering the severity of the weather they showed well. In the next class all were noticed. The first was awarded to an evenly-marked four-pointed Yellow Yorkshire bird, and second to a Ticked Manchester Coppy, an Even-marked Yorkshire and several Ticked Norwich being highly commended.

Game.—1 and Medal, E. Aykroyd, Eccleshill, Leeds. 2, R. Payne, Burnley. 3, S. H. Leech, Preston. *vhc*, W. Ormerod. *hc*, O. Folds; J. Fortune; J. & E. Prince. *c*, J. Nelson.

Brahma.—1 and 2, T. F. Ansdell, Cowley Mount, St. Helens. 3, C. Holt, Rochdale. *hc*, A. & J. Robinson; A. Bamford; G. Barnes; W. Hargreaves (2); W. Harvey. *c*, J. Helliwell; T. Pye.

Hamburghs.—*Gold or Silver-spangled.*—1, R. Watkinson, Thorneyholme, Burnley. 2, T. Cropper, Bacup. 3, J. Ashworth, Burnley. *hc*, J. Ashworth (2); H. Stanworth. *Gold or Silver-pencilled.*—1 and 3, R. W. Bracewell, Earby. 2 and *hc*, J. Ashworth.

Bantams.—*Black or Brown Red Game.*—1, J. Nelson, Hexham. 2, E. Walton, Hornclife, Rawtenstall. 3, T. Barker, Burnley. *vhc*, C. Cronshaw. *hc*, T. Whittaker. *c*, A. C. Bradbury. *Any other variety.*—1 and Cup, Bellingham and Gill, Burnley. 2, J. Nelson. 3, J. Riley, Accrington. *vhc*, Bellingham and Gill. *hc*, W. Atkinson; J. Walker; J. Halstead; F. Holt; T. Dawson; S. Lawson. *c*, T. Barker.

Any other Variety.—1 and Medal, J. Walker, Spring Mount, Rochdale. 2 and Medal, E. Walton. 3, J. Ashworth. *hc*, J. Helliwell; J. Ashworth; H. Wilkinson; G. Barnes; J. Nowell; J. Loder (2).

PIGEONS.

Carriers.—*Cock.*—1, J. Walker. 2, W. Sefton, Accrington. 3, E. C. Stretch, Ormskirk. *vhc*, J. Walker; J. Stanley. *hc*, H. Crosby; J. Stanley; H. Yardley; J. Gardner; W. Sefton (4); W. Harvey. *Hen.*—Cup, 1, and 3, J. Walker. 2, J. Stanley. *hc*, R. W. Bracewell; J. Stanley; J. Gardner; E. C. Stretch; W. Sefton (3); W. Harvey. *c*, W. Sefton.

Pouters.—1 and 3, W. Harvey, Sheffield. 2, J. Richmond, Oswaldtwistle. *c*, W. Hardcastle.

Barbs.—1 and 3, W. Harvey. 2, J. Stanley. *hc*, J. S. Collier; T. Pincock; J. Stanley. *c*, H. Crosby.

Tumblers.—*Short-faced.*—1, W. Brydone, Dunse. 2, T. & W. Oddie, Brierfield, Burnley. 3, J. M. Kidd, Edinburgh. *vhc*, J. Gardner; W. Sefton. *hc*, Powell and Crane; A. & W. H. Silvester; J. Ford; T. Charnley; H. Yardley; J. Gardner. *c*, J. Kidd; A. & W. H. Silvester; J. Ford; J. Hawley.

Tumblers.—*Long-faced.*—1, J. Ford, Monkwell Street, London. 2, Waddington & Booth, Burnley. 3, A. & W. H. Silvester, Sheffield. *hc*, J. Ford (2); T. Newell. *c*, J. Cargill; J. Hawley.

Jacobins.—1 and 2, T. Holt, Bradford. 3, W. Brydone. *hc*, G. E. North N. Smallpage, jun.; J. Ingham (2); J. Cargill; J. Gardner; J. Young; J. Richmond; W. Brydone; W. Harvey.

Turbits.—1 and 2, T. S. Stephenson, Newbegin, Beverley. 3, W. Brydone *hc*, H. G. Poole; A. & W. H. Silvester; J. Gardner; W. Sefton (2).

Owl.—*English.*—1, J. Gardner, Preston. 2, S. Lawson, Preston. 3 J. N

Harrison, Derby. *hc*, J. Ingham; H. Creaby; E. Lee (2); A. Warburton; J. Young; W. Brydone; T. & W. Oddie; S. Lawson.

ANTWERPS.—*Short-faced.*—1 and Cup, R. Brierley, Fishpool, Bury. 2 and 3, F. Woodhouse, Blackburn. *hc*, J. Rushworth; C. F. Copeman; J. S. Collier; S. Fletcher; G. Thicket; J. Parker; Waddington & Booth (2). *c*, J. Stanley; J. Gardner; W. Walton (2).

ANTWERPS.—*Long-faced.*—1 and 2, J. Robertshaw, Thornton, Bradford. 3, J. Lister, Keighley. *hc*, H. G. Poole; R. Brierley; J. Lister; J. Powell; H. Stanworth; H Mitchell; J. Hawley.

ANTWERPS.—*Short-faced.*—*Young.*—1, J. Lister, Keighley. 2, J. Gardner. *hc*, Tordoff & Wilkinson; A. Smith; B. Cressley; R. White.

DRAGOONS.—1, 2, and 3, W. Sefton. Extra 2, H. Yardley, Birmingham. *vhc*, W. Sefton (2). *hc*, S. Cliff; F. Eastwood; Waddington & Booth; T. Charnley; J. Stanley; J. Gardner (5); T. Smith; T. Hartley; A. Boote; A. McKenzie (2); W. Harvey. *c*, J. R. Crompton; B. Edmondson.

DRAGOONS.—*Young.*—1, H. Crosby, Sale. 2, A. Beote, Crewe. 3, J. Robertshaw. *vhc*, J. Gardner. *hc*, Waddington & Booth; J. Stanley; J. Robertshaw; A. McKenzie (2).

ANY OTHER VARIETY.—1, W. Harvey. 2, W. Brydona. 3, J Richmond. *vhc*, A. & W. H. Silvester; A. A. Vander Meersch. *hc*, G. E. North (*c*); T. Charnley; J. Young (2); A. A. Vander Meerach; W. Sefton (2); W. Harvey; W. Sutcliffe. *c*, G. E. North; A. & W. H. Silvester; W. Sefton.

SELLING CLASS.—1, J. Hawley, Girlington, Bradford. 2, W. Brydona. 3, W. Markland, Deane, Bolton. *hc*, A. & W. H. Silvester; —Fletcher; T. Charnley; W. Walton; T. Hartley; J. Bishop. *c*, J. Stanley; W. Sefton; R. Crompton; R. Hutchinson.

CANARIES.

NORWICH.—*Clear Yellow.*—1, J. Stevens, Middlesborough. 2, W. Smith. *hc*, W. Woodward, jun.; J. Jackson. *Clear Buff.*—1, W. Smith, Birmingham. 2, W. Woodward, jun. *hc*, J. Stevens; J. Jackson; J. Shacklet on.

BELGIAN.—*Clear Yellow.*—1, T. Ridiog, Bacup. 2, W. Fletcher, Burnley. *Clear Buff.*—1, W. Fletcher. 2, T. Riding.

TICKED.—*Any variety.*—1, J. Nutter, Burnley. 2, J. Shackleton, Rochdale. *hc*, J. Nutter; J. Stephens; W. Woodward; J. Shackleton (*2*); W. Smith.

JUDGES.—Mr. E. Hutton, Pudsey; Mr. W. Cannan, Bradford.

CRYSTAL PALACE BIRD SHOW.—No. 1.

THE Show of 1875 has certainly surpassed the most sanguine expectations of all concerned. What the Show was a few years compared to the one I am now reviewing is well known to those ardent fanciers who knew the Palace exhibitions in their earlier days. The magnitude to which the Show is likely to attain in the future is a matter of conjecture, but if it makes such rapid proportionate strides in the next five years as it has done over the previous year's exhibition (1874), it will require a marquee double the size to hold the birds. The one used for the Exhibition just held was nearly 50 yards long. Upon entering the tent and taking a bird's-eye view of the lengthy double tiers of stages ranged along each side, and likewise those down the centre, and finding it impossible to fully satisfy my mind in examining the whole of the birds in one day, I contented myself with the Canary portion of the Show during the first day, and paid a visit the following day to examine the British and foreign varieties. How the Judges worked through their labours is best known to themselves, but the work was done. Some Judges have a very happy knack in getting through their work. What it would have been if point-judging, recommended by a certain N.O.A., had been adopted is not for me to say. All I know is, that upon the opening of the Show at twelve o'clock on the first day (Saturday) I was favoured with a catalogue of prizes, faultless as to the completion of it, containing the entire returns. I did not make myself inquisitive as to how Mr. F. W. Wilson of the Natural History Department had so far fulfilled his respective duties, but I noticed him at his post, as courteous as ever to all seeking for information. I was pleased to meet many ardent fanciers in the cause, and having received their hearty greetings I at once made for the identical stage where "Class 1" was prominently posted up. I rather admire the style of elevating the numbers of the classes above the cages, for it may at once be seen how the classes run, and in a Show of large magnitude like the Palace one it saves unnecessary confusion and parading about.

The class for Clear Yellow Norwich contained no less than sixty-four birds, and I was pleased to find in it many fine specimens of the old stamp of Norwich bird giving evidence of good breed; in fact, this was the case in the whole of the first half-dozen classes, and had I my choice I should have selected birds out of those identical classes for breeding purposes rather than out of the high-coloured ones. I am inclined to think that the constitutions of birds reared upon a wholesome seed diet preferable to a spicy high stimulating food (cayenne for instance), which alone answers but one purpose—that for colour. A note in the schedule distinctly stated that the extra prize of £1 would be given to the winner of most points for birds not of high colour, but I could not help noticing that there were very many of very high colour indeed—in fact, some high enough to compete in classes 7 and 8. I could not help thinking that if exhibitors will be so careless in entering their birds they cannot expect to meet with success. Upon the first view I thought it a difficult task for anyone to attempt to pick out the prize-winners, but was glad to find that where the line had been drawn those not answering to the schedule were excluded. In class 1 Mr. R. Whiteacre of the Derby school exhibited a good specimen for the first place, being well followed up with one for second shown by Messrs. G. & J. Mackley of Norwich. Such was my opinion that there was very little difference betwixt them. Mr. Calvert's Yellow did credit to the good old city of York, and very justly had a second extra prize given to it; Messrs. Athersuch of Coventry stood next for a third, and Mr. Flexney of London gained an extra third. The prize birds were all in fine condition.

In the Clear Buff class Messrs. Athersuch here stood first with a very fine symmetrical-shaped bird, possessed of that beautiful mealy tint so much admired in the fancy. Messrs. Mackley were again forward, and it was almost a toss-up which of the two first in this class was best. Mr. Caplin's of Canterbury was a good third, and extra thirds were given to two capital Buffs exhibited by Messrs. Radmore & Galey. Sixty-five entries.

In classes 3 and 4, best Marked or Variegated or Buff Norwich, there was a stout contest for places. Some fine Marked birds were shown in both classes, and the winners stood in the following order:—J. Adams, Orme & Ashley, G. & J. Mackley, and Athersuch & Son, in class 3; and in class 4, G. & J. Mackley, Orme & Ashley, Athersuch, Caplin, and last, but not the least, an extra third exhibited by Mr. Tomes. In the two classes there were fifty-one birds entered.

In classes 5 and 6, for Ticked and Unevenly-marked birds, there were seventy-three entries, and considerable trouble must have been experienced in selecting those birds for prizes, mixed up as they were with so many birds bearing evidence of pepper feeding. Mr. Dennis's first-prize was a smart-made bird, in very close feather and good condition, and justly merited its place. The second-prize bird, belonging to the Rev. G. Herbert of Alcester, was a good pure-feathered specimen, somewhat larger than the first, but correctly placed. Mr. Flexney exhibited three birds in this class; but his 198 bird was placed third, the best of his lot to my thinking, although his No. 200 bird was catalogued at double the price. Messrs. Mackley were awarded an extra third. The Buff class was by far the best of the two Ticked classes, and for form and feather nothing could surpass those claiming the Judges' attention. Mr. Price of Pimlico very easily won first; the second (Adams) and third (Collinson) being more alike.

In the high-coloured Norwich classes (7 and 8) there were no less than fifty-seven Clear and Ticked birds, but only eighteen of best Marked or Variegated, the difficulty being much greater in bringing to the post good Marked birds compared to Clear and Ticked. In class 7 Mr. Adams, Coventry, ran-in an easy winner, he having obtained a first, second, and extra second with birds of extraordinary colour. Mr. Walter of Winchester was well up with a good third, and Messrs. Athersuch well earned an extra third. This and the following class very much attracted the attention of the visitors, many of whom seemed to doubt whether the colour had not been brought about with something more than cayenne pepper. In class 8, for the best Marked or Variegated, the contention mainly lay betwixt three firms of note. However, Messrs. Mackley won, beating the Coventry breeders, who stood thus—Adams second, Athersuch and Son third. Nos. 318 and 320 were here disqualified, the birds being somewhat short of feather.

Classes 9 and 10, Evenly-marked Crested Yellows and Buffs. I have seen better Yellows by odds, but the Buff-crested birds were a very fine lot. Mr. Woodward's superb hen won easily. She is a full-developed hen, being free in feather, fine in colour—evidently had a little spice—and carries a fine regularly-formed crest. Mr. Hovell's second-prize bird, Messrs. Mackley's extra second, Messrs. Waller's third, and Messrs. Moore & Wynne's extra third, were all first-class birds, and richly deserved their places. There were likewise several good birds in the same class with marks of distinction upon their cages.

In classes 11 and 12 there were thirty-eight birds; but as is generally the case in Crested classes, many of them were deficient in perfectness of crests, showing much of the baldness at the back part of the crests. Messrs. Mackley won both first prizes; Messrs. Craiger, Collinson, Pope, Hawman, Colman, and Woodward being the other prizetakers. In class 11 No. 383 was disqualified. In class 12, which was termed by the Judges a "magnificent class," I must especially notice 398 cage (Mackley), which contained a very fine Buff-crested bird. One of the best Crested birds out this season, although not quite so large in crest as Mr. Woodward's hen in class 10, but still very perfect in form, every feather being in its place from the centre of the crown, was the one No. 437 in class 13, which took the first honours; Mr. Clark being well in for second; Messrs. Martin and Griffin for extra second; and Mr. Hovell third, each very perfect.

The Belgian birds were confined to three classes—viz., Clear and Ticked Yellow, Clear and Ticked Buff, and Variegated (irrespective of colour). Mr. Tomlin exhibited a fair-standing Yellow in class 14; Mr. Doel following close up with a pair of birds (Nos. 462 and 461) which to judge of them must have done the Belgian performance proper for second and third places. Mr. Reid's bird was very well worthy of a third, which it received. There were eighteen Yellows, ten of the number being named. Class 15 (Buffs), Mr. Doel first, by odds the best Belgian positioned bird in the lot, carrying its head, neck, and shoulders well, with wings in their proper place, and tail well down. I should have liked it a little better had it been a little more

leggy, but as it was there were sufficient points about the bird to qualify it for the place it occupied. The Rev. H. F. Hamilton also exhibited a splendid specimen, which did duty in its cage exceedingly well. I like to see easy-standing birds in a show room, without so much fiddling with them against a wall. It is all very well to train Belgian birds when young to get them up to a certain stand or position, but to have to put every Belgian bird through a certain amount of drilling before deciding upon their respective merits would alone occupy one day in judging the Belgians alone. Mr. Doel followed the Rev. H. F. Hamilton's bird with a couple of good birds for third and extra third places. Both classes were well represented, many fine and deserving specimens receiving high commendations. Class 16 (Variegated Belgians).—Mr. Rutter of Sunderland was here more fortunate, taking first, second, and third prizes, and a very highly commended. Mr. Doel, Mr. Carver, and Mrs. Ada Dressing were the only other exhibitors.

The classes for London Fancy birds brought to the post a dozen of each kind, Mr. Waller of London showing five Jonques out of the twelve, and taking the first prize with a good-coloured bird (509); Mr. Brodrick being second, and Mr. Price third. In Mealies Mr. Waller was again to the front, his 522, which was decidedly the pick of his pair, being first, and 521 second Mr. Mann of Camberwell, London, showed three Mealy birds and obtained a third place.

Lizards were in good force in the four classes, two of which were for Foul-marked or Broken-feathered birds. In the whole of the classes Mr. Fairbrass was pretty successful. As in the Norwich and Cinnamon classes, I should not be surprised to hear of separate classes being established for high-coloured Lizards; not that I think Lizard birds are at all improved by high feeding, but judges differ somewhat in their views as to colour, some preferring the pure and unadulterated golden tint, and others the fiery red in Jonque specimens. No. 531 (Fairbrass), Golden, was brought to the post in very good order, not a spangle out of place, and fair in other respects. It would have been a doubtful case betwixt that and No. 534 (Cleminson & Ellerton) had not the latter bird's shoulder feathers appeared slightly awry. An equal second was won by Fairbrass, and a third by Bunting, both tolerably good birds, the latter somewhat behind in colour, but much better in shape. Class 20 (Silvers), the first-prize bird a very good one (Reid), in its proper place; the second and third being given to a couple of birds out of Mr. Fairbrass's four. Class 21 (Golden, Broken Caps) were thus fairly distributed: Fairbrass first, second, and extra third; Bunting extra second; and Cleminson & Ellerton extra third. Class 22 (Silver, Broken Caps), Fairbrass once more first with a fine bird, and also third; G. & J. Mackley popping in between the two a clever second.

The class for Yorkshire birds does not make much headway at the great Show, Yorkshire breeders seemingly not caring to send their birds so far southwards. Considering that Clean, Marked, or Variegated (irrespective of colour) are all included in one class, I look upon it as a miserable entry. However, Mr Belk of Dewsbury made it worth his while, having won a first, second, and extra third; Mr. Tomlin of Lincolnshire winning the third prize.

Cinnamon birds this year were spread over five classes, two extra classes having been made for high-coloured birds. This was certainly an improvement upon the previous Show, where high and low colour were mixed up together. Cinnamons of the present day, better known by our forefathers as Quakers, have much improved. They partake more after the shape of the Norwich birds, and to a certainty much of the Norwich blood has been imparted or they would not show the beautiful blooming tint of feather they do. Formerly they were of a dull, quiet, sickly appearance.

In class 24, for high-coloured Jonques, Mr. Adams carried out his season's performance by beating all comers and winning the three prizes. In the next class, high-coloured Buffs, Mr. Adams won first and second with the two birds he had entered; Messrs. Mackley being third, and Mr. Tarrond extra third. In classes 26 and 27 there was more competition amongst the more moderate-coloured Cinnamon birds. The winners in the first of the two classes were Caplin, Poole, and Bexson, and in class 27 Mr. Adams made another point for first place with a fine-feathered bird, followed up very close by Messrs. Moore and Wynne, who exhibited a capital second-prize bird. Mr. Bexson was again third. In the last two classes seventy-two birds were exhibited, which will give some idea of the competition. There were sixteen entries in the class for Marked or Variegated Cinnamons irrespective of colour, and the north-country exhibitors had the best of the race for the first and second places, Mr. Belk leading, followed by Mr. Wilkinson of Great Horton. Mr. Tomes was at home with a fair bird (702) out of his three, not the highest-price one either. By-the-by a bird in this class was priced at no less a sum than £1000, but I did not hear of a buyer—no, not even a bidder. The price of Canary seed could not possibly have enhanced the value of Canaries to such an extent. Not having any wish to purchase I passed on to the next class—Any other variety of Canary not previously specified. There was a fair variety in this class, consisting of Scottish Dons, Manchester Coppys, Cinnamon Crested, an original wild Canary, Green Canaries, a Cape Canary, a Jonque Green, Scotch Fancy, besides others, the prizetakers being Messrs. Mackley first with a splendid Coppy having a glorious crest; T. Curtis second with another good Coppy, and S. Tomes third. Here also I found a talking Canary, the price of which was set forth at £105—much cheaper than the one in the previous class. The bird was mute. Not a word would it utter, and I left it.—An Eye-witness.

RUFFED OR PINNATED GROUSE.

I have been reading "Wilson's American Ornithology." In the second volume from page 314 to 320 is a description of the Ruffed Grouse (Tetrao umbellus). It is well koown over all the United States as the Pheasant or Partridge of New England. Its natural habitats are high elevations covered with wood, and in such places they breed and roost, only leaving such recesses for the purpose of feeding; therefore to many of our noble Dukes—to wit, of Buccleuch, Argyll, Sutherland, and other Highland magnates it would be an elegant addition to the Black-cock, Grouse, and Ptarmigan. They pair in April and lay their eggs in May (nine to fifteen); fine plumage, is 18 inches long and 23 inches in extent; and as it prefers high, cold, mountainous, woody places, it would do well for Scotland. It struts with its tail up in the breeding season the same as our Blackcock does. The Pinnated Grouse are so wild that they would stand immigration. Messrs. Baily might procure some.—A. H. B.

[Pinnated Grouse have been imported in considerable numbers of late years. We have had many, but they are singular birds, and we doubt much if they would ever acclimatise in our islands. There is a belief here and in parts of the United States that at a certain time of the year the Ruffed Grouse is very unwholesome, if not poisonous, food. Attempts have been made two or three times to introduce the Hazel hen into Scotland, but it has not succeeded. We believe climate has something to do with it. We will communicate with the firm you mention.]

Poultry and the Season.—Snow, frost, and sleet follow one another in brisk succession, even in the south of England, and seldom has so unpropitious a season been known for early chicken-rearing. From all sides we hear complaints that eggs do not hatch, and that broody hens are not to be had for love or money. Still there is a bright side to every picture, and we must bear-up against a bad hatch with the hope that, though there be only one chicken, that it is quite possible it may be a cup-winner and sell for £20. While this bitter east wind lasts the few chickens we are lucky enough to have should be cooped in a dry shed, or at least be protected from the wind. March and April chickens generally make the finest birds in the end, and it will not do to condemn stock birds yet, especially if they are over one year old, and doubtless a little warm weather will work a change for the better.

CONSTRUCTION OF BREEDING CAGES AND EXTERMINATION OF RED MITE.

Starting with the advantage of some experience of the subject of breeding gained during my boyhood, for my father was an inveterate fancier, I did not fall into the mistaken views I have seen so frequently repeated by novices of building complicated constructions, or of purchasing the fanciful productions to be obtained at the shops devoted to the sale of presumed requisites. Cages of this description tend to perpetuating the red mite, the most alarming, vexatious, and most costly plague the breeder has to annoy him. There are few breeders who have not fought a battle or two of extermination with this persistent little parasite, and who have not at times given up almost in despair at their very wonderful regeneration.

Specifics out of number have been recommended, but I know of none thoroughly effective, and of one only that can claim any pretence to a cure—viz., cleanliness and isolation of every cage. As it can scarcely be expected that my argument will be sufficiently powerful to induce any of your readers who have made their arrangements for the coming season to start with a complete set of new cages, I will endeavour to explain to them how easily this pest may be kept at a minimum. If they have detached or even semi-detached cages, any precautions taken at this season, if effective, will repay both birds and breeder in comfort and happiness. Presuming that every earnest breeder has been or is busy cleaning, washing, varnishing, and whitening his cages, and that every crack, crevice, and corner has been thoroughly overhauled where it is possible for mites to have taken up their abode, let him obtain two pieces of fine-grained wood—mahogany by preference—3 inches square, and from half to three-eighths of an inch thick, and brad or glue them on to his cage at each bottom corner, with a marginal space of abont

1½ inch from the side and bottom, and into the centre of this screw a five-eighth-of-an-inch common wood screw, so that one-quarter of an inch projects beyond the square of wood. Next get for each nail upon which the cage has to be hung another piece of wood of the same size and kind as the before-described. Paint both the back of cage and nail pieces with two or three coats of best white oil paint until the face of it has a fine gloss. There must be no dry or sucking places left, more especially upon the pieces of wood. If there should be any space or cracks left between the wood and cage, fill them carefully with putty previous to the last coating of paint being laid on.

All the paint being dry and sound, hang the cage by driving a nail through the centre of the separate piece of wood into the wall. It is advisable that this nail have a good full head, so that there may be no danger of the cage falling. The piece of wood will form a shield against the wall, with the nail to carry the cage projecting from its centre. If there should be any danger of mites finding their way from the wall through the wood by the side of the nail, fill-up any vacancy that may exist with putty, and then drive in a three-quarter-of-an-inch clout nail, so that it projects about one-quarter of an inch just below the carrying nail, and thus preventing the cage from touching the shield. Hang the cage in its position, and you will see that no part of the body of the cage touches the wall.

Purchase two-pennyworth of crystal paper varnish, and mix it with an equal proportion of sweet, or, what is better, lard oil, and coat the two pieces of wood at the bottom corners of the cage and the nail shield liberally with this mixture, and you at once construct a bridge over which no mite can pass without paying the toll of death. This "catch-'em-alive-oh" mixture will retain its virtues for some six or eight weeks, after which time it will be necessary to remove it with a small quantity of turpentine, and replace it with a fresh supply of the mixture.

The advantages of this method of hanging breeding cages are, that in the event of any single cage becoming infested the mites are confined to that cage, unless it hangs directly over another, in which case it is more than probable that the latter also will be equally infested. The only attention requisite is to look occasionally to the insulating parts and see that they are not bridged over by a feather or particle of nesting material. Keep this free from dust and dirt, and you can periodically clean any cage and rehang it without the fear of its becoming contaminated by the migration of insects from neighbouring cages.—J. Packham.

OUR LETTER BOX.

Mandarin and Carolina Ducks (*Maude*).—They are easily reared, and commonly reared in England. They differ from most other Ducks in one particular; they perch—that is, if they are to do well they should have an old pollerd or other stem in the water, which they can use for that purpose. They will not make a nest and lay their eggs in it, but they must have a hut or hutch of some kind in which they can make their nest and lay. The accepted form is that of a very small dog kennel securely fastened to a pile driven into water, and standing fully 6 inches above the surface. To enable the birds to go in and out easily there should be a ladder composed of a narrow plank with cross pieces nailed on it, and forming an easy incline to the water. In this as in other cases it is well not to put all your eggs in one basket, half or more of the nest should always be put under a hen, and the rest left to the Duck.

Shell-less Eggs (*L. W. R.*).—Seeing the fowls at liberty are doing well in every particular, while those in confinement are not, we have to seek whether there be anything these latter lack besides their liberty. Their feeding is good. The shell-less eggs prove some of the functions of the body are not properly performed. We advise you to discontinue peppercorns, and to give them large sods of growing grass cut with plenty of earth. Give them whole barley or oats, the latter if they will eat them for their mid-day meal. We believe the grass and earth persevered in will prove a cure.

Fowls' Bowels Disordered (*Crève-Cœur*).—To prevent diarrhœa supervening give them in the morning a feed of bread soaked in ale, and do not let them out very early until milder weather arrives. The cold is the probable cause.

Poultry Trespassing (*W. L. P.*).—Give your neighbour notice in writing that unless he keeps his poultry at home you will sue him for the damage they do. If he afterwards does not keep them from trespassing sue him in the County Court.

Salted Corn (*A. B.*).—Corn soaked in salt water is not injurious either to pigs or poultry.

Chicken's Beak Diseased (*A. P.*).—The formation on the beak of the chicken you sent had the appearance of being caused by an accident. We cannot attribute it to anything else. We have bred many thousands of Brahmas, and have never met with any disease similar to that you describe. We believe if you will make strict examination you will discover the cause. We repeat we believe it to be accidental. The clean-legged chickens would seem to point at a faulty pedigree in the parents. It never happens to us.

Dorking Cockerels Voracious (*Farmer Giles*).—Give both the birds a large table-spoonful of castor oil, confine them for a day or two, and see that it operates effectually. Then feed them on soft food, ground oats or barley-meal, frequently, and very little at a time. No hard food. We believe this will bring them round.

Soft Eggs (*J. F. S.*).—Remove from your fourteen hens one of the three cocks. Supply your fowls with bricklayers' rubbish and a little chalk or lime. If you are feeding on meat, hemp, buckwheat, or canary, discontinue it for a time. To relieve an egg-bound hen take a wing feather and dip it in oil till it is saturated, then pass it down the egg passage till it meets the egg; move the feather about, and then oil it again. The hen will soon be relieved. Do not attempt to assist the egg; you may break it, and that will be fatal in its effects.

Fowls out of Condition (*I. O. N.*).—We should imagine they are very fat. The first thing you have to do is to discontinue the potatoes. They make fat and diseased livers. In this weather you must feed three times per day. Let it be done in this manner: Give at daybreak a meal of ground oats or barleymeal, mid-day some whole corn, and at evening feed as in the morning. Snow often throws fowls out of condition. What is the flooring of their roosting house? Give them enough to eat, but do not let any food lie about.

Fowls not Laying (*Jane*).—Your fowls are not well enough fed to lay. Discontinue the potatoes and bran. Give them slaked barley or oatmeal morning and evening, and a feed of Indian or other whole corn at mid-day. Feed moderately in quantity, and you will soon have no cause for complaint.

Redlock Seed (*C. B.*).—We believe it is true and good.

Goldfinch and Canary (*D. D. B., Redruth*).—Do not all at once discontinue the use of hempseed to your Goldfinch, or the bird might sulk and die. Goldfinches confined are curious birds to deal with; they can accommodate themselves to death very quickly, and it might so happen with your Finch. You may increase the proportion of canary seed to the Goldfinch, and likewise supply rape and linseed. Hempseed mixed with the other kinds will not harm your Canary hen, particularly now and during breeding time. The same food will suffice for both birds when together. You may also supply them with egg and biscuit mixed, and mawseed and young dandelion roots, which will forward them for pairing when the time comes.

Books (*A Straw Hive*).—The second edition of Mr. Pettigrew's book on bees is rapidly passing through the press, and will be published in a few days.

REMARKS.

24th.—Snowing heavily from 10 A.M. till noon, then fair, and thawing soon after 6 P.M.

25th.—Fair in the night, but snow at 7 A.M., occasional gleams of sun, but on the whole a very wintry day, thawing in the evening.

26th.—Dull morning, snow still on the ground, very bright for an hour or two about noon, but dull after 3 P.M.; fair evening.

27th.—Fair, but rather dull all day, and very cold.

28th.—Dull though fair; a few flakes of snow about 1 P.M. The day might be said to be sunless, the difference between the temperature in shade and that in the air in vacuo being only 3.6—*i.e.*, 33.2 and 36.8.

March 1st.—Very dark morning, sleet and fine snow falling from 9 to 11 A.M., and at intervals all day.

2nd.—Snow in the night and early morning. Dull, cold, wintry day.

Cold uncomfortable week, temperature never very low, but on the other hand only twice rising to 40°.—G. J. Symons.

COVENT GARDEN MARKET.—March 3.

This wintry weather of the past week has been telling upon us by keeping the growers away from market, and some of the rough goods have advanced in consequence, but not to a great extent. Hothouse Grapes are now limited to few consignments, and are chiefly Lady Downe's. Potatoes are freely supplied, but very few samples are free from blight. Prices remain stationary.

From observations taken near London during forty-three years, the average day temperature of the week is 50.6°; and its night temperature 33.4°.

GUMMING; ITS CAUSE AND PREVENTION.

WOULD that I dare write cure instead of prevention. I am obliged to acknowledge, however, at the outset that when a tree which is grown out of doors has once got a habit of gumming, I know of no permanent cure for it. This disease (?) often commences at a very early stage of the tree's existence, and it is worse than useless at any time to plant a young tree with the least tendency to gum. In the case of trees which are come to the fruiting stage it is different; they may be planted temporarily to produce fruit for a season or two while young healthy trees are being prepared to supply their places.

What is the cause of gumming? The best general answer I can give is—severe checks to the sap and sap vessels. These checks are brought about in many ways, such as by extremes of temperature, the evils of which are multiplied when the trees come in contact with metal or other quick-conducting substances; by cutting back gross growth, which has been produced by an excess of manure; by wounds from nails, shreds, ties, sharp bends, and sometimes even a touch with the hammer; by pruning after growth has commenced—*i.e.*, any time after Christmas; by disbudding before the bark has set. When the growths are 1 or 2 inches in length it will be found that it is then difficult to remove one of these growths without taking a portion of the bark with it; it is even impossible for the most skilful manipulator at such a time to disbud a fair-sized tree without having one or two mishaps in this way. At a very little later period the bud will part from the bark very easily indeed without any damage. Gumming may also be caused by insects, and by a very low temperatnre checking the first growths in spring, so that the leaf action is not sufficient for the roots. All trees on the Plum stock commence action first at the root, and at a certain stage they require corresponding leaf action; if this is not forthcoming something must go wrong. May not gumming be also caused by leaving too many flowers to set and too many fruit to stone? Remember, if Peach trees were grown in their natural bush form there would not in proportion be a quarter of the fruiting wood on them there is on our trained trees. As far as I am able to form an idea they would be of similar habit to the Kentish or Morello Cherry unpruned and untrained, with the bearing shoots at the extremities of the branches only. Finally, may not syringing with cold water on a hot summer's day have something to do with gumming? Think of the temperature of a south wall on such a day, perhaps it is 120°. If water were used of the same temperature as the wall it would cool it considerably by evaporation. What must be the effect when the water is only 65° or 70°?

Having pointed out some of the ways by which the sap and sap vessels receive severe checks and thereby produce gumming, I will now attempt to explain how these checks may often be prevented.

1. As to Extremes of Temperature.—Now I do not believe the Peach tree, even at midwinter when trained to a wall, is capable of bearing with impunity 25° or 30° of frost followed by bright sunshine while the branches are still covered with ice. If, then, they have to endure such a severe frost, some means ought to be found to screen them from the sun for a time should it make its appearance while they are still frozen. As a rule, plants standing in an open exposed situation, especially if it is elevated, do not suffer so much from very severe frosts as those do which are in what is called a sheltered position, and of course the sun has more effect on the plants so sheltered, so that the extremes are greater. Tender trees, such as Peaches, where they are liable to great fluctuations of temperature, ought certainly not to come in contact with metal or other rapid conductors. Indoors, where the plants are never frozen, a wire trellis is the best; galvanised wire I prefer, but, as pointed out by Mr. Abbey, it ought to have an even surface, or galvanism may get the credit for injury done by a very simple mechanical means.

2. Cutting-back Gross Growth produced by an Excess of Manure.—A soil should be used that is sufficiently rich of itself to produce moderate growth without adding any large quantity of manure. Gross growth is not required, it never ripens and it never produces fruit; if you cut it back you will either have gumming or shoots of unequal dimensions produced from it, and perhaps both. My advice is, rather have the soil too poor than too rich; have it mechanically right, and supply a stimulant if required in the shape of washings from the manure heap any time in winter or spring, but not later than spring; also have the border thoroughly drained and rather elevated with a view to the ripening of the roots.

3. Late Pruning.—I am sorry to see this practice is still recommended, but happily not in "our Journal." The roots of Plum stocks commence growing soon after Christmas, sometimes before; a perceptible swelling of the buds very soon follows; to use the knife then is most cruel—barbarous. If my trees were left so long unpruned I should then certainly leave them till July, keeping the young growths pinched back where they are not wanted, and finally cutting the surplus shoots entirely away when the trees are in full growth. This is what I actually do in the case of late-planted trees—*i.e.*, trees planted after November. All pruning of established trees should be finished as soon as possible after the fruit is gathered. With well-managed trees there is not much to do even then; it is only the bearing shoots of the current year to be cut out. Some people say late pruning of Peach trees causes late flowering. It is perfectly untrue.

4. Disbudding too Early.—Disbudding ought to be done very carefully and not too severely. It is better to pinch-back the points of some of the growths at first rather than disbud too much at once, and allow the principal shoots to get into a good healthy growth so as to be able to utilise the extra sap when the final disbudding takes place.

5. Insects and Low Temperature checking the First

Growths.—The first we have complete command over; there is no reason why an insect or an insect's egg should be left alive on a Peach wall in winter. If they are destroyed there is a chance of the young growths having a fair start before they are again troubled with them. Temperature can only be kept up by good covering; the best next to glass, even preferable to uncovered and unheated glass, is frigi domo and a broad coping. The frigi domo is expensive at first, but it lasts a good many years, and in the end I am inclined to think is cheaper than any kind of netting and ten times more effectual. —William Taylor.

ROYAL HORTICULTURAL SOCIETY.

The Annual Meeting of the Royal Horticultural Society, adjourned from the 9th of February, was held last Tuesday in the Council-room, South Kensington, Viscount Bury, the President, in the chair. Amongst the members of Council present were Sir Coutts Lindsay, Bart., Mr. Webb, Mr. Little, Mr. Burnley Hume, Mr. Kellock, Mr. Benamy Dobree, the Hon. and Rev. J. T. Boscawen, Mr. Warner, Mr. W. A. Lindsay, Secretary. Amongst the general body of the Fellows were Lord Lawrence, Sir Alfred Slade, Bart. (recently resigned from the Council), the Hon. Mr. Chetwynd (who has also resigned his seat at the Council), Mr. Godson, Dr. Hogg, General Scott, Dr. Masters, Dr. Denny, Mr. Fortune, Mr. Houghton, Mr. MacKenzie, Mr. Moore, Mr. Shirley Hibberd, Mr. Bateman, Mr. Paul, Mr. Beale, Mr. Fraser, Mr. Williams, Mr. Turner, Mr. Standish, Mr. Wells, Mr. Andrew Murray, Mr. G. F. Wilson, Mr. Liggins, Mr. E. J. Beale, Mr. Fulton, Mr. Bull, Mr. Smee, Mr. J. R. Pearson, Mr. Noble, Mr. Veitch, Rev. C. P. Peach, Mr. Pinches, Mr. Edgar Bowring, Mr. Walford, Mr. Guedella, &c.

The Secretary (Mr. W. A. Lindsay) read the advertisement calling the meeting.

The following is the amended Report of the Council submitted to the meeting:—

REPORT OF THE COUNCIL TO THE ADJOURNED ANNUAL GENERAL MEETING.

(1.) The Council are happy to inform the Fellows of the Royal Horticultural Society that, since issuing their Report to the Society, the position of affairs has materially changed.

The speech made on behalf of Her Majesty's Commissioners at the meeting of 9th of February was so friendly in character, and conveyed assurances so satisfactory to the Society, that the Council feel it incumbent upon them to omit from their Report any passages which might present even the appearance of disunion between themselves and the Royal Commissioners.

(2.) The Council have great pleasure in again commenting upon the magnificent displays of fruits, flowers, foliage, and other plants at the Society's exhibitions during the year 1874, and especially at the concluding exhibition of the season, when the collections of fruit and Chrysanthemums surpassed almost all similar collections of former years.

(3.) The amendments introduced into the schedule, together with the reduction in the number of the exhibitions, have all contributed to this gratifying result.

(4.) The more purely scientific work of the Society has been ably performed, and the meetings of the Fruit and Floral Committees have been well attended.

To encourage still further the discussion of horticultural subjects, the Council have established, as an experiment, evening meetings, which those Fellows who are interested in horticulture are specially invited to attend. The experiments made at Chiswick form, as usual, the subject of a supplementary report.

(5.) In the course of last summer the Council received a very advantageous offer from Messrs. Prince, for the privilege of constructing a skating rink in the Society's Gardens.

(6.) Messrs. Prince proposed to pay by way of rent a sum equal on an average to £1100 a-year, to erect the rink and necessary approaches entirely at their own expense, and to conform to such conditions and regulations as might be approved by the Council. The Council considered it their duty to accept this offer, believing that it would be agreeable both to Her Majesty's Commissioners and to the Society. The moneys accruing from this source would assist the Society to meet punctually their engagements, not only with their landlords, but with their debenture-holders and other creditors, and by relieving the Society from the pressure of pecuniary embarrassment would enable them to devote more time, attention, and funds to the improvement of horticulture in all its branches.

The rink might thus be said to come within the terms of our lease, by contributing materially, though indirectly, to the interests of horticulture.

(7.) Her Majesty's Commissioners, however, did not consider it expedient to become parties to this arrangement, and as under the Charter of the Society Her Majesty's Commissioners have the power to prohibit any proceeding of the Society which is not directly of a horticultural nature, and the Society have, moreover, no power to assign, underlet, or part with the premises demised to them without the consent in writing of Her Majesty's Commissioners first obtained, the Council felt it right to proceed no further with the arrangement with Messrs. Prince, although no direct prohibition had been sent to them by Her Majesty's Commissioners.

The Council beg to express a hope, based upon friendly communications recently made to them by Her Majesty's Commissioners, that all difficulties in the way of a satisfactory understanding between Her Majesty's Commissioners and the Society may soon be removed.

(8.) The Council have now to call the earnest attention of the Fellows to the financial position of the Society.

During the past year it has been impossible to make any great impression upon the amount of the debts due by the Society referred to in the last report. The Council are, however, happy to inform the Fellows that they have succeeded in compromising for a cash payment of £600 a debt due to the executors of Sir Trayton Drake of £1000 (with interest since 1864), which was advanced to the Society prior to 1860; and which, until the accession to office of the present Council, had been ignored in the published accounts of the Society, and they have also settled a claim of Mr. Cooper's amounting to £105 for work done in the year 1862.

It has become evident to the Council, and, indeed, must be apparent to the Fellows, that the ordinary revenue of the Society cannot support its present expenditure; and to prevent any increase of the Society's liabilities during the year 1875 the Council have been compelled to make several, in their opinion, most undesirable reductions in the expenditure.

The attention of the Fellows is specially called to the fact that unless the rent of £2400 is paid to Her Majesty's Commissioners next year, the lease of the South Kensington Gardens may be forfeited, and to prevent this contingency an increased revenue must be obtained.

This increased revenue the Council suggest may be obtained by concerted action on the part of the Fellows, whether resident in the neighbourhood or not, and by increasing the number of Fellows. The Council are prepared to invite a general meeting of the Fellows to discuss this question in detail. A definite scheme will then be submitted for consideration.

In conclusion, the Council beg to express their unanimous opinion that it is the bounden duty of the Society to do its utmost to retain the Gardens in its possession as "a suitable area in which they may exhibit and display the progress of horticulture," and also to enable them to fulfil the Society's obligations to their life Fellows and their debenture-holders; and in such a course the Council feel sure they will have the hearty and cordial co-operation of every Fellow of the Society.

The Chairman said—It now devolves upon me, gentlemen, to place before you the Report of the Council. You will remember the circumstances under which their former Report was withdrawn. The Council and the Society generally had been long desirous of coming into amicable friendly relations with Her Majesty's Commissioners. A gleam of light dawned upon us not very long ago, and at that time the Report of the Council had been issued to the Fellows. We found that certain passages in that Report stood between us and the consummation of our wishes, and that the Commissioners felt somewhat annoyed at the terms in which they were mentioned in the Report. We felt that as your representatives nothing ought to stand between us and the fulfilment of your wishes and of our wish to enter into relations of the most perfect amity with Her Majesty's Commissioners. We had not intended any disrespect to Her Majesty's Commissioners, but the Council had intended in their Report to state facts they themselves were in possession of [hear, hear]. They felt, however, that it was absolutely essential that even the appearance of disunion should be avoided by them, and they consented most cheerfully to take back the Report which had been placed before you, and the result has been an amended Report, which is now lying on the table for your consideration. We hope that the circumstances which have since arisen are such as fully justify us in the course which we have adopted [hear, hear]. We have several satisfactory announcements to make to the meeting. One is the complete restoration of good offices and good understanding between Her Majesty's Commissioners and the Royal Horticultural Society [hear, hear, and "no"]. That I will proceed to place beyond a doubt before I go further. We have received from Her Majesty's Commissioners a dispatch dated yesterday, the 8th of March. It is as follows:—"I am directed by Her Majesty's Commissioners for the Exhibition of 1851 to inform you that since the Annual General Meeting of the Royal Horticultural Society, held on the 9th of February last, they have taken the opinion of counsel on the effect which the proceedings of that meeting of the 9th of February had on the legal position of the present governing body of the Society; and that they have been advised there has been a sufficient acceptance of the resignations of the members of Council who resigned in April 1873, and a sufficient confirmation of the election of the existing members of Council to render the status

of the Council free from objection [loud cheers]. Under these circumstances I am to inform you that the Commissioners will have pleasure in resuming official relations with the Council of the Society" [applause]. I doubt not, gentlemen, that dispatch is satisfactory to you to hear as it has been to the Council to receive [hear, hear]. We are now in the position we have long desired to be—in immediate relations with Her Majesty's Commissioners, which has, as we believe, smoothed the way to an amicable and equitable discussion of the bases on which the affairs of this Society are to be administered; and we think that with these amicable relations existing between us and the Commissioners nothing need stand in the future between us and financial success, and the success of the Society in the aspect of a horticultural body [cheers]. Passing away for a moment from that, I touch for one moment on the position of the Society with regard to horticulture; and perhaps you will allow me to say two preliminary words with regard to my own position. I know it has been thought, as appears from some of our horticultural journals, that I am one of those outside Fellows—those "local" Fellows as I believe they are called—who are not altogether acceptable to horticulturists pure and simple. Well, gentlemen, I beg to say for myself I am President of the Royal Horticultural Society, and as such I am neither a "local" Fellow nor a "horticultural" Fellow [laughter]. Since I have had the honour of occupying this chair I have never, in all the meetings I have attended, done anything which would further in a greater degree the interests or the objects of "local" Fellows or the local objects of horticulture. I felt it was my duty as chief of your Society to maintain an entirely neutral position [hear, hear], and I trust all those who know me, and I trust all who sit around me, will support me when I say such is the position which I have always assumed [cheers]. Therefore, gentlemen, I request you to take an honest expression of my opinion—as independent an opinion as it is possible for me to form. I should oppose any action on the part of "local" Fellows I thought injurious to the well-being of the Society; and I would equally, if I found it necessary, oppose any action of the section called "horticultural" if I thought it was injurious [hear]; and I consider in so doing I should be loyal to both, because I should be loyal to the Society to which both belong [applause]. Under these circumstances I have been exceedingly sorry to learn it was the intention of the purely horticultural section of the Society to oppose the adoption of our Report this day. I trust the opposition which has thus been announced is only the opposition of a very few members of the Society [hear, hear]. You must remember that on your Council at the present moment there is an actual majority of what are called "horticultural" Fellows. I am sorry that distinction between "horticultural" and "local" Fellows has ever arisen [hear, hear]. I believe it is injurious to the best interests of the Society, and that unless you can get rid of it your Society will go altogether to the wall [hear, hear]. I can assure you at the Council Board upstairs that division is not felt, and that the interests of the Society have been invariably brought to the front, and that our duties have not been regulated by a broad line dividing the "horticultural" and "local" Fellows, but by the independent opinion of members as to the best interests of the Society. When such is the case with the Council you have called upon to represent you, such should assuredly be the case outside these walls. And I think if the Society will reflect upon the position in which we now are, they will find that all "horticultural" Fellows and "local" Fellows —if you still retain the name—are equally willing to support the Council on the present occasion. It is true we have been in great financial embarrassment. We are still in great financial embarrassment. Our best escape from that is not by throwing-up the game in despair [cries of hear, hear], but by putting our shoulders to the wheel and working together [cheers]. We see now, being in amity with Her Majesty's Commissioners, an opportunity of landing you in smooth water; but this is scarcely the time to propose to surrender the gardens we have held under agreement into the hands of Her Majesty's Commissioners. I think we may truly say that is a suggestion un-English and, indeed, cowardly [hear, hear], and I will further say that from all personal communications with Her Majesty's Commissioners I am satisfied they are not desirous of possessing these gardens. I go farther—they would feel a certain embarrassment in the possession of these gardens from which we as partners with them in the gardens and well-wishers of the Society should relieve them. Therefore I think if any "horticultural" Fellow proposes to throw upon our hands this Report, which has been carefully taken and remodelled to meet the objections expressed at the Annual General Meeting of the Society, and if they do not adopt this Report, I think they will commit a mistake in the interests of the Society. It has been said the present Council have not sufficiently devoted themselves to the interests of horticulture pure and simple. One of the objections made is that the schedule proposed for 1875 has not been adhered to, and that the four shows advertised in the schedule have been withdrawn by the Society. When the matter was brought before the Council they went into it on its merits. They found that the funds did not admit of paying the large sum which was set apart for prizes. When you have no money you can spend no money. We were therefore bound to make a reduction in that respect, and the mode of reduction was the question. We proposed to do it by withdrawing four of the Shows advertised, and we were told by members of our Council who well represent the interests of horticulture that that would not be agreeable to horticultural interests generally, and we therefore appointed a committee and gave them this instruction —"It is absolutely necessary that if these prizes be given we should save a certain sum of money; if you can retain all the shows advertised in the original schedule and still show the saving we will reconsider the schedule." We appointed to that committee gentlemen who had an entire acquaintance with and the respect of the horticultural world. Their report has been now presented to us, and I have the satisfaction to tell you that all the shows advertised to be held in 1875 will be held [hear, hear], but that of course, as we have not money to pay all the prizes to their full extent, we must diminish the amount of the prizes. We have taken the opinion of many of the smaller exhibitors who would have been shut out from the exhibition by the non-holding of these four shows; and also the opinion of the larger exhibitors, who are very much concerned in the matter. The latter have very handsomely said they would exhibit whatever the amount of prizes might be, and that is because, as I hope and firmly believe, our horticultural exhibitions are not intended simply for the money value of the prizes they bring, but in the distinction gained by those who win prizes [hear, hear]. I hope that will be taken as an evidence of the strong desire on the part of the Council to meet the views of the horticultural members of the Society as far as it is consistent with their funds to do. I do not think, gentlemen, there are many more subjects on which I need detain you. There is one point which at one time I thought might have produced some discussion at this meeting, and that is that since the commencement of this meeting, of which this is an adjournment, two of the members of our Council have found it necessary to withdraw from our Council Board. The gentlemen so resigning were members who have always taken a most active part in the affairs of our Society. They have brought to bear upon the management of the Society the exceedingly valuable qualities of industry and of ability, and the Council regret their absence; and the Society, I am sure, will regret their absence extremely, because they are very strong props of the Society [hear, hear]. It was thought at one time that their vacancies would come before this meeting to be filled-up, and it was well, therefore, for the Council to be clearly aware of what their legal position was on that matter before they met the Fellows here to-day. The Council have obtained the joint opinion of Mr. Cole, Q.C., and of Mr. Lindley, Q.C., both being names which will command the assent of all present here, because we all know their high legal standing and their deeply solid acquaintance with the affairs of the Society. We are informed that under the bye-law, the validity of which is not impugned, vacancies caused by the resignations of Sir Alfred Slade and Mr. Chetwynd must be filled-up by the Council, and not by the Fellows generally. They were elected at the Annual General Meeting, and so far as that election is concerned the business of that meeting is at an end. The resignations, therefore, of these two gentlemen will come in the ordinary form before the Council, and will not be submitted to the Fellows of the Society. In support of that, as I believe there is some difference of opinion among members of the Society, I will read to you counsels' opinion. [Several members, "Taken as read."] Well, then, gentlemen, you may take it on my word that question shall not trouble us or come before us at all. I think, gentlemen, I have now touched upon the principal topics which it is my duty to notice. I am glad to say that our relations with Her Majesty's Commissioners are now of a perfectly amicable character, and that if any body can carry throughout to its desired consummation the affairs of the Society, the Council which have now the honour of addressing you have as good a chance as anybody else [cheers]. There is one point which, perhaps, it might be advisable for me for a moment to advert to, because upon it I have heard that some Fellows found an objection to our Report —and that is the last two clauses of the Report which say, "This increased revenue the Council suggest may be obtained by concerted action on the part of the Fellows whether resident in the neighbourhood or not, and by increasing the number of Fellows. The Council are prepared to invite a general meeting of Fellows to discuss this question in detail. A definite scheme will then be submitted for consideration." Now, gentlemen, I have heard it said that the wish of some of the Fellows is to send back this Report to us—in other words, to adjourn the meeting until we can tell them what that proposal is. Now I say distinctly that that clause was worded in the way it was deliberately and advisedly. The first object we had before us at the meeting of the 9th of February, of which this is the adjournment—and the only object in point of fact we had before us—was to obtain such recognition from Her Majesty's Com-

misioners as would enable us to enter into friendly and equable relations with them. We heard from them from time to time that when we made ourselves a legal Council they would (and I enter not now into the question whether we were a legal Council or not) be prepared to treat with us on an equal basis. I have now read to you the dispatch of the Commissioners, that the action taken on the 9th of February has made us a legal Council, and that they are prepared to deal with us upon an equal basis. The one object, therefore, which we had to discuss at the last meeting of the Society has been fulfilled as far as the Council is concerned. We felt, gentlemen, that we were bound not to divert the attention of the Fellows from that one main object which will be attained as soon as the Report is adopted by trailing a red herring across your path. Of course, in human affairs you cannot find a large body of men to be of one mind without discussion. If we had submitted any proposal to you in the Report, the chances are your attention would be diverted to the details of that proposal—that you would have discussion on them instead of pursuing the main object for which we have met. When you have passed this Report, gentlemen, you will be in smooth water as far as the Commissioners are concerned. Without doing that you cannot be in smooth water, and you will be going headlong to ruin [hear, hear]. Pass this Report which commits you to nothing. The Report was purposely drawn so that you could vote for the main object we have in view—viz., to land this Society, as regards the Royal Commissioners, in a position of legality which it has not heretofore assumed. I hope, gentlemen, I have made this point clear to you, and I conclude by placing before you for your consideration the Report upon the table [cheers].

Dr. Masters.—Will you kindly say by whom the letter of the Commissioners is signed?

The Chairman.—By "Henry Scott, Major-General." Is there any objection in the body of the hall to the adoption of the Report?

Mr. Dolman remarked that Her Majesty's Commissioners are not disinclined to come to terms or to a satisfactory understanding. He should like to know in what particular way was that about to be arrived at.

The Chairman.—It would be premature for us to express any opinion on that point. There are members of the Royal Commission here present who can speak on the point if it is thought advisable to do so. As we shall not meet the Commissioners until the Report is adopted, I am not in a position to answer the question.

Mr. Andrew Murray.—Why should you not meet the Commissioners until the Report is adopted?

The Chairman.—Because this meeting is incomplete until the adoption of the Report. We are not now in the position of absolute legality which we shall be in when the Report is adopted.

Mr. Murray.—I thought the Report was received.

Mr. Chairman.—The meeting is not yet over, and the Report has not been yet adopted.

Mr. Dolman.—What about the skating rink? Has it been assented to by the Commissioners?

The Chairman.—We have only had a private correspondence on the subject.

A Fellow.—We ought to have some definite assurance whether the proposition as to the skating rink is to be carried out or not [hear, hear].

The Chairman.—The Council has no definite assurance to give you on that point.

Mr. Guedella said he had no wish to throw the apple of discord into the meeting, but wished to express his opinion that there had been an extraordinary change of opinion amongst all parties to these transactions. In the first place, the opinion of the Commissioners appeared to have changed very much after they got the opinion of counsel, which they could have obtained long ago [a laugh]. Then, what change was it that had come over the gentlemen sitting at the Board? With the exception of two gentlemen who had manfully stuck to principles and sent in their resignations the Board had adopted a peaceable line of action, and he should like to know some of the circumstances which induced these gentlemen to come down at the eleventh hour with a change of policy. Then came the question whether the members of the Council were the gentlemen who could conclude the best arrangement with Her Majesty's Commissioners—whether they were the proper people to carry out the arrangements for the benefit of the Society [hear, hear]. He certainly thought the present Council should have exercised more spirit since they came into office. There was one of the finest conservatories in the world on their premises, and if they had a ball in it they could have made £2500 by it ["no" and laughter]. He thought the skating rink was one of the most advantageous speculations that could be made. His object was to rouse the Council from their state of inaction. He regretted the resignations of the two members of Council, and should like to know what were the reasons for them—whether it was a firm adherence to policy and principle that prevented them remaining in the Council?

The Rev. C. P. Peach said he had been asked to propose the following resolution or amendment:—"That the Chairman be requested further to adjourn the Annual General Meeting, so that the Council may be able to present to that adjourned meeting, with their Report, any scheme they may be able to enter into with Her Majesty's Commissioners." The reverend gentleman said it was quite necessary the meeting should be adjourned in order to see what agreement could be entered into between the Council and Her Majesty's Commissioners [cries of "no, no."]. At the last meeting the Chairman said the legality of the Council was granted, and immediately afterwards he tried to force the Fellows to accept the Report by saying that unless they did so the legality of the Council would not be obtained. He could not see how the legality of the Council could be recognised by Her Majesty's Commissioners when an attempt was made to force the Fellows to accept the Report. There was another question which had not been brought before them, and that was the question of the provincial shows. Nothing in the Report showed there was any attempt being made to get up provincial shows in the interest of horticulture [cries of "question"]. Their President said he was neither a local nor a horticultural Fellow [no, no]. Surely this was a horticultural Society, and surely horticulture ought to be considered first by the Society in all its bearings. He appealed to all horticulturists present whether it would not be of advantage to adjourn the meeting [cries of "yes" and "no"] in order to come to some definite arrangement and see where they stood. At present they were, financially speaking, in a condition bordering on bankruptcy. He did not want to reject the Report in any way, but he wished the meeting to be adjourned to see what arrangement could be come to.

Mr. Liggins remarked that the Report had not been seconded.

The Chairman.—No, and for this reason: Our bye-laws say that after the Report has been read the consideration of other business may be proceeded with. A legal question arises whether it means the proposal of the Report for adoption. Technically it does not. Practically we hold to our Report, and any amendment carried against it we should consider as a vote of want of confidence.

Mr. Liggins.—Precisely so.

The Chairman.—We are bound by our bye-laws, so that I move that the Report be considered.

Mr. Quilter rose to second the amendment, which he considered a most reasonable one. When he saw the onslaught that had been made two years ago on the then existing Council—so much so as to cause them to resign [a voice, "They were turned out."]. Well, he believed they would have helped the Society out of its difficulties. After having refused all reasonable propositions from Her Majesty's Commissioners the Council had done nothing that day but consider everything that was adverse to horticulture instead of what would encourage it [cries of "no" and "yes."]. The statement of the Council would prove it. First of all they gave up the provincial shows which produced a good annual income, and next they curtailed the privileges of the members [hear, hear]. Next year the shows were curtailed, and the result was that the Society's funds were far worse now than they were then—indeed the funds were something like £1500 worse now than they were two years ago. Under these circumstances before they passed the Report they ought to have something like a scheme before them to show them the way out of the difficulties in which they were placed. The Chairman told them that if they passed the Report they would be landed in smooth water, but he could not speak with any certainty, and so they might be in worse water than they ever were before. The exhibitors had not been paid prizes which ought to have been paid out of last year's revenue. He supposed the Council had been waiting to receive as much of the Fellows' money as they could [no]. At the last meeting they heard in that room that the Commissioners were willing to meet the Fellows on fair terms, and certainly the Fellows had a right to know what these terms were [hear, hear]. If the meeting did not insist upon that information and passed the Report they would leave the matter in the hands of the same gentlemen who had landed the Society in its present position [no, no]. The proposition he made was not an unreasonable one; it would not stultify the Council in any way, but on the contrary, strengthen their hands. There was amongst the Fellows a vast difference of opinion as to whether it was advantageous to the Society to keep these gardens in their possession. The Chairman told them he did not think the Commissioners wished to have the gardens. Who did wish to have them under existing circumstances? [hear, hear]. He, for one, did not want to see the gardens done away with, but he felt sure there were means to be adopted by which the Society might be relieved from that necessity, and the gardens kept on as well as ever. A Fellow asked him the expense of keeping-up the band. Well, they were told the band was to be discontinued for three months—September, October, and November, but they really ought not to have a band at all unless they had got money to pay it. He begged and entreated the Fellows to vote—not for the

rejection of the Report, and even if it were rejected it would not amount to a vote of censure;—but let them ask the Council to submit the scheme to them, and let them see what was going to be done. That would not reflect upon the Council at all, or place them in such a position that they must resign their posts. He hoped the Fellows would adopt some means of making the Society in reality what it was in name [hear, hear]. If they did not do so they should very soon have to get another name. Let them do everything they could to relieve themselves from the superabundance of debt with which they were surrounded. Let the Report go back to the Council—let there be an interview obtained with the Commissioners as speedily as possible. If that were done the matter might be brought to a successful issue, and the Society placed on a sure and certain basis [hear, hear].

The Chairman.—There is a motion before the meeting moved by Mr. Peach and seconded by Mr. Quilter. (His lordship here read the motion.) It is right the meeting should be accurately in possession of what they are voting about, and therefore it will possibly save time if I say, on the part of the Council, that the Fellows are now about to vote upon a question which the Council consider a vote of confidence [hear, and no]. At any rate the Society will feel we adopt the most manly course in stating at once the way in which we view any amendment to the Report which we now have the honour to present to you.

A Fellow pressed upon the Council the necessity of adjourning the question to see what arrangement could be come to with the Royal Commissioners.

Mr. Liggins said he was surprised at the last two speeches they had heard, because it was obvious to all men of business that if such an amendment was passed it would cast a stigma upon the Council which no man of honour could stand [cries of "no, no," and interruption]. The rule of all societies, from the House of Commons downwards, was that when such a resolution as the present was passed it amounted to a vote of want of confidence. They had no right to express opinions as to amity existing between the Council and the Commissioners without supporting that expression by their votes. He asked them to oppose that obnoxious amendment which had been brought forward in a manner which had astonished him. What after all was this Report? It was coupled with the accounts of the Royal Horticultural Society for the past year. It was more a record of what had been done than a programme of what was to come [no, no]. It was no use to say "no," because the Report was an account of what the Council had done. If these accounts were insufficient the Fellows must have expected them to be so, because they knew the Council had to struggle against the deficit left them by the gross mismanagement of the gentlemen in office before them ["no, no," and much interruption]. Was there any wisdom in the expenditure of £500 for a statue?

Mr. Quilter.—What statue?

Mr. Liggins.—Well, a statue, but I never knew the name of it [laughter]. The statue was the work of the late Mr. Foley. He contended that whilst they were in debt that was an expenditure of £500 unnecessary in the interests of horticulture. There was a legacy of debt equally unnecessary left upon the shoulders of these gentlemen. He begged to say the gentleman was wrong who said the late Council resigned. The fact was they were turned out [hear, no, and some interruption]. The Fellows, honestly and like Englishmen, turned them out, having lost confidence in their management. What had the present Council done? They had done everything to reduce expenditure and make the gardens pay. It was painful to them to have to reduce the prizes and the shows, but it must be remembered that the last Council had been spending vast sums of money they had no right to spend. It was all very well to say, "Oh, reduce the number of bands;" but if they did not make the gardens attractive their local Kensingtonians would fall off, and the few guineas they got back would melt away, and they would have no money for prizes. Let them remember the gardens were not of an altogether horticultural nature, but having got them they ought to do the best they could to retain them, and not let their landlords get them back [hear, hear]. Whether they did or did not desire to possess the gardens, there would be no difficulty in disposing of them at a profitable rate. But it was their duty, to the interests of the horticultural world, to retain these gardens because they encouraged horticulture. Although he was a Kensingtonian, his connection with the Society arose from his love of horticulture. If they passed such a resolution as that now before the meeting they would commit a great absurdity, because they ought to put the Council in the position the Commissioners believed they would be in. Did they suppose that if that meeting was adjourned for a month the International Commissioners would take any action during that month? Certainly not. They would say, "Oh, you are in hot water with your Fellows. You have passed no accounts, they will have nothing to do with you, and until they are passed we can do nothing." In conclusion, Mr. Liggins earnestly besought the Fellows to support their Council.

Mr. Peaches observed that the Report was simply a retrospective account of what had been done by the Society, and he could not see on what ground the meeting could refuse to receive it. They had decided on expunging from the Report the statements considered to be offensive to the Commissioners, and now that they were not in the Report he could not see any ground for postponing the reception of it [hear, hear]. He thought they were treating the Council in a very shabby manner indeed [hear, hear]. As a pretty close observer of the doings of the Society he must candidly say he was utterly at a loss to know on what reasonable grounds they wanted to find fault with what the Council had done. If they displaced the Council they would incur, justly or unjustly, the enmity of the Commissioners, and by the fact of doing so they put the Council out of a position in which they could communicate with the Commissioners. After a careful investigation of the accounts of the Society in the Report and those which went before it, he was bound to say these gentlemen had really done good work [cheers], and had succeeded in paying off a considerable accumulation of debt [hear, hear]. One of their primary objects was the reduction of their debt. Everybody knew they could not reduce their debt and increase their expenditure at the same time. Surely the best thing the Council could have done was to maintain the chief feature of the Society. There had never been any shows so good as those of last year, and for his part he should sooner see three good shows than thirty indifferent ones [hear, hear]. The Council had, he thought, exercised a sound discretion in determining to reduce the number of the shows and increase their brilliancy. He asked the meeting to pass the Report of the Council. Could anything be more insulting to a body of men than to reject their Report after, at the request of the Fellows, they had expunged from it certain phrases considered to be objectionable? It would be most ungentlemanly behaviour to do so, and he did not believe any body of gentlemen would lend themselves to such a proceeding. Now, as to the panaceas which had been suggested. One gentleman said they had only to get up a ball or a fête in order to clear off the debt of the Society. Well, when he was invited to come to an evening meeting there and found just twelve ladies and gentlemen in the room, he asked them, Could anything be more disheartening than such a state of things? What they had to do now was to pass the Report, which was simply a record of the past history of the Society for the year. He quite understood the remarks of the Chairman as to the Council being legally constituted if the Report was passed, and he hoped the meeting would not hesitate to adopt the Report [applause].

Mr. Edgar Bowring was understood to say he should support the Council's Report. With respect to the five hundred guineas expended on a statue, as the person most concerned in the matter was no longer alive, he would tell the exact circumstances. At the time this occurred the late lamented Prince Consort was President of the Society and of the Royal Commission. The Prince Consort thought much might be done for the progress of science and of the fine arts, particularly of painting and sculpture, in connection with the Society, and it occurred to him that sculpture and horticulture might be combined in the gardens. He brought up a plan whereby out of the profits of the Society a sum of five hundred guineas should be annually set apart for the purpose of inviting competitions, so that a sculpture gallery might be established in the gardens. That plan was brought before the Expenses Committee of the Royal Commission, of which he (Mr. Bowring) was a member. As the Commissioners received half the profits of the gardens it was quite clear their consent to the suggestion should be obtained. Well, it was under that arrangement that the beautiful piece of sculpture "Youth at the Stream" was ordered from Mr. Foley. The Commissioners were willing to run the risk and give half the sum towards the sculpture. The Society had the idea that if this could be carried out it would be of great advantage, not only to horticulture, but would do much to promote the cultivation of the fine arts in this country [hear, hear].

Mr. Walford regretted that he made the speech he had made at the last meeting, not exactly as to what he had then said, because that had grown upon him day by day, but because he had discovered a very great dissatisfaction existing amongst the members of the Society as to its future prospects. He had no personal object to serve. He did not want to serve on Council or Committees, or to take any part in the management, but he did want to see the opportunity for doing something, and doing it quickly, not lost. As far as the amended Report went the objectionable clauses had been withdrawn. That was all right; but there were certain paragraphs in the Report which required very careful consideration. The third last paragraph said, "The attention of the Fellows is specially called to the fact that unless the rent of £2400 is paid to Her Majesty's Commissioners next year, the lease of the South Kensington Gardens may be forfeited, and to prevent this contingency an increased revenue must be obtained." Then the Report went on to state that it was proposed to call a special meeting to consider the question of raising the revenue of the Society. That seemed to be all very right and proper: but supposing it should happen

that the scheme of the Commissioners was not approved, the opportunity they had now would be lost by adjourning the meeting. He had no wish to say a disrespectful word of the Council. He had a word to say about them at the last meeting, and he was sorry for it, but the cause for his remarks was no longer on the Council side of the table [hear, hear.]. But he should like to know how that change had taken place. It was known to them all that the time had now arrived when the Commissioners were prepared to discuss with the Council that which they were not prepared to discuss before. Was it wrong to say to the Council, "Don't shut us out from participation in any benefits which may arise. Adjourn the meeting to any day suitable to yourselves, discuss the question with the Commissioners, and come to us and tell us what you propose to do." Were not these business propositions? [hear, hear.] The Society accepted the Report, but deferred the adoption of it until they had a settlement of the scheme referred to [no, no]. It was all very well to say "no, no," but he only asked what was right and proper. There was no reason why these negotiations should not be made within the next month or six weeks.

Mr. J. H. Mackenzie rose to propose to the proposer and seconder of the amendment that they should withdraw it and not drive the meeting to a division [hear, hear]. He was surprised that Mr. Walford should not consider it possible for the gentlemen comprising Her Majesty's Commissioners to decline to negotiate with three thousand Fellows when they could do so with the Council. He had not heard a word fall from any Fellow to the effect that they all had not the fullest confidence in the Council [hear, hear]. Let the Report be adopted, and let it be left entirely in the hands of the Council to enter into negotiations with the Commissioners whether under bye-laws or Charter. It was said that a certain number of Fellows had a right to call a meeting, but he thought that the paragraph at the end of the Report was a very honourable pledge on the part of the Council [hear, hear]. The Council looked forward to meeting the Commissioners and laying before the Fellows the result of their communications. It would not do for them to ride too high a horse with the Commissioners, because to a certain extent they were under their control. He hoped the proposer and seconder of the amendment would withdraw it. As to the question of horticulture, he was sorry to read in Saturday's *Morning Post* a letter from a gentleman calling attention to a clique in connection with the Society. He (Mr. Mackenzie) had been mixed up with many public societies, and from his experience he earnestly entreated all gentlemen who wished to keep this Society in a straight path to help in abolishing cliques [cheers]. One thing he was quite certain of—that the Council were doing the best they could for the Society [hear, hear].

The Chairman.—In a meeting like this, gentlemen, it is well I should have you to understand that the Council are willing to concede and conciliate as far as they can do so consistently with their own dignity. And, gentlemen, I will say at once we are quite willing to give a day for the discussion of this question [loud applause]. You will be just as able then to discuss the question, and when the arrangements made with the Royal Commissioners come before you, will be just as able to put your veto on any of our proceedings as you are now; and you will have this advantage, that you will not have lost valuable time in dealing with the Royal Commissioners. Thus that objection falls to the ground. We only wish, in the interests of the Society, that you should pass this Report at the present moment [cheers].

Mr. Houguton rose to ask the Chairman whether the Council would consent to the Report being adopted at the meeting called for the purpose of discussing it [cries of "no" and "divide"].

The Chairman.—Perhaps it would facilitate matters if gentlemen would put their heads together and come to some arrangement.

Mr. Mackenzie earnestly entreated the Council, if they had brains, or sense, or judgment, as he believed they had, to enter into the negotiations with the Commissioners perfectly untrammelled.

Mr. Alfred Smee believed that the Commissioners wished well to the Society, and would do all in their power to promote its interests. There was much more danger to the Society than what came from the Royal Commissioners.

Mr. Houghton did not think any reflection was cast on the Council by the meeting asking them to adjourn the proceedings. Let them pass the Report and adjourn the meeting [" no, no," and uproar]. He should move "That the Report be adopted and the meeting adjourned to this day six weeks to consider any statement the Council may make" [loud cries of "no."]

Dr. Masters said he rose to second the amendment.

The Chairman.—There is no amendment at present before the meeting [cheers].

After a short discussion, the amendment moved by the Rev. Mr. Peach was withdrawn.

The Chairman said there was no other amendment before the meeting, and the subject now fell to the ground, as under the Charter they were prohibited from making a proposition as to the adoption of the Report.

Mr. Pinches moved, and Mr. Liggins seconded, "That the Report of the Council be now adopted."

Mr. Houghton.—I am now in order, and I beg to move the amendment I have just read.

The amendment having been seconded by Dr. Masters was put to the meeting and lost by a very large majority.

The motion for the adoption of the Report was then put and carried unanimously.

On the motion of Mr. Pinches a vote of thanks was given to the President, and then the meeting closed.

In consequence of the representations made by several of their regular exhibitors (particularly of florists' flowers), the Council of the Royal Horticultural Society have determined to hold all the Exhibitions as originally advertised in the schedule for 1875; but that to carry out the reduction of expenditure suggested in their advertisement in the gardening papers of the 18th and 20th February last by striking off the list the Exhibitions of March 17th, April 21st, September 1st, and November 10th, fifty per cent of all the several prizes offered in the schedule must be deducted, leaving the values of the medals as they are.

NOTES AND GLEANINGS.

On the 26th ult. a testimonial was presented to Mr. James Anderson of Uddingston, N.B., gardener to the late Thomas Dawson, Esq., and now nurseryman at Meadowbank. The form of the testimonial was a purse containing 150 sovereigns and a piece of silver plate bearing the following inscription:—"Presented, along with a purse of sovereigns, to Mr. James Auderson, Meadowbank, Uddingston, at a complimentary dinner in the Clyde Hotel, Bothwell, as a mark of recognition of his fame as a gardener while in charge of the renowned Dawsonian collection of plants, and esteem for his general activity and usefulness, on the occasion of his entering into business as a nurseryman." We wish Mr. Anderson every success in his new undertaking.

—— To test the merits of the new American Potatoes, Snowflake and Eureka, in this country, Messrs. Hooper & Co, of Covent Garden, London, have offered prizes amounting to fifty guineas for the best exhibition of them at the meeting of the Royal Horticultural Society to be held on the 10th November next. The conditions relating to them may be found in our advertising columns, or by application to Messrs. Hooper.

FORCING SEAKALE AND RHUBARB.

I can fully endorse what Mr. Keetley says respecting Gilbert's Rhubarb tubs or boxes. As a protection they are useful, but not more so than long stable litter. I know a market gardener who grows several acres of early Rhubarb, and he uses the stained straw from the stables, merely covering the roots with it in November. When the roots begin to push the stems raise the straw also, and form an excellent protection. The Rhubarb is fit to pull by the beginning or at least the middle of February, and is of a beautiful colour, and the flavour far superior to any that is forced with fermenting manure.

To have Rhubarb through December and January no plan is better, in my opinion, than to take up some good strong roots in October and place them in a warm cellar with a little litter round them, and water them occasionally with milkwarm water. In March cut-up the crowns, leave a good piece of root to each, then make holes 18 inches in diameter and 3 feet from centre to centre, place the crowns against the sides of the holes triangularly, then fill-in with good rotten manure. Do not pull any during the next two summers, when the roots will be in excellent condition for taking-up again.—J. Saunders.

MRS. PINCE versus LADY DOWNES' GRAPES.

I quite agree with Mr. Harrison Weir that Mrs. Pince is a good Grape. As it is grown at Loxford it is large in bunch and berry. It sets well; and though not so rich in flavour as Muscat of Alexandria grown alongside of it, still it is superior to Alicante, Gros Guillaume, and Lady Downes'. One fault it has—it does not colour well, nor does it keep anything like so long as Lady Downes'.

My reason for noticing Mr. Weir's letter is, that he says he has pulled up all his Lady Downes' Grapes in favour of Mrs.

Pince. Now, if Grapes are required in March and April, as far as my experience has yet gone Lady Downes' is by far the best. Mrs. Pince will not keep so long in good condition; moreover, it is a Grape that is not esteemed in Covent Garden Market because of its bad colour. Lady Downes' brings a much higher price even when Mrs. Pince can be obtained. I know of one extensive grower who is cutting out his Mrs. Pince in favour of Alicante and Lady Downes'.—J. Douglas.

FLOWERS FOR OUR BORDERS.—No. 48.

SWAINSONA GREYANA.—Captain Grey's Swainsona.

The Swainsona Greyana is a half-shrubby plant, 2 feet or more high. The genus is allied to the Coluteas, which are, however, very readily distinguished by their curious, inflated, bladder-like seed-vessels, as well as by the two callosities on the standard.

The Swainsonas are numerous, but only four or five species are generally cultivated. Of these the best known is the old

Fig. 49.—Swainsona Greyana.

S. galegifolia, with sweet-scented flowers of a bright red colour and of a similar habit to our plant; there is also a white variety of this species. The S. coronillæfolia has rosy-purple blossoms, and is well worth cultivation, but is less generally seen. The S. pallida is an exceedingly pretty variety or species, we are not quite certain which, with pale rose-coloured flowers. All of them are natives of New Holland, the S. Greyana of the neighbourhood of Port Adelaide, and are therefore too tender to bear full exposure; but they succeed well in the open border during the summer months, where they will flower for a considerable period. The whole are very desirable plants, but the present species is certainly the handsomest of the genus, its long spikes of purple flowers producing an extremely showy effect. They will need to be removed from the ground in winter, but a good dry cold frame or pit will be a sufficient protection; in the south of Ireland, and other favoured corners of the kingdom, we have no doubt that they would bear exposure if planted against a wall and matted-up; we believe galegifolia has been thus grown. As, however, their protection in a frame or cold pit entails no greater amount of trouble than in the case of the Verbena and other plants of that class, we would advise their removal from the ground in autumn.

They may be increased by seeds, which are readily procurable, and should be sown in a strong heat; cuttings of the young shoots will also root under a glass with the assistance of a slight bottom heat, and if struck early in the spring will form flowering plants the same season. The soil best suited to all the species is a light sandy loam with a small proportion of heath mould; if grown in pots they should be well drained, and be frequently syringed to keep down red spider. —(*W. Thompson's English Flower Garden, Revised by the Author.*)

CŒLOGYNE CRISTATA.

Many of your correspondents have at different times sung the praises of Cœlogyne cristata, and yet I venture to add another testimonial in its favour. I have a plant now in my drawing-room with eight spikes and twenty-five flowers all open at once, the majority of which have opened since it came into the room where it has been about a fortnight. It seems a most accommodating plant, and may be treated amongst other flowers in an intermediate stove.

Without any of the capriciousness of most Orchids, it never fails to flower every year, and, while it will stand a comparatively cool treatment, does not seem to mind the heat of a stove in the growing season. It may easily be made to bloom in December and January, and as the flowers are pure white with the exception of the yellow-crested labellum, and are very graceful, it is a beautiful ornament for the hair or for a bridal bouquet, and has the merit of lasting a long time when cut.

Mine is only a medium-sized plant in a 7-inch pot, but, as the individual flowers are large and the trusses evenly distributed, it is very effective. It has another merit too, that for an Orchid it is by no means an expensive one.

If I could induce others who, like myself, have no Orchid house and cannot take up the mania, still to grow a few of those that will bear an ordinary intermediate stove treatment I should name the Cœlogyne cristata as one of the very first to be procured, and next to that the Dendrobiums densiflorum and nobile, and Odontoglossum Alexandræ.—P.

PEARS NE PLUS MEURIS AND BERGAMOTTE D'ESPEREN.

Mr. Cunningham, on page 140, has made some practical remarks on Pears. He names amongst others two kinds which are worthy of extended cultivation, and at the same time suggests that experience is necessary to prove the merits of new varieties; he is also sensible of the effects which different soils have on the quality of the fruit. I have had experience with the above-named sorts, both of which Mr. Cunningham mentions as useful, hardy, free-bearing varieties, and have proved the extreme variation of one of them under different soil, conditions, and mode of culture.

For several years I gathered fruit from a standard tree of Ne Plus Meuris. This was grafted on a Crab stock, and was growing in a rather strong and cold loam. The tree invariably produced a great abundance of fruit, but which was as invariably of a third-rate quality for dessert purposes, and was, in fact, only "very good for stewing." Now, had judgment been given on the experience with this tree alone it would most decidedly have ruled against the variety as a dessert Pear. I have, however, had further experience with the same variety grafted on the Quince and grown in soil of a lighter and warmer nature, and trained on a west wall. The fruit from this tree has always been of the very first order of merit; indeed, no Pear in the garden could surpass it, and very few equal it in quality. The tree was, moreover, a great and certain bearer, and was every year most serviceable to the gardener and its fruit greatly esteemed by the owner. This is a striking instance of the changeableness of a fruit under varying cultural conditions—the quality from one tree being always indifferent, while that from the other was not easy to surpass; indeed it was, and is, considered to be the best Pear in its season (December and January) which the garden produces. Ne Plus Meuris is also adapted as a bush or pyramid tree grafted on the Quince, and if the soil and situation are favourable it will produce heavy crops of good quality, but for a wall it is unhesitatingly recommended.

Mr. Cunningham also mentions another Pear of great value —viz., Bergamotte d'Esperen. If I were driven to name the one best late Pear for general dessert use I would pin my faith on this variety. I have had experience of its good qualities as a standard on the Pear stock and as espaliers and wall trees grafted on the Quince, and in all these forms it invariably gave the greatest satisfaction. This Pear has a very hardy constitution, and its blossoms often escape injury by the frosts of spring when some other varieties fail under their effects.

I am acquainted with a gardener whose standard tree of

Bergamotte d'Esperen has not failed to yield him a heavy crop of fruit for many years past, and he never fails to sell this fruit in March and April at 4*d.* to 6*d.* per lb. A few years ago I advised an amateur, who was planting bush trees as a means of profit by sale of fruit, to plant half his ground with this variety. His confidence was not sufficient to risk that number, and he planted one-fourth. He now wishes he had planted the whole piece with this useful late kind, which has given him a better return for outlay than any sort in his garden.

I am not aware that these instances are exceptional, and, having no other end in view than to establish the merits of any good fruit, I shall be glad to hear if it has failed with other cultivators, and under what conditions. At the present I am of opinion that it is insufficiently grown, as being hardy, productive, excellent, and one of the best of late-keeping Pears. This variety and Ne Plus Meuris are, I am satisfied, two very recommendable Pears, and am glad Mr. Cunningham has directed attention to their merits.

Occasionally late Pears will not ripen, but shrivel instead. When this is the case the first supposition is that they have been gathered too early. This is unquestionably a common cause of shrivelling; but what when the fruit is left until it drops off the trees and still shrivels? In that case the fruit has been stored in a place at once too light, warm, and airy. I was led to this conclusion by fruit which had been inadvertently left on the ground and covered with leaves. This fruit remained quite firm, while that gathered from the trees —not prematurely—and stored as above shrivelled. By keeping in a dark, cool, and damp rather than a very dry place, I have found the premature shrivelling of late Pears considerably obviated.—A Surrey Gardener.

ROSE TREES AND THE INTENSE COLD.

One curious effect of the late severe winter on Rose trees is worthy of notice, as it coincides with what I have before observed, but which seems contrary to the recognised theories. It is generally said well-ripened wood will stand frost better than young and immature shoots. Now, on looking over my Roses before pruning I find that the young wood made last autumn has stood the frost, while old wood on the same trees has been killed. If my Roses had been grown as standards I believe nearly every one would have been killed outright. It is my practice every year to cut out down to the ground every shoot that is more than two years old. For instance, at the next pruning in March I shall only leave two shoots, or rather shoots of two ages—that is, last year's growth and that of the previous year. By these means plants are induced, when on the Manetti stock with their buds sufficiently deeply buried, to throw out young suckers from the base every year.

Now, at this time of the year I have on my trees wood of 1874, 1873, and 1872, the latter of which in the natural course of pruning I should cut away; but, strange as it may seem to most, in nearly every instance the 1872 wood is dead, while the growth of last year on the end of the same shoots is still alive, though, of course, fast dying. The wood of 1873 is much injured, while the young wood of last autumn is in nine cases out of ten not injured at all, especially those growths which were most succulent. There is a remarkable instance of this in the case of a fine plant of Maréchal Niel trained against a south wall in my kitchen garden, with a glass coping 2 feet wide over it. The young shoots under the coping were quite green and fresh at first, but the older wood, some of which was 1½ to 2 inches in diameter, is quite killed in spite of the protection; but a very succulent young sucker which had pushed from the base in September and had grown with great rapidity to about 5 to 6 feet long is still alive, and to all appearance the only live part in the tree, and yet, owing to its having pushed its growth more away from the wall, was more exposed than any other part of the tree.

If this were a solitary instance we might consider it a freak, but I cut down an overgrown bed of Roses in August to make them start afresh, and in this case also the young wood has not suffered. How can this be accounted for? My theory is this—there is always a certain amount of sap left in Rose shoots; the severe frost we had last winter turned this to ice. In the older shoots, as the bark was hard and the wood also hard, neither would give way under the expansive power of frozen sap, so the cells containing the sap were injured. In the other case the shoots are full of soft pith within, and the bark was not hardened, so there was freedom of expansion and the cellular tissue was not damaged. I should like to hear the opinions of others, and also practical experience of others, with regard to damage by frost.—P.

RASPBERRY CULTURE.

"D., *Deal's*," paper on fruit, page 137, contains a note on Raspberries which even "my lord's" gardener might read with equal pleasure and profit, for it undoubtedly contains the pith of the matter.

There are various methods of management and arrangement, such as planting the canes 5 feet apart, tying five or six canes closely to a stake or singly around a hoop, spreading them out fan-shape, bending them to a given angle, or pruning the erect canes to various lengths. Each plan has had a fair trial, but none has proved so thoroughly efficient and profitable as that of planting single canes in rows, pruning them to a uniform height, and tying them to a couple of strained wires.

Having had occasion to pay more than ordinary attention to the culture of this fruit, a few words concerning a failure and its remedy may prove useful to others. In planting a few rows about four years ago no particular care or preparation of stations was thought necessary, although the soil was obviously the reverse of rich. Unbroken success had very likely given me an impression that the Raspberry would thrive anywhere and in almost any kind of soil, and this feeling was strengthened by the sight of a bed of "wild" Rasps growing luxuriantly in an Alder swamp within 100 yards of the garden. The soil was therefore simply trenched, manured heavily as for vegetables, and the Raspberries planted. A tolerably vigorous growth yielding fruit in due course was the result; but I was not satisfied; the fruit was neither so large nor plentiful as was required, and I resolved to start afresh, reserving the old plants for present exigencies.

In making the new bed particular attention was given to ensure a robust growth, which in the Raspberry implies an abundance of fruit, and to arrange the whole so as to make it an easy matter to protect the fruit from the ravages of birds. This was managed successfully by making the rows side by side 5 feet apart, and with the plants 1 foot apart in the rows. Trenches a yard wide, 2 feet deep, and filled with the soil—leaves and dung of some old hotbeds well chopped and mixed, being prepared for each row. Large fruit and plenty of it was the object in view, and Prince of Wales was chosen as the best kind for culinary purposes, its fruit being very fine; but as it is not so sweet as some, it would probably not be generally liked for a dessert fruit.

It was reasonable to suppose that this careful preparation of the bed would induce proportionate results, but I must confess I certainly did not expect to see anything like the extraordinary vigour of the first year's growth. Not only did the roots spread over the trenches, but they quickly met and became interlaced in the alleys, the entire surface soon bristling with suckers, which could only be kept under by repeated hoeings. The canes left to grow in the rows were wonderfully robust; and the old canes, which had been shortened to about a foot at the time of planting, put forth some shoots bearing such good fruits as to cause one to regret having shortened them so much. I do not, however, think it good practice to leave the canes of a new bed unpruned as is sometimes done, but would always reduce them to 1 or 2 feet. In autumn when the leaf had fallen two wires were strained along each row, one 2 feet from the ground, and the other about 3 feet 6 inches; the canes were then pruned a uniform height of 4 feet, tied upright to the wires, and the work was complete.

The bed has now been in full bearing for two seasons, the fruit being both abundant and fine. A heavy annual top-dressing of manure is given to the alleys. The soil is never disturbed, but remains intact just as it was left after the planting. As the fruit ripens the bed receives one or two thorough soakings of water or some liquid manure, which proves very beneficial to the crop, making the latest pickings of fruit quite equal to the first in size and colour.

The fondness of many birds for this fruit renders protection as necessary as for Strawberries; without it no watchfulness will avail. Only let the bed be left unguarded for a few hours, especially in a dry season, when down swoop blackbirds, thrushes, sparrows, and robins, making clean work of every ripe berry. This may not happen in market gardens in a situation unsheltered by trees, but it is invariably the case in private gardens having the usual adjuncts of shrubbery or woodlands; and the plan which dire necessity compels me to adopt is to envelope the entire bed with stout fish netting

stretched upon a light framework of poles made sufficiently high for walking under.

It may be well to remind beginners that trenches filled with manure and rich soil as I have described may readily be adapted to the culture of most bush fruits, but they would be totally unfit for fruit trees. Raspberries and kindred fruits of lowly growth love a deep, cool, rich soil, and it was a knowledge of this fact that induced me to adopt a plan which success has proved to be right.—Edward Luckhurst.

AURICULA GROWING UNUSUALLY.

What is the proper mode of treating an Auricula which has grown up with a bare stem and throws out no offsets at the collar? One writer says that one may safely cut off the lower part of the root, so as to replant deeper; but I cannot but fear that a large root cut through might rot and ruin the plant. —G. S.

[Never having had an Auricula that grew up in this mode I feel hardly competent to advise, but certainly cutting-off would not do. I should suggest planting it deeper.—D., *Deal.*]

THE MINISTRY OF FLOWERS.

I was once told of a gentleman who, passing through a street in London, had his attention arrested by a poor woman stopping to gaze at some flowers he was carrying, and, with tears in her eyes, exclaiming, "Thank God, I have seen a flower!" He was so touched by the circumstance that he gave her the bouquet. This happened some years ago; but the sweet bright flowers are nearly as rare and quite as precious to the dwellers in the flowerless sunless alleys now as then.

The influence of a few flowers was lately shed in the immediate neighbourhood of the "Refuge." Watch the opening of a box—the spring wayside flowers it contains have been gathered by little school children in a far-off country village, and the loving offering accepted and used for the refreshment of the weary ones cooped-up in the tiny dark stifling rooms in the east end. Listen to the joyous shout of our rescued little ones as Daffodils, Primroses, and Violets are in turn unpacked! Follow the sweet blossoms to the room above, where the widows gather for their work, and listen to the praises falling from those white pinched lips.

Come with me next to a close gloomy attic in a street hard by. In a corner lies a poor invalid, the tiny flame of life fast dying out. See how the dim eye sparkles for a brief moment as it catches sight of the fragrant nosegay the Bible woman carries; bend down gently, and watch the wan face as a smile of welcome to the beautiful flowers plays over its features; then she raises them to her lips, and kisses them, oh, so tenderly! and we can just hear the faint whisper, "My Father has sent them to wile me away home." Before the cock crow she is gone, "wiled away home" in very truth.

The mission of those flowers is not yet ended, but I will only mention one more incident.

A letter from a dying emigrant girl to her mother, who lives in one of the worst courts, has to be taken. But a short time since it was said to be impossible for the workers to venture there. However, the work must be done; so Miss Macpherson sets forth, accompanied by one of her helpers, and carrying a bunch of the flowers. Entering the court she is besieged by little children and rough women, whose eyes are black from fighting, all clamouring for a flower. One by one the flowers are given; and oh, the softening influence they exercise!

The way into that court is now opened, and we know the little flowers have accomplished their mission. This mission sprang from a very trifling incident. Some five or six Snowdrops were enclosed in a letter, little thinking of their destiny. Soon after word came that the lady had shown them to her sewing class of poor widows; the flowers were passed round for each of the two hundred "to have a smell," and then divided they were carried to cheer three dying persons, one of whom expired clasping the little flowers.—E. A. H., *Home of Industry, Commercial Street, Spitalfields, E.*

[Extracted from "Woman's Work," with part of a letter from the authoress added.]

If Miss Stanley would like some Laurustinus sprays in flower and also Ivy sprays I can send her some. In due time there will be plenty of Lilacs (coloured); these she can also have. I will also send her one consignment of Roses in due time. I cannot offer more, as people come from Southampton and other places far and near to see the Roses, and would be much disappointed if they came and found the best Roses cut and sent away.—(Rev.) W. F. Radclyffe, *Okeford Fitzpaine, near Shillingstone, Dorset.*

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 30.

I have long felt that some injustice is done to the beetle race by various epithets applied to such insects, and by figurative allusions in which they appear. "As blind as a beetle" is a familiar phrase decidedly erroneous in its generalisation, though there are some beetles which, if not positively blind, do not make extensive use of their visual organs. Perhaps the misapprehension in this instance has arisen partly from the blundering way in which some beetles move along. My friend the Dor may be taken as an example (he is already beginning to sniff the approach of spring); but I myself set down his peculiar movements not to imperfect vision, I rather ascribe them to remarkable obstinacy. A phrenological examination of the skulls of beetles would probably prove that in this order firmness or resolution are more marked qualities than in any other order of insects. "Beetle-headed" in some counties is, I am told, a phrase employed to denote human stupidity; but it is very unfair in its application to the insects of the Coleopterous order, which are quite as wise in their generation as any of their brethren. Then, again, what an insult it is to all respectable beetles that such a villainous scamp as the common cockroach should be called a black beetle! though the mistake doubtless arose from some non-entomological domestic imagining that the cockroach was the same creature as the beetle designated popularly the Churchyard Beetle (Blaps mortisaga), not by any means confined to churchyards and the like places, but common also in yards and sculleries in various parts of London, and found in country dwellings frequently—a scavenger not without utility in its way.

These and other causes have made the name of beetle rather an opprobrious one, and occasionally, when I have been pointing out to some one a beautiful insect of the order, I have been met by an incredulous smile, as much as to say "That can't be a beetle." Some of the handsome Cerambycidæ, such as the Musk Beetle (Aromia moschata) certainly offer a great contrast to some of the gloomy-looking species. Our illustration (fig. 50) exhibits the imago and pupa of Cerambyx Heros, a species much resembling our own Musk Beetle, but of larger dimensions. Like others of the Cerambycidæ this beetle visits gardens, not with any particular ill design. Its larva feeds upon wood, and the older authors gave most of the Cerambycidæ a good character, stating that they only fed on decayed or decomposed wood; but Mr. Newman asserts, in a recent number of the "Entomologist," that these larvæ prefer sound wood, and therefore to an extent they may be regarded as hostile to the plantation if not to the garden. We do not, however, make much account of the injury we receive from Cerambyx larvæ, because our trees have so many enemies more serious. Just so does the Londoner trouble himself little about the ninepence per ton he has to pay for the City dues in the face of the exorbitant advance of twelve shillings or so which the merchant has now added.

The long necklace-like antennæ of the Musk Beetle are occasionally an impediment to the creature's free locomotion. A party of them has been observed on a tree trunk with their antennæ singularly interlaced and entangled. Whether they had drawn together in sport, or whether, like wild bulls, they had engaged in combat, is not known. The elytra or wing-cases display a variety of tints; the green ground is shot with a bluish tint, or with purple and gold: on the surface of the thorax and abdomen are also fine indentations. Taking its name from the Musk it is really better entitled to be called after the Rose, the scent having most resemblance to the perfume of the Sweetbriar, and therefore decidedly agreeable. It will adhere to the hand for some little time after the insect has been taken in the fingers; and Mr. Wood concludes, from his observations on the species, that the insect can emit or suppress this at its pleasure. As one man's meat is another's poison, so what is an agreeable odour to some beings is as repulsive to another; and if we regard the scent of A. moschata as one of its means of defence, there must be some foe deterred thereby from seizing it. Birds there are which prey upon such seemingly uninviting morsels as these hard-cased insects. A peculiar chirping sound is produced by the Musk Beetle, not

caused by the friction of the shank of the legs, as in the vocal performance of the grasshoppers, but traceable to a movement of the head. It has been compared to the shrill cry of the bat, though really it is a louder sound. Many entomologists have discovered the larvæ and pupæ in Willow trees. The fat muscular larva of the species is probably a creature of slow growth. The pupa, as seen in the illustration, of an allied Cerambyx exhibits curiously the parts of the future insect. I don't know how it may be with others, but these beetle pupæ always bring to my mind the recumbent figures of Crusaders, to be seen in stony stiffness on various antique monuments.

A pretty beetle, also a visitor to gardens and fond of flowers, is the Wasp Beetle (Clytus aristis). The resemblance to a wasp is rather superficial; still, the rapid vibration of its antennæ and its plan of dodging in and out amongst the leaves are a little startling; but the antennæ are much longer than those of the wasp, though short as compared to some of the Cerambycidæ. The general colour of this beetle is black, the elytra being banded with yellow, some specimens having yellow spots in addition. Though the species is of moderate size, the larval state lasts two or three years. Strangalia armata, a beetle nearly allied to the last named, has a penchant for umbelliferous flowers in field and gardens, popping out of view directly any person approaches it. It has been called "armed," because the elytra are deeply cut and toothed at the edges. The contrast of colour in different specimens is striking, the black and yellow being interchanged, some having one, some the other, as the ground colour.

Not a few gardens are to be noticed, skirted perhaps on two or three sides by a Hawthorn hedge. Much as I love the Hawthorn, the "bonnie May," I question whether it is a good plant to form a hedge of, at least for a flower garden; in the case of a kitchen garden there may be less objection. From a Hawthorn hedge individuals of the species designated Timarcha lævigata make their way into gardens. I have seen them in Surrey nursery grounds where their presence occasioned needless alarm, for the beautiful insect is comparatively innocuous, for apparently the larvæ eat nothing but Hawthorn leaves, and it is questionable if the imagos eat at all. Both bear a marked resemblance to each other. The perfect insect has from its peculiarity of emitting a red fluid from the mouth received the name of the Bloody-nose Beetle; this secretion, however, does not appear to be acrid. To the unaided eye the plump body looks black; only by the application of a glass do we perceive that the colour is an intense purple, varied with a greenish gloss. The upper side of the body is dotted over with small punctures; and the tarsi or feet are especially deserving of inspection, as they have broad pads, which

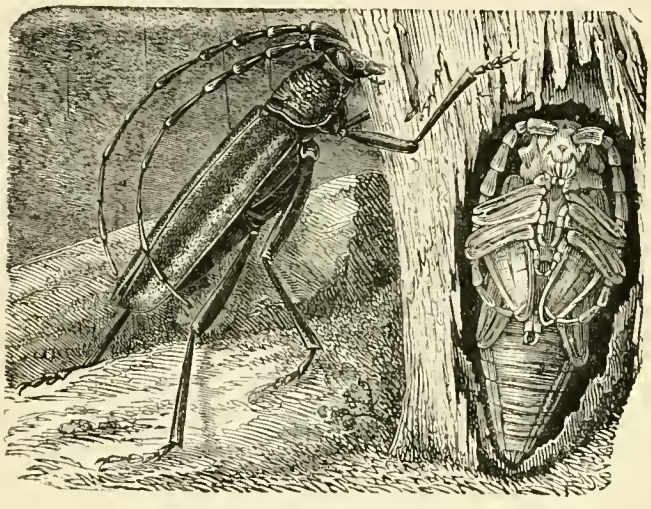

Fig. 50.—Imago and pupa of Cerambyx Heros.

Fig. 51.—Xylopoda fabriciana.

strengthen the grip of the beetle on the leaves or twigs, otherwise its heavy body would render it very liable to capsize. The equally fat but still softer larva must be a *morceaux* to a hungry bird, unless it has an unpalatable flavour.

Unpromising collections of dead leaves swept-up in corners at random at this season contain some minute pupæ of various small but splendid moths, waiting the spring to call them forth in the winged state. Most of the species of the genus Lithocolletis contain examples of some of our smallest moths, which are splendid in colouring, with wings deeply and delicately fringed; these pass the winter in the pupa state, when many are killed by the frost or moisture. The bulk of these small species do no harm worth mentioning, but there are one or two notable as disfigurers of garden plants. Thus, the elegant species L. emberizæ pennella, of silky aspect, yellowish, and barred with white, has a larva that leaves behind it an unmistakeable impress on the Honeysuckle. Wherever this insect occurs the foliage of the plant is at first contorted, and by-and-by it exhibits pale patches, and finally the leaves twist and drop off.

Scarcely any of the species of the genus Lithocolletis have received English names, which is quite as well, since so large a proportion of the vernacular appellations are either silly or inappropriate, such as Carpets, Veneers, Quakers, and all that category. One pretty Lithocolletis a well-known popular author on natural history calls the Brown Dolly, because the brown markings scattered over the white wings bear a slight resemblance to a rude wooden doll. A microscope brings out the beauty of the insect, and shows up the contrast between the creamy white and the rich brown. As the larva feeds on the leaves of Hazel it has received the name of L. corylella. Some of the minute pupæ of the genus Nepticula are also detectable in winter, but most of these, having become full-fed, quit the leaves they have been mining, and make compact cocoons of silk attached to a stem or twig. Here, again, we have various tiny yet splendid insects; thus, N. plagicolella has wings of a brown colour shot with rich violet; across them runs a bar or stripe of bright silver. Amongst the Tortrices (the familiar, and in some instances troublesome, leaf-rollers, while they are larvæ) we have many beautiful moths, though half an inch to three-quarters is about the average size. Amongst those likely to be visitants to our gardens is Xylopoda fabriciana (fig. 51) and Tortrix roborana.

In closing this series of papers, in which I have not pretended to treat the subject I have taken in an exhaustive manner, I would call attention to a valuable little volume from the pen of Sir John Lubbock on "British Wild Flowers in relation to Insects." Though not dealing specially with the work of flower-fertilisation as carried on by insects in gardens, it contains information which will be of interest to every horticulturist. Amongst the curious facts it contains or hints at is this somewhat surprising one—that it has been supposed by some students of this branch of science that the genus Thrips, much disliked, and with good reason hitherto, on account of the ravages committed by its prolific hosts, may aid in a degree in bringing about the due impregnation of the flowers it frequents.—J. R. S. C.

Hot-water Joints.—A short time since you printed a communication recommending rope and Portland cement for joint-

ing hot-water pipes. I have tried this and various other methods, and much prefer plaster of Paris to cement. The joint is ready for use in ten minutes, and is easily cut out if required.—J. T.

DALKEITH.—No. 2.

Little if anything of a purely ornamental nature is noticed in this paper, the notes being principally devoted to fruit, for which Dalkeith is so deservedly famed. The great master of Grape culture, Mr. W. Thomson, here achieved some of his greatest triumphs, and his able successor, Mr. Dunn, has won an honourable place in the roll of British gardeners by his excellent practice and successful results. Before entering the houses it may be observed that the illustration (fig. 52),

Fig. 52.—Montague Bridge.

gives a rather inadequate idea of the Montague Bridge with the little natural cascade and foaming river bounding over its stony bed below. Another (I think north-east) view of the Palace is seen in the distance with the Ivy clinging to its old walls, and from this spot the prospect is not devoid of the picturesque. This, however, is not the theme, and we hasten into the houses and briefly discuss their contents. The glass ranges are very extensive and are in excellent order and keeping.

The first house we enter is a Muscat vinery 80 feet long, 18 feet wide, and 15 feet high, in which there was a good crop of various sorts of Muscats and late black Grapes for winter supply. Muscat of Alexandria, Tynninghame Muscat, Barnes' Muscat, Early Muscat, Archerfield Muscat, and Scott's Muscat are all growing in this house side by side with no perceptible difference between them—in fact, if the labels were detached from the Vines it would defy the cleverest expert to tell the one sort from the other. Scott's Muscat is here thought to be the best of the above varieties, being, perhaps, the best setter and having the strongest constitution, finishing its bunches rather better, but the ripe bunch is not to be distinguished from a well-finished Muscat of Alexandria. We also noticed good examples of the Duchess of Buccleuch Grape with berries considerably larger than usual with this variety, which is generally not worth growing except where high flavour is appreciated. The black Grapes consisted of good Alicante, a very useful winter Grape; Gros Guillaume (Barbarossa or "Seacliffe" Black); Muscat Hamburgh (does badly here on its own roots, and is being all inarched or grafted on Hamburgh or Muscat stocks); Madresfield Court, grafted on Lady Downes', with good bunches and magnificent berries, the largest in the house, having a fine flavour and keeping well. It is liable to crack if care is not taken to protect the roots from excessive wet after the berries begin to colour. It is kept quite dry here and never cracks, but has done so when watered after showing colour. Gros Colman had a good crop of moderate-sized bunches and splendid berries, but deficient in colour and coarse in flesh and flavour, and, on the whole, not equal to the Alicante in use at the same time—that is, mid-winter. Mrs. Pince's Black Muscat is also grown here and in some other of the vineries, but it is to be discarded, as being very unsatisfactory, neither finishing properly nor keeping well, nor having the slightest taste of Muscat flavour.

The earliest vinery is 60 feet long and 11 feet wide. It is a nice, useful, compact house with the border wholly inside, and heated underneath by hot-water pipes, which are, however, seldom used, and are not approved of except in cold wet soils, and then they must be used with extreme caution. The Vines are two years old and coming into good bearing condition. They are started in October to be ripe by Easter, the supply of old and new Grapes always overlapping each other by a few weeks. The late-kept Lady Downes', as long as they will keep, being preferred for flavour, although the new Grapes make the handsomest dish. The back wall of this house, as well as of the Pine stoves, is fitted-up with shelves for Strawberries and French Beans, which are forced in large quantities. Of the latter Osborn's is found to be the best in size, flavour, and productiveness.

We now turn into the late vinery, a lean-to, 100 feet long and 12 feet wide. Black Lady Downes' is the principal sort grown, and is bearing a good crop of even-sized well-finished bunches with splendid berries. White Lady Downes' also does well in this house, and, except in colour, is an exact counterpart of the black variety. Both keep equally well on the Vines till the middle or end of April, when the last bunches are cut to allow the Vines to be started. To prevent bleeding the shoots on which the bunches hang are all disbudded early in February back to the eye required to start, and the shoot ringed outside that eye to prevent such a flow of sap to the bunch as would burst the berries when growth begins. Flavour being a first consideration here, this plan is adopted in preference to cutting the crop in February or March, and keeping them in the fruit room on the bottle system, by which means they keep well enough, but are found by Mr. Dunn to deteriorate in flavour. A single Vine of a few other late sorts is grown in this house for variety, Trebbiano and Black Alicante being the best of them. The supply from this house meets the earliest vinery in April, and so long as the old fruit lasts it is preferred for eating, however fine the early Grapes may be. Leaving the vinery we take a peep into three ranges of old-fashioned single-light pits each 150 feet long, in which are grown the succession and sucker Pines, Cucumbers, Melons, and plants, all looking well.

We now enter a pair of lean-to houses 80 feet long and 14 feet wide, the first one being a Fig house, in which the Figs (White Marseilles) are planted out in a bed in the centre of the house, trained as bushes, and yield good crops, which are ripe in April. This Fig is found to be very prolific, and of delicious flavour if kept in a cool fruit room for a day or so after being gathered ripe. A few other sorts of Figs are grown in pots on a stage, but none of them equal the one named in productiveness and other good qualities for forcing. The other division is an early Muscat vinery, the crop being ripe and cut in June for the London season. The Vines are old and worn out, and the roots being wholly in an outside border it is surprising they bear a crop at all; but house and Vines very much want renewing. The leaves being off the Vines, a bed in the centre of the house was used to ripen-off a good batch of Tea Roses in pots, amongst which we noticed some very fine plants in 12-inch pots of Maréchal Niel and Gloire de Dijon budded upon a seedling Briar by Mr. Hugh Dickson, Belmont Nursery, Belfast. They were young plants received from Mr. Dickson last winter, and being potted and grown-on liberally they have each made several growths 12 to 14 feet in length; being strong and healthy, and ripening-off well, there is every prospect of their producing good crops of their beautiful flowers, which are always in demand, and especially early in the season, when these will be in flower.

We now come to the principal range of forcing houses. These are lean-to's about 370 feet long, divided into nine compartments of unequal lengths and widths. The first house we enter is the earliest Peach house, ripe in the beginning of May, the next following closely at its heels, and the third ripe in

the middle of June. The wood was ripened and the trees had nearly shed their leaves, but looked well for a crop next season. The soil here suits Peaches, and they are generally a successful crop. Amongst many sorts grown, Stirling Castle Peach (true) and Elruge Nectarine are found to be much superior to any others tried for forcing, and never miss a good crop of fine-sized excellent-flavoured fruit.

The fourth house in the range is a greenhouse, filled with Indian Azaleas in all sizes up to 6 feet high and about as much through. They were clean healthy plants well set with flower buds, and mostly trained as pyramids, but not too stiffly. They are all forced into flower between December and April, and are one of the most showy and useful class of plants that can be grown for that purpose. On the front stage and at the ends were a lot of free-grown Epacris, the young shoots studded with flower buds, and some good specimens of standard Epiphyllum, also laden with buds, and resting preparatory to being pushed on for Christmas decoration.

The fifth house is a tropical fruit house, the centre bed being planted with Bananas (Musa Cavendishii), which ripen fine bunches during the summer, and are highly appreciated by the family. Monstera deliciosa is also fruiting freely here, and when well ripened in a high temperature it is found to be quite delicious and a great favourite at table. Along the front stage were growing useful plants of Eucharis amazonica, Ixoras, Crotons, Dracænas (amongst which, conspicuous for their fine colour, were reginæ, Cooperii, and stricta variegata), flowering Begonias, variegated Cyprus, &c., and also a nice plant of the new Curculigo recurvata variegata with seven or eight full-grown and beautifully coloured leaves, forming one of the handsomest of table plants, and decidedly a great acquisition.

The remaining houses in the range are early vineries, from which the crops were cut in May, June, and July. One house is chiefly Black Hamburgh, the Vines evidently past their best, and are to be renewed in rotation with the others in this range. The available soil here is found to be too light in the texture for making good lasting Vine borders, and requires to be frequently renewed and highly fed to produce good crops of Grapes. Another house is planted with Muscats and Frontignans, and the next with Black Hamburgh. A Vine or two of each of several other sorts of Grapes than those named are growing in these vineries, such as Foster's White Seedling and Buckland Sweetwater, both good early white Grapes; Golden Champion; Duchess of Buccleuch, first-rate flavour but otherwise not profitable; the new Grape, Duke of Buccleuch, has been planted or worked on others in each house, so as to fully test its forcing and keeping qualities. If it will stand hard forcing and finish well in March, April, or May, it will be the greatest acquisition amongst white Grapes since Muscat of Alexandria was introduced. From what is known of it here good hopes are entertained that it will accomplish all that is expected from it.

Leaving this range we proceed by the west walk outside the kitchen garden to a long range of glass on the south wall extending to about 450 feet, and 9 feet wide. The first half we enter is devoted to Apricots and Figs on the back wall, and a line of Pear trees in pots between the path and the front. The Pears in pots are not satisfactory, and are to be replaced by Plums and Cherries planted-out and trained to a trellis reaching about halfway up the roof, which will be much more profitable than the Pears in pots. A good collection of Chrysanthemums was doing well in the shelter of this house, but the main stock of them were still outside plunged in a south border, as they are wanted to be kept as late as possible to come in at Christmas for decorating purposes. The other half of the range is the late Peach house, the trees clean and healthy, and had just been cleared of a good crop. This range is unheated, and in favourable seasons good crops are procured of it; but Mr. Dunn considers it a serious mistake to go to the expense of building such houses and leaving them unheated, the crop being liable to be ruined by one cold night, which a crown's worth of firing would have saved, besides the uncertainty of ripening the wood in such dull sunless seasons as 1872 and 1873 without artificial heat. It is a clear case of "sinking the ship for the want of a pennyworth of tar."

We now enter the range of fruiting Pine stoves, 200 feet long and 12 feet wide, in three divisions. The first division is filled with Queens, which were maturing their growth preparatory to being started in January to give a supply in June and July. The next division is also filled with Queens in a slightly more advanced stage for fruiting in May. The last and largest division is filled with fine healthy plants. Some were just showing, some in flower, and some swelling-off, so that the supply through the winter would be unbroken. The principal sorts grown are Smooth Cayenne, very good and large fruit; Charlotte Rothschild, the best and heaviest generally; and Black Jamaica. This is found to be a sure setter and unequalled in flavour as a winter Pine, growing, however, too much crown in proportion of fruit. Montserrat is often grown as the Jamaica, but is in all good points inferior to that variety. Enville is also represented by large useful fruit, but is not considered of first-rate flavour. Prince Albert is another very handsome fine-sized fruit of good flavour, but liable to go black in the heart in winter. Black Prince, Providence, Moscow Queen, Thoresby Queen, and Otaheite are all found here, but none are considered worth growing in quantity except the four first named—that is, Common Queen, Smooth Cayenne, Charlotte Rothschild, and Black Jamaica.

Having now examined most of the glass structures of this great garden, there remain yet the flower and kitchen gardens, which may be briefly noticed in a future issue.—J. Wright.

NOTES on VILLA and SUBURBAN GARDENING.

Raising Seedlings.—It is now time to make a move with regard to sowing many sorts of seeds to raise plants for the embellishment of the flower garden during the coming season, and as most of the seeds are small it may be an advantage to make a few remarks on the manner of raising them. This is the more necessary, because I take it to be a fact that an amateur has not at all times a sufficient space to raise plants for the sake of experiment, but only just sufficient convenience to raise those he really requires. As most of the plants in request are of a tender nature, the seed at this early season will need the assistance of a little heat. It will be necessary in the first place to put up a gentle hothed, and place a frame upon it, and half fill the frame inside with the heating material; after the heat has subsided, which will only take a few days, cover the whole with a thin coating of ashes, yet not so thick as to prevent the heat from penetrating through it. This will bring the pots close to the glass or nearly so, which is a very great advantage to young seedlings, as it prevents them from drawing up weakly. Such a bed will suit the most tender things, as German Ten-week Stocks, Lobelias, Cockscombs, Cannas, Balsams, Asters, Tagetes and other Marigolds, Phlox Drummondii, Petunias, Larkspurs, Portulacas, Nasturtiums of the dwarf sorts, Mignonette; also the following choice things—Chamæpeuce Casabonæ and Diacantha, a Thistle-like plant of great ornament for an amateur's garden and Gaillardia picta, an old-fashioned plant neglected, but yet a beautiful and useful plant, with a large flower, crimson centre and yellow edge, very showy. Then there is Spherogyne speciosa, which is easily raised from seed; this is a yellowish flower with violet centre, and a capital border plant.

Now those who cannot afford a frame for all or any of these may raise the most tender of them in the warmest part of their greenhouse or vinery, and for the remainder make up a bed of heating material under a south wall, and place 3 or 4 inches of good open soil thereon; sow the seed, and cover at nights and cold days with mats spread over a frame of hoops. If the soil is not kept too wet the plants will not be long in coming up.

In sowing the seeds named above, an excellent rule to observe is to cover the seeds to the depth of their own size or thickness. This will be understood when I say that it would be quite wrong to cover the small seed of a Portulaca or Petunia to the same thickness as a Canna or those of a Ricinus or Castor-oil plant, which are the size of a Mazagan Bean. This is not all: the smaller the seed the finer should the soil be, so that its particles may press closer to it, and retain the moisture so necessary for its germination and after-growth.

Again, the application of water to seedlings raised in this way must have much attention. Some will require it much oftener than others, for two reasons—according to the depth they are placed in the soil; and the state of the atmosphere, whether dry or otherwise, in which they are expected to germinate. A small seed but just under the soil will need the surface frequently but gently moistened, while others of a greater depth may have water more freely, yet will not require it so often. In all cases, however, be careful not to saturate the soil and bring it to a sour state.

Let me now remind the amateur that before raising plants he should form a true estimate of his convenience for them, and not attempt the raising of too many at a time, because most of these plants which flower the same season require to be grown well and without check; also, to be thoroughly enjoyed they ought to have their growth well developed by taking every care for their progress before flowering. To secure this it is necessary that the seedlings be pricked out either in pots, boxes, or any other convenience as soon as they can be conveniently handled,

otherwise they draw up together, and their roots become entangled, so that they are not easily separated without great injury resulting. Clean vessels and fresh soil must be used, and the plants must be again placed near the glass, and at all times have air admitted according to the weather and the character of their growth and habits. At this time of the year, when every place is crammed to excess, all sorts of temporary contrivances have to be adapted for the welfare of the plants, and trouble in this respect is never thrown away.

Another important class of plants must not be omitted from the list of seeds to be sown now, and that is the climbers for trellis-work and covering bare walls, or making groups of flowers in suitable places in the open ground, also for suspending from vases, &c. These are the tall-growing Nasturtiums, Sweet Peas, Convolvulus major, Calempelis scabra, or as some call it, Eccremocarpus scabra, Lophospermum spectabile and scandens, as well as the common Canary Creeper. All the above are fast growers, and if they are wanted to cover a large space they ought to be grown to a good size before planting out.

It will be necessary to say there must be a regular process of hardening-off as their growth and the weather permit, for none of the things named above ought to be kept in heat beyond a certain stage of their growth, and some will require moving to cooler quarters. Others, such as Balsams, will be best kept growing in a milder temperature till they flower. — THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

"WHEN the wind is in the east it's neither good for man nor beast," is an old saying, and unlike a good many old couplets it is true; nor would its truthfulness have been questioned if the whole of the members of the vegetable kingdom had been included in the adage. Not only are our hardy fruit trees affected by it, but in the forcing houses its influence is also felt. At the present time the blossom buds on Apricot, Pear, and Cherry trees are very prominent, but none of the incipient buds have as yet burst through the scaly protecting covering in which they are enveloped, and it is well for the trees, as the east winds accompanied by frosts that would cut off any exposed blossoms. On Friday morning the thermometer exposed on the lawn registered 10° of frost; on other nights the temperature fell below the freezing point. At present nothing can be done either with trees on the open borders or on walls. Nailing, except a few small Morello Cherry trees, has been finished, the borders dressed with manure and dug.

The nailing of Morello Cherry trees on north walls is usually left until the last. As the fruit is all borne on the young wood of last year, it is well to lay it in rather thickly. Of course the largest proportion of young wood is formed at the extremity of the branches, and unless the trees are well managed the centre becomes thinly clothed with bearing wood. All growths near the centre should be encouraged to grow by careful training. Instead of nailing the young wood near the naked branches close down to the wall, they will do better if tied with strips of matting or fine tar twine to the stems; when the trees are in leaf they will in this way hide the naked stems. The Morello Cherry does not do well in any soil; the trees delight in a medium clayey loam, but in damp stiff loam or light sandy soils the branches canker, and some of them die-off early. If trees are in this plight it is necessary to unnail the whole tree and to nail it again regularly over the space to be occupied. Perhaps no more profitable fruit trees can be planted on walls facing north than these, but in some gardens if all such walls were planted with them there would be too many.

Red Currants succeed as well on a north wall as anywhere. They come in after those planted on a warmer station are over, and it is very easy to net the trees to keep birds from carrying off the fruit. Gooseberry trees are also quite as much at home on a north wall as the others; and a dish of Gooseberries is always esteemed, especially when the main crops are forgotten. In Scotland some of the late varieties, such as Warrington and Hedgehog, can be preserved on the trees in good condition down to October.

The best way to train both Currant and Gooseberry bushes on walls is to nail a branch horizontally right and left from the main stem, training up from these (vertically) the branches that will furnish the wall with bearing wood. These should be about 6 inches apart, and even if the walls are high there is no difficulty in furnishing the branches with fruitful spurs their entire length.

If the protecting material for walls is not already fixed in its place no time should be lost in attending to it. Correspondents are sometimes asking how the trees ought to be protected. The question is not always What is the best way? but, How can it be done the most cheaply? First, there ought to be a projecting coping about a foot over the wall; this may be of wood, which is perhaps the cheapest, then some stout poles, such as are used in the Hop-growing districts to train the Hop plants to should be obtained. These are sunk in the ground about 2 or 3 feet from the base of the wall, the upper end of the pole resting against the wall coping. The poles must be about 12 feet apart, these will prevent the material from being dashed against the trees. The simplest way is merely to nail the canvas to the coping and also at the bottom of the poles. When it is not required over the trees it can be rolled up and tied at the top with a small piece of strong twine.

FRUIT AND FORCING HOUSES.

Vineries.—In the earliest house the Grapes have set well and have been thinned. If the Vines require it the border should have a good watering, as the formation of young rootlets has previously taken place. A good supply of manure water will cause the berries to swell to a large size. The Muscats are now in flower, and they seem to be setting pretty well. The dull cold weather may be thought injurious at such a critical period, but as a rule Grapes set better in dull weather than they do with continuous sunny days, but a few blinks of sunshine are certainly beneficial to raise the temperature a few degrees. On sunny days with a high temperature in the vineries, when a bunch in flower is shaken the pollen may be dispersed in clouds, but it is not so efficacious as the smaller quantity which would be distributed in dull weather, or better still with just occasional glimpses of sun.

Many Grape-growers also stipulate for a very dry atmosphere at the flowering period, but a mistake may be made in this which will not be easily remedied. The atmosphere may become overdry if no water is sprinkled on the paths or borders. The result of this will be that the juices of the leaves will be dried up, the growth checked, and the whole plant be predisposed to the attacks of red spider. We water the outside borders of the early houses about three or four times during the season; each time the fermenting material is turned over a little fresh stable manure is added to raise the waning temperature. The young growths ought not to be stopped when the Vines are in flower, especially Muscats.

CUCUMBER AND MELON HOUSES.

Except attending to thinning-out and tying the growing shoots of Cucumber plants to the trellis, little more attention has been required. A very large proportion of male flowers were produced on some plants which had been raised from seeds; these were picked off, as they tend to exhaust the plants. Red spider appeared on some of the plants. There is no remedy except knocking them off with water applied from the syringe. This has been done on fine mornings, applying the water with some force to the under sides of the leaves; but as these are very easily damaged some caution is necessary.

The young plants of Melons had been growing on a shelf near the glass in small pots, and were very healthy, having made short-jointed stout growths. The border had been previously prepared for them by the soil being placed in the house a few weeks previously to become warmed. The temperature of the house is from 60° to 65°. As the plants were put out in rather moist soil, no water was applied to them at the time of planting. They will be watered after having made some growth.

GREENHOUSE AND CONSERVATORY.

These are now more attractive than they are at any other season of the year. Besides the usual forced flowers, such as Roses, Deutzias, Azaleas, &c., Hyacinths and other bulbous-rooted plants are also in full beauty. It is also worth noting here that some Hyacinths flower much stronger if the plants are kept in a warm house until the flowers are almost open the whole length of the spike, and amongst them are some of the best of the new sorts, such as King of the Blues, single; and Koh-i-noor, double red. Ida, the best yellow Hyacinth, opens best in heat; and Lord Byron, a fine porcelain blue flower, if it is not opened in heat the flowers at the top of the spike sometimes do not open at all, and a symmetrical spike is impossible. We pay attention to tying the spikes to sticks about the time the first flowers open. If this is not attended to in time the spikes fall over and sometimes snap at the base.

Amaryllis of sorts have also a brilliant and decided effect. A succession of them are kept up by placing the bulbs in heat, and just before the flowers open place them in the greenhouse, as, if the flowers are allowed to fully expand in heat, they do not last very long.

Chrysanthemums. — The cuttings had been put in, two or three in small pots, and as they were put in a hotbed they rooted freely; the plants have now been potted-off into 4 and 5-inch pots and have been placed in cold frames.

Picked withered flowers from Heaths, Epacris, &c. This should always be seen to as soon as the flowers fade, as not only are they unsightly but are also injurious to the plants.

FLOWER GARDEN.

We continue to pot-off Zonal Pelargoniums as opportunity offers. Those intended for the principal beds and borders were done some time ago, and are now well established in pots. Some are planted out in boxes, but bedding Pelargoniums do not plant out so well from boxes as most other bedding plants; the mould falls from the roots and the plants suffer. The best way is to pot the plants in 5-inch pots, and to see that they have

plenty of room. One bushy sturdy plant that has had sufficient space to develope itself is worth three or four that have been overcrowded; the latter do not start into growth until the summer is nearly gone, and they also suffer much during the process of hardening-off. It is difficult to give details of work amongst bedding plants at this season, as there is continual work moving the plants from warm to cooler houses, and from heated structures to frames or turf pits. All subtropical plants must be kept growing in a little heat until a change occurs in the weather.—J. Douglas.

TO CORRESPONDENTS.

Books (*G. A. B.*).—We have no such work. At one large establishment we saw lists printed on a slip of paper, and the cook marked the articles needed. Any printer would print a thousand of such lists for a few shillings. (*C. L. T.*).—Dr. Hooker's "Synopsis of Ferns" has no illustrations; Mr. Lowe's has coloured figures. Any bookseller could obtain either. We do not know the prices.

Cost of Digging (*A Subscriber*).—Digging light garden soil one spit deep, 1½*d.* or 2*d.* per rod. If the soil be heavy, 3*d.*

Prince's Briar Roses (*J. P.*).—They are fully noticed in our No. 703. Your wall Cherry trees need root-action. Give them a good soaking with weak liquid manure, and keep mulch over the roots.

Preserving Garden Nets (*A Constant Reader*).—Have them soaked thoroughly in a tanner's pit of oak-bark liquor, and when not in use keep them in a very dry place.

Cattleya citrina (*A Subscriber*).—It will succeed in a cool house in the temperature you name, which we presume is from fire heat. It should have a higher temperature when growing—60° to 65° at night, and 75° to 85° or 90°, the latter with sun, and should have more moisture, being sprinkled with water two or three times a-day, and this continued until the growth is perfected, when the block should be kept more dry, a light sprinkling once a-day, or not that in dull weather, being the whole of the plant's requirements during the season of rest. It succeeds the best of slight shade from powerful sun. It ought not at this season to be kept wet, but only damp, until the growth is considerably advanced, and then increase the supply of moisture with the growth.

Propagating Sphædogyne latifolia (*Idem*).—Your plant will not succeed in the temperature you name, it is too low, and to this is to be attributed the falling of the leaves and the rotting at the collar. The point of the shoots may be made into cuttings of two joints with the growing point to each, the leaves removed from the two lower, and insert to the next pair of leaves singly in pots well drained, and in a compost of sandy peat, turfy loam, leaf soil, and silver sand in equal parts. Place in a bottom heat of 75° to 80°, and keep rather close, moderately moist, and shaded from bright sun until rooted, when they should be shifted into larger pots, and have a moist atmosphere without syringing overhead. In potting from the cutting pots omit half the quantity of sand named for the cuttings.

Pruning Orange Trees (*Conservatory*).—The plants, having become straggling, ought at once to have the straggling growths cut back or removed, and if the heads are very thick of wood they should be thinned. This should be done with judgment, so as to produce evenly-balanced heads. Too much pruning, however, would only encourage growth and induce overcrowding, which will make the growths weak and liable to go off. No precise instruction can be given, but the above will give the needful idea of what should be aimed at in pruning Orange trees.

Ferns and Plants for Drawing-room (*Manor Hill*).—We have found the following plants very suitable and easily cultivated. Ferns are very useful, but it is necessary that the growths be completed and hardened-off before placing in such a position, or the fronds from the drier atmosphere of a drawing room are liable to suffer. Ferns are—Adiantums assimile, Capillus-Veneris, æthiopicum, cuneatum, formosum, setulosum; Asplenium bulbiferum, caudatum, dimorphum, and præmorsum; Blechnum occidentale, Davallia dissecta, D. tenuifolia, Doodia aspera, Goniophlebium appendiculatum, Gymnogramma ochracea, G. tartarea, Lastrea decomposita, L. decurrens, L. elegans, Lomaria gibba, L. Herminieri, L. Patersoni, Nephrolepis davallioides, N. exaltata, Platycerium alcicorne, Platyloma rotundifolia, Pteris cretica albo-lineata, P. longifolia, P. serrulata, P. serrulata cristata, P. umbrosa. Those require stove or greenhouse temperature. Hardy Ferns are even more suitable, of which we name a few which succeed admirably grown in a cool greenhouse:—Asplenium adiantum nigrum, A. marinum, A. trichomanes, Athyrium Filix-fœmina, vars. Applebyanum, apuæforme, corymbiferum, and plumosum, Blechnum spicant, and var. imbricatum, Lastrea dilatata cristata, L. Filix-mas, var. cristatue; Osmunda gracilis, O. regalis cristata, Polypodium dryopteris, P. vulgare, P. vulgare cambricum, Polystichum aculeatum, P. angulare cristatum, P. multifidum, Scolopendrium vulgare, vars. corymbiferum, crispum maximum, ramo-cristatum; and Lycopode, which do well in a stove with moisture, as Selaginellas erythropus, formosa, Lyalli, Martensi variegata; and in greenhouse, S. Wildenovi and denticulata. Stove plants—Alocasia Jenningsi, Anthurium Scherzerianum, Aralia leptophylla, Croton Johannis, C. angustifolium, C. Weismanni, Cyperus alternifolius fol. variegata, Dracæna Cooperi, D. reginæ, D. stricta, D. utilis, D. rubra, D. terminalis, Jacaranda mimosæfolia, Maranta zebrina, Musænda frondosa, Pandanus graminifolius, Panicum variegatum, Paullinia thalictrifolia, and Pilea muscosa. Isolepis gracilis is very useful, and such common things as the fine-foliaged Begonias. The above list will be more than you will need, but from it you may select what you require, and it may be useful to others of our readers.

Geranium Leaves Browned (*T. Best*).—The leaves are evidently injured by cold and damp. The plants should have a light position, and be near the glass without touching it; about a foot from it is proper. Then we think you water them overhead, as also the Fuchsias, which during the winter ought not to have more water than sufficient to keep them fresh. The temperature ought not to fall lower than 40° at night, and it need not be more than 45° by night or day from fire heat. Water more carefully, keeping the soil moist, and increasing the supply as the weather improves and the plants increase in growth, but it will all be of no use if you do not exclude frost.

Pump for Raising Water (*Anglicana*).—Your plan is not a good one, and we do not think 53 yards too long a distance to draw water by hand-power. We should have an ordinary iron 4-inch barrel pump at A instead of B, as any ordinary pump will raise water 15 feet. This will allow of a clear fall of 3 feet from A to B, the pipe being taken above ground with that amount of fall by the delivery pipe to the reservoir B. A 2-inch delivery pipe you would have instead of 2-inch suction pipe, and it would be not only cheaper, as a more economical pump would answer, but be very much easier to work. The pump could be raised upon a platform at A.

Cucumbers in Peach House (*M. J.*).—Very different indeed is the treatment required by the two. The Peaches require considerably more air—in fact, they could not in summer have too much, and the Cucumbers to succeed in a greenhouse require to be kept closer, more moist, and warmer than is good for Peaches.

Vallota purpurea (*A Lady*).—It will succeed as a window plant, and is one of the best. All that it requires is a window with a south aspect, and to be potted at this season if it require it, as it should now be making fresh growth. It should be liberally supplied with water up to July, after which it will suffice if the soil be kept moist. The leaves will require to be sponged occasionally to free them of dust. After June it may be stood outdoors in an open warm exposure, well watered or kept from flagging, removing to the window in early autumn.

Knight's Monarch Pear (*C. R.*).—It is usual for this Pear in a hot and dry season to become hard and never become tender in flesh. It is not suitable for a hot and dry position, but is one of the finest-flavoured kinds when grown on a west aspect. The fruit now hard will not ripen, especially as they have shrivelled, which would indicate imperfect ripening and too dry an atmosphere in the store room. See remarks on shrivelling in another column.

Crocuses Eaten (*Idem*).—Mice are the most likely cause of the injury of which you complain; a few would be sufficient to commit the damage, field mice existing often in greater numbers than is supposed. Squirrels we do not think would take them, and they do not suck rooks' or partridge eggs any more than the goatsucker sucks goats or the hedgehog cows; all are popular absurdities.

Propagating Roses by Cuttings (*Agricola*).—Spring cuttings may be had from forced plants which have just shed their flowers. These cuttings may be made with three joints cut transversely below the lowest, and the lowest leaf removed, then insert singly in 2-inch pots, using a compost of turfy loam, sandy peat, and silver sand in equal parts; insert the cuttings about 1 or 1½ inch deep. The pots should be plunged in cocoa-nut fibre refuse, sawdust, or other material over a gentle hotbed (70° to 75°), and kept close, sprinkling very lightly every morning with water the same temperature as that of the bed, and the cuttings to be shaded from sun. In about a fortnight they will have rooted, but they are not to be removed from the frame until shoots are made of 1 or 2 inches in length, and then they may be removed to a frame also with gentle heat, or be kept in the same, but having a little air daily to harden them. In about three or four weeks after insertion they will be fit to shift into larger pots, and may be placed in a cold frame, and be kept moist, rather close, and shaded from bright sun for a few days, when they should be hardened-off, and planted-out in May, or shifted into larger pots, and grown-on outdoors, the pots being plunged in ashes. Summer cuttings may be taken in July just after the flowers are shed, inserted in pots, and struck either in bottom heat as above described, or in a cold frame kept close, and sprinkled every morning. They will root less quickly than in a hotbed, but quite as surely. Autumn cuttings may be of any spare shoots in September or early October under a north wall, putting-in firmly, and in the following April they will be ready for potting.

Constructing Greenhouse (*Ashfield*).—It is not desirable to have Peach trees against the back wall of greenhouses, they are seldom satisfactory; but you may retain them if you are prepared to give them a low temperature in winter, which is essential for rest. We should remove them, and have instead a few Vines for the roof of one or both houses, which will give you better return than Peaches against the back wall. You can have the house in two divisions, one of 10 feet for a warm house, and the other 17 feet for a cooler house. The appearance would be best not to project beyond the house wall, the width therefore will be 10 feet. The front wall we should have 2 feet 6 inches high from the floor line, and to clear the door from drawing room you will need 4 feet 6 inches of front lights, and the height at back 11 feet 6 inches, or just beneath the coping of the wall. The front wall we should have built on piers, and arched over just level with the ground line, and this will allow of your having the Vines planted inside the house, the spaces between the pillars allowing of the roots passing outside. The glass most suitable is 21-oz sheet, thirds quality, and in squares of about 15 inches (not more) wide, and 2 feet to 2½ feet long. Heat by hot water, having a stokehole in the tool house, and take the pipes from the boiler across the end of the warm house to the front of the house, and then branch to the right with two pipes, and two returns for the warm house beneath the stage, and to the left with one flow and return for the cooler house, the pipes in both houses being beneath the front shelf, and about 18 inches from the front wall. You will need a valve upon the flow pipe of both houses just where they leave the main, so that you can regulate the heat at will in both houses. The flow and return across the end of warm house will do for both houses. The path the width of doorway, 2 feet 6 inches, so that you will have a shelf in front of 2 feet 6 inches in width, and that height from the floor, and a back stage of 5 feet; two shelves of a foot and one of 3 feet in width, each being raised a foot, the first on a level with the front one. These may be made of laths about 1½ inch thick and 1½ inch wide, with an inch space between each. Almost any boiler will heat the houses, so that you will not have to get up in the night, the fire being made up at ten o'clock; you may have one that will not require attention for several hours. The pipes should not be less than 3 inches, and are better 4 inches, which is the best size of piping. The piping must go the whole length of each house.

Greenhouse for Amateur (*Ignoramus*).—If you have a wall already up and with a suitable aspect the most economical form of house is a lean-to, and it answers very well as a greenhouse; but if you have no wall the best form is a span, as it admits light equally all around. The best mode of heating each a house would be a stove boiler, and 2 or 3-inch hot-water pipes. The stove may be within the house, having a pipe or funnel to take the smoke and injurious products of combustion clear of the house. We cannot recommend one dealer preferably to another. It is matter for your own choice.

Heating Cucumber House and Greenhouse (*T. Haslam*).—To grow Cucumbers and Melons successfully you will require pipes for bottom as well as top heat. Two pipes will be necessary for bottom heat to a bed of 4 to 5-feet width, the pipes being surrounded by and covered with rubble about 9 inches thick, and over this the soil a foot thick. You will therefore require the additional pipes for bottom heat to the Cucumber house, which will make

a difference of about £2. One pipe along two sides and one end will be quite ample to heat the greenhouse, though with two pipes you can regulate the heat by valves, and if you at any time wish it you could with the two pipes along both sides command a stove temperature. If you have a bed on both sides of the Cucumber house you will need hot-water pipes for each, and the expense would be double. The pipes for top heat ought to be over the bed or upon the walls of the beds.

Insects in Vinery (*Somerset*).—We failed to find anything in the soil, where you could hardly have thrips or red spider. The other insect in the piece of paper appears the remains of a smashed thrip, which may be destroyed by fumigation with tobacco, but be careful not to apply it too powerfully or the Vines may be scorched. It would have been better to have sent us a leaf or two of the Vines, for upon those the insects live, and if there is no evidence of them on the leaves you have no cause to be alarmed.

Seakale with Long Stems (*Idem*).—If your plants are not very old and the stems thick you may cut them over level with the ground as the heads are cut for use, and new crowns will be formed sufficiently strong for forcing another season. If, however, the stems are very thick, it is likely some of them may rot, especially if the weather be wet for some time after cutting; but we think the stems may with safety be cut back, as they have been drawn by the ashes.

Irish Fern (*Gloucester*).—It is one of our rarest native Ferns, Trichomanes brevisetum.

Crickets (*Idem*).—Chass's beetle and cricket poison can be obtained of any chemist.

Van Thol Tulips not Flowering (*G. S. R.*).—The cause, we think, is that the bulbs were not ripened well. All the Vermilions failing confirms our opinion. They were probably grown by a different florist than those with different coloured flowers, which all produced blooms.

Fruit for N.E. Wall (*S. S.*).—Morello Cherry; Adams's Pearmain and Stormer Pippin Apples; Brown Beurré and Winter Nelis Pears; Purple Gage and Peach Plums.

Deodorising Catgut Manufactory Sewage (*Werp*).—Try mixing half a hundredweight of sulphate of lime (plaster of Paris) with each hundred gallons.

Maranta (*E. D.*).—There were no insects in the soil or roots. They were probably the white Acari that often swarm on decayed roots, and decayed were the roots of your Maranta, probably from being kept too cold and too wet. The fleshy-leaved plant is the Aloe perfoliata, the Succotrine or Bitter Aloe. It requires a high temperature and dry air to induce its flowering. There is a portrait of the flowers in the "Botanical Magazine."

Insects on Willow Twigs (——).—The small yellow grubs boring in the young twigs of Willows are the larvæ of a little midge (Cecidomyia salicina), which are sometimes very injurious to the Willows used by basketmakers.—I. O. W.

Name of Conifer (*G. B.*).—It is, we think, Cryptomeria elegans, but the colour is pale for the species, which may be due to its growing in a sheltered position. Ours are of a bright chocolate colour.

Names of Plants (*John*).—No. 2 is Sweet-scented Coltsfoot. The other three specimens, being only leaves, we cannot name. (*G. A.*).—Helichrysum speciosissimum.

POULTRY, BEE, AND PIGEON CHRONICLE.

JUDGES.

Now, when there is a cessation of poultry exhibitions, and committees are consulting over their schedules for fresh shows, it seems to be a good time to say a few words on the judges.

We have watched and seen with pleasure how many societies have advertised who their judges are to be, for this is a very important announcement. However good a schedule may be, however much trouble a committee may take over their show, unless the judges are up to their work, and men that the poultry fancy have faith in, come to grief that exhibition must. Shows are now excessively numerous. Every town—nay, many mere villages—have an open poultry show, and exhibitors consequently can pick and choose where to send to. We have heard of shows got up solely for the "benefit" of some few; but such shows live a short life and collapse, for in these days exhibitors will have justice.

It is a well-known fact that those shows which do advertise who their judges are to be have the most entries. We noticed this most especially in December last. In one week alone some fourteen or fifteen exhibitions were held, and, without one exception, those that advertised their judges had the most entries, and those who did not had only one or two entries in some classes. The locality had nothing to do with it, for birds were sent to those places where the owners knew who would judge them irrespective of distance.

We feel it must be apparent to all promoters of shows that the judges should be known beforehand, for on that must depend more or less the number of their entries. Some committees may think that exhibitors, knowing who are to judge their birds, might try and make some arrangement with the judges. To such committees we say that a man who can be "arranged with" would soon be found out, and could no longer hold his position. Such a state of things would soon come to light.

But even to those who do advertise who their judges are to be we would say a word. Most shows have two judges—that is, most shows of any size; to those who only have one we say nothing. Let them go on advertising who that one is to be; but we think most assuredly that those who have two or more judges should in their advertisement which states who those are, state also what classes each is to judge. Take two judges, say A and B. A may be a well-known skilful adjudicator, while B may be a bad hand at the work; but the entries are made in consequence of A's name being advertised, while B may have to award the prizes in some classes he knows little about. Or A may be more especially at home in some classes, and B in others. The committee, however, not knowing this, may make out their judging books quite differently, and so again the awards would not be made by that man who the exhibitors at entering expected would make them, for all the exhibitors know the right man for the right work. We frequently see advertised in the Pigeon department—"Mr. C will take the Pouters and Carriers, and Mr. B the remainder." Well, so let it be in poultry. Let exhibitors know who will take the various classes in future at those shows which have more than one judge. We are sure it would pay, and the committee could easily arrange the matter when they correspond with and engage their judges.
